She went up stairs and threw herself upon her bed, and wrestled with a devil of unjust indignation. The Eldons would see that prying, intrusive, narrow-minded, inquisitive Mrs. Simcox, and would hear her garbled account of the meeting at Sedgwick, and Gertrude would be influenced by it, and would hold her (Nina) to blame! It was altogether unfair and uncalled for. "I should be wanting in what is due to myself if I pandered to a taste for idle gossip by offering up a confession to Mrs. Eldon as soon as she comes home," Miss Delany thought, hotly. "I have done nothing that I would not do again to-morrow" (this was untrue). "If Gertrude is capable of listening to any thing against an old friend of her husband's

that is uttered by a recent acquaintance, she does not deserve that I should confide in her in the smallest degree." So, for a while, the devil of unjust indignation had it all his own way with Miss Delany.

She was still hot, weary, wrathful, and exhausted when the maid came to tell her that it was time to dress for dinner. "Missus was home, and nearly ready," she added; so she could stay and help Miss Delany, if Miss Delany required her services. So Nina's toilet was soon made, and then she went down to face the Eldons.

Mrs. Eldon was very much engaged with a spray of luxuriant rebellious roses that had crept in at the open window as Nina entered the room. Frank, who was standing near his wife, ceased speaking, and turned and smiled at Miss Delany as she came near to them; but his smile was less free and unrestrained than usual, and Nina felt the change keenly.

"Have you had a pleasant ride, Gertrude? I was too tired to come and meet you," she said, as unconcerned as she could.

"The ride was not unpleasant," Mrs. Eldon answered. "Oh, dinner! I'm so glad," and Nina felt that she had been maligned by Mrs. Simcox.

CHAPTER VI.

AN EXPLANATION.

THERE was a something, distinctly, there was a something; but what that something which had risen up between them was, Nina was far too indignant with Fate and her friends to inquire. What if she had untowardly gone out in the heat of the day, and wearied herself by buying things which she did not want, and rekindling the nearly burned-out embers of that faintly flickering romance which had sparkled up again at sight of Gerald Barrington? What if she had done these things? Was Gertrude, safe, sound, newly married Gertrude, to be her (Nina's) judge and executioner? "She has neither the moral, nor the mental, nor the social right to assume that she knows better than I do what is proper and discreet," Nina said to herself, as she sat out the sad, stiff, slow dinner in silence. "And she shall not be able to meanly avail herself of her hostess-ship much longer," the girl went on thinking, irritating her soul against her friends by the thought, and spoiling her appetite.

That dull, dreary dinner came to an end at last, and then, contrary to his usual custom when they were alone, the vicar of Ardleigh allowed the two ladies to go away into the drawing-room by themselves. "While Gertrude maintains her 'dignified reserve,' as I have no doubt she calls it to herself, I shall follow her example," Miss Delany thought. So the aspect of affairs promised ill for a social evening; and the promise was not belied by the performance,

though Mrs. Eldon speedily showed that she had no intention of maintaining reserve of any kind.

Nina had settled herself down before a frame, and was apparently intently occupied in counting stitches in a most elaborate and difficult bit of scroll wool-work, when Mrs. Eldon broke the almost oppressive silence :

"You will be surprised to hear, Nina, that I have had a letter from Lady Delany to-day."

"No; I'm not surprised. Lady Delany is in the habit of doing uncalled-for and out-of-the-way things. Her doing one more does not startle me." But, though Miss Delany said this, it was evident that she was both surprised and startled, and a little curious too.

"There is nothing uncalled for or out of the way in a mother writing to the mistress of a house in which her daughter is staying."

"Certainly not, in a 'mother' doing it; but please don't degrade that relationship by trying to make out that it exists between Lady Delany and me. Angry as you are with me about something, Gertrude, don't be so unjust, so foolishly unjust as that."

Miss Delany had lost her temper, and given out the challenge to open combat in this speech. The definite accusation that would wring from Nina a definite defiance would surely be made now.

"I am not 'angry.' I have no right to be that," pretty Mrs. Eldon said, blushing a good deal; "but I do feel that you have treated me as a half foe instead of a whole friend. Lady Delany, in her letter to-day, tells me of something you have never even hinted at—your engagement to a Mr. Manners. She—"

"Tells you an untruth," Nina said, speaking with that air of calm deliberation which betrays so surely excitement and wrath.

"Do you mean to say that there is nothing?"

"Nothing where?"

"Nina, what is this between Mr. Manners and you?"

"More than a hundred miles at present," Nina said, laughing. "That is to say, if he is where I believe him to be—in London."

"And you are not engaged to him?"

"Decidedly not," Nina said, with her eyes flashing; "does Lady Delany dare to say that I am."

"Well!" Mrs. Eldon paused, pondered, then went on with a shade of hesitation in her face and voice and manner. "She does not make use of the word 'engaged;' but she says she 'hopes you have told me of the understanding which exists between Mr. Manners and yourself, as she thinks any concealment on such a subject tends to evil;' what could I suppose after reading that, but that you were engaged to him?"

Miss Delany made no answer for a minute, at least. She sat leaning forward on the work-stand, her chin resting on her hand, her eyes fixed on Mrs. Eldon's face. At last she said:

"And what brought this letter and this caution, just now, Gertrude?"

"No word or hint of mine, I assure you," Mrs. Eldon said, warmly.

"She was prompted to the interference by her own nasty, malicious little mind, then," Nina said, quietly.

"And by a half truth which has reached your father," Mrs. Eldon said, deprecatingly. "Sir Arthur has heard that Mr. Gerald Barrington is living in our neighborhood, and he has not heard that he is married. I believe it is by your father's desire that Lady Delany wrote, to caution me not to aid in throwing you together. You see it is all well meant; and now, Nina, may I say a word or two more?"

"Yes."

"You will not be offended?"

"I don't promise you that," Nina said, shaking her head. "If nothing is said to offend me, I will not be offended; but I'm not a patient Griselda—I'll not bear unjust rebuke, or aspersion, or suspicion."

"Now I'm afraid to speak."

"Then you must feel that what you were going to say was unjust; and therefore it is better left unsaid," Miss Delany remarked, coolly.

"No; I will risk your wrath, and say it; because I feel it to be the reverse of unjust or unkind. Tell me about Mr. Manners—do, Nina."

"He is a very nice fellow—a friend of papa's, which is saying little for him—a friend of mine, which is saying a great deal for him."

"And is he not more than a friend?"

Nina dabbed at the pattern before her with the point of her needle as she answered:

"No; nothing more. Is not being 'a friend,' being owned and valued as a friend, a great thing in this hollow, pleasant, deceitful world?"

"And he is not to be more than a friend, even in time? You can't care for him—love him, I mean: won't you tell me, Nina?"

"I have never even told you that he wanted me to try," Nina said, frowning a little. "He would be grateful to Lady Delany, if he knew she made him the theme of her fluent pen and wild speculations."

"Then you mean me to understand that it's all a fable about there being even an understanding between you," Mrs. Eldon said, in a disappointed tone; and then Nina colored and looked confused, and Mrs. Eldon shrewdly divined that there was something, after all.

By-and-by, when the daylight died and the moon got up, they sauntered out into the garden, and there, in the sweet soft light, and amidst the tender silence that hung over every thing, Nina relaxed a little from her reserve.

"I always feel that John Manners would make me happier than any other man in the world, if he did marry me," she began, abruptly; and Mrs. Eldon encouraged this phase of feeling by taking Nina's arm and pressing it within her own affectionately.

"Why don't you marry him then, dear?" she asked.

"I said if he married me—not at all implying that it was optional with me whether he did so or not," Nina said, quickly. "He's such a good fellow, Gertrude—such a determined, clever, good fellow; his wife, whoever she may be, will have reason to be proud of him—and will be proud of him." She spoke very seriously now—almost as if she revered her subject.

"And has he what even the most determined, the cleverest, and best of men can't do without?" Gertrude asked. "Has he money enough to marry on without coming down a round of the social ladder?"

"Yes, I believe so," Nina said, carelessly. "He's just the sort of man that one feels at first sight never has had to, and never will have to, shift and shuffle, and study ways and means."

"And have you known him long?"

"Only about two years; and, to make a clean breast of it, Gertrude, in a month from this time I have to give him my definite answer as to whether I will be that proud and happy woman, his wife, or not."

"I fervently hope your answer will be Yes," Mrs. Eldon said, warmly. "Dear Nina, it's late, but thank you for having given me your confidence; thank you for having given me the right to say, 'Consult your honor and safety and happiness by marrying the man who loves you, and whom you respect so warmly and truly.'"

"Ah!" Nina said, sorrowfully, "obligations are hard to endure; and I should feel under a heavy one to the man who gave me his heart and had to take what I render just as freely to Church and State, my 'respect,' in return. No; time was, time is; but I need not say No for a month." And when her willful friend said that, Mrs. Eldon grew severe in her soul again, and approached what had been her real object throughout the conversation.

"Nina, I can't help feeling sure that you are going to throw away the substance for a shadow—for worse than a shadow, for a snare and a delusion; what good can come of the renewal of your intercourse with Gerald Barrington—a man with a great, hale, hearty, healthy wife, who I really believe to be too good for him—who, at any rate, is far too good for him ever to get freed from her by a divorce?"

"Really there is something absurd in your reprobating my weakness and Mrs. Barrington's strength in the same breath," Miss Delany said. "As to the renewal of my intercourse with Mr. Barrington, it was accidental, and it will be brief; he has nothing whatever to do with the No that will be spoken."

"Was your meeting with him to-day at Sedgwick accidental?"

"I suppose you heard of it from an obtrusive woman, whose want of breeding put us all in a false position, for which I refuse to be considered accountable," Nina said, quickly. "I foresaw all this—this pettiness, as soon as I heard you were gone to Cranborough—at least as

soon as I heard who lived at Cranborough; still, you ought to know me well enough to feel quite sure that I should not have done what I have done without good cause. Mr. Barrington had a right to demand that I should listen to him. I thought to save you all anxiety and responsibility by listening to him in Sedgwick."

"It did look so like an assignation," Mrs. Eldon urged.

"Well, you may say the same of every meeting by appointment. Assignation is an ugly word, though. After all, he might have shouted out all he had to say to me in the open market-place."

"You actually appear to regret that."

"Of course I regret that," Nina said, boldly. "I went hoping to hear some words from him that should make me think the man I did love so much less weak than I have thought him since I have seen his wife; instead of that, as I say, the words I did hear every one might have heard—he had nothing to say for himself to me."

"You could not have listened to words framed for your ears only from a married man."

"Yes, I could," Nina said; "I went to hear them—I wanted to hear them."

"It is well for you that you did not hear them—well for you both that he was too weak a sinner to speak them," Mrs. Eldon said, with the scorching warmth that the subject is apt to engender in the minds and mouths of young wives; "now, at any rate, if any thing uncharitable is said about you, in consequence of your rashness, you will have the satisfaction of feeling that it is partly undeserved."

"There will be no satisfaction to me in that; it's not my vocation to be a martyr. Let us go in, Gertrude; the longer we speak of this, the farther we get away from each other's meaning and motives." Then they went into the lamp-lighted room together; and Frank Eldon, who was sitting there, saw at a glance that matters were very wrong indeed with them.

The subject was discussed once more that night—this second time between Mr. and Mrs. Eldon.

"She never attempted to conceal it, or to excuse herself," Mrs. Eldon began, angrily.

"My dear Gertrude, according to my idea, she would not have improved the case by evasion or falsehood."

"But it would only have been natural for her to show a little shame or contrition, after having been guilty of such folly; now, wouldn't it, Frank—wouldn't it have been natural?"

"Not at all natural for Nina."

"You ought not to vindicate her, Frank; I am very, very fond of her, and entirely fascinated by her; but I'm not blinded by her into believing that she is justified in striving to render that wretched man more disgusted than he is already with his wretched wife." Then Mrs. Eldon would not say any thing more on the

subject, for her husband would not treat it quite as she desired, and Nina deserved.

But other people said a great deal about it in a short time. That ill-advised walk, before going up from the station into gaping Sedgwick, was fruitful in strengthening evil report. Mrs. Simcox, who disliked Mrs. Barrington as a woman and a neighbor, was a violent partisan of the mistress of Ardleigh End as a wife. "It was audacious, and indecent, the way in which that Miss Delany went flaunting about Sedgwick, after being found by me in that very queer position—in a private room in an hotel, with a married man!" Mrs. Simcox would say this to every one she saw, and then compress her always compressed lips, and declare that she would say no more; but that, still, she must say, if she were in Mrs. Barrington's place, she should let Mrs. Eldon know what was thought of her friend by all right-minded people! For a clergyman to countenance such goings on was scandalous; and how could Mr. Eldon think that people would attend, etc., etc.

And all this because Mrs. Eldon was too loyal to publicly blame and censure Nina. In private, as has been seen, she was capable of rebuking the wrong, and pointing out the right; but she would not join the herd in throwing stones and mud at Miss Delany. So, as was natural, some of the freely cast stones and mud fell upon her, the blameless one, and the neighborhood shook its head, and said that, "really, it behooved a woman situated as Mrs. Eldon was to be very circumspect."

"People seem to fight shy of you here, Gertrude," Miss Delany said, one morning, abruptly throwing down a local paper, in which she had been reading an account of a series of festivities which had taken place at the neighboring seat of some county magnate. "Frank and you ought to have been at Balderton; all the neighboring clergy seem to have been given a taste of the dear delights of worldliness and sin, by being present at some private theatricals there."

"Oh, I don't know," Mrs. Eldon said, speaking with some embarrassment; "we don't go in for visiting, you see."

"But you don't go in for not visiting? No, Gertrude, I'm not blind, or stupid, or ill-natured, or indifferent to the comforts of my friends, though I have seemed to be all these things lately. The fact is, it was useless talking about the unpleasantness until I could relieve you from it; people don't like my presence in your house, and so they try to punish you for it."

"I hope that you are not forced to say this from any thing in my manner, Nina."

"Indeed not; you have behaved—well, just as Frank's wife ought to have behaved, and that's the highest commendation I can give any one; for if I could be in love with a hu-

man being just now it's your husband; but I can't be; I'm out of love with humanity altogether, its representatives in Ardleigh have been so hard upon me. But this is what I have to tell you: my father has written to ask me to go to them again, to go at once and stay with them in town till the third week in August, and then to accompany them to a place he has hired near Boulogne—a dull hole, I fancy it to be, in which Lady Delany would never consent to bury herself but for a purpose."

"What do you think that purpose is?" Mrs. Eldon asked.

"To make me fully appreciate the blessings and advantages which might be mine if I married Mr. Manners," Nina said, carelessly. "Don't mistake me though; don't imagine for an instant that I think him capable of being a party to such a scheme. However, to save trouble, I have agreed to it; and so I'm going, Gertrude, and you won't be tabooed any more." She got up and went over and put her hands on Gertrude's shoulders as she spoke; and as she stood so looking down her beauty was so great that Mrs. Eldon felt that it would be well to be tabooed by any neighborhood to any extent for Nina Delany.

"My dear Nina, granted that it is as you say, and that foolish people act foolishly, stay with us while you can be happy; honestly, I was angry with you just at first when you—when I thought it would have been just as well if you hadn't gone to Sedgwick," Mrs. Eldon said, deprecatingly; "but now other people have proved themselves so egregiously wrong in their conclusions and deductions about you that I can't consent to consider your mite of share of wrong in the matter at all."

"Two wrongs don't make a right,' to be strikingly original," Nina said, sadly; "honestly (as you spoke), I own to feeling that I was weak, weak, weak as the weakest of my sex in going there that day to meet Gerald Barrington, in half feeling, half affecting to feel, and wholly showing that I had an interest in him still. Well, I suppose I looked my last at him that day, and I shall think my last of him when I leave here the day after to-morrow."

"You have quite resolved upon going, then?" Mrs. Eldon said.

"Yes, I have made up my mind to go; after all, as I have said before, Lady Delany is no greater bore to me than I must be to her."

"And you won't let yourself be coerced by circumstances and dullness into marrying? Do promise me that, Nina. It would be dreadful, both for you and the unfortunate man, if you were," Mrs. Eldon said, sympathetically.

"No," Nina said, decidedly; "I like the man I could marry too well to do him such an unkindness—I shall remain as I am. I have outlived my romance, and I can find no good substitute for it: I am only like many others."

BY-PATHS TO PROSPERITY.

THERE are two ways of making money. They differ *in toto*. The one is better exemplified in this country than any where else in the world, and may be called the grand style. The other is less represented here than in older countries, and seems petty by contrast as well as in actual fact. In the first method the amount of business and the variety of undertakings are accounted as evidence and means of success; in the second, prosperity is dependent upon the development of a single form of industry. In the grand style, much of the business must be done simply for the sake of reputation. Lines of unprofitable goods must be kept in store, large transactions must be made, and extensive operations must be conducted in order to keep custom, or as a mode of advertising display; although an immediate loss thereby is probable, and ultimate gain is problematical. The large houses in New York, who unhesitatingly sell at certain seasons heavy amounts of goods, of produce, or of stocks, are not always in immediate want of cash; they hope on the one hand to damage their rivals, and on the other to secure new customers.

These processes attract particular attention when practiced by dry-goods houses, but they are confined to no one form of trade. They have become a feature in all departments of commerce and manufacture; and it seems to many of our citizens, as they express themselves, that "the business of this country is falling into the hands of a few." The dream, the ambition of a New York business man is to be at the head of a "big house," to "swing a heavy line," to control a "market;" and a similar infatuation is noticeable in other cities.

Every one of these large fortunes acquired in trade at the present day, upon this system, is of necessity built upon the ruins of a number of less fortunate undertakings. Every year it requires a longer purse and a more unscrupulous pertinacity to obtain a foothold in business, and compete with those who already possess such formidable advantages.

It is, therefore, interesting, if not profitable, to consider the other mode of making money. True, it is not so much in accordance with our national tendencies, nor does it hold out flattering hopes of the great prizes in the lottery. Simultaneously with the accumulation of large fortunes, and the control of widely extended interests by a small number of individuals, there has been the growth of fair competency slowly attained by men who have devoted themselves to single and peculiar lines of business. This class embraces many foreigners and adopted citizens. They have the advantage of economical habits, and live strictly within their means, having narrow notions in regard to display either in their trade affairs or their mode of living. Between the rich old houses, who grind him with the weight of their wealth and power, and the "skinnners," who are contented to make

transactions at an insignificant profit, the tendency of an average American, who feels his capacity for doing a variety of work, or for conducting almost any business that may afford opportunity, is to fritter away his exertions upon too many different undertakings, and to verify the proverb that "a rolling stone gathers no moss;" or to freight his vessel too heavily, and extend his sails too widely, so that he is the first to founder in a financial storm.

The subdivision of mere labor has been carried to a much greater extent in English factories than here, and, although it results in work that is in some respects more perfect, it seems sometimes to stultify the workingman. Our Commissioners of Emigration mention, as an instance of the difficulty of procuring for immigrants employment of the kind to which they have been accustomed, that a woman past middle age arrived in their charge, who, from childhood, had been constantly employed in sorting files, and had no knowledge whatever that fitted her for any other occupation. But if a manufacturing establishment be devoted to a single purpose, the perfection of its work thence resulting will ultimately enable it to distance competition. Although we are assured that, so far as poetical products are concerned,

"The man who means success should soar above
A soldier's feather or a lady's glove,"

it is yet a prosaic fact that two of the most noted French manufacturers are exclusively engaged in making those trifles. Nor is there of necessity a connection between a petty business and a narrow mind. The Fabers, who represent a family and a lifetime devoted to wooden lead-pencils, are alike distinguished for the excellence of their products and their hearts, having liberally provided homes and education for their work-people; nor is there any evidence that the European manufacturer who has acquired a million of dollars in making dolls' eyes is himself peculiarly wanting in breadth of view.

The extraordinary number of patented articles in this country furnishes numerous instances where men, by devoting themselves to the business which a single one of these inventions may originate, have met with singular success. The sewing-machine may properly head such a list. For, although vast manufacturing industries are founded upon the improved varieties of its mechanism, the original invention, patented by Elias Howe, Jun., in 1846, was a practical machine; and the business which originated with it enabled the patentee not only to meet the heavy expenses of a score of legal contests respecting the validity of his title, but also to carry on his own manufacture, and accumulate the substantial rewards of industry. The washing-machines and wringers of recent invention, especially the latter contrivance, have become the basis of extended and exceedingly profitable business. In an enumeration of instances of American manufactures which com-

pete successfully with Birmingham goods in British markets, an extract from an English Parliamentary report was recently read before our House of Representatives; exhibiting in the strong light of facts the success of our industries in particular lines. Thus, American axes have no equal in the world; horse-nails, "beautifully made by machinery in the United States," supersede all others; and American pumps not only take the place of foreign articles, but one of them is recorded as *the* pump that found water for the Abyssinian expedition.

But in the line of what are sometimes designated as Yankee notions, fortune seems to follow small manufactures with peculiar favor. A small garden roller made a handsome competence for the owner of the patent; certain petroleum lamps supplanted the English manufacture in the East India markets. There was a churn, operated by means of gearing, that connected it with weights suspended outside the building, patent rights for which, for three States only, were sold for \$12,000. Patent rights, in fact, are sometimes more profitable to sellers than buyers, and there is a famous instance in the case of the sorghum manufacturing patents, said to have been disposed of for \$200,000 to parties who never succeeded in bringing their costly purchase into practical use.

Locks, bolts, catches, and latches, if their histories were written, would show a large proportion of successes. An instance is mentioned where a window-catch yielded a profit of \$50,000. A padlock to fasten dog-collars fixed the foundations of a small fortune. Of toys, the "return-ball" is most frequently alluded to, on account of its extreme simplicity and the suddenness with which it found popular favor. There was a fortnight during which it was a feature on the stock exchange. Prominent operators varied the excitement of calling stocks by slinging red balls at each others' faces, not always controlling the missile sufficiently to make it return before striking the object of such demonstrations, who perhaps assisted the sport by an endeavor to catch the ball before it was pulled back to its owner. The stock-brokers of New York are among the best customers for ingenious mechanical toys. An air-pistol which exploded a piece of paper with a loud report found ready sale in Wall and Broad streets. The jumping-jack contrivance, by which a small wooden figure of a darkey danced "break-downs" with unlimited suppleness, had a long run of custom among them; and the various improvements upon it, which have all been of great profit to their inventors, met attention and investigation from men accustomed to manipulate puppets and pull wires where the success or failure of the merest trick might involve large amounts of money.

The sugar-dealers, among others, once took a fancy to purchase ingenious fly-traps, and assisted in securing a satisfactory business to an

individual who at that time made these contrivances a specialty. Although his shop contained nothing but fly-traps, it was a veritable curiosity-shop, and the diversity and intricacy of these contrivances gave interest to the eloquence with which the proprietor was wont to expound their separate merits.

There are instances of ingenious devices being extensively used for purposes entirely foreign to the intention of their inventors. Thus the spring clothes-pins, of which there are two or three varieties, attained considerable sale for use as letter-clips, and to secure papers. A peculiarly shaped knife, originally made to be sold as an "eraser," to scrape ink from writing-paper, found a more extended demand as an instrument for trimming toe corns and finger nails.

In certain trades long apprenticeship is required to confer by practice the requisite taste and skill. But when there is added to the necessity for experience and practice to insure good handiwork the restriction of a small demand for the product of such labor, the craft can comprise but few members, and it may become a monopoly. A branch of the industry over which Saint Crispin presides has recently come into existence, to meet the separate requirements of a class itself widely removed from saintly patronage. There is now in almost every important city in this country a "theatrical bootmaker;" and if the statements that have appeared are reliable, the price obtained for the adjuncts to the elegance of "the buskined stage" is about five times that of the ordinary calf-skin foot-coverings.

The addition of genius to the dexterity which is acquired by training may in some occupations convert the artisan into the artist, and by the perfection of handiwork secure the meed of fame. Of these, type-cutting and hand-printing, in the early days of those arts, tapestry-work and line-engraving, present familiar examples, and the names of John Baskerville, William Caxton, the Gobelin family, and Albert Durer are not likely soon to be forgotten.

There is an artist in New York who has developed a peculiar skill in the rare art of cutting cameos. Do you wish the stone to represent your own lineaments or those of your most loved one? is there a scene, a device, an emblem that is dear to your memory? name your desire, and he will reproduce the likeness in high or low relief, perpetual, in stone. From the actual sitter, from the bust, the photograph, the painting, or perhaps even the pencil-sketch with a few words of description, this man of genius can construct the counterfeit presentment. He, and the admirable artist who has recently furnished the public with silhouettes of marvelous delicacy and singular beauty of outline—the original cuttings of black paper being now copied as engravings and popularized through the agency of the printing-press—are probably not much troubled by competition.

The manufacture of artificial noses is a unique business in which rivalry is not apt to be excessive; and should we pity the person who makes this his specialty at a season when his trade is dull, we must yet hesitate to accord him such sympathy as to wish him an increase of customers. A certain studio in the fifth story of a building in Broadway used to be better known to the "fancy" than any other rooms in the city where the painter's skill may give to fancy shape. The artist who occupied those premises rarely had in daylight an idle hour: sitters thronged upon him, and waited for their turn with their faces in their handkerchiefs, their hats drawn down over their eyes, or, if of the gentler sex—and there were many such—closely veiled. His especial skill and constant occupation was in painting to a natural tint the human countenance, when its divinity was obscured by bruises or by a "black eye."

Of a humbler grade is the "artist" who confines his efforts to repairing the injuries and fractures of meerscham pipes. There are professional destroyers of vermin who contract by the month or quarter to remove rats, mice, and roaches from hotels, restaurants, etc. Some of these hunters of small deer also furnish live rats in large numbers within twenty-four hours from order, for the exhibitions of dog-pits. They do not keep the rats on hand, but catch them as required. It is generally believed, and is perhaps true, that they use some bait or attractive scent in trapping the vermin. Such is not, however, the explanation as the writer heard it from the lips of one of the most skilled in this vocation.

"I never use bait or drugs. I have studied the animal." Here he drew himself up in the consciousness of superior knowledge, and proceeded with a lofty air. "No man that understands the rat needs such things; nor are fancy rat-traps of any account. Look at a rat's nest! It is hid behind a wall. It is near a chimney or a heat flue, so that it is kept warm. It is lined with soft stuff—rags, hair, lint, torn paper. Would you catch rats? Make a nest for them. Use a box having a sliding door to a small aperture. Put rags in the box, or saw-dust, or both, and leave it in the warmest part of a room that the rats frequent, covered with an old carpet, the aperture left open. No one must disturb the room; the longer things are thus left the better. There will be a time when you can walk in quietly, drop the sliding door, and carry off the box under your arm with every rat inside that was in the building."

"At what hour of the day or night do you find all the rats in?" we inquired.

"You would not ask the question if you had studied the rat," was the somewhat evasive reply.

About once a week a man puts his head into our office, and says "Wanchewredinkmister?" and, not receiving any reply, departs. Some

months elapsed before we succeeded in discovering the intent of his inquiry. He is presumably a German, and vends carmine writing fluid to those who apprehend and affirmatively answer his question, "Want you red ink, mister?" A man well known in engraving establishments seems to make his rounds about once a month. The whole point of his existence is to sell diamond points for engravers' use—one lasting the best part of a lifetime. An industrious individual makes barrel-bungs for a living. A Boston gentleman feathered his own nest by producing wooden nest-eggs. A new commercial business is confined to furnishing oil to be used only on sewing-machines. In Paris an "International Exhibition of Fans" is announced. In New York there is a house exclusively engaged in the manufacture and sale of church furniture. In Boston there is a shop devoted to the sale of glass chimneys for kerosene lamps.

With patience, success in a retail business devoted to a single article is almost certain in a large city. Thus, let a man sell nothing but dolls' heads, keeping his prices well down, and remaining in the same store for years, and although, perhaps, for a long while unnoticed, and strongly tempted to expand his business into a toy-shop or a variety store, if persistent in the one idea, he will eventually attract an exclusive trade, and draw customers for dolls' heads from distant quarters; for it is alike the observation of buyers and sellers that the best place to buy an article is that where only that article is dealt in. But if the dealer in the case supposed were to include the bodies, the garments, and the furniture of dolls, he might procure a larger business in the first few years, but with no such prospect of ultimate increase or permanency.

The specialties of scientific knowledge give occupation to men possessed of thorough knowledge of peculiar departments. To enumerate these special callings is but to give the designations appropriate to the divisions of science. The professions are similarly pursued in individual lines; and we have patent lawyers and divorce lawyers, cancer doctors, and chiropodists. Of the last there was one who went traveling from house to house, before the days when citizens hired a "corn-doctor" by the year to operate monthly, whose reputation was founded upon an alleged capacity for extracting the roots of corns. After nicely trimming the afflicted feet, he would affect to pull out the said roots with tweezers. He bored a small hole in the corn, and his legerdemain was very neat; but a gentleman on whom he operated kept a "root," and examined it under a microscope. It was a piece of a fish-bone.

With special reference to human frailty, there is a business reduced to a system in Paris, employing a number of discreet deputies, who go around to liquor shops and places of public resort at night, and accompany, or otherwise assist to their homes, for a consideration, inebri-

ated gentlemen, who would otherwise fall into the hands of the police. In that city there is also, at almost every alternate street corner, that most valuable of messengers, the *commis-sionnaire*. Licensed, and amenable to strictly enforced penalties if he overcharges, defaults, or even blunders, he is yet your servant for the occasion, capable, for a reasonable compensation per hour, of the greatest variety of service. He can procure for you a ball-ticket; order your dinner, and summon your company; ascertain the whereabouts of a book in the public libraries or the shops; perhaps even collect a bill, or prepare the preliminaries of an *affaire du cœur*. He is frequently employed by a jealous husband or wife to follow, and report upon the movements of the suspected party; and occasionally the same agent is hired by both the partners in a domestic infelicity.

A business has grown into formidable dimensions within a few years in London which it is impossible to regard with complacency. The nearest approach to it in this country is the Association for the Suppression of Gambling, which, with a worthier motive, adopts somewhat similar means. "Private Inquiry" offices are an invention to the credit of which England is perfectly welcome; and we devoutly hope that nobody on this side of the water will either copy or infringe upon their peculiarities. Employing great numbers of young men and women apparently engaged in other pursuits, as house-servants, clerks, etc., to collect and communicate to a central office all the gossip, scandal, and personalities that they can pick up and acquire in the families or firms where they have such opportunities, these establishments obtain information in vast quantities, which is carefully recorded and tabulated. This information, these family secrets obtained by infamous bribery and espionage, are for sale. To these offices a husband or wife proceeds in search of evidence when thinking of applying for a divorce. Thither, also, go morbid wretches in search of food for jealousy; partners who doubt each other; employers who suspect their agents. And so widely spread are the ramifications by which this institution has penetrated the privacy of British households, that it is said that an applicant rarely calls at an office without finding that there are at least some details already "booked" respecting the object of his inquiries. But no profit which may accrue to employers or employed can compensate for the utter loss of self-respect involved in such an occupation.

When in literature the subdivisions of industry are placed upon a mere trading basis, singular effects follow. Experience in a restricted avocation results in peculiar skill, and the work of the expert in some branch of literary pursuit is not apt to want dexterity or finish. Yet, whenever the produce of one man's brains is sold to be fathered as another's, whatever benefit each may receive pecuniarily, morally both must be injured. Although for years it has

been customary to sell sermons in England, and the practice is alluded to by the poet Cowper, we can not admire it. More recently their newspapers advertise to furnish either sermons or the mere skeletons of sermons, with illustrations, on subjects selected by the purchaser, or from a general assortment; to be sent by mail on receipt of price.

Lecturers also can be similarly supplied with "original MS. lectures." Some of the subjects are thus enumerated in an advertisement: "Coincidences. Freemasonry—its history, secret rites, and mysteries. Superstitions. Social and Humorous Sketches. Swiss History. Inventors and their Opponents." There is in England a class of reporters who do not themselves write any thing for the journals, and are not known as connected with them; they simply collect incidents for others who write descriptive reports.

The French capital is famous for providing literary wares adapted to all exigencies. At the time of the *Exposition Universelle*, there were scribes to be found who could produce light or solid essays upon any topic, division, or article illustrated or exhibited therein, in any language required. One of these literary hacks furnished the complete and exhaustive report upon industries represented in the Exhibition which a commissioner from a foreign nation presented to his government as the result of his own investigation. And this elaborate report, upon which the commissioner was generally complimented, was not only written in his native tongue, but was also an accurate imitation of his usual handwriting. Perhaps it is not too much to say that the Pascal-Newton forgeries may be accounted the ripe fruit of so dangerous a vocation.

Edgar A. Poe, the poet, had acquired a facility in imitating handwriting which he once turned to account as a practical joke. A lady in Washington left with him her book of autographs, containing those of a large number of celebrated individuals, with the request that he would add his own. The autographs in the book were scattered through it without any arrangement. Poe kept the book a few weeks, and when he returned it there appeared a duplicate of each autograph upon the page opposite or nearest adjoining. Neither the owner of the book, nor any one else, was able afterward to decide which were the genuine autographs, and which Poe's fac-similes.

The recent evidence made public in Philadelphia, respecting the operations of a dealer in medical diplomas, has revealed a danger that may require special legislation. It seems that he furnished the degree of M.D. to any person who chose to pay for it, and that the sheepskins were genuine issues of collegiate institutions, that shared the profits of the sales with this unscrupulous broker. But dealing in diplomas is not confined to this country, though it appears to be conducted abroad with some reference to the mental acquirements of the pur-

chaser. The following advertisement is from a recent London newspaper :

"Degrees. M.A., Ph.D., etc., *in absentia*. Qualified gentlemen, desirous of proceeding to the following honorary degrees, B.A., M.A., Ph.D., Ph.B., LL.B., LL.D., D.D., M.D., receive official instruction and advice without charge, by writing to LL.D., 10 St. Paul's Road, Canonbury, London. N.B. The degrees and diplomas are guaranteed *bona fide*, and they are issued by colleges and universities empowered by charter to grant the same. Only the application of authors and other decidedly qualified candidates will be replied to. Unqualified men and busy-bodies need not trouble themselves to write, and their personal applications will not be attended to."

One of the most extreme instances of concentration upon a single literary pursuit is that related of a German professor of philology, who had spent the whole of a long and laborious life in the study of the Greek article. In his last hours he called his son to his bedside, and said, "Take warning by my fault. Don't attempt too much. I see now that I ought to have confined myself to the dative case."

PLAYED TO THE END.

ONE of the prettiest rooms in one of the prettiest houses in all Fifth Avenue, and, to complete the picture, a lovely woman in a toilet that was a poem, and an attitude which would have served as a study for Meditation, or a new Clytie, or any thing graceful and beautiful that you please.

Certainly that place and that presence were about the last in which one would have expected to find a skeleton intruding itself, noting into the bargain that there was no vulgar closet where it could hide, according to the agreeable habit of its kind. But the skeleton was there, nevertheless; a fine, bony one, admirably articulated, and as lively as if he were galvanized at least twice in the course of every twenty-four hours.

I doubt if he even missed the closet in which an ordinary skeleton is supposed from preference to take lodgings when it is his mission to haunt some luckless bit of mortality; perhaps, as a skeleton accustomed to luxurious quarters in a fashionable part of the town, he would have despised any such confined place. At all events, he made himself entirely at home in the shadowy, perfumed boudoir, sat on the top of the mosaic table, grinned out of the niche where the marble boy reclined, hovered inside the silken window-curtains, tip-toed along the little recess filled with blue and gold editions of the poets and French novelists, showed his ribs and joints in the bay-window where the rare exotics blushed at their own loveliness, and was altogether so agile and disagreeable that he might have taken charge of the whole avenue and had plenty of time on his hands, instead of centring his vigilance on one pretty woman.

He was out in great spirits this morning; one never would have dreamed that he had

been awake and up the whole night through, dancing, grinning, mowing, and displaying a skill in tormenting which only a thorough-bred skeleton, educated among the very first families, could possibly show. A blood relation could not have been more persistent in his attentions and scrutiny. A sister-in-law, or an old maid aunt, or any other of the tribe ycleped kindred, whom one is cruelly forbidden by law to put to death, would have been almost preferable as a companion. It was a wonder he was not a little stiff in the knees just now, for he had not only been up all night, but once early in the evening he showed himself in the opera box without so much as a sheet to cover his hideousness, and even then was not content to go home like a Christian and wait till his prey returned. He appeared at the ball—the finest of the season—skipped about among the dancers, and made himself so odious to one pair of eyes that the possessor of them wished the floor might give way or the ceiling come down, or any other unpleasant and unexpected catastrophe occur which would effectually flatten him.

He went away from the ball—probably blasé in regard to amusements, as a modern skeleton ought to be—but he did not lose himself on the road. He was safe in the boudoir when its pretty owner returned—safe, and lively as a bill-collector or a jealous husband, or any other of the monsters with a genius for rendering life insupportable. And here he was now—poking a bone in the chocolate, and spoiling it as completely as the harpies did the feast prepared by the wandering Trojans; bending over the flowers, and withering them by the chill of his presence; and, worst of all, tossing about a vellum and silver port-folio, and holding up the cards and billets and love-letters, one after one, and making each a new mockery or pain by some insulting gesture or impromptu dance that had a language plainer than any words.

I think no woman ever lived who could less easily endure the slightest semblance of authority and control than Violet Livingston, and to be haunted and tyrannized over in this ruthless manner was a realization of purgatory which few people are called upon to suffer in this world. The handsomest widow that Murray Hill could boast; witty as the best style of modern novel; a genius in dress that Eugénie might have envied; mistress of a house, carriage, diamonds; and only twenty-five—certainly, the last person among one's acquaintance whom one would expect to set up a private skeleton. The ghost of a pretty girlish romance, just enough to give an excuse for poetical regrets and a becoming pensiveness, one might have looked for; but there was something anomalous and disgusting in the idea of her being subjected to the espionage of that osseous monster, and his gymnastic tricks, which he performed as easily as if his creaking joints had been steel springs.

Presently there was a tap at the door—the skeleton hid himself in the dressing-room, but peeped out to watch who came and what might be said—the pretty widow saw him plainly enough still. She turned her back on him resolutely, and requested the tapper to appear. It was only the elderly female relative who lived with her, in accordance with the necessity there is for a pretty widow having a Colley; and old Miss Berners made a very good one—she never gave tongue unless she was bidden. “And how did you sleep, my dear? And are you tired? And how charmingly you look this morning!”

And Violet would have liked to fling a slipper at her, or call her bad names, or throw her down and jump on her. Not because the antique servant of Diana had done any thing wrong, but just from sheer nervousness and exasperation with the world in general. However, she was too well-bred, like the rest of us, to follow her inclinations. She answered sweetly, and invented a commission at once which would take the virgin out of the house and out of the way, after she had asked questions enough to make Violet’s head buzz.

When she had gone, back came the skeleton and grinned at her, as if to say, “You’re mighty clever, but you can’t get rid of me—you can’t get rid of me;” and, without the slightest warning, the pretty widow threw up her hands and went off in a burst of hysterical sobs that might have touched the heart of a Borgia, but did not soften her tyrant in the least.

Then another tap at the door, and Violet composed herself as quickly as a conjuror performs one of his mysterious feats. Once more she bade the tapper come in. This time it was her maid, with a card that had a coronet on it. The young widow shook out her gray and garnet plumage before the mirror, noticed the skeleton leaning over her shoulder as she did so, and prepared to go down stairs to greet the Baron Rothmille.

But she was not to go yet. The adorning of beauty had a note in her hand, as well as the card, and presented it, while the skeleton pirouetted in delight. Violet glanced at the billet, made a gesture as if about to tear it, opened and read the few lines instead, and straightway turned so white that the maid cried out in alarm. This brought the widow back to sense, and the color into her cheeks. She recommended the Frenchwoman to leave the room more sharply than she often spoke to any dependent, and Mademoiselle flounced off in a rage such as only a Parisian seraph could get up at short notice.

Violet read her note again, and it was difficult to decide whether fear or anger was the predominant emotion in her mind.

“Will come this morning—Boodle stocks an utter failure.” “Oh, the wretch! That was what he meant last night! If I could kill him—I would myself, only I’m such a coward!”

She did not shriek this, nor mutter it. I believe people only do such things on the stage

or in novels. But she thought it, and a whole volume of bitter, crazy, wicked thoughts, in the short space she stood tearing the billet, as she would have torn Cloudy Forester’s heart, if he had owned one, and she could have got at it. All the while the skeleton grinned and danced before her, and looked at least twenty feet high; he had a pleasant faculty of growing at will a good deal more rapidly than Jack’s famous bean-stalk.

Then Violet saw the coroneted card on the table, and remembered the Baron. She put by her histrionics, or, rather, she began doing high comedy instead of melodrama, and swept down stairs. By the time she reached the reception-room she looked her part to perfection.

The Baron was waiting for her with any amount of smiles, and small talk in such doubtful English as he was master of, and French when that failed, somewhat less elegant than Violet’s own. He had German blood in his veins; and she spoke the language with an ease which nobody born outside of Paris, except an American woman, can ever hope to acquire.

“A thousand pardons, Baron! I have kept you waiting shamefully—but I wasn’t blacking my eyebrows.”

The Baron got off a rather long speech about the delight any man must feel at waiting in the charmed atmosphere of that house; but the speech halted a little, owing to the German phlegm, of which he could not rid himself.

“That’s very pretty, Baron,” returned the widow; “but I dare say you are cross all the same.”

“Yes,” said the Baron, curling his mustache, “because a billet-doux came in when I did.”

“A tender epistle from my dress-maker,” answered Violet, with the most natural laugh. “She disappointed me about my toilet for last night, and throws herself on what she calls my angelic clemency—I wish she may find it.”

“Are you always hard-hearted when people do that?” inquired the Baron, in a very meaningful tone.

Straightway she knew what had brought him! He meant to be tender! He was about to give her an opportunity to make every marriageable female on Murray Hill expire of envy. A thousand reflections came in a flash. The chance of wearing a title, a reception at court—for the Baron’s position was good beyond a doubt—dinners at the Tuileries, visits at Compeigne, new dresses without stint, ease, splendor, a whirl of pleasure, friendship with Eugénie, successful rivalry of Madame Metternich—no end of delightful things! And the impossibility of snatching at the future thus opened, bound hand and foot, the lines in Cloudesley Forester’s note swimming before her eyes—great Heavens! the skeleton, too, crept in while she reflected, and stood grinning behind the Baron’s chair.

Time—she must have time! Queen Elizabeth at the last pinch had not greater need of it, and, more fortunate than the vestal monarch,

Violet held the matter somewhat in her own hands. The Baron was a person of importance, of course, and nearly as stupid as Death, but easier to circumvent and put off.

She rattled on in the most bewitching and bewildering way; she dazzled the Baron's eyes with her smiles; she confused and fluttered him strangely; and all the while she was praying that the door-bell might ring, somebody come in—any body, from the bishop to the devil! But, praying or talking, she was haunted by visions of a Parisian heaven, Cloudy's letter, and the grinning face of the skeleton, all mixed up in the most sickening and incongruous fashion. And the Baron growing more tender, more hopelessly imbecile every instant, as a man with matrimonial proposals on his lips is doomed to do; her crazy thoughts coming swifter, the skeleton jumping higher, and she so mad with pain and rage that she had much ado not to make a tragic end to the comedy by dancing at the Baron, choking him black in the face, beating her brains out against the wall, and singing for a dust-brush and pan to clear up the litter! The Baron was drawing his chair nearer; his face lost the last gleam of reason—it was coming! She must take leave of her senses now. She would not refuse; she dared not say yes; the skeleton warned her not. No way of averting the finale; the man was utterly dazed, and bent on speaking! She saw Paris and the court and that odious Metternich away off on the other side of the gulf which blackened between her and that fruition of worldly hope, and knew that she could never reach them. The Baron's mouth opened, but the door opened at the same instant. She was saved; she came near springing to her feet, and shouting the word at the top of her voice. Saved by her spinster relation, two old tabby cats of her friends, and Helen Morgan from across the street. Helen had seen the Baron enter, and followed as quickly as she could get into her newest walking dress, for fear of the consequences if the foreign bird of price was exposed to the solitary effects of the widow's fascinations.

It was dear and love, and billing and cooing without stint. The old maid's jaws creaked ominously in their longing to make the kisses bites. Helen Morgan did astonishment, and Violet looked "lies, lies," sweetly in her face, and kissed her again. Finally, stunned by the noise, the Baron went off in a huff—if a Baron may be supposed to indulge in a state of feeling so vulgar.

More chatter—more laughing—jests in regard to the Baron from the spinsters, pointed by bitter-sweet innuendoes from Helen Morgan. The virgin relative looking remorse for having intruded so inopportunistically—every thing under heaven that was tiresome and irritating. Violet rang the bell for luncheon; she would have been glad to ring for an ogre to eat them; but there was none at her beck, unless it might be Cloudy Forester, and he meant to eat her—

indeed, he might come and attempt it before she could get the gorgons away.

The meal was seasoned with the newest scandal. The spinsters would have made respectable vultures, beaks and all; but Helen Morgan was a regular hyena—I mean an irregular one—with a morbid love of feeding on human reputations instead of human flesh.

Violet laughed and joined in the talk; but it all sounded very far off. There was nothing real, nothing tangible, but the skeleton—he was in the dining-room first of any body, and never left his stand by the side-board. Sometimes she lost the thread of the discourse completely, and had to strain every faculty to catch it again. After one of those lapses, she heard her venerable relative exclaim:

"It isn't possible! Back, after all these years—why, I thought he was dead! Did you ever hear the like, Violet?"

"Never," said Violet, and had not the least idea what or who was meant.

"She is proof against surprise," said one of the spinsters, with a giggle that she had kept by her so many years it had turned into a croak. "Yet, I remember—oh, well, that's all over!"

Violet took refuge in a smile—she felt that it must be the very essence of imbecility.

"Yes, yes," chorused the other tabby cat. "I remember too."

"Try these pickles," exclaimed the virgin relative, violently, afraid that Violet might be annoyed.

"What do you all mean?" groaned Helen Morgan, conscious that there was a secret withheld from her. "Who is Fred Townley? Seems to me I remember the name."

Violet felt herself collapsing into a state of coma. That name to come up now! Why, she had not heard it pronounced in seven years.

"Mrs. Livingston does not speak," said the first tabby.

"Yet, Violet Berners knew him, I think," croaked the second.

"Suppose we go up stairs, if every body has done luncheon," interposed the virgin relative, glancing at her cousin.

"Wait a moment, Elizabeth dear," spoke Violet, and gave no sign of the new blow. "Is Mr. Townley back, Miss Everett?"

"Yes, indeed," spoke both tabbies at once, each trying to drown the other's voice. "And rich as Cræsus—been in Australia—found dozens of gold mines."

"How glad I am!" interrupted Violet, in her most drawling society voice, the while she saw the skeleton loom taller than ever. "Who is he, Helen? An old, old friend of mine—ages ago—while you were in pinafores! Dear me! people used to say we flirted dreadfully, didn't they, Miss Everett? I had forgotten all about it, to be sure."

She led the way back to the reception-room, and on the road Miss Everett whispered to the eager Helen, just in time to save her from dying of curiosity:

"People said they were engaged. She broke it off, because they were both poor, when old Livingston popped. Oh, she treated him dreadfully. She never had any more heart than a stone."

Helen felt that the story was not worth hearing, after all; only another proof of the widow's conquering powers. No man any where that did not come under her spells. Miss Morgan would have liked to bite her, then and there. As that was impossible, she waltzed up to Violet, and said, with a rather overdone childishness:

"I remember all about it now! I was a child at the time; but I used to hear mamma and the older girls talk—little pitchers have large ears."

Violet took the close of the remark in a literal sense, in the most delicious way. She looked straight at Miss Morgan's auricular appendages, which were large, and glanced at her form, which was slight.

"Yes," she said, in pleasant assent; and Helen Morgan wished that she and the widow were two cats, with no fence between them.

"Suppose I tell the Baron?" she exclaimed, roguishly.

Violet drew her down and arranged thé bird on her bonnet.

"Suppose I tell your step-mother you went masked to the Liederkranz ball?" whispered she.

The little wasp could not even buzz! Any female insect with a sting was liable to get itself sadly mutilated if it meddled with Violet Livingston. She despised her sex too deeply to get much in earnest, though; she had done that for seven long, weary years, beginning by contempt for herself when she allowed the family council to sell her for old Livingston's money-bags.

Seven years ago—oh, a whole life!—she had been engaged to Fred Townley—though that was a secret. He was poor, and the relatives broke off the affair, in a truly religious spirit, for her own good. They told her lies, always in the same proper spirit, when they found that she was likely to prove rebellious. They made her believe Fred repented, and yearned after the shekels of a certain hideous heiress. Fred's mother helped—likewise animated by an heroic sense of duty—and, on her side, assured Fred that Violet wanted a pretext to escape. Of course the pair quarreled. Off flew Fred, nobody knew where; and Violet buried her romance, and married old Livingston. She lived it all over in the few seconds of quiet she obtained after her last scratch to Helen Morgan. Now he was back, he was nothing to her—she said over and over—not even a ghost. It was not his fault that she lost her faith in humanity—she learned that years ago—but she would not tell him so. Elizabeth Berners had let out the whole story since they two lived together. Violet knew what her relations and Fred's sanctimonious old mother had done to

part herself and her lover; but the knowledge came much too late. She had wasted her dream—lost her youth! Fred Townley was nothing to the woman she had become; and he might as well go on hating the girl she had been to the end of the chapter; only it was like having a phantom come up out of the past, and she wanted none. It was enough to be dogged and persecuted by a tame skeleton, without having any other horror thrust into her life.

But her guests were leaving; she must return to her part. More talk, more noise—certainly they never would get off.

"Dear Mrs. Livingston, don't be vexed with me—I only wanted to tease," whispered Helen Morgan, effectually subdued by Violet's whisper.

"My dear child, as if I ever took the trouble!" returned she, rather too carelessly to be agreeable. "I'll chaperon you to Mrs. Rossmore's reception to-morrow, if you like."

Tangible proofs of forgiveness like that Miss Morgan could appreciate. It was always pleasant to go out under the widow's wing; one was sure of plenty of masculine support; for Violet had a legion at her beck nearly as large as the Emperor Napoleon's standing army.

The two departed, and Miss Elizabeth followed in their wake. She was a conscientious soul—interested in hospitals, great at begging for charities, had any quantity of poor people whom she helped and harassed—in short, went about doing good till every body hated her in the most approved style.

"I am going out too," Violet said; "tell Martin so, if any body comes." She got up to her room, and locked the door. Mademoiselle had asked the day to herself, and was gone; so there was no one to reveal her whereabouts. In consequence, when Miss Elizabeth went down stairs, and Martin let her out, she said:

"Mrs. Livingston has gone already."

She meant to ask a question, but Martin took it for assertion; so when, shortly after, the door-bell rang, and a handsome, wicked-looking man demanded the pretty mistress of the mansion, Martin answered truthfully enough:

"She is out, Sir—she and Miss Berners both."

Cloudesley Forester went down the steps, and got into his brougham and drove away, cursing the widow, and vowing that she should pay dear for this bit of insolence. Violet peeped out from behind the curtains and saw him, and congratulated herself even on this brief respite; then up skipped the skeleton, and asked her what she expected to gain thereby—she was only a fool for her pains.

If Cloudy had written the truth, she had nothing to hope or gain in any quarter—she was ruined. That was bad enough, in all conscience; but there was worse than money losses behind: she was in Cloudy Forester's power, and he meant to make love to her. She had known for days that if this last speculation proved a failure, and she could not relieve herself from her pecuniary obligations to him, he

intended this; and it was the crowning degradation which made life utterly unendurable. And just now, when she dared not accept it, the chance of becoming a baroness—Fred Townley back, besides! She certainly must go mad! Hours and hours before it would be time to dress and go out for the evening; if she could only obtain temporary forgetfulness—get away from herself even for a while! She found a bottle of laudanum that mademoiselle had brought up to use for a sprained wrist; she drank of it as carelessly as if it had been water. Luckily, not being accustomed to the taste, she could not swallow much, after all, so ran no risk. She went to bed, and fell into a sleep so deep that it brought no dreams.

When she woke it was long after dark; mademoiselle was back—dinner over. Miss Berners thought she needed rest, and would not allow her to be disturbed.

"Who would have dreamed Elizabeth could develop sense at this late day?" quoth Violet, ungratefully. She was shivering and unsteady from the effects of the narcotic. "Bring me some black coffee, Pauline, and I'll dress."

The powerful stimulant made her alive again, to her very finger tips. An hour later she joined Miss Berners down stairs; and the virgin fairly squeaked with surprise. In all her experience of Violet she had never seen her so beautiful as to-night.

"Never mind admiring me," said the widow; "there's the carriage. Two parties and a ball! I wish I was a caterpillar under a green gooseberry bush! Come along, Elizabeth."

"Such spirits!" tittered the virgin; and Violet longed to make her a martyr as well.

She was gorgeous, and her dress perfection—fresh from Paris, and the bill with it. That was paid; so were not scores and scores beside; and, in consequence, the door-bell sounded at all hours like the shriek of a fiend.

At the second reception she met the Baron; and the Baron forgot his huff, and worshiped.

"Those dreadful women!" she said, softly; "they sent you away. Do you hate me outright?"

The Baron was so agitated that he could only sputter. Violet took him off with her in triumph to the ball; and appearing late, on his arm, drove every female creature on promotion out of her senses at once.

But they were avenged presently, though they did not know it. The first waltz with the Baron was over; he was just begging her to go into the conservatory for a breath of air, when up came Cloudy Forester, handsomer, wicked, more insolent-looking than ever, and dared to say:

"You promised me this galop, Mrs. Livingston;" and hurried her away almost before she could whisper an apologetic word to the Baron.

He dared to do this, when she had never danced with him or promised to in her whole life. Oh, his letter must be all true! She ought to have taken a larger dose of laudanum.

There was no other escape from her troubles. She let him whirl her half a dozen times up and down the room, then she could bear no more.

"I must sit down," she said. "I got your note, Mr. Forester."

"But you would not see me," returned he.

"The letter was enough for one day! Did you mean what you wrote?"

"Every word! I am so sorry—"

"Never mind! How much have I lost?"

"You don't mean to talk business here?"

"I mean you to answer me."

He made some figures on a card and showed them to her. She only bowed, smiling still. The world had come to an end; at least the world she had shone in. She must go down, down from her dazzling eminence. She might be a governess, a sewing woman—or she might starve. She could only hold her own in this sphere for a little while; not for a day if Cloudy Forester got angry with her; and there was only one means of preventing that—let him be tender. No, not if she died in the streets! People called her a reckless flirt; but life could not bring her to a pass when she would tolerate this man's presence in other than the merest show of acquaintance—not while there was any laudanum left in mademoiselle's bottle, she thought.

Then, standing there opposite him, with the crowd floating before her eyes, the music sounding in her ears, her quick fancy conjured up a vision of herself found cold and white on her bed—mademoiselle shrieking—Elizabeth in hysterics—friends pouring in to look at her and ferret out the truth. Perhaps this was her last night of triumph; at least she would make it memorable. Never, in all the years which had made her beauty and wit famous, had she been so dazzling as this evening; and every where she moved she felt Cloudy Forester's eyes on her, and shivered under the last words he had whispered:

"I shall come to-morrow."

Dancing, jesting, coquetting—the Baron quite imbecile with adoration—a score of men ready to fall at her feet—troops of women wishing their eyes were basilisks, to strike her dead—she growing more insane each instant—that odd feeling, that this was the culmination of her success, waxing each instant stronger. Then, in a pause of the dance, as her adorers gathered about her, a new-comer appeared at her side. She looked up, and saw Fred Townley, so little changed by these years of separation that it might have been yesterday they parted. Straightway the one beautiful dream of her life mocked her with its loss, and her heart cried out as it had done in the first weeks, while her grief was fresh and real.

"Do I need to be introduced to you?" he asked, quietly.

"Unless you feel the necessity on your own account," she answered, holding out her hand. "I am very, very glad to see you."

He had wanted to meet her, to assure him-

self that it was true he had entirely recovered from his old disappointment; that even anger had died out, and he felt nothing but indifference toward this woman who had desolated his youth. But, behold, at the touch of her slender fingers, the sound of her marvelous voice, the glance and smile, he heard his heart flutter till he mentally cursed himself for a triple idiot, and tried to believe it was only the power of memory which moved him.

Whatever it was, he could not shake off the spell. Presently he forgot that he wanted to do so. Violet talked, and made him talk—not ordinary ball-room nonsense—getting out on the dangerous ground of the past. She did not mean to do it, but she was born a flirt, and could not resist using her power; and after a little she grew so much interested that she might as well have been in earnest.

Of course this was the work of a brief space—up came more men.

"Please ask me to dance," Violet said, with her softest laugh, "else one of those wretches will carry me off before you have finished; and I want to hear how it ended."

Something he was relating connected with his Australian experience; but they both forgot it in the pleasure of whirling away to the measure of the waltz which used to be their favorite in the old days. Cloudy Forester watched and glared; but for a time Violet forgot even him. The Baron watched and glared, as well as his watery blue eyes would permit. He began to think he had not made his august intentions plain enough to the widow. She could not know the honor in store for her, or she would give him an opportunity to speak.

The waltz came to an end. Violet caught sight of Forester and the Baron, and her senses returned. Fred saw the change in her face, and once more felt vexed with himself for having been momentarily softened. He said something as sharp as politeness would allow, and she relapsed into the fine lady at once. He went away, and she was glad. This sort of thing must not be repeated. She recollected the skeleton awaiting her at home, and knew that she should die if Fred Townley, of all men, ever suspected its existence.

Cloudy Forester was waiting for her—so was the Baron—so were a dozen men. Her head was whirling, the room was unsteady as a ship at sea; but all the while dancing, talking, conciliating Cloudy, or keeping the Baron up to concert pitch, without an opportunity to free his mind, her restless thoughts never ceased to torment her. This was her final triumph—tomorrow the deluge! If it were not for that—if she had been less mad—what chances of life would be open before her!

Perhaps a happiness like the girlish dream, for Fred Townley had not turned to marble—she saw that. Or if no such sweet romance were possible, at least the Baron and Paris were in her reach. But, with all his devotion, the Baron was practical; he would want time to

be certain that the fortune of which she had the credit was secure—and that fortune was a wreck. There had never been any where near the amount supposed, and for several years she had spent more money than any woman ever heard of, unless it might be Eugénie.

She knew nothing about business, she took money right and left, not her dividends, but the principal, and sped along in her mad chase. Finally she had arrived at mortgages and unpleasant straits of all sorts. A few months before, she had become infected with the mania for stock-jobbing. Ever so many women made delightful sums by getting friendly Bulls or Bears to take them "flyers"—why, with good luck she might free herself from her embarrassments. In an evil hour she allowed Cloudy Forester to be the means whereby she was to work these wonders.

In spite of his doubtful reputation—no, of a reputation unfortunately not in the least doubtful—Cloudy maintained a certain position in society. So many men were deep in his Wall Street schemes that they dared not allow their wives and daughters to give him the cold shoulder. As long as his lucky star was up—his schemes successful—he must be tolerated. Though six months ago his wife left him and buried herself in the country, the world insisted on believing it her fault—she had been a stupid, nagging woman, and very likely was to blame for half his follies.

Violet had always detested the man, and it could have surprised nobody so much as it did her, to find herself mixed up in his projects and gradually falling into his power. But he had been at hand at the moment when she was most worried—had taken a "flyer" for her just as a joke, and it brought in such a golden harvest that she went crazy, as people always do. She had not stopped to think, she rushed on, and he helped her. When it was too late to retreat, there came losses. Cloudy encouraged her—she was not to be troubled—no need to advance more money yet—he should get hers back quadrupled. She had waited and waited, and now the end had come! Not only the risk of pecuniary ruin, but her secrets in Forester's hands, and he, during the past fortnight, showing plainly enough for her quick wit to understand what use he meant to make of her position.

The night culminated and waned. Violet was enduring the tortures of the damned, but they were better than home and the society of the skeleton. She lingered still, and her eyes waxed brighter, her reckless tongue more unmanageable, and men worshiped and women reviled, and she grew so mad that she longed to shriek her story out in full hearing of the crowd, and make a tragedy of herself on the spot.

Fred Townley was going—she saw him looking darkly at her—she could not let him go in that way. She brought him to her side by a gesture with her fan.

"I wanted to say good-night," she said,

softly. "Don't come near me any more—it makes my heart ache for an old friend to see me as I am. Ah, Fred! Fate has been hard on me—good-by!"

It was partly earnest, partly acting; she would have been mortally afraid to have him in love with her again, but she could not bear to think her power was wholly lost, and the old dream looked so beautiful! He went away puzzled by his own emotions—cursing himself for an ass—but not able to forget the mournful eyes raised beseechingly to his, the timid, fleeting smile that for an instant had made her so like the Violet Berners of former days.

The lights in the ball-room were out—the Baron was safe in his bed, dreaming of the pretty widow and her half million of dollars, which would make so charming a fortune joined with his income of fifty thousand francs. Fred Townley was rushing up and down his rooms in the same hotel, smoking his biggest meerschaum, vowing that on the morrow he would quit New York forever and not see that woman's face again, yet conscious that he could not go till he had looked once more in her eyes. Cloudy Forester had gone to finish his night at a gaming-table; always, during the intervals of thought given by the card-dealing, swearing to himself that he would reach the goal he had tried so hard during the past weeks to attain. With each and all, the thought of that beautiful woman was persistent and engrossing; and she was at home—if they could have seen her then! She was shut in her apartments—the communicating doors of the whole suit thrown open to give her space for the weary march she kept up the whole night through. The skeleton marched by her side, not to be tired out or shaken off—gibing, muttering, pointing to the laudanum bottle—whispering a thousand mocking recommendations—reminding her over and over that the world had come to an end—that she had better kill herself and be done—better be found cold and stiff, and leave at least a mystery, than to drag out a few more days or weeks of suspense and have the final blow fall.

No way out—nothing left—neither money nor friends—even her good name attacked. She knew well enough that when the pack of hounds once opened mouth there would be no limit to their ferocity. She must share the fate of any dethroned idol—nothing too bad to be said or believed: "*Perle avant de tomber, fange après sa chute!*"

Morning—noon—the new day had come! Mademoiselle, tired of waiting, managed to upset a chair in the dressing-room, and so waked her up to meet it. Then a visit from the virgin Elizabeth; half an hour to herself, more purgatorial than Pauline's chatter or Miss Berners's commonplaces; then the announcement she expected—Cloudy Forester was waiting to see her.

It was a relief that the moment for action had come. She was actress enough to rise to the excitement of her part. She had dressed

herself admirably for the scene—I can not describe how; a marvelous blue and white combination of silk and soft cashmere that floated and fell in graceful folds such as no other woman's dress ever would assume. It gave her an indescribable look of purity and distance from ordinary mortals, which would have made it difficult for the most hardened men to hold very base thoughts in her presence. I don't suppose Cloudy Forester was that—bad enough in all conscience—but I never saw any body so wicked that I did not hear of somebody worse. However, Cloudy had gone raving with this new fancy that he called love—was such to him—and he would not have been awed by the devil, or, what is more to the purpose, by an angel.

"How good of you to be punctual," said she, with her most unconcerned smile; "and admire the business habits I am acquiring; I have not made you wait."

"I am sure I should be repaid if you had," returned he, and overdid the matter, as he always would an attempt at gallantry, and so made it unpleasant. "I never saw you look so charming in my life."

"But we are not in a ball-room now," said she, laughing; "we are down in Wall Street, and Wall Street knows nothing about pretty speeches."

"How nicely you put me on the footing you might a business agent," said he, flushing angrily, though making an effort to control his impossible temper. "I was not aware that I occupied that precise position toward you or any body."

"Not toward me, certainly," she replied, apparently undisturbed. "You have been a very patient, kind friend, and allowed me to bother you dreadfully."

"You never could do that—where business is concerned."

She altogether ignored the speech and its double meaning. She was busy fastening a little bunch of scarlet flowers in her belt.

"Yes, dreadfully," she went on, in a voice that never quavered, though there was a mortal chill at her heart, and she was growing horribly afraid. "But it's all over; I retire from the Stock Exchange. I'm quite satisfied with my little lesson."

He admired her pluck hugely, for he knew exactly the position in which she was placed; but his admiration only made the hot passion in his heart more violent.

"It never answers to get discouraged," he said; "one never knows when matters may take a turn."

"Mine did that weeks and weeks ago—only they took a wrong turn," retorted she; and, self-controlled as she was, she could not help saying it bitterly.

"I hope you do not blame—"

"Any body, but luck or circumstances—or whatever god may be worshiped or rebelled against in Wall Street," she interrupted, laughing again.

"I want you to let me talk frankly about the bad luck, and tell you what I think the wisest and best thing to be done," he said, gravely.

A gleam of hope sprang up in her heart. Perhaps she had wronged him; he might prove less ungenerous and mean than she had expected.

"Tell me," she said, turning her beautiful face toward him with a new brightness in her eyes, and a soft tinge of color in her cheeks. "You know I am any thing but a business woman."

"For that very reason I don't wish you to trouble yourself about what has happened," he answered, slowly.

"What nonsense!" she exclaimed, impatiently. "I owe you thousands of dollars; of course you want them paid, and I want to pay them. I have been an idiot, and must suffer the penalty."

He tried to look grave as ever, but she saw a sudden triumph shining in his eyes. She knew that, whether she succeeded or not in freeing herself, she should have to listen to the insulting secret which he had made visible in his face for weeks; and it was the first time in her life that any man had dared bring such trouble near her. A shiver of sickening fright, fierce anger, a fiery pang of shame and remorse, shot through her soul in the brief instant of silence that followed her words. Then he spoke so rapidly that there would have been no opportunity to interrupt him, even if she could have got back her breath and strength.

"You need not think of that, or be troubled," he said. "There is not the slightest occasion. What loss there is nobody knows or needs to know. It is a matter entirely between you and me."

If he had struck her in the face it would have hurt less than his words; but she could not articulate a syllable. Besides, there was no escape; she had got to hear him through; she who, in spite of her untold flirtations, had always been able to boast to herself that no man had ever ventured upon so much as a look beyond the rôle she laid down for him.

But the skeleton had not grinned at her for weeks without reason in his malice, and she had come upon the most bitter humiliation of her life. Another instant, and Cloudy Forester was holding her hands fast, and pouring out the story of his love and suffering in high-flown words that might have been effective with a young girl, but which reminded her so much of a scene in some French play that, angry and frightened as she was, they made her long to laugh.

She allowed him to finish; by that time she was too angry to care or think of the consequences of offending him, desirous only of punishing his insolence in the most effectual manner. She knew very well that open expressions of wrath would only give him courage—that tears would be considered a theatrical display. She drew her hands away from him, as he half

knelled before her, and said, in the quietest, most delightfully insolent voice:

"Perhaps you will have the goodness to get up now. This little stage business was thrown in, I suppose. Well, a bit of practice never comes amiss."

He was on his feet before she concluded her sentence. She saw a legion of devils looking at her from his handsome, wicked eyes; but she would not have taken back her words if she could. She knew he would have liked to make his nervously working fingers meet about her throat and choke her until she was black in the face; but he mastered his anger, and, still clinging to the theatricals that he had so often found effective, he burst into an eloquent tirade against her cruelty, and renewed protestations of his earnest devotion.

"When did you hear from Mrs. Forester?" she asked, quietly, when he paused.

He kept himself from uttering bad words. In the midst of her trouble, Violet enjoyed the difficulty he had. After a little he said, reproachfully:

"From any body else the question would be an insult; from you it is cruel."

"It occurred to me that you had forgotten there was such a person," returned she, coolly. "Suppose we go back to the business in hand."

"You shall not put me off in this way," he said, in a tone that was fierce in spite of his efforts to subdue it. "I will not be trifled with—"

"And I!" she interrupted, too angry now to remember any prudence. "You dare to come to me with words of love on your lips—you, a married man! You venture to insult and outrage me because you believe me helpless. But there, tragedy would be wasted! Mr. Forester, I am in a hurry to go out."

"I am the same as free," he exclaimed. "The divorce will be arranged in a few weeks. I ask you to be my wife. Violet, no man will ever love you as I do—"

She was standing before him, white as death, her eyes blazing with a light which, callous as he was, he found it hard to meet. But she controlled herself, made a gesture with her hand as if dismissing some importunate servant, and said:

"That will do. Allow me to bid you good-morning; we will settle our business by letter."

He was furious now, and uttered menaces which roused her temper to a pitch nearly equal to his. Then he dared again to plead his love, and at last she cried:

"Either leave this house, or I will ring and have you put out."

With a man who had only the thinnest possible varnish of gentlemanly breeding over the animal coarseness of his nature, of course after such words a terrible scene was unavoidable. He absolutely threatened her with exposure—a suit to recover his money—and, to add to her anger and fright, showed her that something she had put in his hands by way of security

only made her position worse. It was a claim on property already mortgaged to its full value, which, in her delightful ignorance of business, he had induced her to make use of. But she bore even that gallantly.

"No matter what comes," she exclaimed, "at least I shall be free from your society. Any thing would be better than meeting you, and being forced to treat you civilly."

He left her. It was almost the first time in his life that Cloudy Forester had failed in a scheme on which his heart was set, and he vowed to revenge himself at any cost.

Violet remained in the reception-room—not thinking, scarcely feeling—dazed and stunned by the blow which had fallen at last. The world had come to an end! She caught herself repeating the words again and again, and laughed aloud at her own idiocy. What was to follow? She asked herself that; but she could not think, she was too tired. Ruin—disgrace—she knew that both hovered near; but it was no matter—oh, nothing was any matter!

People were coming in—a whole army, she thought—and wondered in a feeble way if the story was already known, and they had come to stare at and revile her. Then she managed to recover an outward show of civility, saw that it was only the old maid and her spinster relative, and got rid of them soon on some pretext. She would have liked to give orders that nobody else should be admitted; but no, let whoever would come—perhaps it was the last time. So the Baron was next, and the Baron offered his title for her acceptance, and proposed uniting their fortunes, besides telling, in very pretty French, that his whole heart was offered too.

"My dear Baron," said she, laughing anew, "I should like it of all things! Unfortunately, it is out of the question. I have lost all my money."

He could not believe his ears at first; when he did, he vowed that it was of no consequence, and for the moment he thought so. But his German phlegm came to his aid, and he was greatly relieved when she persisted in her refusal. He departed in his turn; but as he was a gentleman, in spite of his dullness, of course her confession remained a profound secret.

Violet sat there and wondered whether it was real, or if she had dreamed it all, and could not decide. Then Helen Morgan and one of her companion gigglers appeared, along with a youth who seemed bent on giving himself an indigestion by devouring his seal ring. While the girls tittered and the youth nibbled, and Violet shut her lips tight to keep from astonishing them by dreadful words, Fred Townley found his way in, and Violet knew that she must go mad, but she did not.

Fred had tried to harden his heart during his sleepless night by the recollection of her falsehood, yet he could not resist coming to look at her once more; and when he left the

house he hated and despised himself, because he knew that the old spell was still strong upon him.

When he was gone Helen Morgan told Violet that he was engaged to some girl in Washington, and was to be married shortly. Violet was left to herself, and could shed a few tears for the first time in weeks. Not over her present trouble—not over the knowledge that Fred Townley had found happiness apart from her—just over the beautiful dream of her girlhood that had been so ruthlessly murdered by such cruel hands.

Two days passed—they were like a horrible nightmare to Violet. There was not a moment unoccupied. It was near Lent, and all the amusement possible was crowded into these last weeks. She went from breakfast to concert, from there to dinner, parties and balls after, and in looks and spirits she surpassed herself.

Cloudy Forester haunted her like a ghost, but would not speak; he knew that this dread in which she lived was the most horrible revenge he could take. Fred Townley watched her afar off; the spinster Elizabeth watched her too, but did not dream what was amiss. She formed her own theory—being a woman, she must have one—and, dating the change in Violet from the time of Townley's arrival, believed that she had found a clew.

So the third day at a reception she waylaid Fred and told him a long story; he did not astonish propriety by hugging her on the spot, but he came near it.

And Violet, unable to endure her torture longer, had at this time walked straight up to Cloudy Forester and taken his arm.

"I want to speak to you, and I will," she said, recklessly. He bowed, and the sneer on his face showed how thoroughly he enjoyed his triumph. They went into the conservatory; he stood nonchalantly smelling of the flowers.

"This mustn't go on," she said, hoarsely. "Whatever you mean to do, do it at once; I'll not live like this."

"My dear friend," returned he, fastening a rose-bud in his button-hole, "don't be in such haste to be sued; matters may right themselves yet."

"I want my freedom!" she exclaimed; "let me have it at any cost."

"Think of the paragraphs in the Sunday papers," sneered he. "I am sure you have adulation enough; you don't want notoriety."

In that instant Violet comprehended how it was that women went mad and committed the deeds of which she had shuddered to read. If she could have laid hold of any weapon with death in it, Cloudy Forester would never have tormented any other unfortunate.

"I tell you this shall end," she said, quietly enough—people don't do theatre at a moment like this. "I am desperate now."

"My dear creature," returned he, "let me

settle your difficulties. I'll advance you any amount of money you may need."

"Don't you speak one insulting word more," she said, with a composure at which she could even then marvel, "or, at any cost to myself, I'll tell my story out for the whole world to hear; at least some man would show humanity enough to kill you before my face."

He looked at her and knew that she meant the words, insane as they were. He could not answer, for Fred Townley was close beside them; Forester was certain by his look that he had caught her last words.

"Mrs. Livingston will excuse you," said Fred.

"She can say so," retorted Forester.

"She does," exclaimed Violet, roused to a sense of what might happen between the two men. "Mr. Forester, please call my carriage. Mr. Townley, I must beg you to find my aunt and say that I wish to go home."

She took Forester's arm and walked toward the drawing-room; both men obeyed her.

Every thing else was a confused dream until she found herself seated in her carriage, and the virgin Elizabeth silent as usual by her side.

The dinner hour passed; night came. Violet was dressed to go out, and sitting in her library waiting for Elizabeth. She knew that some horrible news was close at hand. She could not even tremble or be afraid. She was cold and dead; even the capability of suffering acutely was gone.

The door opened, she did not lift her head from its resting-place on the table.

"I am ready, Elizabeth," she said, dreamily. "I think I died hours ago, but don't tell any body."

"Violet!"

She looked up on that utterance of her name and saw Fred Townley.

"I thought it was Elizabeth. I had forgotten you were to call for us," said she.

He stared at her in alarm. It was not, however, that her brain was disordered; she only thought there must have been an arrangement for him to come, and that she had forgotten it.

"I have had no opportunity to congratulate you," she went on. "I think you might have told me; we were old friends. I hope you'll be happy. Don't ever tell her about me, Fred."

Miss Elizabeth had made him acquainted with Helen Morgan's romance, so he understood this speech.

"I have to congratulate you too," he answered.

"If I am really dead," she could not help muttering.

"But I have to scold you first," he continued,

cheerfully, afraid that she was ill, and wanting to break his news as gently as possible.

"You used to scold me, and I liked it," she answered, still with the feeling that the whole scene was one of her odd dreams. "What have I been doing?"

"When fate brought an old friend near you ought to have trusted him," he said, "and so spared yourself the trouble and danger of these past weeks."

"So you know," she said, slowly. "Is it in the papers? Don't you blame me, Fred! We sha'n't see each other any more. There'll be enough to speak harshly of me."

He took a paper out of his pocket and showed her Forester's signature on it.

"That is his receipt," he said; "the whole matter is settled. I have been to your lawyer also. I think I told a fib—he thought you sent me. I know all about your affairs. You are by no means ruined, if you will let matters be sensibly managed."

"I'll go away," she said; "let them take every thing! I can live. Elizabeth must stay with her brother."

"Violet! Do try to understand—"

"Yes, I do! I want to thank you, you know! So you paid Forester? Thank you, Fred. I'm not even ashamed that you know. I think I'll not go to the ball—I wonder if I could have some water—"

She leaned back in her chair and fainted away. When she came to her senses Fred Townley was dancing about like a mad hare. Her dress was wet with the water he had thrown over her. Somehow, the first thing she remembered was the story of his engagement.

"I want to hear her name," she said. "Let me write and tell her how good you have been to me."

Fred Townley was kneeling at her feet, pouring out the old story of his love, and crying:

"Only own that you care for me, Violet! Blot out these years—come back to the old dream! I love you better than in the dear old days—trust me. Violet, come!"

She could neither expostulate, nor think of her unworthiness to be so loved and trusted. She went straight into his open arms, and the dull world faded, and left them alone in their regained Eden.

Society was charmed with the news of the engagement the next day, and Cloudy Forester was a fortnight in his room with a blackened eye—no, a pair of them—he said from a fall down stairs; and it was true that he had had one.

The skeleton betook himself to his grave. Violet Livingston recovered from a brief illness to realize that she had expiated her follies by the suffering of the past months, and that a new effort at life was mercifully granted her.

AMERICAN ARTISTS IN ITALY.

NOT the least of the impressions of an American traveler in Europe comes from the mark made by his own country and countrymen there. He finds every where the stamp of America, as decidedly, if not always as definitely, as in the Five-twenty bonds that he sees in the windows of the bankers of the great cities. The American is regarded as belonging to a nation of his own, and as having a character of his own; and "America and the Americans" means as much in the great centres of European travel as "England and the English." I did not find the prevailing caricature of my countrymen that I expected; and although in certain dainty social circles there was a disposition to make light of our travelers for their loud talk and laugh, and their vulgar dash and extravagance, the common people, and also the quiet intellectual class, seemed to look upon our countrymen as a well-educated, independent, unpretending, kindly, and plucky set, who liked to see and have the best things, and pay fairly, but not foolishly, for them. Our people certainly are not behind the Europeans in susceptibility to what is beautiful; and I am sure that they are more familiar with the grand scenery and fine galleries of Europe than with the haunts of dissipation or the castles of indolence. As yet this susceptibility is deficient in culture, and we abound more in amateurs than in artists; yet of these we have furnished a good share; and the American who goes to see the old art of Italy is sure to find his own countrymen hard at work studying its secret and catching its inspiration.

I made a little tour among the studios of our countrymen at Florence, and was surprised and delighted with the result. I went chiefly among the sculptors, and found enough among them to prove that genius is no mere tradition of the age of the Medici, and that invention is alive now as then. Sometimes a man is nearer his readers by not being ashamed of his ignorance; and I am willing to stand upon a par with my readers by honestly confessing that I am no expert in Art criticism; and I looked at pictures and statues with a child's curiosity, and write about them very much as other novices would do in my place. The first visit was to Gould's studio, near the Porta Romana. He is from Boston, and has in his eye and build the sensitiveness and strength of the old Puritan stock. He is young, yet he has done good things; and his "Cleopatra," in her dreamy ease, his "West Wind," in her airy movement, his head of "Christ," in its godly sanctity and blessed humanity, and his head of "Satan," in its blasted cunning and infernal pride, show a scope of invention and skill that give him a good name among the new claimants to the honors of the chisel. His head of "Christ" struck me as his best work, and, so far as expression is concerned, it satisfied me more than the "Christ" of Tenerani at Rome, who is set by Romans at the

head of their living sculptors, while the Roman sculptor has a stronger hand, and gives more of the antique grandeur to his work.

I next went to Powers's studio, and was glad to find him so handsomely established in his new villa. It is interesting to know that artists can earn money, and how much they can buy for it abroad. Powers has a fine piece of ground of over an acre, I think, with a nice house of brick and stone, with large studios adjacent, and the whole inclosed with an iron fence—in fact, an ample and beautiful estate, that should satisfy any man of taste. The cost of the whole was only 80,000 francs, or \$16,000 in gold. I could not but think how little that sum would do toward giving one of our artists a similar villa within a mile of the heart of one of our best American cities. Before he had begun to build his house he would find that his grounds and his fence had taken up about the whole of his money. I believe that the stairs and floors of the house are of brick and stone, and that it is thus, after a fashion, fire-proof. It is well for an artist to have a firm pedestal to build his creations upon; and I do not believe that poverty and anxiety are the only or the essential inspirations of genius. A young man may need the spur of want to make him work; but when habits of thought and labor are established, there is a certain power as well as peace in the assurance that the artist is not out of doors, but has at once in his home a retreat from trouble and a fortress of strength. Poverty may compel him to work enough to keep the pot boiling from day to day; but if he would do great works through months and years, he must borrow some patron's house, and means to keep him, if he has none of his own.

Powers is in every respect a remarkably well-balanced man, and in his looks, his ideas, and habits, as well as in his works, he is a man of the *golden mean*. There is nothing *too much* in his make or manner. He is a good specimen of a well-formed man, and his own statue would make a good sign for the front of his studio, or frontispiece for a photograph album of his works. The fact that so many persons see no genius in his designs comes from this absence of excess, and this perfect balance of proportions and features. He does not seek startling effects or strike out into salient points. His "Greek Slave" and his "Eve" soothe and charm you by their exquisite harmony, instead of surprising you by any bold strokes. I saw with astonishment Bernini's "Daphne" at the Villa Borghese in Rome, with its amazing rendering of the process of transforming the beautiful nymph into the laurel-tree. It was clear to me that Powers was not Bernini, and the two were the antipodes of art. How Powers would handle that same subject I can not say; but I am quite sure that the nymph would have been presented by him as sweetly blooming into a fair laurel, and not as if changed by a ruthless force into that rugged wood. His busts partake of the character of his original creations, and are more

memorable for harmony and repose than for flashing expression or striking attitude. It is praise enough of him to give him this credit and to call him the sculptor of the *golden mean*, alike because he seeks the medium path and turns all his work into gold. His second "Eve" may be a step in the other direction, and there is certainly a dramatic purpose in the attitude of the woman toward the serpent, and in her look of mingled penitence and triumph; yet loveliness predominates over the whole, and Eve's victory does not much disturb her Eden tranquillity.

Powers is full of work, and his studio is one of the resorts of our countrymen. He has quite a gallery of American heads, and he has lately added the most remarkable of them all in his bust of Longfellow, which gives our poet, with his fine beard, an antique grandeur. It would be a relief to see one feature of his studio disappear—I mean the shelf of busts marked "Delinquent," whether by having the delinquents pay their arrears or by the sculptor forgiving the debt, or at least keeping it out of sight.

Near to the house of Powers we find the house of the sculptor Ball, who welcomed us graciously to his studio with its rich treasures. He has some memorable new works, such as his noble statue of John A. Andrew, his group of "Faith and the Angel of Death," being a most lovely monument for Mount Auburn, and a figure of Eve just awake to the wonders of creation. There is no more pleasing sculptor than Ball among our Americans, and he has, with a good deal of vigor, a certain freshness of feeling and tenderness of sentiment that give him a ready place in the affections. How far he is master of the anatomy of the human figure I am not able fully to judge; but the impression made upon the eye is favorable to the correctness as well as the beauty of his designs.

Pierre Connelly is quite an artist by himself, and a poet in his sculpture, perhaps too much so to meet the stern conditions of the marble in which his fancies must speak. His heads of some of Shakspeare's heroines are exquisite, and show his poetry without overtaking the chisel to give them expression, while the groups of "St. Martin and the Beggar," and of "Death and Honor," are subjects better suited for the painter, especially the latter of these, which never should have been attempted in clay, even if it was worth attempting at all, which I must doubt. He has most enthusiastic admirers in Florence, and some of these rank him above Powers in genius, or at least in originality.

Hart is a kind of monastic artist, a philosopher and poet as well as a sculptor, who thinks even more than he works, and who seems to concentrate the thought of years upon a few tasks. He has a charming little design of a child with a morning-glory, which sets childhood before us in the glee of dawn and with heart all alive to the joy of nature. His great work is

what he calls "Woman's Victory," an admirable figure of a beautiful woman, who holds an arrow aloft, and looks down upon love at her feet as if to say, "If I am to be won it must be by one who can rise to my standard of faith and purity, and not by my being dragged down to the earth." It is a noble work, and one that tells its story in marble for the mind of our time on the great question of woman's destiny. Hart is something of a mechanic, too, and he has invented a machine for copying form, as the pentagraph copies drawing, and which allows the operator to copy any figure that he will. This machine may fitly be called the morphograph or form writer, and is likely to be useful in various ways.

Larkin Meade is doing the largest piece of work among our Florentine sculptors, and his group of "Isabella and Columbus" was nearly completed in October. It is a very effective composition, and presents our great navigator as receiving his commission from the Queen, who is seated in royal state. The details are carefully studied, and the whole work is a chapter of history as well as a study in art. It is intended for the house of one of our merchant princes in Connecticut, and will reward many a pilgrim for a journey thither. Meade's statue of Abraham Lincoln, for the Springfield monument, was not completed; yet what I saw of it was very promising, and looked as if it might fulfill the two difficult conditions of combining gentle humanity with rugged, and perhaps ungainly, simplicity. The artist has shown much force in the accessories of the monument, and it remains to be seen how far the result will be an harmonious composition, and not a collection of fragments. His works impressed me far more than when I saw them some years ago, and gave me the idea of strength, and not chiefly of ingenuity. He has evidently gained much by treating historical instead of fanciful subjects, and has risen from pretty conceits to high design.

The Florentine artists seem to have a wholesome neighborly feeling with each other, and with the society and culture of the city. They find there a good deal of sympathy in the generous thought of the best people, and they can visit and worship to their mind in a pretty large circle of friends. It struck me that their social life was more domestic and elevating than that of their brother artists of Rome, who live more by themselves, and for the most part aside from the society, and especially from the religion, of the city. Florence is in many respects very English, and full of mental and religious liberty, while Rome is intensely Roman, and the native society has little or nothing to do with foreigners who are non-conformists. At Florence our artists have so many houses of their own that they have much of the home feeling and character, while at Rome all live in hired lodgings, and seem to have something of the tone of hotel life. They make up for the deficiency of home accommodations at

Rome, however, in a measure, by the attractions of the American Club at the Palace Gregori; and while it was hard to keep warm in the great hotels and houses, there was always a good fire blazing there, and a genial company, mostly of our artists, around the blaze. American travelers will find it well to win a place there by due election, and at the moderate cost of fifty francs a month for the full range of those spacious apartments, with their ample supply of books, newspapers, and creature comforts.

I looked in upon Randolph Rogers first of all at Rome, and was startled at the extent of the work going on there. In several large rooms workmen were busy upon statues and pedestals, and two stately monuments were developing their proportions—one a Lincoln monument for Philadelphia, the other a State monument for Michigan. Rogers seems to me to have the boldest, strongest hand of any American sculptor, and to do things upon a grander scale. He is himself full of muscle and animal spirit, and there is a dash of vigorous life in all his statues that makes him an especial favorite with American committees. His statue of Lincoln is full of power, combining strength with dignity, while his colossal figure of Michigan has memorable grandeur with its unquestionable grace. It may be this sculptor's danger that he is tempted to sacrifice delicacy to force, and to be content with being large instead of great; but he certainly has his share of gentle sentiment as well as fine thought, and his statues of Nydia, the blind girl of Pompeii, and of Isaac, and his bass-relief life of Columbus, on the bronze doors of our Capitol, illustrate characteristics that he will do well carefully to cherish in these days of his prosperous name, instead of dismissing them as dreams of his youth.

Mozier, whose studio is next door, if I remember rightly, is in quite a different vein, and deals chiefly with subjects of feeling, such as the Prodigal Son, the Wept of the Wish-ton-wish, Rizpah, etc. He designs somewhat in the tone of Thomson's "Seasons;" and there is a tranquil beauty over his works that makes them such favorites in so many American homes. He studies faithfully, and is content with completing one statue each year. He is one of the American fathers at Rome, is interested in social and public affairs, and is a conspicuous figure at the American Club, where he occupied the chair at the pleasant social reunion of Americans on Thanksgiving evening, November 18, 1869.

Ives has his well-known statue of Pandora in sight, and the model of his admirable colossal statue of Bishop Brownell. He has done nothing better than his charming design of a playful child, "Sans Souci."

Haseltine is a sculptor of much versatility and most fertile brain and ready hand, perhaps too eager to press his fancies into marble embodiment; yet evidently encouraged by ready patrons, and abounding in home affections and

patriotic sentiments, such as win favor with our people. His statue of "America Victorious" is full of spirit, with perhaps overmuch of symbolism in its details, while his groups of "Love" and "Youth" are poems as well as statues, and perhaps more so. He is quite unique among American artists in his tendency to work in couplets, and to set off joy and grief, love and hate, good and evil, against each other in contrasted groups. He is making good with his chisel the patriotism which he proved by his sword as officer in our army; and he is a fine specimen of a true American gentleman, who does not forget country and friends in the luxury of his Roman home.

Rinehart, in the Via Sistina, is a close student and indefatigable worker, and his studio is full of the fruits of his thought and toil. "Latona," "Hero," "Woman of Samaria," "Thetis," "Penserosa," "Endymion," "Antigone," prove the compass and power of his art, as his execution of the designs of Crawford for the bronze gates at our Capitol proved the fidelity of his hand and eye. He was at work on a statue of Clytie when I visited him, and was modeling the arm from that of a woman before him, who was one of the six different living models that he employed in completing this figure, which promised great excellence. He is a Southerner, who submits with good grace to the results of the war, and wishes well to our flag with a characteristic honesty which makes him apparently a favorite with his brother artists.

Franklin Simmons, who is sometimes known as the Maine Sculptor, is, in his way, unique, and with as accurate an eye and touch as any other. He has an ideal power that in no other man is more closely united with faithful and exact detail. His statue of Roger Williams for our Capitol is a master-piece of invention and work; and the leading sculptors of Rome concurred in naming it one of the very best works that had been done there. As there is no portrait of Williams, the sculptor was compelled to think out the Rhode Island reformer into form, and the result has been most happy in its combination of Miltonic intelligence and dignity with rugged simplicity. In portraits, Simmons is remarkable; and no man in Florence or Rome puts more of a man's life into the marble bust than he.

Enough has, perhaps, been said, in a general way and often, of our lady sculptors at Rome, with Miss Hosmer at their head; and they deserve an article by themselves, if the writer would fairly present their designs and works, and illustrate their success in leading a life of social satisfaction and professional profit in that peculiar city. Miss Hosmer is in herself a fact of the new womanhood of our time; and whether seen in her palace-like studio, the most spacious and elegant of any that I saw in Rome, or in her drives along the Piazza or the Pincian Hill in her handsome coupé, generally with no more exacting company than a beautiful hound, she gives you the impression that the coming woman

is on the way, and men must have something more than their sex to boast of if they would keep the track of honor and wealth to themselves.

Story's statues took me quite by surprise, and I had no idea of his having such great and versatile genius. He is known here in America most by his portrait statues, which are not his best works. Critics are sometimes hard upon him for showing more of the man of letters than the sculptor in his designs, and making them more literary than sculptural; and there is probably some truth in the statement. Yet it is by no means to his discredit. Is it not clear that our nineteenth century must make its own mark in sculpture as well as in painting, architecture, music, and the drama, and that the thoughtful, interior spirit of our age must record itself in marble and brass as well as in colors and tones? I do not profess to be able to criticise thoroughly Story's knowledge of anatomy and the fidelity of his designs, but he surely gives marvelous life to his figures, and his ideal studies walk forth in realistic form and action. I may as well frankly own that I saw no modern sculpture that so instructed and delighted me as his. He seemed to me to put our best New England thought into marble; and to be doing for our new intellectual Puritanism in sculpture what Channing, Emerson, Parker, Lowell, Longfellow, Bryant, and others have been doing in words. He is modeling nature and history from within outward, and proving that marble, as well as canvas and paper and voice, can speak from within outward, and record its protest against all mere formalism, whether of the bigot's symbol or the pedant's rule. He is by eminence our spiritualist in art, as Simart is sometimes called the spiritualist of French sculpture, on account of the intellectual expression in such master-pieces of his as his "Minerva," his figures of "Poetry," "Philosophy," "Agriculture," "Justice," "Painting," "Sculpture," "Architecture," his "Orestes," his colossal "Napoleon," and his "Virgin and Christ." Story's "Saul," "Cleopatra," "Delilah," "Sappho," and "African Sybil" are all grand spiritual studies, and are as much born out of his thought as any poem is born out of the poet's soul. Yet he has much to do to fulfill his mission; and he has not yet reached what Simart so well calls the true aim of modern sculpture, "to make the Christian sentiment live under the beautiful form of antiquity." His study of history has great defects, and he lacks the true conception of the highest spiritual life, in common with the whole transcendental school to which he belongs. He is too intensely subjective, and his muse is rather seeker than apostle, and rather looking after the divine life than calmly rejoicing in its exalted peace. His "African Sybil" is to me his most inspired work, and she speaks out of that eloquent marble the prophecy of the redemption of her race which sober history is now fulfilling; yet even she does not tell the great secret of Africa's uprising, and her face glows more with the aspira-

tion of the human soul than with the inspiration of the Divine Spirit. The statues of Saul and Delilah are remarkable statues of Hebrew history. Saul is king in his madness and in his health, and his melancholy and his joy come from his sense of unseen powers. The artist tells us at once his struggle and his triumph, and the gleam of light on the moody monarch's face shows from what a depth of gloom he was called by the music of the shepherd boy. Delilah is wholly an original study of the subject; and the wanton girl, instead of gloating over the purse of gold in her hand, holds it in contempt and hate, with a look that seems to say, "I would give that money and all the gold on earth, and this whole crew of savage Philistines, if I could only save that young hero from their clutches, and have him in my arms again."

Story has had a remarkably varied, yet uniformly successful life, and when I saw him at his work in Rome many scenes of his previous career came to mind. I remember him as a playful boy about his father's house and the streets of Cambridge, with his down-turned collar, merry eye, and, if I mistake not, with clustering curls of hair; then a college youth taking his part at foot-ball on the Delta, and on the platform at exhibition with an original poem, I think. Then he was law student and lawyer and maker of law books, with a word of poetry now and then in the magazines and at the Phi Beta Kappa anniversary. Then he astonished the public more than his friends by dabbling in clay with the moulding-stick; and he is now one of the most pronounced facts of that old Rome whose rubbish he has so celebrated by his pen. He looks well and strong, with a touch of a soldier's toughness in his make, as if he kept muscle as well as mind in full play. He talks well, and said more that is worth remembering for original thought than any man that I met at Rome. They scold about him a good deal there, and accuse him of turning the cold shoulder toward Americans and currying favor with the English, especially with the aristocratic class. He did not seem to me to be of that temper, but rather to be a lover of culture wherever he finds it; and it was this, and not time-serving, that led him to have Browning spend part of the summer with him. If there is any coldness between him and Americans, it is probably as much their fault as his, and they prefer less intellectual work and less exacting society than his, while perhaps he makes too much a luxury of his gifts, and does not wholly keep up his republican loyalty.

It seemed to me that Dr. Stone has done some excellent work quite in a unique way, and his series of bronze vases, that represent the course of ages in cycles of heroes and sages, is an original and valuable contribution to American art. The vase that presents the masters of Greek genius as preparing the way for Christ is a noble composition, and would grace any gallery or palace in the Old World or the New. His head of Harvey and his statue

of Hamilton are good specimens of what he can do with portraits in marble.

I saw less of the painters than the sculptors in Rome, yet enough of them to know that they represent American art well, if not as conspicuously as sculpture is represented. There is a reason for their limited number and power in the fact that the painter needs comparatively little foreign help in his work, and can set up his easel and find subjects every where, while the sculptor must have his models, his marble, and his marble-cutters, which are found so much more readily and cheaply abroad. Buchanan Read has most charming studies in his room, and his "Star of Bethlehem" was coveted by all beholders, and there was eager competition as to who should carry away the prize. His "Will-o'-the-Wisp" and "Aurora" were in the same poetical vein, and proved that the poet can help out the painter by putting something of the life of the pen into the dash of the brush. Freeman is the patriarch of our painters at Rome, and remembers the day when Crawford, Terry, and himself were the only representatives of American art there. He has many careful and interesting studies. He was busy with a sad face from a model whose special value was in the look of grief that seemed to come from a tried life, and to show that we can put into picture as well as song what we learn by suffering. He had some good studies of children and birds, with a rich collection of works of former years that he is having copied into a photographic album for friends, a worthy exhibition of his faithful labors for so many years. Inman's fine studio had some new designs of flower pieces, and some most valuable studies from the haunts and shrines of St. Francis of Assisi, which he had taken from careful sketches made on the spot, and which were most instructive contributions to Church history as well as specimens of art. C. C. Coleman was busy with some very elaborate studies of Italian scenery and architecture, and his picture of an interior of a chapel at Perugia was the most careful work that I saw on any artist's easel. William Haseltine had not fully begun to work, but had just made his arrangements for his winter campaign, in which he will be sure to add to his well-won honors by land and sea.

So I have glanced at our artists at Florence and Rome in a very hasty manner, yet with enough thought and good-will to call attention to them and their good works. They certainly do us much credit, alike by their industry, their talent, and sometimes by their genius. They work hard, and I was much impressed by the time and labor that they give every day to their tasks. They stimulate each other to fidelity, and the art circle is so large and so sympathetic as to create a public opinion and habit in favor of industry. The artists have, indeed, their play days and pastimes, as we must all have them; and they are perhaps more given to easy manners and free conversation in their seasons

of recreation than other men of equal culture. May it not be that we all like to throw up our especial work when we play; and if school-boys jump and scream after school, and clergymen sometimes smoke and laugh when they are dismissed from church restraint, may it not be that artists who are busy all day with trying to make things appear well, and literally doing their prettiest, may be moved in quite the other direction when they play, and may delight in putting things out of joint, and setting them upside down and topsy-turvy? It seemed to me that the artists of Rome tended in their fun to a very inartistic view of things, and that they might have more wisdom and refinement with quite as much sociality and humor.

Their models seem to occupy much of their thought, and be the butt of much of their remark. Yet I was led to think that the relation between them is free from the evils that one tends most to suspect, and that the artist keeps toward his models purely the professional relation. I was led to believe that a woman can be a professional model without losing character or reputation, and that the whole spirit and rule of the art profession are fixed and severe in this respect. The models are certainly a remarkable feature of Rome, and the steps of the Pincian Hill are often a living picture with picturesque faces, forms, and costumes. These Italians seem to tumble into the picturesque; and men, women, and children, who are any thing but clean, or, on a near view, attractive, are quite charming at a distance. It is really wonderful to see how they are made up for the effect. That little boy has his shoes tied round and across his legs up to his knees with an amount of string that would almost fly a kite; and that girl with ruddy brunette cheeks wears her head-dress and skirt with a queenly art quite in contrast with the coarseness of the material, and quite fascinates you as she walks along the Piazza di Spagna. The Italians are the most graceful people that I have seen; and they seem to be so by not minding how they look, and especially by being wholly unconscious of ever being ridiculous. They not only let the world alone, and take things very easy, but they *let themselves alone*, and so are very natural, free, and easy. I saw a fellow on Sunday afternoon, in a very conspicuous rig, march by our hotel blowing a bagpipe, with most sonorous blast, in what would be with us a most absurd way; but he had not the least idea of being laughed at, and he actually won my admiration for his sublime simplicity and repose. Again, a little fellow, not much above my knee, brought me a cup of coffee in a sculptor's studio with a wonderful grace; and when he received his two soldi in addition to the price, he said, "Grazia, Signor," and "Addio," with princely dignity; and marched off with his little tray as if the cup held the priceless pearl of Cleopatra. An old man came in to see if he was wanted as a model, perhaps for some antique head; and he was an odd combination of

gravity and fancy in air and dress; yet he kept his dignity perfectly, so that you could not laugh at his odd hat and strange belt if you would. Here is a lesson for us, who are thinking of ourselves so much that we are likely to lose the ease we covet by being uneasy lest we shall not win it. We are much like the boy whose new coat takes all his thought; and we Americans wear our new coat less gracefully than the Italian wears his threadbare garment.

How far American art is telling our characteristic ideas to the mind of Europe it is not easy to say, sure as we may be that it has made its decided mark, and that our sculptors and our landscape painters are equal to any in the world. I visited the studio of Tenerani at Rome, and saw his two master-pieces, the "Angel of the Resurrection" and the "Psyche," yet did not find in them the expression that Crawford and Story have in their best works; and he seemed to me a copyist of the old classic forms, rather than a master of our present inward life. He has died since I left Rome, and his good works live after him—and many of them there are, alike in palaces, museums, and churches. He was the last of the Romans in the strength of his art, and the leading Roman sculptors who survive him, Giacometti, Benzoni, and Rinaldi, will do well to rise above their delicacy, if not their prettiness, into something of his majesty.

One is much struck with the new connections of our American history with American art, and the number and magnitude of the works that are making the marble of Carrara speak of our times and our men. The largest groups that I saw in progress were monuments of our war for the life of our nation, and at Florence and Rome more is doing to perpetuate the name of Abraham Lincoln than that of any of the Napoleons or the Cæsars. It is evident that our people have heart and money enough for art whenever it touches their actual life, and that not merely public-spirited individuals, but neighborhoods, towns, and cities, can order first-class works from the sculptor as soon as there is any thing that they really wish to have ever before their eyes in stone. The trouble with most of what we are doing and loving is that it is not of such a nature as to be easily brought within the conditions of sculpture or painting. War and royalty are easily carved and painted in a few conspicuous characters or representatives; but peace and popular government and the people are too general, and perhaps prosaic, to be as good material for art. The Colosseum took its name from the colossal statue of Nero near its gate, and republics do not care to have a Nero, or to spend money to magnify his pride. That building was the Flavian Amphitheatre for keeping alive the passion for war. We have no such buildings, but our favorite arena is the school and the play-ground. There is some comfort in knowing that, if the Colosseum goes far beyond any of our structures in size and strength, we can beat old Rome and new in the number, if not in the magnitude, of our arenas;

and if our school-houses were brought together in one grand circle they would girdle the eternal city with a mighty bulwark of intelligence, and represent more millions of bright and aspiring children than ever bowed there to the sway of the Cæsars or the popes. When those children are duly schooled in knowledge and trained in virtue there will be no want of artists or subjects for art in America. I said this in substance at Rome, at the social festival of Americans on last Thanksgiving-night, and I now write it here with not diminished faith. Shame on the American who gives his hand or voice against those schools, and who will help to act over here the sad old story of ignorance and servility which has for ages been repeated from the hills of Rome!

AS EASY AS LYING.

FROM my youth upward I always had an extreme reverence for truth, with a corresponding contempt for falsehood. This admiration for truth was not an innate virtue, but was one carefully inculcated by my respected father, who, as soon as my understanding was ripe enough to grasp his meaning, constantly repeated this celebrated maxim: "Tell the truth and shame the devil." I am not sure that the mere reiteration of these words would have had the desired effect upon my infantile mind had not any slight divergence on my part from the principles they are supposed to teach been invariably followed by severe flagellation.

As I grew older, and thought more, two things about this maxim and its enunciator occupied much of my meditations: Firstly, why telling the truth *should* shame the devil (a point upon which even now I have arrived at no satisfactory conclusion); and secondly, why, when such admirable precept was always on my father's lips, he did not enforce it by example; for he certainly was the greatest—well, exaggerator, to put it respectfully—it was ever my fate to encounter. Be this as it may, I grew up the very embodiment of truth; and never did any, even the slightest, deviation from its path sully my lips or my thoughts until after I was engaged to be married. Circumstances which I shall relate then hurried me into a very whirlwind of falsehood, the result of which was nearly to destroy my fair name, and all my hopes of happiness.

I resided in the country town of X—, where my father, and my grandfather, and Heaven knows how many generations of my ancestors, had resided before me; in truth, in a true spirit of conservatism, I continued to reside there simply because they had, not from any particular advantages held out by the place itself; and I became, at the age of twenty-four, matrimonially contracted to the sister of my college chum, Charles Darley. To enter into a description of the charms of my intended would be foreign to my story. Be kind enough to take it for granted that she was perfection in

every particular, but one—she told fibs; and on this point we had many disputes—she, as a general rule, acknowledging her fault, and promising better behavior for the future.

One day, after some graver peccadillo than usual of this description, I read Annie a long and severe lecture on her evil propensity. I pointed out, first, its immorality, then its meanness, its uselessness, as being invariably discovered. There was nothing clever in it; for any body, however weak his intellectual powers, could tell a lie with the greatest ease. “Dean Swift,” said I, waxing oratorical, “has himself made many caustic remarks on the futility of falsehood. Did he not say that, considering how easy lying was, it was a wonder people did not do it better?”

“Yes,” said Annie; “but how can he judge of the fibs (I don’t like the word lies—it is harsh) which have never been detected?”

Strange this hadn’t struck me before; and was rather a poser. While pausing to recover from its effects, Miss Annie arose, and thus held forth:

“Now just listen to me a few moments. I utterly and totally deny the justice of any of your strictures upon white lies. The practice is neither mean nor useless. Mean! How many friends do we save from pain, danger, or mortification by a harmless fib? Useless! Why, what a world to live in this would be if our thoughts were always freely expressed, uncloaked by what you are pleased to call lying, but what is generally termed *courtesy*! And as to its being easy, just you try it—just you see whether you can, at a moment’s notice, forge a fib so probable as to be accepted as truth, and be devoid of disapproval hereafter; so naturally spoken as to raise no suspicion, and yet of such a nature as to screen you from any difficulty into which the outspoken truth would have led you; and lastly—this is the most important of all—implicate nobody but yourself. I say just try it.”

So saying, she left the room. I sat speechless. Lying recommended to me as an amiable virtue! It took me some time to recover. At last I rose and walked home, revolving what she had said in my mind. “Not easy to tell a fib!” thought I. Rubbish! Nothing so easy. I’ll prove it by taking her advice. So I resolved to tell an untruth, just to prove the soundness of my principles. What should be the subject of it? It then struck me that the proper and fairest way to test the matter was to wait until the occasion presented itself, and invent the story on the spur of the moment. To give some color to my lie, I staid away from Annie one whole evening, and went, not without trepidation, to call on her on the ensuing morning. I was not a little bothered to find Charlie with his sister, as well as one or two other people of my acquaintance. (There was no mamma in the case, for Darley and his sister were orphans.)

“Why, where were you last night?” chanted a general chorus.

“I—why, I—I went out for a ride!”

“A ride!” sung out Charley. “Why, I thought you were no equestrian. Which way did you go?”

I hadn’t bargained for this sort of thing. I found myself under the necessity of backing up my miserable attempt at falsehood by other fibs. I felt half inclined to draw back; but no. I wanted to read Annie a lesson; so I floundered on.

“Where did I go? Why, let me see. I went—”

“Why, surely,” said Annie, “you didn’t ride with your eyes shut; although from what you have told me of your horsemanship, I shouldn’t wonder if you had.”

This taunt aroused me. “I rode into Mr. Ford’s park.”

“No, did you?” said one of my friends present. “I walked that way myself yesterday evening. Strange I didn’t see you. I entered by the gate nearest to the town.”

“Oh, that accounts for it,” answered I, boldly. “I rode on and entered by the southern gate.”

“The deuce you did!” said Charley. “Why, man, it has been nailed up for the last seven months: but I suppose you *mean* the gate near the house.”

“Ah, just so,” acquiesced I, for fear of again putting my foot in it.

“Well, I declare,” said Annie, “I am astonished. Whose horse did you ride?”

“Whose horse? Oh, Gardiner’s.”

“What, the white mare?” asked Charley, with a strange grin.

“Yes,” returned I, rushing desperately on my fate, “the white mare.”

Master Charley looked at me for a few moments in a way I didn’t much like, and then left the room, whistling melodiously. Delighted at his departure, I attempted to turn the conversation into other channels, but in vain. I had set the ball rolling, and nothing could now curb the curiosity of my friends.

“About what time did you start?” asked one.

“Just at dusk,” answered I, as I thought, with deep diplomacy, for this would account for no one having seen me in the streets and recognized me.

“At dusk!” exclaimed Annie. “What an extraordinary creature you are! You have never ridden at all within the memory of any body here; and when you do go, you choose a horse known to be restive, and set out at dusk along a lonesome road. Was the old misanthrope’s house looking as dull and gloomy as ever?”

“The—eh? oh yes! certainly; very dark—quite doleful; but, pray let us change the subject. Surely it is nothing so strange for a man living in a country town to take an evening ride?”

“No,” answered one of my friends (confound him!); “but when one goes at dusk in the direction of a house known to be almost the prison of a very pretty girl—well, if you were

not engaged, I should say it was decidedly suspicious."

I saw Annie change color; and, though I felt that my experiment had plunged me into unforeseen difficulties, I was determined to carry the thing through; but I didn't see my way as clearly as I could have wished. While trying to talk indifferently on other subjects, the door burst open, and in rushed Charley, holding a printed notice in his hand, and apparently intensely amused at something or other.

"Well," said he, "you certainly are a most wonderful fellow when you *do* once get on horse-back. Just listen to this:

"NOTICE.

"If the individual on a white horse, who last night, after issuing from Mr. Ford's park gate, feloniously leaped over the fence of the undersigned, and after prowling near the house, the alarm having been given, made his escape through the flower-garden, doing damage to a large amount, does not wish to figure in a case of justifiable homicide, let him in future keep on the high-road, and a decent distance from the residence of

WILLIAM TRELAWNEY."

"Oh, Frank!" exclaimed Annie, clasping her hands, "what have you done?"

"Done! why, who says it was I?"

"Not you!" said Charley. "Did you not say you rode out yesterday evening on a white horse?"

"I did."

"Did you not say you entered Ford's park by the gate near the house?"

"I certainly said so."

"Well, if you entered by that gate at dusk, you must have also made your exit by it, for all the others are locked after sunset invariably."

"Yes," added Annie, "and you evidently *did* go near Trelawney's house, by your confusion when asked about it. I believe that there is more in this escapade than appears on the surface."

"Why, you surely don't doubt me?"

"I don't go quite so far as that, but the whole affair is an excessively strange one. When asked where you were yesterday evening, I remember you hesitated, as though trying to do violence to your truthful principles" (this was rather too bad), "and though you *did* speak the truth, you did it reluctantly."

At this moment the servant ushered in a Mr. Morton, a lawyer of the town with whom I was acquainted. I saluted him, and wondered what could have brought him away from his business at such an unusual hour. I did not long remain in ignorance.

"While I congratulate you, Mr. Charlton, upon the reputation you have so suddenly acquired as an equestrian, my pleasure in doing so is somewhat lessened by being engaged by Mr. Trelawney to claim on his behalf a considerable sum of money as compensation for the damage you, in your rather eccentric course, did last night to his flower-garden—"

"But—" interrupted I.

"Listen to the end, if you please," said the long-winded old lawyer. "While my client is,

on the one hand, determined to have recourse to the utmost rigor of the law to punish you as a trespasser, should you refuse to meet him in his view of compensation, he is not, on the other hand, averse to a compromise, provided it be immediate."

"I refuse to do any thing of the kind. Let him prove that I was the trespasser, and the law will give him his rights; but I rather fancy he will find it difficult to do that."

"Not at all," said Morton; "and it is for this reason that I advise your accepting his conditions. It appears that the old gentleman, whose jealous guardianship of his daughter is doubtless known to you, was going his evening rounds when you leaped over the fence. Startled at such an extraordinary apparition, he allowed you to approach the house without giving the alarm. It was too dark to recognize the face of the rider, but he described the animal to me as all white. Knowing of only one horse of the kind, I went with him to Gardiner, to whom it belongs, to seek information."

"Ah!" said I, jubilant, seeing a way out of all my troubles; for, of course, the stable-man would *know* that I was not the man. "And what did he hear from Gardiner?"

"Unfortunately Gardiner had been out on the previous evening, and could tell us nothing. The stable-boy, however, who prepared the horse, described a gentleman of your size and general appearance, rendering the matter more positive by describing the gray great-coat which I knew you to possess. On our return through the stables we found your ride of last night a topic of general conversation. Trelawney therefore pressed me to call on you at once. I did so, and discovered that you had already come here. I then took the liberty of asking your housekeeper to show me your gray coat. The old lady did so, and I found it torn in two places, apparently by brambles, and the skirts bespattered with mould. After transacting some business of importance I came here to see you—a liberty which I know, Madam, you will pardon" (this to Annie)—"so as to settle this disagreeable affair as soon as possible." Here was a pretty kettle of fish! Was I dreaming? Had I been out for a ride without knowing it? Of course it struck me more than once to deny the whole affair, and relate how I was only joking when I said I had been out riding; but I had been alone the whole previous evening. I hadn't seen or spoken to a soul. How to prove an alibi?—for it was necessary with this evidence against me, combined with my own confession. I hadn't much time for meditation; for no sooner had Morton finished than Annie rose and had her say.

"Well, I think the evidence is pretty conclusive; in fact, you have attempted no denial. I should advise you to settle this claim at once, and in future to avoid excursions, which, believe me, do not reflect too creditably upon your reputation." This, with a toss of the head, an exit, and a bang of the door.

I saw only one way out of my difficulties; this was to pay the compensation required by the abominable old Trelawney. And, after allowing the excitement which had been raised by the affair to subside, explain all the circumstances, and show my friends that I had been *amusing* myself (God save the mark!) at their expense. I therefore accompanied the lawyer to his office, and paid into his hands what he considered a fair amount for the damage I was supposed to have done. I own I was puzzled. I certainly had *not* been out for a ride; but *somebody* had; *somebody* must have used my coat; *somebody* must have galloped over Trelawney's garden—perhaps made love to his daughter—and I, miserable victim, paid the damages. I returned home, worried to death. Here was the whole town discussing my misdeeds—misdeeds that I had confessed, that I had paid a certain sum of money to hush up, and which I was perfectly certain I had had no hand in. How I cursed the moment when I had determined to tell a lie! Annie was right about the difficulties surrounding a fib; however, as far as detection was concerned, I was safe enough from *that*; but the consequences! Friend after friend dropped in to hear the details of the affair, and I soon discovered that the prevailing impression on the public mind was, that I had tried to steal an interview with Trelawney's daughter!

Horried at this slur upon my character, I hurried off to Gardiner's, to try and obtain some clew to the real culprit. What was my disgust at being presented with a bill for the use of a white mare three and a half hours! Nature could bear this no longer. "My good man," said I, as calmly as I could, "I do assure you that it was not I who rode your horse."

"Sir!" said the stable-man, astounded. "Not you? Why, the whole town is ringing with it. You are joking, Mr. Charlton. Why, surely you paid Mr. Trelawney for the damage the horse did; and now you be a-going to refuse payment for the horse, saying as how it warn't you! Oh, Mr. Charlton, you so truthful too" (the deuce take the fellow!); "you must be dreaming."

In truth I thought so myself; either that or mad. I paid the money—what else could I do?—and then determined to walk out to the scene of my supposed transgressions and study the locality. Being already steeped in falsehood, and having paid the expenses of the expedition, I thought I might as well carry it with a high hand, and so I went to look around me and be prepared to answer all the questions which for the next ten days would doubtless shower upon me.

I arrived about sunset, and commenced my observations. Trelawney's house was situated exactly opposite the park gate, some way back from the road, and almost hidden from sight by immensely high fences. Ye gods! thought I; and am I supposed to have jumped over these? I wonder who the fellow was! what a rider he must be, to be sure! I then ap-

proached the fences, and separating the interlacing branches scanned the inclosure. I didn't look long, for I perceived a young lady walking near, in any thing but that mood which Shakspeare describes as

"Maiden meditation, fancy free."

I no sooner caught sight of her than I cautiously withdrew, fearing that if she were to perceive me she might raise an alarm, and really place me in the predicament which every body supposed me to have been in on the previous evening. As I turned round, to my intense disconcertion and confusion I saw two ladies issue from the park gate, whom I immediately recognized as Annie and Aunt Julia. Now I had a wholesome dread of Aunt Julia; conscious of an uninterrupted rectitude of conduct during her whole life, she had not the slightest leniency for the errors of others, and though my presence there was innocent enough in fact, to their minds it must have been suspicious. I determined now to tell the truth, the whole truth, etc., etc.

"Why," said Annie, stopping short, "what are you doing here *again*?"

"Studying the locality."

"Upon my word you take this remarkably coolly; you first of all commit a gross outrage upon propriety, leaving out of the question the want of respect shown to me, and then follow it up by deliberately insulting me. 'Studying the locality,' indeed! and pray, if I may ask, with what object?"

"Yes, Sir," said my aunt, in her turn taking up the cudgels; "has not your extremely eccentric and extraordinary breach of all laws, human and divine" (good Lord! how some people will exaggerate!), "satisfied you—have you not dragged the name which you bear, stainless until now, sufficiently in the mud? Has not—"

"Really, my dear aunt, I do *not* think your violent reproaches are justified by the facts. As to breaking all laws, human and divine, even were I guilty of the slight misdemeanors attributed to me—"

"Which are 'attributed' to you!" broke in Annie. "Did you ride out here or not? Did you confess to have jumped Trelawney's hedge, Heaven knows for what purpose, except, perhaps" (here she began to sob), "perhaps—"

"To make love to his daughter," added my aunt, sternly. "I can not doubt it, let us leave him, my dear; he is beneath your contempt."

"Stay, Annie; my dear aunt, one word. This story of the ride—this trespass on Trelawney's ground—I give you my word that as far as it implicates me there is not one word of truth in it. I never rode out here. I never was on horseback in my life, I do assure you."

"Do you mean to say, Mr. Charlton," said Annie, "that you were not speaking the truth, when you spoke of this excursion only this morning?"

"I confess to my shame that, for the first time in my life, I descended to falsehood."

"With what motive?"

"Merely to prove to you that telling fibs was easy, and that the merit you attached to the faculty was fictitious; but I yield the point now; in fact, I am inclined to agree with you."

"But if this be true—the stable-boy's description—your coat too—and then here again, 'studying the locality'—what for? what is the locality to you? No, no; I must be on my guard. If you spoke falsely then, you may be doing so now; and if you spoke the truth then, you *must* now be deceiving me. I have a right to demand clear and ample proof that what you now state is true; and until then it is, perhaps, as well that we should not meet. Good-evening. Come, aunt."

Aunt Julia examined me through her eyeglass, as though I were some peculiar animal unknown to her zoology, and passed on, leaving me, as may be imagined, in a nice, comfortable, I may say, elysian state of mind. As soon as they were out of sight I strolled back into the town, reflecting upon what had taken place.

Now the thing was becoming serious. I must take some action in the matter. So thinking as I went, I resolved upon seeking out Charley, making to him a full confession, and enlisting his services to discover the real culprit.

I found Master Charley in my housekeeper's room, indulging in a *tête-à-tête* with the worthy old dame's grand-daughter, learning crochet, seated on a stool.

"Halloa, my friend!" said he, on perceiving me, "here I am installed, you see, the charming Rose teaching me to read love in her eyes!"

"Lor, Mr. Charles! How can you say such things? I was teaching him crochet, Sir," she said. "I must either stay with him or be kissed before I went, and so—"

"You staid!" said Charley, laughing; "and now that you are going, here's the kiss."

But the young lady was too sharp for him, and all he got for his motion was the door in his face.

"Charley," said I, "can you be serious a moment?"

"Well, I'll try, if it is to oblige you, old fellow. What's up?"

"What's up? Nothing is up! Every thing is down; my hopes are down; my spirits are down."

"Then send for some wine, and when that is down I shall be as grave as a judge."

"Yes, but not as sober. So just 'lend me your ears' a minute." It is needless to recapitulate all that the reader already knows. I told him every thing—how I had determined to try the experiment of lying; that I had left the subject until the last moment; that some extraordinary coincidence had, by the aid of my falsehood, identified me with the trespasser in Trelawney's grounds, etc., etc.

Charley's astonishment knew no bounds, and found vent in such exclamations as, "Lord bless me!" "You don't say so!" "Extraordinary, indeed!" "Wonderful!" "I never heard the

like!" and at last, bursting into a fit of uncontrollable laughter, he threw himself into an easy-chair and rolled with the emotion. I bore it patiently for some time. At last, however, I exclaimed, "Really, Charley, I see nothing to laugh at; your sister is very angry, and, as to my aunt, I fear I have lost her good-will forever, though that is of less consequence; and I think, instead of rolling about there in that idiotic way, you might suggest some plan of tracing out the abominable villain who has taken so much pains to cast a slur upon my name."

At this he only laughed the more. Seeing, however, that I was becoming very angry, he gasped out:

"One moment—one moment—I shall recover. Ha! ha!" (Another burst of laughter.)

I turned to leave the room, disgusted, but he caught hold of me, saying:

"Stay, my dear Frank. This rascal, this villain, this 'abominable' villain, who has so terribly misused you, was—"

"Who?"

"I—I—myself! Ha! ha!" *ad libitum*.

"You?" said I, in amazement.

"Never a soul else. Just listen. On the memorable evening I came here to ask the loan of your coat, as the weather was chilly, and I wanted particularly to see Fanny Trelawney. I could find you nowhere. I suppose you had hidden yourself to meditate on your lie that was to be. I therefore took your coat, hired Gardiner's mare, and was the real trespasser on Trelawney's premises. When, on the ensuing day, you said you had been for a ride, I knew you were fibbing, for I was perfectly aware you had a wholesome horror of mounting a horse. I led you on, till I managed to implicate you in the affair of the evening before, and then stole out and replaced your coat. Really, you behaved most handsomely about those damages. Ha! ha!"

"Oh, laugh away, confound you! But then that idiot of a stable-boy—"

"Idiot? On the contrary, a deuced clever fellow. I knew there would be trouble about my escapade; so on my return I tipped him handsomely to put any questioners on a false scent, and I think he succeeded admirably."

"This may be a joke to you, Charley, but it's death to me. A pretty mess you have got me into!"

"Got you into! I like that. Got yourself into, you mean. If you hadn't taken an insane notion into your head that you could tell fibs, the affair would never have happened. Let this be a warning to you never to swerve from the paths of truth."

"You are a pretty fellow to lecture me about 'the paths of truth!'" answered I; "though I certainly shall take your advice; but I don't let you out of my sight, my friend, until you have explained matters to Annie."

That this explanation took place, and was satisfactory, I can offer no better proof than that Charley's sister is now Mrs. Charlton.

My aunt Julia, however, would listen to nothing. One way or the other I had, in her opinion, disgraced myself; and the only mention made of me in her will was that she had originally intended to make me her sole heir, but could not leave the wealth acquired by hon-

est industry (this referred to the savings of many years) to one who did not speak the truth.

"Take warning by me, good people," and always

"Tell the truth and shame the devil."

TWO POETS.

I.

HE said: "The poet's soul of more hath need
Than meets him in this common life of ours:
Fair shapes and symbols must his fancy feed,
And give suggestion to his waking powers.
And that he may, from things external, win
The deeper sight that is to genius kin,
The beautiful must all around him lie,
And train to finer senses ear and eye."

Rose on his wearied vision, dull and mean,
The level sweep of the low prairie sea;
Tideless and shoreless stretched its billows green,
And mocked him with their still monotony.
"Ah! if some dryad-haunted wood," he said,
"Some noble summit, here might lift its head,
Some minster vast, some crumbling, moss-grown pile,
The heart to dreams of some grand Past beguile—

"Then might I show indeed the gift I hold;
Might songs create whose tones should swell as far
As theirs whose lyrics charmed an Age of Gold
With music that the centuries could not mar.
Shall I these low-hung vapors still endure,
And on these plains Boeotian rest obscure?
Or seek the air that fans the sacred fire—
The distant heights to which my thoughts aspire?"

He left his home, to seek on every shore
The scenes that had inspired those singers old—
The magic of their influence to implore.
But sky nor strand to him its secret told;
Yet every wave of island-studded sea,
And every temple dear to minstrelsy,
Nay, every tree and flower, cried out some name
That love of them had lifted up to fame.

He walked the Attic hills, but dared not praise
The violet mists that o'er Hymettus hung;
By elder voices awed, whose grander lays,
Close as the hues that made their beauty, clung.
Wood, fount, and stream, what could he learn from these
They had not taught their own Euripides?
To him should speech of Homer's vales be plain
Whom his own broad savannas wooed in vain?

The Sphinx, too, chilled him with the silent scorn
Looking from her unfathomable eyes:
"To thee," she cried, "of whom, one little morn,
The shadow swift across my desert flies—
Who never drank the charmed lotus wine,
Nor reverent bowed at Isis' awful shrine—
To thee shall I reveal the spell, in vain
By patient sages sought through years of pain?"

The old Italian cities felt his tread,
By ruined watch-tower and by buried town;
By rugged palace, and by fortress dread,
Whose every stone some legend bore as crown;
In halls where still looked down from tapestry
The triple lily and the golden bee.
But when their tale he would have heard and sung,
It came to him in Dante's native tongue.

He sought, in old cathedrals, to retrace
 The rapturous visions given to poets there
 In times when spire and arch and angel-face
 And every sculptured flower had been a prayer.
 In vain; their ecstasy he could not feel;
 The glittering altars moved him not to kneel;
 His age through other channels would express
 Its aspirations after holiness.

For, while the chanting monks their chorals sang,
 He heard a peal of bells across the sea,
 And all his better self to meet it sprang—
 "Lift up the poor, and let the oppressed go free!"
 How swiftly, through the incense-burdened air,
 His soul went upward with his nation's prayer!
 A gleam of sudden hope came back again
 To quicken lifeless heart and sluggish pen.

He wrote of many a lovely lake and bay;
 Of olive groves and cities strange and quaint;
 Romance enriched with many a pleasing lay
 Of ancient knight and medieval saint.
 Still through his heart some sense of failure thrilled—
 This was not all his early genius willed.
 At last, with scanty sheaves, as gleaners come,
 He turned his restless footsteps toward his home.

II.

"The cloud-capped mountains and the sea," he said,
 "Have had their bards, whom they inspired and taught;
 Perchance their grandeur had my spirit led
 To higher strains, with nobler meanings fraught.
 But thou, O ever-green and ever-blooming sod!
 Thou art, even as the hills, a thought of God;
 Teach all thy varied language unto me:
 From thee I sprang—my fame must spring from thee!"

He learned its every aspect: morning dim,
 With all her cloudy tents encamping there;
 And noon, with fiery splendors, seemed to him
 To lend an equal charm that made it fair;
 Till far the horizon flamed with Tyrian dyes,
 And overhead the deep and solemn eyes
 Of bending constellations came to brood
 O'er its far-spreading world of solitude.

To him its untamed winds their vigor brought—
 A sense of growing freedom and of power;
 Its wreathing mists his finest fancies wrought,
 Feeding his soul not less than blade and flower;
 And not a little bird could sway and swing
 On some tall, wind-swept sheath, and joyous sing,
 But had some note for him, some tender wiles,
 That won for his poor copy tears and smiles.

And when some gorgeous blossom from its green—
 Lily or orchid—sprang, unnamed and wild,
 Magnificent as some barbaric queen,
 Dazzling the eyes that on her beauty smiled,
 He felt a joy akin to theirs who near
 The beckoning shore of some new hemisphere:
 For never bard, with tuneful voice or pen,
 Had praised its perfect loveliness till then.

And soon the prairie loved him—filled his song
 With long-unuttered dreams of her great heart;
 And cried: "My poet, do me not the wrong
 To think I can no deeper tones impart
 Than those my careless flowers and grasses teach!
 I have a thought as worthy noble speech
 As any mountain trumpet ever blew
 To Greek immortals when the world was new.

"I sweep from northern frost to southern sea,
 And through my broad domain no barriers stand
 To fence from each my cities, mingling free,
 Whom my great river binds with silver band.
 No mountain-locked Arcadia here can keep
 Her festal days, while Sparta's children weep—
 From Minnesota to Louisiane
 One wave must murmur tones American.

"Therefore in me shall broader thought find room,
 Far-reaching sympathies, and tolerance rare;
 All genial impulse come to fuller bloom
 In my indulgent soil, my generous air.
 Here hall and cot shall share my equal sun;
 A nobler type of nations be begun;
 And petty interests, bound to state and clan,
 Shall widen into one—the weal of man.

"Grand were those lays of early poets born;
 The embattled steep, the castle, and the tower,
 Heroes that looked on weaker hearts with scorn,
 Were theirs to sing; theirs was the Age of Power.
 But I, who welcome millions to my breast—
 Who give the hungry food, the homeless rest—
 Can teach thy lyre a song all songs above:
 Mine is the newer day—the Age of Love."

This strain he sang through many changing keys;
 Through him the Plain's unfettered spirit spoke,
 Till, swelling upward on the southern breeze,
 The call to battle on its silence broke,
 When War's swift summons spread its fierce alarms
 Through all its golden harvest-fields and farms,
 And o'er its green phalanxes, prostrate bent,
 The blue-robed legions, lightly marching, went.

Ah! then he thought no more of theme nor rhyme;
 The very echoes taught an utterance grand—
 The indignation, sacred and sublime,
 Of men who rose to save a father-land;
 The glorious youth who laid their youth aside,
 And at the stormy front as veterans died;
 The tender mothers who found strength to say
 The words that parted them and Joy for aye;

And they that, languishing in mortal pain,
 In lonely wards saw day's last sun grow dim,
 Or their life's star in hopeless prisons wane,
 Not less heroic seemed nor fair to him,
 Than Greek to Greek opposed, or Trojan lord,
 Or Roman falling on a stainless sword:
 Their lives no duller shone, their deeds not less,
 That his own time they would illume and bless.

He did not need to search the mouldy Past
 For names of shadowy heroes long approved;
 Sweet eyes where Roland's fate no gloom had cast—
 That Bayard's story had but little moved—
 Grew dim o'er lines that praised, with mournful pride,
 Him who at Bethel or Atlanta died;
 And full hearts blessed him in whose verse were read
 The shining acts of the beloved dead.

So in his country's love he grew; his life
 Ennobling hers, from her received its crown.
 To thoughts with which her myriad homes were rife
 He gave a voice and answer; his renown—
 The deep, spontaneous homage of her heart—
 Was of her greatness evermore a part;
 And those bright blooms that first he gave to fame
 For evermore went murmuring his name.

CHARLES LANDOR.

ONLY CLODHOPPERS.

"I WISH you wouldn't call the child 'Li,'" I said my mother; "it jars upon every nerve in my body. She was christened Lily."

"Lily!" mimicked my father, and laughed uproariously; "a nice-looking lily she is!"

My poor mother made no reply; she could not refuse to acknowledge that the name was entirely unsuited to the gaunt, gawky girl of fifteen that buttered her father's bread with a hand almost as brown and brawny as his own.

"Not but that she suits me well enough," added my father, as he noted a hot flush leap into my face. "I'd rather have you as you are, my girl, than any lily of them all. You know they toil not, neither do they spin, and that kind of thing wouldn't suit a poor farmer like me."

My father patted me upon the shoulder as he went out into the field, but the riotous blood lingered in my face, and while washing the greasy dishes and pans that accumulate so rapidly in a farm kitchen, I declared to myself that the lilies had a good time of it, and no wonder they were so pretty; they had nothing to do, and were arrayed gloriously every day. I decided that nothing could be more unjust than the way things were parceled out in this world, and slammed every individual plate, and rattled every pan, until mother called out that I was "driving her crazy."

Then father came in again; he looked tired and discouraged, and went with a weary step into the sitting-room, where mother lay upon the lounge, and Patience Clark, the dress-maker, droned on incessantly with the small news of the village.

"It's no use talkin'," said father, "I can't manage that team and plow the field alone; it's as much as a man can do to keep the plow in the ground with those stones and stubbles, let alone guidin' that skittish mare."

"Farmin's poor work nowadays, Mr. Ware," said Patience Clark.

"It never was any thing else that I can remember," said my mother.

And my father, heaving a huge sigh, murmured under his breath, "Job's comforters," and came out into the kitchen again.

"Li," he said, "I wish you were a boy."

"For the hundredth time, father."

"And yet I wouldn't change you for a rude lad of your age; but there's that pesky five-acre lot!" Then he sighed again.

"Father," said I, flinging down the dish-towel, "I can drive the horses, and you shall plow; wait a minute, and I'll get my sun-bonnet."

Father laughed at the idea, then he refused outright; but seeing me tie my sun-bonnet and let down my sleeves, a ray of hope lighted up his face; then he said, "What will your mother say?"

"She won't know any thing about it, and Martha'll be through with her washing and

can finish up the dishes." I started out to the field, and father followed me to the furrow, where the skittish mare was quietly chewing a bit of loose harness. I picked up the reins and father the plow-handle, and away we went cheerily. The mare was used to my voice, and was gentle as a kitten. I was thinking what a nice breeze there was, and how pretty the apple-blossoms looked, when suddenly a voice called to us from the fence:

"Hallo, Mr. Ware! That's tough work for a girl."

My father stopped the horses with a jerk.

"I suppose 'tis," he said; "but this pesky field, John, is so mortal full of stones and stubbles, and the critter knows Li's voice; but run in the house, Li—"

"No, no, father, I ain't a bit tired" (with an indignant look at John Bates).

"Let me try a hand at the plow, Mr. Ware, and do you drive a bit."

"Well, if you will, John," said my father, resigning his plow, and taking the reins from my hand. "Run in the house, Li, and rest." I ran in the house, and this is the way I rested: I finished washing and wiping the dishes, folded down the clothes, mopped up the kitchen, helped to milk six cows, made biscuit for tea, set the table, cleared every thing away again, and helped Martha get things ready for an early breakfast, so that we could commence ironing early in the morning. I murmured to myself, "Why should we only toil, the roof and crown of things?" and entered the sitting-room just in time to hear Patience Clark say, "She was so glad Lily was a girl; that boys were worked to death upon a farm."

"Dear, dear!" sighed my mother, "it's impossible to make Lily look graceful; but do slope the shoulders a little more, Miss Clark."

"If I do they'll pucker and bag," replied the dress-maker, "for she's as square as square can be."

"She's like her father," said my mother. And finding they were not ready to try on my dress, I went out in the porch, where father was smoking his pipe.

"Softly!" he said. "Look, Li, at that fellow on the clothes-line!" At that moment a flood of music poured from the throat of a belated blackbird that rocked to and fro upon the rope before us; a robin was cheated into taking up the refrain, and the frogs commenced to thud, the moon climbed up in the wan sky, and father and I sat there silently for hours. At last he said, as we went into the house, "It's a pretty place, Li; we must take care of the farm." And on his death-bed, four years later, his last words were, "Take care of the farm, Li."

But how was a girl of nineteen to take care of a farm, an invalid mother, and a lame brother? The place was in wretchedly poor condition; and my father had literally lost his strength and broken his heart in striving to clear off the mortgage. The dear old farm was

a ruin, in fact; and I used to think sometimes the very outside loveliness of it was a bitter mockery. Why were the tangled flowers so beautiful, and the gnarled old trees so fancifully fair? The ground was one mass of stones, and the trees bore the knottiest fruit that ever was seen; and, toil as you might, it seemed impossible to get a living and pay the interest money, let alone the principal. Then the parting with father was a bitter wrench. I felt as if there wasn't much left to live for, until the night of the funeral, when little Dolph stole into my bed, poor little lambkin! Adolphus was a foolish name for him, too; but as I hugged my little brother in my arms, and quieted his wild sobbing, I vowed to myself that it was better, after all, I was not a lily; and that I would take care of mother and Dolph and the farm somehow.

When Patience Clark was making up the mourning I heard her say something to mother about "book-learnin'" and "rooms in the village;" and I knew the meaning of it when mother stopped crying after supper, and grew quite cheerful over her cup of tea.

"Lily," she said, in her languid way, "my poor child, I trust there are happier days in store for us. Thanks to the education which I insisted upon your having, you may be able to take the place of Miss Gibbons at the village school. We will sell this wretched place, dear, and get rooms at the village."

My heart came up in my throat.

"Oh, mother!" I said; "father told me to take care of the farm; and I should die cooped up in that hot room with a lot of dirty children!"

My mother set down her cup of tea, went and lay upon the lounge, and commenced crying again.

"You'd rather be among cows and pigs than among your fellow-creatures!" she said. "You're like your father; and he never had any more sentiment or feeling about him than a—*a*—cabbage!" Father wasn't cold in his grave! I flung myself out of the room, and walked up to Patience Clark, as she was wiping her hands on the rolling towel in the kitchen.

"Listen here," I said, setting my teeth hard; "don't put any more nonsense in mother's head, if you please!"

"Gracious powers! how you frightened me, Lily! I almost jumped out of my skin!" And she went into the sitting-room with rather a crestfallen air.

But mother always had her way; and I think we should have fallen into the groove Patience Clark had suggested but for a timely codicil that was found to father's will. It left the place to Dolph, with only a life interest to mother, and five hundred dollars to me. The money was left with Lawyer Williams, at Wimbleton; and he rode down the week after father died, and gave it into my hands. "I do not think you will spend it in furbelows," he said; and there was something about him that inspired confidence. I was forlornly destitute of friends,

and completely governed by impulse. I told him all my projects about the farm; and he listened to me with as much gravity as if I were consulting him upon a matter of law. When I had finished, he looked kindly upon my flushed and tear-stained face, and bade me be of good cheer, and not to mind about the mortgage—he would take care I was not troubled about that—and advised me to use my ready money in improving the place, suggesting the improvements in a way that led me to think agriculture was a part of law. Father died in midwinter; and when the spring came the place was busy with the hum of labor. The barn-yard was drained, a great muck-heap made from the refuse of the stalls, six poor cows sold for two good ones—and on the fifteenth of June, when I was twenty years old, the place was blooming like a rose. Had it not been for John Bates, my nearest neighbor, I should not have got along so well.

We went shares with the five-acre lot, John Bates and I, and on this very fifteenth of June the plants were brought down, and every hand about the place busied in setting them out. When we were putting in the last row, Dolph came running out to the field, and said that I was to come in directly, for Lawyer Williams was there, and Miss Gibbons, and they were to stay to tea, as it was my birthday. I started to my feet, and pushed back my sun-bonnet, and there, within a rod or two of us, was the prettiest creature that ever the eye rested upon. I thought, as I always did, when I saw her, that her name—Grace—was as suited to her as mine was unsuited to me, and I did not blame John for staring at her, open-mouthed, as she walked back with me to the house.

"You'll stay too, John?" I said to my fellow-workman. He nodded cheerfully. What an honest, bright, winsome face he had!

But never before had I felt that sudden pang of discontent and envy. It was because I was tired as a girl could be, and felt begrimed with heat and dirt, and I did not blame mother for looking upon me with a sort of disgust, and bidding me go to my room and dress immediately.

The perfume of clean linen mingled with that of the June roses in my room. There was my pretty muslin dress. But I fidgeted before the glass, and tugged at my hair, pulling it out in huge tangles; but, tug as I might, I could not change its sombre brown to a ruddy gold—and a frown between the eyes is no beautifier. I declared inwardly I never would linger so long again over my dirty fields, nor toil so fiercely for what seemed to me then a wretched reward.

This discontent was, however, of short duration. Honest toil brings an even temper, and adds hugely to the cheerfulness of one's nature by promoting a good digestion. Then, when I had put a ribbon about my neck, and smoothed the ugly wrinkle from my brow, I saw in the glass a rather comely face, after all, with nice brown eyes like my father's.

I looked out of the window at my field, and John was putting in the very last plant. Tears of remorse sprang to my eyes. How could I have called it a dirty field, and unprofitable labor? Could any thing be prettier than the rich dark mould, and the rows of tender green? No, not even eyes of heavenly blue, and hair of ruddiest gold! There was something positively beautiful to me about that cabbage-field, and I gazed upon it lovingly from my window, going over again in my mind the profit we hoped to gain from it, John Bates and I. So many thousand cabbages at so much a head. I think there is nothing nicer in the way of building castles than an agricultural one, one takes such a tangible delight in watching the structure grow day by day; then, even if it tumbles down ingloriously, are the delights of anticipation to be reckoned as nothing?

I will not say that my step was light when I went down stairs; but my heart was at ease, and I made some of the lightest and flakiest of French biscuits for tea. Then I went into mother's room to get down the china. Lawyer Williams and Miss Gibbons were sauntering about the garden, and mother looked upon them with a frown.

"You don't think it possible, Lily," she said, "that old fool is caught by her pretty face?"

"I shouldn't wonder, mother," I replied; "it is such a very pretty face."

"And to think of your coming into the parlor with that old sun-bonnet hanging from your head, and your face in a blaze with heat! Why didn't you slip up stairs quietly?"

"It's the fault of the house, mother. I'm too substantial a figure to slip through stones and mortar. You know one has to pass through that way."

"Yes, yes," sighed my poor mother; "it's such a miserably built old barn—not a convenience about it. But who, in the name of goodness, is coming this way? Why, truly it is that John Bates, with his hair all wet and curled, his face shining with soap-suds, and one of those queer linen coats on. What does he want, Lily?"

"He wants his supper, I suppose," I said, boldly, although I quaked inwardly.

"And is he to get it here?" she cried, raising her voice, and a flame of anger darting into her eyes. "Because if he is, please to send in my tea by Martha. I can not, in my state of health, eat with a man fresh from the fields. I endured it long enough with your poor father."

I whispered a kind of prayer in her ear, but she turned such an indignant look upon me that I retreated to the kitchen, and the currant jam wasn't redder than my face when I found John Bates standing in the doorway whistling. I knew he must have heard every word that mother said. And why did she object to him so bitterly? He was surely as good as any of us, with honesty of purpose and manly worth written upon every line of his countenance. There was a flush upon his cheek, and a latent fire

in his eye. I thought he was offended, and I could not say a word; but presently he turned to me with his cheery smile, and said, "Have you any message for Wimbleton, Miss Lily? I'm going down to see about those oxen."

"N-now?" I stammered. Then, as he stepped off the sill, I added, "You'll have supper first, John?"

"I think not, Miss Lily," he replied; "it's a nice ride by daylight, and I don't remember ever seeing things look so fresh and green. There's such a lot of wild roses down that way. I've often thought, Miss Lily, Rose would have been a prettier and better name for you—there's such a bloom and sweetness about a rose; and I never did care for lilies myself," he added, with an involuntary glance at the loiterers in the garden.

"A cabbage rose, John?" I said, laughingly.

"A bramble rose, Lily," he replied, coming close to me and lowering his voice; "such as grew in the garden of Eden." Then he went away without even a biscuit, and out of sheer gratitude I stood looking after him; until the voice of Patience Clark, at my elbow, made me start.

"Good gracious, Lily! why, I thought it was Martha! You'll spile that young man, sure as this world—he'll be as set up as—as—" she added, somewhat at a loss for a comparison—"as a peacock." So Patience Clark took the place at the table that should have been poor John's, and mother was scarcely able to eat a mouthful after all. The summer flitted by; the golden-rods and chrysanthemums were all in bloom. There never was a castle so substantial as the one I built about the cabbages. I have always thought a host of fairies guarded them and tilled them at night; while all about us there was rot and mildew, and the cabbages would neither head nor prosper, our field thrived amazingly; and when all was done, and they were gathered and sold, I had a nice little sum to pay upon the mortgage.

One day in October I went down to Wimbleton, but Mr. Williams had been called to meet a client some distance in the country.

"Tell him Miss Ware called," I said to the boy; and that night Mr. Williams rode up to the farm. Mother had grown weaker of late, and went to bed early, and Dolph and I sat croning over our books in the parlor, when a knock at the door startled us. I do not know why my heart beat so wildly, nor why I called to Dolph to run to the door. It was only Mr. Williams, and we sat down comfortably to chat together. I told him of my intention to pay him a little on the mortgage, and spoke glowingly of my cabbage-fields; he seemed to waive the matter aside, and turning to Dolph, asked, in quite a grave and formal manner, the lad's permission to see me alone. Dolph gathered up his books and went out of the room.

"A fine boy!" cried Mr. Williams; "and not so lame, I think, as he gets stronger."

Then I launched into a panegyric upon Dolph

that lasted half an hour, and still Mr. Williams listened gravely; but when I paused a little, and felt like apologizing for my sisterly warmth, he approached the table near which I was sitting, and laying his hand upon mine, he said:

"I have come here to-night, Miss Ware, to speak to you upon a subject that has lain near my heart for a long time—since I paid into your hands a certain sum of money, and became impressed with the rare dignity of your character, and your nobleness of heart. Can I hope you will not meet with disfavor the affection of one so much older than yourself? Will you be my wife?"

I did not speak for a time, and when I found my voice I could say nothing but that I was very, very grateful, but could not leave the farm.

"Well, but, Miss Lily, if that is your only objection, perhaps there might be a compromise arranged. You know I have already a hold upon the farm. Can we not fit it up for a country seat? You shall have the planning of the improvements," he added, cheerfully; "and your brother, when he is old enough, shall study law."

"Oh, Mr. Williams!" I cried, in affright, "do not speak loud, I beg of you! if my mother, if Dolph, should hear you, they would make me consent, and—and—" here I broke down, and fell into a passion of weeping.

"What is this, Lily, my child?" he said, his face lighting up with a kindly feeling that became it well. "Is there any other reason for your repugnance? Speak frankly, Lily, and let me be your friend, if nothing more."

"I shall be so glad to have you for a friend," I said, reaching out my hands to him; "but I'm so sorry, for Dolph and mother, that I can't be more to you."

"Well, Dolph shall study law, in any case, my dear—"

"And don't tell my mother!" I said.

"No, indeed," he replied, smiling; and bidding me a kindly good-by, he went away. When I heard the door close I laid my head upon the table, only wanting to be alone and think; but suddenly a cold hand was placed upon my shoulder, shaking me with spasmodic energy. I looked up: there stood my mother, her face pale and wild, her great hollow eyes seeking and searching my face.

"Tell me," she gasped; "is it all right—are you—to be—his wife?"

"Oh, mother!"

"Speak!" she cried; "you have not dared refuse him?"

I buried my head in my hands upon the table, and fairly trembled as I murmured "yes."

"The richest man in Wimbleton!" cried my mother, beside herself with rage and disappointment—"a gentleman! And you, selfish, ungrateful wretch that you are—you will see me die in this place when you have it in your power to give me life and happiness. Listen to me, Lily," she cried, coming nearer to me

and looking upon me with savage earnestness; "I will go to my bed and never leave it, I will neither eat nor drink, if you refuse this man."

"But I have refused him, mother!"

"Then call him back again, say that you did not know your mind; he will think it a girlish freak, and be all the fonder of you. Oh, Lily," she cried, sinking on her knees at my feet, "do not throw away your life as I did mine, and regret it ever afterward; do not bury yourself with a clodhopper on a farm, and wear your life out in useless remorse, for I will die, I tell you. Oh, say that you will marry him, that I shall live once more in luxury and ease. I will never get up till you grant my prayer!"

"I will, mother, I will!"

"God bless you, dear!" said my poor mother, and I helped her to bed. How could my mother bid God to bless me? I went to my room, but not to bed. I walked to and fro, thinking, thinking; but think as I might, the clodhopper and the farm resolved themselves into the garden of Eden, a tender manly Adam, and I, the Eve to my husband of all that was desirable in sweetness and bloom; and the days seemed to lengthen themselves before me into a paradise of honest toil and happy pleasure, while that other choice of luxury and ease pictured itself gloomily before me. I remembered well the great dreary house in Wimbleton, the mould-smelling, chintz-covered furniture, the stone-paved yard; I saw myself clothed in purple and fine linen, and faring sumptuously every day; and yet, and yet—alas, that women should be so different and fate so adverse! But there was my mother; she had resolved to die if I refused, and she always would have her way. In the early dawn I went down among the sweet-brier that grew about my father's grave; he was only a clodhopper himself, and could understand my sorrow. Dolph had grown fond lately of wearing fine clothes and spending his time in study; then he was delicate—a little lame. Well, it was all over. I went down to Wimbleton that very day and told Mr. Williams all that had happened.

"If you'll kindly forget what occurred last night, I will do my best to please you," I said, as if applying for a situation.

"My dear Lily," he said, "although I seem old to you I have kept a young, warm heart, and I do not know whether to laugh or cry about you."

"Oh, do not laugh, Sir," I said.

"And I will not cry," he replied. "Well, it is settled, then; do you go home, my dear, and I will come up and see you in the course of a week. May God bless you, darling!" He laid his hand caressingly upon my head, and somehow I liked his blessing.

As I rode home I let the reins fall upon my pony's neck, and strove to think that, in making mother and Dolph happy, I should gain contentment for myself; but the day seemed gray and dead, and it was so strange when I reached

the lane that John Bates should be waiting there with such a bright, hopeful smile upon his winsome face.

"Come, Lily," he said, "let the boy take the pony in, and do you come with me a bit—I've something to say to you."

We walked a long way, I think, without uttering a word; then he turned suddenly and spoke:

"You know well what I wanted to say to you, Lily, my darling, my sweet wild rose; I loved you when you were a child, and I helped plow the five-acre lot with your father; and since we've planted it in those dear old cabbages, you have grown unspeakably dear to me. Say, my fellow-worker, my dearest and best, shall we be partners for life?"

"How can you be so cruel?" I cried; "you know my mother would never hear to such a thing!"

"Cruel!" he repeated; "your mother! You don't mean to say you are not to be my wife? Lily, you love me?"

"Oh, John," I said, and clung trembling to his arm.

"Speak, Lily," he said; and I told him all.

"I can not let her die, John," I cried, "I can not let her die."

"There, let us speak no more for a time. I can yet be strong, and hold you for my friend. May I not, Lily?"

"Until death," I whispered, and said no more. We were walking up the woodland path, the wind whistling through the great gaunt trees, and the ground inches deep in fallen leaves; the night was growing wild and chill, and great black clouds hovered in the cold sky. We had scarcely reached home when a tempest of storm swept over the country.

At last I went to bed. "Dolph, dear Dolph," I said, creeping up to his warm little body, "love me, dear, won't you? I am so lonely, Dolph, so lonely and sad!"

"Don't crowd so, sis," said the little fellow, rubbing his eyes; "I say, I'm getting too big to sleep with you, I think."

My poor mother grew weaker day by day; and, strive as she might, she was unable to leave her bed, save for an hour or two in the middle of the day; but the news of my engagement had been industriously spread, and my mother received the villagers' congratulations with haughty satisfaction. There was also a very perceptible change in the relations that had existed between mother and the dress-maker; but Patience Clark insisted upon her old freedom of speech.

"I'm powerful glad," she said, one day, "that Lily's set herself in a butter-tub. I was afraid there one time she'd throw herself away."

"Are you speaking of my daughter?" said my mother.

"Why, of course. Who should I be speakin' about, I'd like to know?"

"Please to speak respectfully, then," said my

mother; "and don't cut those ruffles straight. I see by the fashion-plates they're all made bias."

I thought Patience Clark would have burst with indignation. She looked at my mother, and her pale blue eyes grew almost bloodshot.

"Highty, tighty!" she cried at last; "cut them for yourself!" And she threw scissors and silk on the floor. "And I'll have you to know, Miss Ware, I am as good as you any day in the week, and a deal better on Sundays; and I'll talk as I please, and work as I please, and I'll not be ordered about by any body, let alone a skeleton like you!"

She flounced out of the house, leaving my poor mother disconsolate with her flounces and furbelows.

No dress-maker could be found for a week: and whether it was that the excitement of preparing the wedding finery had kept her up, or the scorn of the dress-maker had preyed upon her mind—whatever might have been the cause, at the end of a fortnight my poor mother died.

"Oh, mother," I cried, reproachfully, "you promised to live!"

"Haven't I tried hard enough?" she said, catching my hands in hers. "Remember your promise, Lily. You won't break it because I'm not here?"

"No, no," I said. And she replied, quickly:

"It'll be a comfort to me to know you and Dolph are gentlefolks. As for me, I never did have things as I wanted them." Then she turned her face to the wall. What difference could it make in heaven, pray? Are they not all gentlefolks there?

The night after the funeral Dolph went home with Mr. Williams, and I was alone walking to and fro in the parlor. Suddenly the door opened, and in walked John Bates, looking thin and gaunt as a spectre.

"Tell me," he said, walking over to me, and looking at me with great wistfulness in his eyes, "did she relent when she was dying? Did she leave happiness to you and to me?"

"No, no, John; I promised her again when she was dying. I promised, and I must obey."

I held up my hands to keep him off, but he caught me in his arms and kissed me savagely.

"Good-by," he said.

"Oh, why good-by? Where are you going, John?"

"I don't know," he said; "to the devil, I think." And kissing me again, he went away.

I sat with my head in my hands for an hour. I never stirred when I heard the tramp of a horse and a knock at the door, nor raised my head when Mr. Williams entered.

"My poor darling," he said, and endeavored to take my hand. I drew it away rudely.

"You can not surely," I said, raising my head, "speak of love to me now, or think of marriage so soon after my mother's death?"

"I do not think of marriage at all, my dear," he replied. "That is all over now between you and me, Lily," he said, suddenly, taking my

hands in his. "Do you love another as I would fain you had loved me? Answer frankly, dear, and do not fear. I am too fond of you to cause you useless pain."

A thrill shot through my heart. Then I remembered my promise to the dying, and grew cold with fear and dread.

"Oh, I must marry you, Sir," I said, and told him all.

"Well, my dear," he said, "mine was a foolish dream at the best, and I will endeavor to make up to you for the sorrow I have unwittingly caused. You shall let the poor rich man go, and marry the rich poor man."

"Oh no, Sir," I said; "I dare not."

"But then, if not your true love, who will you marry?"

"You, Mr. Williams."

"I will not have you. Come, if you persist, I will e'en run away to be rid of you. I will sail for Europe in a week."

"But my mother."

"You have done all that a daughter could. I say I will not marry you, but I will strive and make you and Dolph gentlefolks."

Then the warm, happy tears drenched his hands. I threw my arms about his neck. "My dear, dear friend!" I said.

He grew a little pale, and kissing my brow, he went away.

Now, John's strip of land joined mine, and I could see the glimmer of light from his kitchen window. I ran out the door, and across the cabbage-field, my feet sinking in the damp

earth, my shoes filling with dirt and stones. At last I reached the kitchen door. For a moment my heart failed me. John had no one but his old blind father; but I was afraid some of the workmen might be about. I opened the door softly. Old Mr. Bates sat fast asleep in his chair, and John sat gazing into the smouldering embers on the hearth.

I stole up behind him; but he divined that I was there, and starting up, he met me halfway.

"I was afraid you were gone, John," I said, with a great sob in my voice.

"Gone?" he echoed.

"Yes, gone somewhere; but I—don't choke me, John."

"Speak, then, quickly! My God! what brought you here?"

"Why, Mr. Williams says he won't marry me; that nothing can induce him to; that he'll run away to Europe first. Will you, John?"

"What's the matter, my lad?" said Mr. Bates, awaking. "You'll break my heart, as well as your own, if you go on in that way."

"It's with happiness, father, this time; and here's Lily, mine at last!"

"God bless her!" said Mr. Bates. And He has blessed me. Dolph has become a great swell; but all Mr. Williams could do, he couldn't make gentlefolks out of John and me. Although he gave us the finest place in the county for a wedding gift, and suggested a fancy farm of fruit, and all that, John and I prefer to raise cabbages. You see we are only clodhoppers.

FEMALE SUFFRAGE.

A LETTER TO THE CHRISTIAN WOMEN OF AMERICA.

Part I.

THE natural position of woman is clearly, to a limited degree, a subordinate one. Such it has always been throughout the world, in all ages, and in many widely different conditions of society. There are three conclusive reasons why we should expect it to continue so for the future.

First. Woman in natural physical strength is so greatly inferior to man that she is entirely in his power, quite incapable of self-defense, trusting to his generosity for protection. In savage life this great superiority of physical strength makes man the absolute master, woman the abject slave. And, although every successive step in civilization lessens the distance between the sexes, and renders the situation of woman safer and easier, still, in no state of society, however highly cultivated, has perfect equality yet existed. This difference in

physical strength must, in itself, always prevent such perfect equality, since woman is compelled every day of her life to appeal to man for protection, and for support.

Secondly. Woman is also, though in a very much less degree, inferior to man in intellect. The difference in this particular may very probably be only a consequence of greater physical strength, giving greater power of endurance and increase of force to the intellectual faculty connected with it. In many cases, as between the best individual minds of both sexes, the difference is no doubt very slight. There have been women of a very high order of genius; there have been very many women of great talent; and, as regards what is commonly called cleverness, a general quickness and clearness of mind within limited bounds, the number of clever women may possibly have been even larger than that of clever men. But, taking the one infallible rule for our guide, judging of the tree by its fruits, we are met by the fact that the greatest achievements of the race in every field of intellectual culture have been the work of

[NOTE.—We have printed this Letter, which will be continued in our next Number, not as an expression of our own views, but simply as the plea of an earnest and thoughtful Christian woman addressed to her fellow-countrywomen.—EDITOR OF HARPER.]

man. It is true that the advantages of intellectual education have been, until recently, very generally on the side of man; had those advantages been always equal, women would no doubt have had much more of success to record. But this same fact of inferiority of education becomes in itself one proof of the existence of a certain degree of mental inequality. What has been the cause of this inferiority of education? Why has not woman educated herself in past ages, as man has done? Is it the opposition of man, and the power which physical strength gives him, which have been the impediments? Had these been the only obstacles, and had that general and entire equality of intellect existed between the sexes, which we find proclaimed to-day by some writers, and by many talkers, the genius of women would have opened a road through these and all other difficulties much more frequently than it has yet done. At this very hour, instead of defending the intellect of women, just half our writing and talking would be required to defend the intellect of men. But, so long as woman, as a sex, has not provided for herself the same advanced intellectual education to the same extent as men, and so long as inferiority of intellect in man has never yet in thousands of years been gravely discussed, while the inferiority of intellect in woman has been during the same period generally admitted, we are compelled to believe there is some foundation for this last opinion. The extent of this difference, the interval that exists between the sexes, the precise degree of inferiority on the part of women, will probably never be satisfactorily proved.

Believing then in the greater physical powers of man, and in his superiority, to a limited extent, in intellect also, as two sufficient reasons for the natural subordination of woman as a sex, we have yet a *third* reason for this subordination. Christianity can be proved to be the safest and highest ally of man's nature, physical, moral, and intellectual, that the world has yet known. It protects his physical nature at every point by plain, stringent rules of general temperance and moderation. To his moral nature it gives the pervading strength of healthful purity. To his intellectual nature, while on one hand it enjoins full development and vigorous action, holding out to the spirit the highest conceivable aspirations, on the other it teaches the invaluable lessons of a wise humility. This grand and holy religion, whose whole action is healthful, whose restraints are all blessings—this gracious religion, whose chief precepts are the love of God and the love of man—this same Christianity confirms the subordinate position of woman, by allotting to man the headship in plain language and by positive precept. No system of philosophy has ever yet worked out in behalf of woman the practical results for good which Christianity has conferred on her. Christianity has raised woman from slavery and made her the thoughtful companion of man; it

finds her the mere toy, or the victim of his passions, and it places her by his side, his truest friend, his most faithful counselor, his helpmeet in every worthy and honorable task. It protects her far more effectually than any other system. It cultivates, strengthens, elevates, purifies all her highest endowments, and holds out to her aspirations the most sublime for that future state of existence, where precious rewards are promised to every faithful discharge of duty, even the most humble. But, while conferring on her these priceless blessings, it also enjoins the submission of the wife to the husband, and allots a subordinate position to the whole sex while here on earth. No woman calling herself a Christian, acknowledging her duties as such, can, therefore, consistently deny the obligation of a limited subordination laid upon her by her Lord and His Church.

From these three chief considerations—the great inferiority of physical strength, a very much less and undefined degree of inferiority in intellect, and the salutary teachings of the Christian faith—it follows that, to a limited degree, varying with circumstances, and always to be marked out by sound reason and good feeling, the subordination of woman, as a sex, is inevitable.

This subordination once established, a difference of position, and a consequent difference of duties, follow as a matter of course. There must, of necessity, in such a state of things, be certain duties inalienably connected with the position of man, others inalienably connected with the position of woman. For the one to assume the duties of the other becomes, first, an act of desertion, next, an act of usurpation. For the man to discharge worthily the duties of his own position becomes his highest merit. For the woman to discharge worthily the duties of her own position becomes her highest merit. To be noble the man must be manly. To be noble the woman must be womanly. Independently of the virtues required equally of both sexes, such as truth, uprightness, candor, fidelity, honor, we look in man for somewhat more of wisdom, of vigor, of courage, from natural endowment, combined with enlarged action and experience. In woman we look more especially for greater purity, modesty, patience, grace, sweetness, tenderness, refinement, as the consequences of a finer organization, in a protected and sheltered position. That state of society will always be the most rational, the soundest, the happiest, where each sex conscientiously discharges its own duties, without intruding on those of the other.

It is true that the world has often seen individual women called by the manifest will of Providence to positions of the highest authority, to the thrones of rulers and sovereigns. And many of these women have discharged those duties with great intellectual ability and great success. It is rather the fashion now among literary men to depreciate Queen Elizabeth and her government. But it is clear that,

whatever may have been her errors—and no doubt they were grave—she still appears in the roll of history as one of the best sovereigns not only of her own house, but of all the dynasties of England. Certainly she was in every way a better and a more successful ruler than her own father or her own brother-in-law, and better also than the Stuarts who filled her throne at a later day. Catherine of Russia, though most unworthy as a woman, had a force of intellectual ability quite beyond dispute, and which made itself felt in every department of her government. Isabella I. of Spain gave proof of legislative and executive ability of the very highest order; she was not only one of the purest and noblest, but also, considering the age to which she belonged, and the obstacles in her way, one of the most skillful sovereigns the world has ever seen. Her nature was full of clear intelligence, with the highest moral and physical courage. She was in every way a better ruler than her own husband, to whom she proved nevertheless an admirable wife, acting independently only where clear principle was at stake. The two great errors of her reign, the introduction of the Inquisition and the banishment of the Jews, must be charged to the confessor rather than to the Queen, and these were errors in which her husband was as closely involved as herself. On the other hand, some of the best reforms of her reign originated in her own mind, and were practically carried out under her own close personal supervision. Many other skillful female rulers might be named. And it is not only in civilized life and in Christendom that woman has shown herself wise in governing; even among the wildest savage tribes they have appeared, occasionally, as leaders and rulers. This is a singular fact. It may be proved from the history of this continent, and not only from the early records of Mexico and Cuba and Hayti, but also from the reports of the earliest navigators on our own coast, who here and there make mention incidentally of this or that female chief or sachem. But a fact far more impressive and truly elevating to the sex also appears on authority entirely indisputable. While women are enjoined by the Word of God to refrain from public teaching in the Church, there have been individual women included among the Prophets, speaking under the direct influence of the Most Holy Spirit of God, the highest dignity to which human nature can attain. But all these individual cases, whether political or religious, have been exceptional. The lesson to be learned from them is plain. We gather naturally from these facts, what may be learned also from other sources, that, while the positions of the two sexes are as such distinct, the one a degree superior, the other a degree inferior, the difference between them is limited—it is not impassable in individual cases. The two make up but one species, one body politic and religious. There are many senses besides marriage in which the two are one. It is the right

hand and the left, both belonging to one body, moved by common feeling, guided by common reason. The left hand may at times be required to do the work of the right, the right to act as the left. Even in this world there are occasions when the last are first, the first last, without disturbing the general order of things. These exceptional cases temper the general rule, but they can not abrogate that rule as regards the entire sex. Man learns from them not to exaggerate his superiority—a lesson very often needed. And woman learns from them to connect self-respect and dignity with true humility, and never, under any circumstances, to sink into the mere tool and toy of man—a lesson equally important.

Such until the present day has been the general teaching and practice of Christendom, where, under a mild form, and to a limited point, the subordination of woman has been a fact clearly established. But this teaching we are now called upon to forget, this practice we are required to abandon. We have arrived at the days foretold by the Prophet, when "knowledge shall be increased, and many shall run to and fro." The intellectual progress of the race during the last half century has indeed been great. But admiration is not the only feeling of the thoughtful mind when observing this striking advance in intellectual acquirement. We see that man has not yet fully mastered the knowledge he has acquired. He runs to and fro. He rushes from one extreme to the other. How many chapters of modern history, both political and religious, are full of the records of this mental vacillation of our race, of this illogical and absurd tendency to pass from one extreme to the point farthest from it!

An adventurous party among us, weary of the old paths, is now eagerly proclaiming theories and doctrines entirely novel on this important subject. The *Emancipation of Woman* is the name chosen by its advocates for this movement. They reject the idea of all subordination, even in the mildest form, with utter scorn. They claim for woman absolute social and political equality with man. And they seek to secure these points by conferring on the whole sex the right of the elective franchise, female suffrage being the first step in the unwieldy revolutions they aim at bringing about. These views are no longer confined to a small sect. They challenge our attention at every turn. We meet them in society; we read them in the public prints; we hear of them in grave legislative assemblies, in the Congress of the Republic, in the Imperial Parliament of Great Britain. The time has come when it is necessary that all sensible and conscientious men and women should make up their minds clearly on a subject bearing upon the future condition of the entire race.

There is generally more than one influence at work in all public movements of importance. The motive power in such cases is very seldom

simple. So it has been with the question of female suffrage. The abuses inflicted on woman by legislation, the want of sufficient protection for her interests when confided to man, are generally asserted by the advocates of female suffrage as the chief motives for a change in the laws which withhold from her the power of voting. But it is also considered by the friends of the new movement that to withhold the suffrage from half the race is an inconsistency in American politics; that suffrage is an inalienable right, universal in its application; that women are consequently deprived of a great natural right when denied the power of voting. A third reason is also given for this proposed change in our political constitution. It is asserted that the entire sex would be greatly elevated in intellectual and moral dignity by such a course; and that the effect on the whole race would therefore be most advantageous, as the increased influence of woman in public affairs would purify politics, and elevate the whole tone of political life. Here we have the reason for this movement as advanced by its advocates. These are the points on which they lay the most stress:

First. The abuse of legislative power in man, by oppressing the sex.

Secondly. The inalienable natural right of woman to vote; and imperatively so in a country where universal suffrage is a great political principle.

Thirdly. The elevation of the sex, and the purification of politics through their influence.

Let us consider each of these points separately.

First. The abuse of legislative power by man in the oppression of woman.

In some countries of Europe much of wrong is still done to woman, at the present day, by old laws owing their existence to a past state of things, and which have not yet been repealed or modified to suit existing circumstances. But we are writing now to American women, and, instead of the evils existing in the other hemisphere, we are looking at a very different state of society. Let us confine ourselves, therefore, to the subject as it affects ourselves.

To go into all the details which might be drawn together from the statute books of the different States of the Union bearing on this point, and to do them full justice, would require volumes. Such a course is not necessary. The question can be decided with truth and justice on general principles—on generally admitted facts. We admit, then, that in some States—perhaps in all—there may be laws in which the natural and acquired rights of woman have not been fairly considered; that in some cases she has needed more legal protection and more privileges than she has yet received. But while this admission is made, attention is at the same time demanded for a fact inseparably connected with it; namely, the marked and generous liberality which American men have thus far shown in the considerate care and protection they

have, as a general rule, given to the interests of women. In no country, whether of ancient or modern times, have women had less to complain of in their treatment by man than in America. This is no rhetorical declamation; it is the simple statement of an undeniable fact. It is a matter of social history. Since the days of early colonial life to the present hour—or, in other words, during the last two hundred and fifty years—such has been the general course of things in this country. The hardest tasks have been taken by man, and a generous tenderness has been shown to women in many of the details of social life, pervading all classes of society, to a degree beyond what is customary even in the most civilized countries of Europe. Taking these two facts together—that certain abuses still exist, that certain laws and regulations need changing, and that, as a general rule, American women have thus far been treated by their countrymen with especial consideration, in a legal and in a social sense—the inference becomes perfectly plain. A formidable and very dangerous social revolution is not needed to correct remaining abuses. Any revolution aiming at upsetting the existing relations of the sexes—relations going back to the earliest records and traditions of the race—can not be called less than formidable and dangerous. Let women make full use of the influences already at their command, and all really needed changes may be effected by means both sure and safe—means already thoroughly tried. Let them use all the good sense, all the information, all the eloquence, and, if they please, all the wit, at their command when talking over these abuses in society. Let them state their views, their needs, their demands, in conscientiously written papers. Let them appeal for aid to the best, the wisest, the most respected men of the country, and the result is certain. Choose any one real, existing abuse as a test of the honesty and the liberality of American men toward the women of the country, and we all know beforehand what shall be the result.* If husbands, fathers, brothers, are ready any day to shed their heart's blood for our personal defense in

* There is an injustice in the present law of guardianship in the State of New York, which may be named as one of those abuses which need reformation. A woman can not now, in the State of New York, appoint a guardian for her child, even though its father be dead. The authority for appointing a guardian otherwise than by the courts is derived from the Revised Statutes, p. 1, title 3, chapter 8, part 2, and that passage gives the power to the father only. The mother is not named. It has been decided in the courts that a mother can not make this appointment—12 Howard's Practical Reports, 532. This is certainly very unjust and very unwise. But let any dozen women of respectability take the matter in hand, and, by the means already at their command, from their own chimney-corners, they can readily procure the insertion of the needful clause. And so with any other real abuse. Men are now ready to listen, and ready to act, when additional legislation is prudently and sensibly asked for by their wives and mothers. How they may act when women stand before them, armed *cap-à-pie*, and prepared to demand legislation at the point of the bayonet, can not yet be known.

the hour of peril, we may feel perfectly assured that they will also protect us, when appealed to, by legislation. When they lay down their arms and refuse to fight for us, it will then be time to ask them to give up legislation also. But until that evil hour arrives let men make the laws, and let women be content to fill worthily, to the very best of their abilities, the noble position which the Heavenly Father has already marked out for them. There is work to be done in that position reaching much higher, going much farther, and penetrating far deeper, than any mere temporary legislation can do. Of that work we shall speak more fully a moment later.

Secondly. The inalienable natural right of woman to vote; and imperatively so in a country where universal suffrage is a great political principle.

This second proposition of the advocates of female suffrage is of a general character. It does not point to particular abuses, it claims the right of woman to vote as one which she should demand, whether practically needed or not. It is asserted that to disqualify half the race from voting is an abuse entirely inconsistent with the first principles of American politics. The answer to this is plain. The elective franchise is not an end; it is only a means. A good government is indeed an inalienable right. Just so far as the elective franchise will conduce to this great end, to that point it becomes also a right, but no farther. A male suffrage wisely free, including all capable of justly appreciating its importance, and honestly discharging its responsibilities, becomes a great advantage to a nation. But universal suffrage, pushed to its extreme limits, including all men, all women, all minors beyond the years of childhood, would inevitably be fraught with evil. There have been limits to the suffrage of the freest nations. Such limits have been found necessary by all past political experience. In this country, at the present hour, there are restrictions upon the suffrage in every State. Those restrictions vary in character. They are either national, relating to color, political, mental, educational, connected with a property qualification, connected with sex, connected with minority of years, or they are moral in their nature.* This restriction connected with sex is, in fact, but one of many other restrictions, considered more or less necessary even in a democracy. Manhood suffrage is a very favorite term of the day. But, taken in the plain meaning of those words, such fullness of suffrage has at the present hour no actual existence in any independent nation, or in any extensive province. It does not exist, as we have just seen, even among the men of Ameri-

ca. And, owing to the conditions of human life, we may well believe that unrestricted fullness of manhood suffrage never can exist in any great nation for any length of time. In those States of the American Union which approach nearest to a practical manhood suffrage, unnaturalized foreigners, minors, and certain classes of criminals, are excluded from voting. And why so? What is the cause of this exclusion? Here are men by tens of thousands—men of widely different classes and conditions—peremptorily deprived of a privilege asserted to be a positive inalienable right universal in its application. There is manifestly some reason for this apparently contradictory state of things. We know that reason to be the good of society. It is for the good of society that the suffrage is withheld from those classes of men. A certain fitness for the right use of the suffrage is therefore deemed necessary before granting it. A criminal, an unnaturalized foreigner, a minor, have not that fitness; consequently the suffrage is withheld from them. The worthy use of the vote is, then, a qualification not yet entirely overlooked by our legislators. The State has had, thus far, no scruples in withholding the suffrage even from men, whenever it has believed that the grant would prove injurious to the nation.

Here we have the whole question clearly defined. The good of society is the true object of all human government. To this principle suffrage itself is subordinate. It can never be more than a means looking to the attainment of good government, and not necessarily its corner-stone. Just so far is it wise and right. Move one step beyond that point, and instead of a benefit the suffrage may become a cruel injury. The governing power of our own country—the most free of all great nations—practically proclaims that it has no right to bestow the suffrage wherever its effects are likely to become injurious to the whole nation, by allotting different restrictions to the suffrage in every State of the Union. The right of suffrage is, therefore, most clearly not an absolutely inalienable right universal in its application. It has its limits. These limits are marked out by plain justice and common-sense. Women have thus far been excluded from the suffrage precisely on the same principles—from the conviction that to grant them this particular privilege would, in different ways, and especially by withdrawing them from higher and more urgent duties, and allotting to them other duties for which they are not so well fitted, become injurious to the nation, and, we add, ultimately injurious to themselves, also, as part of the nation. If it can be proved that this conviction is sound and just, founded on truth, the assumed inalienable right of suffrage, of which we have been hearing so much lately, vanishes into the “baseless fabric of a vision.” If the right were indeed inalienable, it should be granted, without regard to consequences, as an act of abstract justice. But, happily for us,

* In connection with this point of moral qualification we venture to ask a question. Why not enlarge the criminal classes from whom the suffrage is now withheld? Why not exclude every man convicted of any degrading legal crime, even petty larceny? And why not exclude from the suffrage all habitual drunkards judicially so declared? These are changes which would do vastly more of good than admitting women to vote.

none but the very wildest theorists are prepared to take this view of the question of suffrage. The advocates of female suffrage must, therefore, abandon the claim of inalienable right. Such a claim can not logically be maintained for one moment in the face of existing facts. We proceed to the third point.

Thirdly. The elevation of the entire sex, the general purification of politics through the influence of woman, and the consequent advance of the whole race. Such, we are told, must be the inevitable results of what is called the emancipation of woman, the entire independence of woman through the suffrage.

Here we find ourselves in a peculiar position. While considering the previous points of this question we have been guided by positive facts, clearly indisputable in their character. Actual, practical experience, with the manifold teachings at her command, has come to our aid. But we are now called upon, by the advocates of this novel doctrine, to change our course entirely. We are under orders to sail out into unknown seas, beneath skies unfamiliar, with small light from the stars, without chart, without pilot, the port to which we are bound being one as yet unvisited by mortal man—or woman! Heavy mist, and dark cloud, and threatening storm appear to us brooding over that doubtful sea. But something of prophetic vision is required of us. We are told that all perils which seem to threaten the first stages of our course are entirely illusive—that they will vanish as we approach—that we shall soon arrive in halcyon waters, and regions where wisdom, peace, and purity reign supreme. If we cautiously inquire after some assurance of such results, we are told that to those sailing under the flag of progress triumph is inevitable, failure is impossible; and that many of the direst evils hitherto known on earth must vanish at the touch of the talisman in the hand of woman—and that talisman is the vote.

Now, to speak frankly—and being as yet untrammelled by political aspirations, we fearlessly do so—as regards this flag of progress, we know it to be a very popular bit of bunting; but to the eye of common-sense it is grievously lacking in consistency. The flag of our country means something positive. We all love it; we all honor it. It represents to us the grand ideas by which the nation lives. It is the symbol of constitutional government, of law and order, of union, of a liberty which is not license. It is to us the symbol of all that may be great and good and noble in the Christian republic. But this vaunted flag of progress, so alluring to many restless minds, is vague in its colors, unstable, too often illusive, in web and woof. Many of its most prominent standard-bearers are clad in the motley garb of theorists. Their flag may be seen wandering to and fro, hither and thither, up and down, swayed by every breath of popular caprice; so it move to the mere cry of "Progress!" its followers

are content. To-day, in the hands of the skeptical philosopher, it assaults the heavens. Tomorrow it may float over the mire of Mormonism, or depths still more vile. It was under the flag of progress that, in the legislative halls of France, the name of the Holy Lord God of Hosts, "who inhabiteth eternity," was legally blasphemed. It was under the flag of progress that, on the 10th of November, 1793, Thérèse Momoro, Goddess of Reason, and wife of the printer Momoro, was borne in triumph, by throngs of worshipers, through the streets of Paris, and enthroned in the house of God.

Beyond all doubt, there is now, as there ever has been, an onward progress toward truth on earth. But that true progress is seldom rapid, excepting perhaps in the final stages of some particular movement. It is, indeed, often so slow, so gradual, as to be imperceptible at the moment to common observation. It is often silent, wonderful, mysterious, sublime. It is the grand movement toward the Divine Will, working out all things for eventual good. In looking back, there are for every generation way-marks by which the course of that progress may be traced. In looking forward no mortal eye can foresee its immediate course. The ultimate end we know, but the next step we can not foretell. The mere temporary cry of progress from human lips has often been raised in direct opposition to the true course of that grand, mysterious movement. It is like the roar of the rapids in the midst of the majestic stream, which, in the end, shall yield their own foaming waters to the calm current moving onward to the sea. We ask, then, for something higher, safer, more sure, to guide us than the mere popular cry of "Progress!" We dare not blindly follow that cry, nor yield thoughtless allegiance to every flag it upholds.

Then, again, as regards that talisman, the vote, we have but one answer to make. We do not believe in magic. We have a very firm and unchangeable faith in free institutions, founded on just principles. We entirely believe that a republican form of government in a Christian country may be the highest, the noblest, and the happiest that the world has yet seen. Still, we do not believe in magic. And we do not believe in idolatry. We Americans are just as much given to idolatry as any other people. Our idols may differ from those of other nations; but they are, none the less, still idols. And it strikes the writer that the ballot-box is rapidly becoming an object of idolatry with us. Is it not so? From the vote alone we expect all things good. From the vote alone we expect protection against all things evil. Of the vote Americans can never have too much—of the vote they can never have enough. The vote is expected by its very touch, suddenly and instantaneously, to produce miraculous changes; it is expected to make the foolish wise, the ignorant knowing, the weak strong, the fraudulent honest. It is expected to turn dross to gold. It is held to be the great

educator, not only as regards races, and under the influence of time, which is in a measure true, but as regards individuals and classes of men, and that in the twinkling of an eye, with magical rapidity. Were this theory practically sound, the vote would really prove a talisman. In that case we should give ourselves no rest until the vote were instantly placed in the hands of every Chinaman landing in California, and of every Indian roving over the plains. But, in opposition to this theory, what is the testimony of positive facts known to us all? Are all voters wise? Are all voters honest? Are all voters enlightened? Are all voters true to their high responsibilities? Are all voters faithful servants of their country? Is it entirely true that the vote has necessarily and really these inherent magical powers of rapid education for individuals and for classes of men, fitting them, in default of other qualifications, for the high responsibilities of suffrage? Alas! we know only too well that when a man is not already honest and just and wise and enlightened, the vote he holds can not make him so. We know that if he is dishonest, he will sell his vote; if he is dull and ignorant, he is misled, for selfish purposes of their own, by designing men. As regards man, at least, the vote can be too easily proved to be no talisman. It is very clear that for man the ballot-box needs to be closely guarded on one side by common-sense, on the other by honesty. A man must be endowed with a certain amount of education and of principle, before he receives the vote, to fit him for a worthy use of it. And if the vote be really no infallible talisman for man, why should we expect it to work magical wonders in the hands of woman?

But let us drop the play of metaphor, appropriate though it be when facing the visions of political theorists. Let us look earnestly and clearly at the positive facts before us. We are gravely told that to grant the suffrage to woman would be a step inevitably beneficial and elevating to the whole sex, and, through their influence, to the entire race, and that, on this ground alone, the proposed change in the constitution should be made. Here, so far at least as the concluding proposition goes, we must all agree. If it can be clearly proved that this particular change in our institutions is one so fraught with blessings, we are bound to make it at every cost. The true elevation of the whole race: that is what we are all longing for, praying for. And is it indeed true that this grand work can effectually be brought about by the one step we are now urged to take? What says actual experience on this point? The whole history of mankind shows clearly that, as yet, no one legislative act has ever accomplished half of what is claimed by the advocates of woman's suffrage as the inevitable result of the change they propose. No one legislative act has ever been so widely comprehensive in its results for good as they declare that this act shall be. No one legislative act has ever raised the entire

race even within sight of the point of elevation predicted by the champions of what is called the emancipation of woman. Hear them speak for themselves: "It is hardly possible, with our present experience, to raise our imaginations to the conception of so great a change for the better as would be made by its removal"—the removal of the principle of the subordination of the wife to the husband, and the establishment of the entire independence of women, to be obtained by female suffrage. These are not the words of some excited woman making a speech at a public meeting. The quotation is from the writings of Mr. Stuart Mill. The subordination of the wife to the husband is declared by Mr. Mill to be "the citadel of the enemy." Storm the citadel, proclaim the entire independence of the wife, and our feeble imaginations, we are told, are utterly incapable of conceiving the glorious future of the race consequent upon this one step. This is a very daring assertion. It is so bold, indeed, as to require something of positive proof ere we can yield to it our implicit belief. The citadel we are urged to storm was built by the hand of God. The flag waving over that citadel is the flag of the Cross. When the Creator made one entire sex so much more feeble in physical powers than the other, a degree of subordination on the part of the weaker sex became inevitable, unless it were counteracted by increase of mental ability, strengthened by special precept. But the mental ability, so far as there is a difference, and the precept, are both on the side of the stronger sex. The whole past history of the race coincides so clearly with these facts that we should suppose that even those who are little under the influence of Christian faith might pause ere they attacked that citadel. Common-sense might teach them something of caution, something of humility, when running counter to the whole past experience of the race. As for those who have a living belief in the doctrines of Christianity, when they find that revealed religion, from the first of the Prophets to the last of the Apostles, allots a subordinate position to the wife, they are compelled to believe Moses and St. Paul in the right, and the philosophers of the present day, whether male or female, in the wrong. To speak frankly, the excessive boldness of these new theories, the incalculable and inconceivable benefits promised us from this revolution from the natural condition of things in Christendom—and throughout the world indeed—would lead us to suspicion. Guides who appeal to the imagination when discussing practical questions are not generally considered the safest. And the champions of female suffrage are necessarily compelled to take this course. They have no positive foundation to rest on. Mr. Stuart Mill has said in Parliament, in connection with this subject, that "the tyranny of established custom has entirely passed away." Nothing can be more true than this assertion. As a rule, the past is now looked upon with doubt,

with suspicion, often with a certain sort of contempt, very far from being always consistent with sound reason. The tyranny of the present day—and it may be just as much a tyranny as the other—is radically opposite in character. It is the tyranny of novelty to which we are most exposed at present. The dangers lie chiefly in that direction. There will be little to fear from the old until the hour of reaction arrives, as it inevitably must, if the human mind be strained too far in a new direction. At present the more startling an assertion, the farther it wanders from all past experience, the greater are its chances of attracting attention, of gaining adherents, of achieving at least a partial and temporary success. In the age and in the country which has seen the development of Mormonism as a successful religious, social, and political system, nothing should surprise us. Such is the restlessness of human nature that it will often, from mere weak hankering after change, hug to its bosom the wildest theories, and yield them a temporary allegiance.

Let us suppose that to-day the proposed revolution were effected; all women, without restriction, even the most vile, would be summoned to vote in accordance with their favorite theory of inalienable right. That class of women, and other degraded classes of the ignorant and unprincipled, will always be ready to sell their votes many times over—to either party, to both parties, to the highest bidder, in short. They will sell their vote much more readily than the lowest classes of men now do. They will hold it with greater levity. They will trifle with it. They will sell their vote any day for a yard of ribbon or a tinsel brooch—unless they are offered two yards of ribbon or two brooches. They will vote over again every hour of every election day, by cunning disguises and trickery. And thus, so far as women are concerned, the most degraded element in society will, in fact, represent the whole sex. Nay, they will probably not unfrequently command the elections, as three colored women are said once to have done in New Jersey. A hundred honest and intelligent women can have but one vote each, and at least fifty of these will generally stay at home. If, which God forbid, it actually comes to female voting, a very small proportion of the sex will, at common elections, appear at the polls. Avocations more urgent, more natural to them, and in which they are more deeply interested, will keep them away. The degraded women will be there by the scores, as tools of men, enjoying both the importance of the hour, the fun, and *the pay*. Fifty women, known to be thieves and prostitutes, will hold, at a moderate calculation, say two hundred votes. And, as women form the majority of the resident population in some States, that wretched element of society will, in fact, govern those States, or those who bribe them will do so. Massachusetts, very favorable to female suffrage now, will probably come round to the opinion of New Jersey in former days. Great will be the con-

sumption of cheap ribbons, and laces, and artificial flowers, and feathers, and tinsel jewelry, in every town and village about election time, after emancipation is achieved. We are compelled to believe so, judging from our knowledge of human nature, and of the use already made of bribery at many elections. The demagogues will be more powerful than ever. Their work will be made easy for them. It seems, indeed, probable that under the new era our great elections shall become a sort of grand national gift concerns, of which the most active demagogues of all parties will be the managers. Not that women are more mercenary, or more unprincipled than men. God forbid! That would be saying too much. We entirely believe the reverse to be true. But the great mass of women can never be made to take a deep, a sincere, a discriminating, a lasting interest in the thousand political questions ever arising to be settled by the vote. They very soon weary of such questions. On great occasions they can work themselves up to a state of frenzied excitement over some one political question. At such times they can parade a degree of unreasoning prejudice, of passionate hatred, of blind fury, even beyond what man can boast of. But, in their natural condition, in everyday life, they do not take instinctively to politics as men do. Men are born politicians; just as they are born masons, and carpenters, and soldiers, and sailors. Not so women. Their thoughts and feelings are given to other matters. The current of their chosen avocations runs in another channel than that of politics—a channel generally quite out of sight of politics; it is an effort for them to turn from one to the other. With men, on the contrary, politics, either directly or indirectly, are closely, palpably, inevitably blended with their regular work in life. They give their attention unconsciously, spontaneously, to politics. Look at a family of children, half boys, half girls; the boys take instinctively to whips and guns and balls and bats and horses, to fighting and wrestling and riding; the girls fondle their dolls, beg for a needle and thread, play at housekeeping, at giving tea-parties, at nursing the sick baby, at teaching school. That difference lasts through life. Give your son, as he grows up, a gun and a vote; he will delight in both. Give your daughter, as she grows up, a gun and a vote, and, unless she be an exceptional woman, she will make a really good use of neither. Your son may be dull; but he will make a good soldier, and a very tolerable voter. Your daughter may be very clever; but she would certainly run away on the battle-field, and very probably draw a caricature on the election ticket. There is the making of an admirable wife and mother, and a valuable member of society, in that clever young woman. She is highly intelligent, thoroughly well educated, reads Greek and Latin, and has a wider range of knowledge and thought than ninety-nine in a hundred of the voters in the same district; but there is nothing of the

politician in her nature. She would rather any day read a fine poem than the best political speech of the hour. What she does know of politics reaches her through that dull but worthy brother of hers. It is only occasionally that we meet women with an inherent bias for politics; and those are not, as a rule, the highest type of the sex—it is only occasionally that they are so. The interest most women feel in politics is secondary, factitious, engrafted on them by the men nearest to them. Women are not abortive men; they are a distinct creation. The eye and the ear, though both belonging to the same body, are each, in a certain sense, a distinct creation. A body endowed with four ears might hear remarkably well; but without eyes it would be of little use in the world. A body with four eyes would have a fourfold power of vision, and would consequently become nearly as sharp-sighted as a spider; but without hearing its powers of sight would avail little. In both cases, half the functions of the human being, whether physical or mental, would be very imperfectly performed. Thus it is with men and women; each has a

distinct position to fill in the great social body, and is especially qualified for it. These distinct positions are each highly important. And it is reasonable to believe that, by filling their own peculiar position thoroughly well, women can best serve their Creator, their fellow-creatures, and themselves. No doubt you may, if you choose, by especial education from childhood upward, make your girls very respectable politicians, as much so as the majority of your sons. But in that case you must give up your womanly daughters—you must be content with manly daughters. This essential difference between the sexes is a very striking fact; yet the advocates of female suffrage constantly lose sight of it; they talk and write as if it had no existence. It is not lack of intellect on the part of women, but difference of intellect, or rather a difference of organization and affinities giving a different bias to the intellect, which is the cause of their distinct mental character as a sex. And, owing to this essential difference, the great majority of women are naturally disinclined to politics, and partially unfitted for action in that field.

ANTEROS.

BY THE AUTHOR OF "GUY LIVINGSTONE," "SWORD AND GOWN," "SANS MERCI,"
"BREAKING A BUTTERFLY," ETC.

CHAPTER XVI.

HESLINGFORD could hardly pretend to the dignity of a manufacturing town; yet a fair stroke of trade was done there, chiefly in the coarser cloth and linen stuffs; and if the air for leagues around was not poisoned with the reek of her furnaces, even on a breezy summer day her brows were seldom clear of smoke; and a utilitarian's ears would have been gladdened by the concert of her steam-mills. It was a big straggling place, closely packed in the centre, but opening toward the outskirts into many rows and terraces of desirable tenements, and beyond these again scores of detached or semi-detached villas encroached on the green fields year by year.

The gray minster had more than a local renown; and besides this, immediately around and near the market-place there were a few gables and porches that stray archæologists had thought worth photographing; but even in this quarter the aspect of things was rather old-fashioned than ancient, and the most imposing of the private dwellings were only primly respectable.

Unless special business or pleasure had brought you there, you would perhaps have passed on a hundred times without pausing before a certain tall square mansion—built of red, or rather russet brick, with stone casings to the narrow windows—that filled up a goodly portion of a short street leading out of a princi-

pal thoroughfare. There was no pretense of an approach or court-yard before it. The house stood out bluffly in the same line with its humbler fellows, dwarfing them by contrast, like a grenadier shifted into the ranks of a light company. A row of iron railings, inclosing about a fathom's width of gravel, was all that divided the walls from the pavement. If you had bestowed a second glance on this building you would probably have guessed that, though Breckonstone was scrupulously neat and clean, and the minutest breaches of time or weather had been carefully repaired, many years have passed since its first courses were laid; and, furthermore, that the tenant was a person influential by wealth or otherwise. No graven door-plate was needed to tell you that it must needs belong to the chief banker or lawyer of the place; if by any absurd incongruity an utterly idle man came to dwell there, one might fancy him, by the pure force of circumstances, impelled to dabble with paper or parchment.

But, like other eminent respectabilities, the staid old mansion kept for its intimates a very different face from that which it turned toward the profane; not that—even to these—it could ever seem rollicking or jovial; but under this second aspect decorum was tempered with cheerfulness, and dignity ceased to be austere. It was a grateful surprise to a stranger when, after passing through the stiff formal doorway, he caught a glimpse of greenery at the further end of the long cool corridor paved with black

and white marble, that ran through the house from east to west; and traversing this, found himself in a fair garden, the boundary-walls whereof were scarcely to be discerned for ivy and embowering trees. A few flower-beds, richly rather than gaudily colored, glistened in the midst of sward fresher and smoother than the show-lawn at Templestowe; and the most venerable manor in all Loamshire, which boasted not a few of such, could show nothing to compare with those twin cedars—so lowly with their trailing branches, so haughty with their soaring spires. Moreover, the dull uniformity of the street façade was broken by bow-windows on the ground-floor, deep as oriels, and by casements above of diverse shapes and sizes.

Building land in the heart of such a thriving and increasing town as Heslingford was a very mine of profit; and if the value of property is to be estimated by the capital lying dormant there, the maintaining of that modest *plaisance* was a costlier whim than the preserving of a deer-park farther afield.

Since a Corbett came to dwell here, four generations ago, the family—prospering steadily as a rule—had known, like their neighbors, seasons of trouble and strait; but they had never once been tempted to diminish, by a cubit's breadth, this plot kept for their delight.

They were rather notable people, these Corbetts. The founder of the line appeared in Heslingford as chief clerk in a bank already of some standing there. He was London-bred, and of his antecedents little or nothing was known; but his aptitude for business and industry were such that none were surprised when, after twenty years' hard work, he was received as a partner. Before John Corbett died, in a good old age, he had managed, in his placid, pertinacious way, to engross a large proportion of the authority, if not of the profits, of the concern; and his descendants had followed in his footsteps, gradually extruding the original elements, so that for some time past the Co. following their name had become a polite fiction. The cautious methodical spirit of their ancestor had long survived him. There is no doubt that the Corbetts might have waxed much wealthier if they would have embarked in thoroughly justifiable speculation; but they had preferred to increase their pile slowly and surely, avoiding all risks not necessarily incidental to the finance trade. And those cadets who, in default of finding room in the bank, sought fortune in the law, the army, or the Church, showed themselves not less careful than their seniors in no wise to impair the family credit. Yet though "safe," they were not hard men; and cases might have been quoted where, to assist an honest farmer or deserving tradesman, the banker had furnished from his own private resources the aid which he was bound professionally to deny. Precise they might be, but scarcely precisians; their religion was of the steady church-going order, with no

tinge of fanaticism; and there was nothing of the mawworm or mere money-grubber in their blood. They entered into sport and pleasure at proper seasons not a whit more sadly than their fellows, subscribing to the Loamshire hounds just as regularly as to the Heslingford charities. Furthermore, they had always shown a proneness to intermarry with the squirearchy; and at the present time of speaking their personal interests were certainly more closely allied with the county than with the town.

Arthur Corbett's grandfather had purchased a moderate estate, with a good house upon it, a dozen miles or so from Heslingford; and here resided Jacob, his father. Still nominally the head of the firm, but suffering from ill health, he meddled very little with the management, only occasionally sitting in the bank-parlor to satisfy his own conscience, or the fancy of certain ancient customers, who liked maundering over their business, and usually made it an excuse for a heavy luncheon and a lengthened prose. So on the said Arthur's shoulders rested all the real burden of responsibility; and they carried it exceeding lightly.

In business hours the junior partner showed himself to the full as shrewd and painstaking as his predecessors; but when he closed his desk he seemed to lock up all his cares in it, and came forth the most hilarious and convivial of creatures. It was quite wonderful what a large cantel of his time he contrived to allot to amusements, without in any wise neglecting duty. He was a good second-rate shot, and a fair, though by no means "bruising," rider to hounds. In any scheme of public or private diversion, from a festival down to a picnic, Arthur Corbett's name was safe to be prominent; and his "little dinners" were renowned throughout Loamshire. He was a Benedict of some ten years' standing now; and around his table there have grown up a very bower of olive branches. But there was much of the school-boy about him still; and with his round musical laugh ringing in your ears, you would have found it hard to believe in either his family or his financial dignities. He had never given his wife a single grave uneasiness, or society a single occasion for scandal; but—sooth to speak—he was an incorrigible philanderer, and was as variable in his devotion as in the fashion of his garments; the which is a wide expression, for he was choice and costly in his attire, erring rather on the side of gorgeousness. Also he affected, not unsuccessfully, the dragoon swagger; and was far prouder of his commission in the yeomanry than of his deputy lieutenancy. Could he have had his will, he would have invented for that corps such a uniform as would have cast into shade the splendors of the Chevalier Guard. "The sweetest temper in the world," said his numerous admirers; and so perhaps it was, though it had very seldom been tried. Not only had he passed through no furnace of adversity, but the flame of a taper

burning awry had never scorched the butterfly wings he fluttered so gayly. His mother—dead now some years—his sisters, and his wife, had all in their turn worshiped and cosseted him; and his father, in masculine fashion, had spoiled him no less consistently. That their prince could do no wrong was the prime article of the family creed; and had he been more faulty and negligent in his domestic relations he would still have remained their sole standard of excellence. However, no shortcomings in this respect could fairly be charged against Arthur Corbett. The inner fount of his affections seemed always brimming over; and he was content that his kinsfolk, no less than his friends, should drink freely of the abundance thereof. Endowed with such a character, and ample means withal for developing his genial tendencies, he could not be otherwise than popular—amazingly popular. Perhaps, though they liked him well, men hardly believed in him as implicitly as women did. But if *le bel Arthur* had been aware of this, it would not have greatly troubled him: he would have been content that things should be so.

Look narrowly at him, and you will see that the *physique* is a very fair reflex of the *morale* of the man.

An undeniably handsome face, if something soft and sensuous, and becomingly framed in crisp waves of pale golden hair. A figure almost commanding in its proportions, with only a promise of portliness as yet, though the outlines are already rounded. You would say, perhaps, that the figure wants setting up, and the face wants fining down; and both would remind you of the Bacchate ideal—the presentment, not of the Indian god, bearded, grave, and serene, but of the Theban reveler, made twice immortal by Praxiteles.

His air and manner are pervaded by a self-satisfaction bordering on self-sufficiency; and to this, at the present moment, is added the beatitude of one who has thoroughly enjoyed a savory meal. It is only a conjugal *tête-à-tête*, but his evening attire is elaborate, and jewels sparkle on breast and wrists and on the plump white fingers toying with the curls of the pretty child nestling at his knee.

Emma Corbett by no means emulates her husband's splendor. Her dress is plain, almost to homeliness, and not adapted to set off even the modest *uxoriam pulchritudinem* of which she can boast. The cares of maternity and house-keeping have told on her face not a little already; but she has a pleasant, honest smile, and a pleasant voice withal, though not a musical one.

"So you have actually seen this famous bride. And how were you so lucky?"

Arthur stretches out his length of limb, and yawns luxuriously.

"I saw her very much; and this is how it happened. Lord Atherstone came to see me at the bank this afternoon; and when we had

finished our business he asked me if I would like to be presented to my lady, who was sitting in the carriage. Of course, I was only too happy."

"And what did you think of her?"

"I—decidedly admire her."

Mark the importance of his manner; it is as though he said, "I am aware that my verdict is too valuable to be lightly given, *cependant je me risque*."

Emma Corbett smiles good-naturedly.

"How very glad she would be if she knew that! But it don't exactly describe her, you see."

"Well, she's tall—very tall, so far as I could judge, as she leaned back half buried in furs; and rather dark than fair, with plenty of coloring, though not in the least coarse; and coloring all in the right place too, in spite of the north wind; and her eyes—brown I think they are—are simply superb."

"And does she seem pleasant?"

Arthur pauses a second or two, as if trying to recollect.

"I fancy she might be—very pleasant, if she chose to take the trouble; but there's a cool, languid way about her, and perhaps she would not always choose. I don't dislike that; it's rather good style than otherwise."

"And does Lord Atherstone seem very fond of her?"

"What a thoroughly wifely question! Yes; he appears very fond of her, and proud into the bargain. If she had been a pearl of great price, he could not have wrapped her up more tenderly. I never thought till to-day that it was possible his face could thaw."

"There's an end to most frosts, I suppose," Mrs. Corbett replies. "You make me more curious than ever to see the last new thing in brides. I don't implicitly believe in all your swans, you know."

Corbett laughs lazily.

"Well, you needn't pine much longer; next week won't be a bit too soon to call. I'll drive you over myself, if you like. And now—Meta shall have the story I promised her, if she was good."

CHAPTER XVII.

FROM very old time it has been proverbial how ill they fare who, trusting in their own strength, presume to walk in independence, if not in defiance, of the deities. They need not fall as fell Capaneus, nor need any great wind from the wilderness smite the four corners of the house where the criminals are feasting; but the punishment, we are bound to believe, sooner or later, is sure. And why should not the same hold good with those who, either by choice or heedlessness, wander on aloof from their fellow-men, till at length they find themselves out in the desert, standing quite alone? The frail hand that, before it was stiffened, was strong to

indite many wise and tender words, was seldom better used than when it wrote of

"The bond which is not loosed by any:
And thou and I this law must keep—
If not in love, in sorrow, then—
Though smiling not like other men,
Still, like them we must weep."

It was in the first bitterness of enmity against his kind that Timon

"Made his everlasting mansion
Upon the beached verge of the salt flood;
Which once a day with his embossed froth
The turbulent surge should cover."

If he had lived longer—long enough for Ape-mantus's curse to take effect—it may be he would have grown weary of his cave, and have hankered for the fair city whose very hum and bustle sounded sociable, though in the crowd mingled so many harlots, traitors, and parasites.

Without being sentimental or sensitive, a man may find it somewhat galling to realize that the great joy or the great sorrow that has befallen him does not appear to interest his neighbors in the faintest degree; and the lack of sympathy in the first case is almost as vexatious as in the last.

The causes of Lord Atherstone's unpopularity in his county have been noted above, and how, if not actually sought, it was thoroughly earned. Possibly since then he had seen the error of his ways; but it is not probable that till now he had ever repented of them. It happened to him as it has happened to many other stark soldiers: while they had only their own safety to think of their harness was well able to protect them; but in striving to buckler another they perforce left their side unguarded, and the quarrel came home. Soon after her marriage he had said to Marian Ashleigh, "The Loamshire folks and I understand one another pretty well by this time. I can't alter my habits, even to suit such an occasion as this." Soon after his own he would have altered some of those same habits very readily, and began to wish that the said "understanding" was not so perfect. Among his bitterest enemies of either sex, social, political, or personal, not one had been found bold enough to put any overt slight, much less insult, on Ralph Atherstone; but somehow by tacit consent he had been edged gradually aside, till the place that by all rights he ought to have filled knew him no more. He was seldom solicited now to add his name to the stewards' list on the occasion of any public festival; private invitations were just as rare; and all the visiting-cards left at Templestowe were intended for the Ashleighs. The few men with whom Ralph was on familiar speaking terms were hunting acquaintances, and their conversation was usually confined to the simple interchange of ideas on the subject of weather, crops, and scent, that forms the staple of covert-side talk. The Baron hitherto had been perfectly content to be allowed to gang his ain gate; but it was different now.

The bridal *retraite* was past, and yet the Loamshire matronhood seemed by no means eager to welcome, or even to recognize, the last recruit to their ranks.

The Rev. Hubert Ashleigh (the same who had acted as Philip's guardian) called as soon as he decorously could, bringing his wife with him. He was a very correct and sensible divine—a trifle time-serving, some people thought, and rather too apt to "be all things to all men;" but, even where the course was badly buoyed, he had a rare knack of so steering and trimming his sails as to strike the middle course, that is generally the shortest, as well as the safest in the end. He was chatty and cordial enough when "he'd just dropped in to lunch without ceremony, because he was sure to catch his cousins at home at that hour;" but—dining that same evening at his archdeacon's, with a clerical party—he contrived to make it fully understood that a sense of family duty, rather than personal inclination, had brought him thus early to Templestowe; neither did he intimate that it was absolutely incumbent on his brethren to follow his example.

Besides the Corbetts, some half-dozen squires and rectors, dwelling in the immediate neighborhood, called or left cards; but none of these last carried very great weight in the county, and their civilities only brought out in stronger relief the general remissness—a remissness that could not be quite accounted for by weather wild and wet enough to make a merciful man loth to take his horses far from their stable.

It was not the weather, you may be well assured, that induced Lord Atherstone to give his hunters a holiday—for since his marriage he had not shown at the covert-side. It was his fancy not to go out till Lena could decorously accompany him. She had not had much cross-country practice; but Ralph soon discovered that she had exceptionally good hands, a firm seat, and wonderful nerve. So, during their retirement, whenever there was a lull in the wind and rain, he gave her an hour's schooling on a couple of his horses that, for a wonder, had mouths and manners, and only required a little steadying to make them thoroughly safe conveyances.

They did not pass irksomely those quiet days. Lena was not a bit of a philosopher, and not a bit too proud or too wise to relish keenly the good things of this world, whereof she had as yet had but scanty share. It was pleasant enough to open her eyes on tapestry still rich and warm in color, though a century had passed since it left the loom, and on soft silken hangings, merging into cloudy lace, instead of on white draperies, bare gray walls, and a scant-carpeted floor; pleasant to be tended by the most skillful of *caméristes*, instead of being dependent on the second services of Mrs. Shafton's ancient maid, sometimes grudgingly, if not grumblingly, rendered—for the good Julie's temper, naturally subacid, had been nipped and soured on the northern fells, and she deemed in *ce sacré pays*

a *Parisienne* fully worthy of her hire without working double tithes; pleasant, within doors, to be surrounded by manifold devices of comfort and luxury, after being used to faded, scanty furniture, and all the small domestic shifts of "poor gentility;" pleasant to look forth on a wide rolling park, studded with timber majestic even in leaflessness, instead of on a miserable strip of yellow pasture-ground, fringed with stunted firs that would scarcely shelter a Highland steer; pleasant, too, when the weather was too wild to go farther afield, to stroll through the stables, where the worth of a fair estate was represented by the tenants of the deep boxes and wide stalls, and to watch the light of the swinging lamps reflected on hides glistening with the last polish of the "rubber," and to contrast all this with the ruinous, draughty out-building, where, since Miles ceased to reside at Blytheswold, stood only a couple of hill ponies, with their shaggy coats all staring; pleasantest of all, to feel that she had only to speak a wish to find it carried out to the letter, quickly and cheerfully—for both the Upper and Lower Chamber in the household at Templestowe had passed a vote of confidence in their new mistress, and were, in truth, disposed to rejoice in their emancipation from the somewhat strict rule of Marian Ashleigh.

Of the infinite tenderness toward his wife underlying Ralph's *brusquerie* she, at least, never doubted; but he was none of the foolish fond old men who cloy their "pets" with sugar-plums, and wax querulous if the darling at last turns her head away from the *bonbonnière*. After all, the *reality* in the rare softening and lightening of his hard, dark face was worth a dozen demonstrations. Before she had been a week at Templestowe Lena discovered that the household, in so far as her master was concerned, was ruled by fear much more than by love. Lord Atherstone never rated his servants, but that they stood in awe of his glance, to say nothing of his frown, was very perceptible. Seeing all this, Lena felt a sort of satisfaction in the consciousness that *she* was never likely to be afraid of him.

Nevertheless, not once since their marriage had it ever entered into her head to call her husband by his Christian name. The address affected by Marian Ashleigh seemed to Lena just the right compromise; and so Ralph was "Monseigneur" still.

Watching the pair you would perhaps have decided that the change in their estate had affected the bridegroom less than the bride; and yet the truth was far otherwise. Of the fierce delights of battle, and of "the hunter's sullen joy," the Baron had had his fill; but the fruits that men gather only under their own vine and their own fig-tree were as new and strange to him as cates would be to a Polynesian.

Albeit little prone to misgivings, there were

moments when he felt almost afraid of his great happiness; and yet he did not fully realize it then, nor ever—till it stood out in relief against the darkness of the after-time.

Is it not so with all of us? I think the keenest pang that comes with the memory of the *temps felice* past and gone is the consciousness of how imperfectly we appreciated it while it endured. I am speaking now of the quiet and, so to speak, domestic bliss, not of the perilous ecstasies snatched between storm-gusts. No doubt we thought it pleasant at the time, while sitting dreamily over the fire, to have soft, bright hair always within reach of our caress, and to find in earnest eyes always a sympathy with our joys and sorrows, ay, though the first were no greater than having held our own in

"The glory of the gallop forty minutes over grass;" and the last no heavier than an error at whist suitably punished. But *how* pleasant it was we never knew till over all this there came a change.

Till our nerve or our purse fail we shall probably persist in pursuing; but, saving our dear friend, Harry Copeland, who has an eye to a deal, not a living soul will care whether the good horse Esca, whose price lies heavy on our conscience, makes the very utmost of a lucky start, or after a mile of deep going comes back to the rack, and we frequent the board of green cloth more regularly than before; but while sorting our cards it may occur to us that, besides our saturnine partner and the rash outsider who has backed the deal against the science, none will rejoice over the rubber pulled out of the fire.

It does not much matter of course, only sometimes, as we jog homeward through the twilight, or issue forth into the gray morning, we shall find ourselves wondering how in the old time we could ever have been tempted to leave, were it but for an hour, that cozy ingle-nook and that gentle company. The hearth to which we are returning is cold and lonely, or there gather round it faces—familiar, perchance, and not unkindly—but which can no more fill up a certain void than time can bridge eternity. The soft bright hair has lost its sheen, if it has not moulded into dust; and if, in the visions of the night, we stretch forth our hand to caress it, when once awake we laugh the folly to scorn; for to satisfy that longing we should need to delve two fathom deep into the soil of God's Acre, and lift the lid of a coffin. And the earnest eyes—if it were possible—would they still care to sympathize with our confessions, light or grave?

Over such a doubt wiser brains than yours and mine, my brother, have wearied themselves in vain; when it is fully solved, there will be few secrets left to be unraveled, and there will abide unbroken but one of the Seven Seals.

HEARTACHE.

THE still skies hear a moaning
 Among celestial airs;
 Low at the Throne are drooping
 The winds that carry prayers.
 The Face that is the light of heaven
 Grows sad with pitying;
 For a heartache, a heartache,
 Is such a common thing!

Where flesh to flesh complaineth,
 Grievs are a clamorous host;
 Where silence lieth deepest,
 The heavens listen most.
 In unsuspected ministry
 Stoops many an angel-wing;
 For a heartache, a heartache,
 Is such a common thing!

A costly thing to carry,
 Of all things, is a heart:
 I never knew I had it
 Until I felt it smart.
 The wandering pain is quick to come,
 To come again and cling:
 Oh, a heartache, a heartache,
 Is such a common thing!

A heart is that which opens
 To trouble's thousand ways;
 An unseen arrow wounds it,
 To halt through all its days.
 An evil-eye may scatter blight,
 A flitting mite may sting—
 No wonder that a heartache
 Is such a common thing!

I've heard of some that carry
 A heart secure from harm,
 But nothing wholly human
 Had ever such a charm;
 For joy, I know, hath still unrest,
 And love still fluttering—
 All the world round, a heartache
 Is such a common thing!

Full-throated are the singers
 That dwell in deepest shade;
 It's less of joy than sorrow
 Our precious songs are made.
 There's never silence in the breast
 That hath so sweet a spring—
 Oh, a heartache, a heartache,
 Is such a common thing!

Entreat who will of Pity—
 Friend, let not you and I!
 There is not heart's-ease growing
 Enough for all who sigh.
 Oh, never mind us, merry world!
 We too will dance and sing;
 For a heartache, a heartache,
 Is but a common thing!

One certain cure for heartache
 My sister Sorrow told:
 "There's naught so quickly healing
 As is the church-yard mould."
 How well it is the very one
 That Time is sure to bring;
 Since a heartache, a heartache,
 Is such a common thing!

Editor's Easy Chair.

THE death of Dickens was a shock, but probably not altogether a surprise, to those who knew him most intimately. It was the peculiarity of his temperament that he seemed always to be under full headway. Whatever he did with his hands or his head he did with his heart also. There are people who never seem to get so far as to be wholly alive. They are like fires that never quite burn, but smoke and smoulder away; or candles that feebly flicker, but never spring into a clear, bright flame. Others burn and blaze warmly and cheerfully from the first, and therefore are sooner exhausted. The very intensity of Dickens's nature should have announced the probability of a comparatively brief career. How busy he was in many ways all the world knows. But how equally devoted in many other ways of private beneficence only those know who came nearest to him.

Even those who did not personally know him well, of whom the Easy Chair is one, may recall many a pleasant instance of his heartiness and profuse humor. One bright June day in London, several years ago, there was a little dinner at Cattermole's, the artist, at which Dickens had promised to be present. The company assembled, and every thing went pleasantly until the dinner hour arrived. There was then some pause of expectation, for Mr. Dickens had not come.

Conversation became a little more difficult; and as the conviction gradually seized the party that perhaps he would not come at all, there was a very obvious disappointment. When it was impossible to wait longer the dinner was served, and the guests descended to the dining-room; but it was curious to remark the blight that had overspread the feast. There was the usual gay murmur of a dinner all around the table, but it seemed as if every body were secretly looking for something or somebody else. Suddenly, when the business was well advanced, there was a loud ring at the door, which every body heard, and the cloud instantly lifted. "There's Dickens!" said several of the guests, with an air of delight and relief; and those who did not say it looked it. The next moment a noise was heard in the hall above, merry voices, pleasant laughter; and then there seemed to be a charge of school-boys or light cavalry down the stairs, and Dickens and his friend John Forster burst into the dining-room, each loudly excusing himself, and accusing the other as having caused the delay.

Dickens seated himself by the mistress of the house, and instantly, as it were, took up the conversation, and carried it along with little sallies of fun; and his "carrying on" with the waiter when he wanted a piece of bread was like a rollicking scene from "Pickwick." It was the over-

flow of the highest animal spirits, and was as electrical in his manner as it is in his books. He felt entirely at home; and the feeling that the solemn English waiter would be confounded by such antics—which, however, did not in the least turn him into ridicule—was part of the humor. Dickens made a mock apology for his delay, founded upon a promise to attend a picnic in the earlier part of the day given by the manager of the Opera, at which Grisi and the other singers, with the dancers, had been present. He sketched them all with a word and a smile. They were all vividly before the company. He took the dinner guests also, as it were, to the picnic. "But oh! the eating!" exclaimed he. "Dear Madame, do you know the eating at an operatic picnic—I mean, of course," he added, with a solemn sly twinkle in the eye, "when the ladies of the ballet attend?" It was sheer extravaganza; and however foolish and flat it seems in the tame telling, it was delightful and memorable. After dinner, when the ladies went up stairs and the children peeped in, Dickens beckoned to them; and seating one on each knee, took a slate and pencil, and drew the most grotesque figures as illustrations of the most absurd story; then sent the young folks away as merry as the elders.

What he did at that table he did in the world. He told the most delightful stories, he made the most harmless fun; and all his story-telling and fun-making were morally healthful. He was a great civilizing and Christianizing power during thirty years. He was one of the men of the most unquestionable genius and positive influence that have appeared in English literature, and meanwhile it was almost as good as his own fun to hear the comments that were made upon the man and upon his works. Sir Piercie Shafton, especially, was obliged to use his pouncet-box whenever the name of Dickens was mentioned. "Such a snob, Sir; really no gentleman at all, I assure you." There were those who thought him a caricaturist—a writer of mere extravaganzas, no artist; a kind of newspaper reporter on the great scale. That last criticism Dickens himself would undoubtedly have accepted. For the business of the great novelist is to report human life and character as they daily appear; but his genius makes his reports the best of literature. As for caricature, every genius must follow its own law. Miss Austen finished each of her exquisite miniatures of character with an airy-fine delicacy. They are exact and natural and agreeable, but never typical. They have not named and classified human nature for us. The work is so elaborate and smooth that you may bring your eye close to the surface and yet you do not see the stroke. But however broad and coarse the touch of Dickens may seem, the effect is wholly lifelike, and the proof is the universal acceptance of the type. Common conversation and current literature reflect the humor and the wisdom of this genius as the streams and lakes reflect the bright sky.

In the Sistine Chapel at Rome, if you go close to the huge fresco of the "Last Judgment," you are lost in amazement that such a mass of heavy color should be called the greatest picture in the world. But if you will step to the other end of the chapel and look at it, you will

acknowledge that there is no greater. So Dickens's power is felt at a distance, so to speak. His fidelity is approved by the general effect he produces. It is often said, for instance, that he could not truly describe what is called "society;" and that in this respect one chapter of Thackeray is worth all that Dickens ever wrote. But is not the difference merely that Dickens offers the plump, incarnate fact, while Thackeray delineates it in detail? There are plenty of Lady Kews, for instance, upon the larger or smaller scale, in every highly artificial society, and there is perhaps no Mrs. Merdle to be seen any where. Therefore we say Thackeray, in the "Newcomes," really holds "the mirror up to nature;" while Dickens, in "Little Dorrit," creates a monster and labels it nature. Now the impression produced by Thackeray is, that the tendency of what is called "society" is to harden the heart and produce a wholly artificial and repulsive life. He shows us, further, how it is done; and he shows it so skillfully that those who are familiar with the sphere and influence that he describes accept it as masterly. But is not the pleasure confined to them? They follow with delight the amusing fidelity of the work; but that is a purely artistic pleasure, which is not shared by the great multitude of readers. Dickens, on the other hand, presents an unshaded Mrs. Merdle as the representative, the type, of the demoralization and utter artificiality wrought by society. It is recognized and accepted every where. That is what "the million" feel about "society." The book speaks for them and to them. The habitué of society knows that there is no Mrs. Merdle, but he does not reach the next corner upon his promenade without meeting a suggestion of her.

This same characteristic is shown in the delightful Dick Swiveller or Micawber. Nobody ever saw Micawber, but every body knows him perfectly well; and this makes Dickens what is called the story-teller for the million. His spirit is sympathetic with man, not with classes or characters only. In Thackeray there is no technical "low life." He takes us into the kitchen indeed, but that is only the down-stairs parlor. So Scott's sympathy with lords and ladies is never hidden, and Edie Ochiltree is one of the figures of a feudal society. But Dickens deals with general, common humanity. His range is wider, if in particular points his insight is not so deep, nor his grasp so firm. It seems worth while to say so now, not to insist upon comparisons, which at such a height of genius as that of Scott and Thackeray and Dickens are useless, and which seem ungenerous, but because there has been a disposition to be unjust to the real qualities of Dickens. A year ago there was a very ingenious and brilliant depreciation of him in one of the English magazines; and Mr. Justin McCarthy was, he said, surprised to find that in this country Mr. Dickens was praised as he was not at home.

It is the fortune of such a man, however, to be criticised as an artist while he is felt as a power. But let us discriminate. If an extravaganza quickens the charitable heart of a whole people, as Thackeray declared that Dickens's Christmas tales had quickened that of England, he is surely a great human benefactor, whether he be a great artist or not. A recent writer in the *Penn*

Monthly Magazine, at Philadelphia, declares that Dickens

"reproduces the husk and outer shell of the men and women he has met. . . . He is generally a reformer and a disciple of Brougham. . . . He will never again stir the blood of England and America by the gall of his pen, nor terrify venerable and respectable 'barnacles' by his weekly numbers, as Anthony Trollope portrays him in that cleverest of counter-caricatures, 'The Warden.'

'Untimely lags the veteran on the stage;'

and as work after work comes from his pen, the new public look on in stupid wonder, as if Addison were arisen from the dead to continue the *Spectator*. Grotesque wit, clever caricatures, keen mimicry, are here as of old, but the life is not here. The generation has passed out of living sympathy with the writer, and we only regard him with a faint antiquarian interest. It has been stirred by new thoughts which he has not felt; it is agitated by contending purposes and desires which find no reflection in his breast. Let him read us 'Copperfield' and 'Paul Dombey' if he will; but as for his 'Great Expectations,' 'Mutual Friend,' and 'Edwin Drood'—fugh! they are a weariness to the flesh."

Just as these words were published Dickens died; and the feeling with which the news of his death was received is perhaps the most conclusive reply to the general assertion of the article.

For although it is undoubtedly true that so many of Dickens's stories are batteries opened upon actual wrongs, it is not easy to see that they are therefore ruined as stories, or are doomed to the decay that is said to overtake all art that aims at a moral. The question of the direct morality of art is rather a large one. But it is hard to see why "Macbeth" is not a great poem because it is a very plain sermon upon ambition, or "Othello" a true work of art because it shows the deplorable consequences of jealousy. That "Little Dorrit" is not one of the most delightful sketches of character in our literature because it exposes the miseries of a debtors' prison, or that "Nicholas Nickleby" is not a marvelous picture of certain conditions of English life because it crucifies the head demons of boarding-schools, would be extremely difficult to establish.

It is true that the fashion of story-tellers passes away. Every history of literature is a body of dismal proof of that truth. But the influence and the admiration of great genius do not pass away. The mere novelist, the delineator of the temporary forms of society and of persons as affected by them, will gradually become curious as he becomes obsolete. But the story-teller who deals with human nature itself, and who paints human character, which does not lose its freshness with the lapse of time, although he may direct his force at a particular and even transitory object, is not the prey of a changing fashion nor of a whimsical taste. "Don Quixote" is a story with a purpose, but it is told by a great genius, and therefore it is dear to every generation of men. It is a permanent contribution to the realm of imaginative creations, like the dramas of Shakespeare or the tales of Chaucer. And every story-teller, in the degree of his genius, has the same hold of the world. Sterne was not a lovable man. He had no especial humanity. Certainly there was no lofty and generous purpose in "Tristram Shandy." But My Uncle Toby is one of the beautiful figures that the imagination of the English-speaking race will not lose. Sterne will not fade from the common knowledge like Mrs. Behn, or any other story-teller who is already forgotten. It is a great mistake in those who read Scott's novels

thirty years ago to suppose that they are not read now. So our children will read Dickens. And the blithe story-teller who has made this generation rejoice, who has touched with so masterly a hand the deepest springs of generous emotion and of high resolve—who, far more than any other, has been the literary minister of that sentiment of humanity which is the spirit of the age, will not fade from the English heart like a fashion, but will rather be, like Chaucer, one of the darlings of its permanent affection.

When it is said that Dickens was the people's story-teller, how much is said! The word people describes a universal range of sympathy. It signifies no class, but means all classes. It includes, as the old alliterative phrase was, the peer and the peasant. And how immense the service to the general faith in each other which we all really wish to cherish, is that of a man who shows, as Dickens did, that the greatest and most universal popularity, the favor of the most ignorant and of the most educated, may be won without pandering to a single mean impulse, without the least ridicule of noble and generous emotion, without any touch of baseness! What work is so truly lofty as that which, while morally cheering and strengthening all men, also inspires and justifies a deeper mutual confidence? This is the service of Dickens. If he was not a great artist, so be it. If he was a caricaturist, so be it. If he was not a gentleman, again so be it. But he was the most popular author of a time when reading was universal, and popular without a hint of impurity. He was more widely loved than any author has ever been in his time; and he left no man living whose death would be so sore and personal a grief to the English-speaking race as his has been.

Farewell, kind master! generous heart! How many and many in America or in England, gathering roses in that solemn week of June, did not wish that they could lay them upon his grave! For even so, sweet and perennial as June roses, full of all summer warmth and beauty, shall be the memory of the man whose tender touch still makes, and will yet make, summer in a thousand, thousand lives.

PHILOMUSICUS came to town in the heated term of June to do honor to the memory of Beethoven. Since the previous December his mind had been fixed upon the great festival. If he thought of a certain other similar undertaking, in a certain other city, in a certain other last year, for instance, he smiled at praiseworthy provincial efforts, and hoped that in the interests of high art the provinces would repair piously to behold the metropolitan magnificence of commemoration. He had heard, indeed, of the universal preparation in the provincial neighborhood in the previous year. He had himself found in small towns and villages, dependent, as it were, upon the provincial centre, a hum and interest of activity, a vigorous rehearsing and practicing, a constant, deepening pride and enthusiasm, which certainly promised fine results. But he had also seen that the Music Hall was loftily doubtful, if not scornful. There were rumors of anvils and bells and artillery, and, in its severe judgment, triviality upon a great scale threatened the very citadel of classicism in music. Then he remembered the stories of the

event: a triumph wholly out of rule, a success banged and roared and rung out, as it were, but an undeniable triumph, an immense success—for the provinces, thought Philomusicus; but let the metropolis speak!

So, when Fahrenheit marked ninety degrees, Philomusicus, who had retired to the country in May, returned to town to join in the mammoth memorial festival in honor of Beethoven. He chose the day upon which the "Elijah" of Mendelssohn was to be performed; and he observed that permission had been generously given to a famous society of prominent singers to assist in swelling the mighty chorus. Arriving in town, very warm, very moist, very dusty, and not in a strictly pious and reverential frame, Philomusicus bestirred himself to reach the temple of concord.

"Where is the Coliseum?" demanded he at the office of the hotel at which he had alighted.

"In Rome, Sir," answered the affable and gentlemanly and evidently highly accomplished clerk.

"Pshaw! I mean the Rink."

"What Rink, Sir? Skating is out of season," smiled the gentleman in duck, profusely perspiring.

"Where the unmentionable is this great concert?"

"Ah! yes, Sir! Somewhere out toward Harlem."

"How do you get there?"

"Cars, I suppose, Sir."

"What cars?"

"Second or Third Avenue cars, Sir."

"Why don't they say so, then?"

"I'm not on the committee, Sir."

"What time does the music begin?"

"Don't know!" getting very crisp.

"Why don't they advertise?" fiercely.

"Don't know!"

"Who the unmentionable does know?"

Philomusicus shot out this question very savagely, and turned away. He had written for a ticket and paid four dollars for it, and in the burning day the temple of concord was becoming very visionary. He began to feel as if he had secured a front seat at Tadmoor in the desert, with the mercury at invisible altitudes. He went to the door, and gazed with an air of injury up and down the street. "Shine yer boots, Sir?" said a rude boy, whom nothing but the severity of early moral training prevented Philomusicus from riding upon his boot over the curbstone. Then he set forth to find a car. He took the Third Avenue at a venture. It was packed with passengers, and he clung desperately and in great peril to the hand-rail. Every body was very hot, very uncomfortable, very disagreeable. Every body was evidently on the way to honor the memory of Beethoven, so that there was no prospect of any body leaving the car and relieving every body else. The journey was interminable.

"And how are we ever to get back again?" asked Philomusicus of a neighbor, who had evidently lunched upon the cheese of Gruyere.

"Mein Gott! verstand nichts," responded the neighbor, with the best feeling in the world.

Philomusicus took out the advertisement which he had cut from a newspaper, and which he knew by heart. It was a whole column of capitals, but it had no mention of any hour nor of any means of conveyance.

"Was ist das?" asked the Gruyere neighbor.

"Das!" replied Philomusicus, energetically, and indignant with a man who said "das" when he meant "that"—"Das is the programme; and I should like to know, if ten thousand people assemble at the concert, how they are ever to get back to town again, hey? What's to bring 'em? These cars?" And he sneered dreadfully.

"Mein Gott! Mein Gott! verstand nichts," replied the gentleman from Gruyere, evidently full of sympathy, and pitying his own inability to convey intelligible comfort to his neighbor.

Philomusicus stood uncomfortably upon the step of the car until it came near the temple, the Coliseum, the Rink, and reached a seat, and was thankful that, after much tribulation, he was now about to offer respectful homage to the memory of the illustrious master by listening reverently to the performance of the noble oratorio of "Elijah." He dismissed the awful doubt of how to get back again, and abandoned himself to blissful expectations, such as only lovers of music know.

But the Easy Chair will not prolong the melancholy story. Philomusicus was treated to anvils and bells and resounding cannon, but the "Elijah" was not sung. How he returned to the city he has never been able clearly to describe.

"My dear Columbio," he said to a friend, "it was monstrous! I was taken I know not how many miles, in the suffocating heat, reeking with the stench of Gruyere cheese, to be robbed. I was swindled out of my money. I bought a ticket for which they promised to give me the 'Elijah,' and they offered me the 'Quadrilles of all Nations,' or something in red shirts with hammers. They did not even give me a chance to take my money back. But I say nothing of that. I suppose they were sure that when they had taken a man out to Harlem, and provided no means of return but a horse-car with eight thousand other people for fellow-passengers, his powers of resistance, and even of remonstrance, would be gone. My Gruyere friend was quite right. When I think of the great Metropolitan Beethoven Centennial, 'Mein Gott! Mein Gott! Verstand nichts!'"

"Philomusicus," replied Columbio, "I understand it all. I paid I know not how much money for seats to hear the 'Messiah,' and circumstances did not authorize the managers to produce it. But the same circumstances authorized them to keep my money; and when I spoke with the ticket-seller, he said that he had turned over the money, but would sell my tickets for what he could get. It was courteous, but it was not the contract."

The chorus from the provinces is understood to have gone home in disgust. Philomusicus went home in the same frame of mind; nor has he since been able to escape the conviction, that instead of an honor to the great composer, the centennial festival was rather a disgrace to the great city—if not, after all, a mere private speculation.

It is no wonder that Mr. Disraeli writes novels, for his life is like a novel. He has strictly followed Sir Philip Sidney's advice, to look into his own heart and write. Indeed, the most rapid sketch of his own career would seem like the

outline of one of his own stories. He wrote the "Wondrous Tale of Alroy;" but the Wondrous Tale of Disraeli is as striking.

The first scene presents us the brilliant son of a family of Spanish Jews, who fled from the Inquisition to Venice, and who, glorying in their race, took the name of Disraeli. The young man's grandfather came to England a hundred and twenty years ago, was rich, and died at ninety years of age. His father devoted himself with ardor and success to literature, living at his ease; and his son Benjamin, born to comfort, handsome, clever, charming, and ambitious, was early a favorite in society. He traveled in Europe, and studied in Germany, and at twenty-one wrote, in a very short time, and published in the same year with Scott's "Woodstock," the sparkling story of "Vivian Grey," full of satire and wit and sentiment and coxcombry—"serving up" some of the chief notabilities of the time, and plainly the work of a youth who felt his power, and had set his heart upon all the political prizes of his country, which are the most precious and dazzling to the mass of his countrymen, because the renown is immediate and the success tangible. In "Vivian Grey" the youth's poetic imagination idealized to Englishmen the ordinary facts of English life, and gave them a fine Oriental color and flavor; but the keynote of the author's whole career was in it, with a kind of secret, cynical disdain of the aims and the prizes that he desired and extolled.

Young Mr. Disraeli was immediately one of the most famous and popular authors in England. D'Orsay drew a portrait of him, the cynosure of golden youth. Willis describes him, a little later, lounging at Lady Blessington's like a young emir of the Lebanon. His book was translated into all languages, and the author presently crossed to the Continent, and made a long tour in the East. While still absent he sent to England two other romances, "The Young Duke" and "Contarini Fleming," full of the same spirit and tastes and charm as the earlier story. "Contarini Fleming," indeed, is a delightful romance. It is like a characteristic poem of Byron's told in equal prose. That the aim of the young Mr. Disraeli was a political career had been evident from the first, and when he returned he tried to get into Parliament, but failed. Upon the hustings he was charged with friendship for O'Connell. He warmly denied the charge, calling O'Connell "a bloody traitor." The Agitator, who acknowledged no master before the people, retorted: "For aught I know, the present Disraeli is the true heir-at-law of the impenitent thief who died on the cross." So the Hebrew and Roman flints struck fire.

But the prince of golden youth, Disraeli the younger, as he was fond of calling himself, still brilliantly writing tales, letters, and pamphlets, did not enter Parliament until the first year of Victoria; and, upon his entrance, the famous, witty, haughty, self-possessed author failed grotesquely, failed absurdly, as an orator. The House of Commons was not merely indifferent—did not only read and sleep and slip out to dine while he was speaking—but it roared at him and laughed him to scorn. It was a test of the young man's quality. Instead of sinking into his seat, abashed, mortified, confounded, silenced, with his political career ruined, he shook

his fist defiantly at the House, and thundered out: "I am not surprised. I have tried many things, and in each I have at last succeeded. I sit down now, but one day you shall hear me." The House halloed, and Disraeli the younger took his seat, undaunted. He knew his future subject, if it did not recognize its future master; and he kept his word.

For three years he sat silent, but he still wrote, and doubtless studied hard; and the stories of "Coningsby" and "Sybil" were even more popular than the earlier tales. They were political, and the characters were familiar figures in England thinly veiled. They, too, had the earlier charm of touching the traditional forms of British Toryism with a romantic light. But there was the same alien under-tone, a kind of persiflage so subtle as to be Mephistophelian, or perhaps even, unconsciously, the protest of a superior intelligence against its own aims and absorptions. The talent of Disraeli the younger created a fanciful, foolish party known as Young England. Its doctrine was very much that of Carlyle's Niagara, namely, that the nobility alone could be expected to produce a millennium in the United Kingdom. Lord John Manners wrote some doggerel about it. He was willing that laws and learning and art and science should die, "but spare, oh, spare our old nobility!" The aristocratic youths of this party were what might be called ritualistic Tories; and the dark-eyed Disraeli the younger was naturally one of their leaders, as his political novels shadowed forth their tenets. The world of the stories was May-fair. The moral seemed to be: "Use the world as you best can. Strike for the great prizes, and remember that in England the great prizes are political. Get success, whatever you lose. Put your lances in rest, gentlemen, and follow me!" And away swept the bold leader, a magnificent Murat, charging right and left; and always in the thickest of the fray there were his nodding plumes and golden trappings and gorgeous costume; and always also the careless, half-cynical smile at the mêlée.

"From underneath his helmet flow'd
His coal-black curls as on he rode,
As he rode down to Camelot.
From the bank and from the river
He flashed into the crystal mirror,
'Tirra lirra,' by the river
Sang Sir Lancelot."

But of the steady, old, evangelical Tories Sir Robert Peel was still the chief. Yet the crown hurt him. It sat ill upon him. He was too wise. In a certain sense he was too truly an Englishman to be a Tory, for Toryism depends much upon the imagination. When the Corn Law debate began Sir Robert felt instinctively what his course ought to be, and knew that it could not be that of his party. Therefore, the man who represented the common-sense of the most common-sensible of nations, and who had the same kind of supreme talent, without genius, in politics that the Duke of Wellington had in war, ceased to be the true Tory leader, and was succeeded by the most imaginative politician in England, the most un-English of Englishmen. But meanwhile Sir Robert, the great Commoner, the Prime Minister, the master of the House, the typical Englishman, feared no onsets like those of the young Hebrew, who a few years before was overwhelmed by an

uproar of ridicule, but who now came down to the Commons crammed with all the blue-books in the kingdom, and dazzled the eyes of the country as he marshaled his serried ranks of statistics, and pierced the grave Minister with his agile and scathing and scornful wit, like the jeweled Saladin, with his sharp and flashing cimeter, nimbly curving and careering around Cœur de Lion. Disraeli the younger had disappeared, and Benjamin Disraeli, Esq., the only man of whom Sir Robert Peel was afraid, was a man of as fair a future as any in England.

After Sir Robert was dethroned, but not disgraced, the Easy Chair was planted one summer morning upon the deck of a steamer going to Hamburg, and asked its fellow-passenger John Bull why Disraeli's party had not put him in office. Mr. Bull replied, with emphasis: "No Jew novelist will ever enter the British Cabinet;" and the worthy gentleman paused suddenly, as if mentally crossing himself at the mere thought of such sacrilege. But within two years of that morning there was a stately procession in the streets of London. The windows and sidewalks were crowded with people staring at the handsome equipages, the liveried footmen, the superb toilets. In one of the fine coaches, clad in official robes, and looking out at the carriage windows, with black eyes overhung by clustering curls, was the Hebrew gentleman who had written novels and been laughed down in the House of Commons. The state carriage, with outriders and gay liveries, drove to Buckingham Palace. Perhaps the gentleman inside remembered certain scenes in certain popular political novels. It was Vivian Grey holding trumps. It was the Right Honorable Benjamin Disraeli going to kiss hands as Chancellor of the Exchequer.

From that time he has been the actual and efficient leader of the Tory party. The Earl of Derby was its titular chief, and when he took office Mr. Disraeli was always his lieutenant. After the Earl's last retirement, the Queen summoned the author of the wondrous tale of "Alroy" to form a Cabinet. He who had been so fond of describing dukes and other noblemen now made them. The descendant of the Jewish refugees from ecclesiastical ferocity now nominated bishops. The author of Vivian Grey and of all the political stories was now, by his own skill and resolution, the chief figure in the life he had loved to portray. He who had opposed Sir Robert Peel now measured swords with Sir Robert's most illustrious disciple, Mr. Gladstone. His audacity even outdared the Liberal leader, and for a day he crowned himself with Gladstone's laurels. At last, inevitably, he yielded to the man who represented the tendency of English political development; but, in retiring, the laureate of the aristocracy refused to be made a viscount.

And now at sixty-five Disraeli the younger writes, with a difference, the novel that he wrote at twenty-one. It is all perfume, mother-of-pearl, and gold spangles; all satire, rhetoric, and romance, but it lacks the exuberance of wit, the delicacy, the pathos, the purple light of youth, that make "Vivian Grey" memorable. It has the old familiar air of the world and of high society. Nobody has less than a million a year; and the only embarrassment is to decide in which of the most stately and ancient and picturesque

of castles to pass a week in summer. It describes a country in which artists entertain their friends in Turkish pavilions, and refresh them from gold plate, own islands in the Mediterranean, to which they sail in their yachts, and marry the daughter of the Constantinopolitan Cantacuzene. It is a book which constantly implies that the author believes his readers to be of those who delight in the *Court Circular*, and who find sweet consolation in learning that yesterday Prince Bulbo took pony exercise, and that in the afternoon Princess Hunkamunka walked upon "the slopes."

Meanwhile the real significance of "Lothair" is not that a retired English prime minister writes a novel. Far from that. You may think the story foolish or delightful, and its author a genius or a charlatan. But its motto might well be Hamlet's father's: "Remember me!" For he has remembered. The Roman Church drove his ancestors from Spain. With defiant pride they chose a name that marked them Jews of Jews. And now their descendant, having won every prize in the most powerful of Protestant states, turns in the fullness of his renown upon his old enemy, and haughtily cries to Rome, "You drove me and mine from moribund, miserable Spain! Begone from England!" "Lothair" is the Jew turning Rome out of England. The author skillfully hints and sketches—for nothing more is artistically possible in a novel—the various methods, intrigues, blandishments, appeals, arguments, coercions, cajoleries, and falsehoods by which the Roman Church is believed to entice or entangle, to terrify or subdue, its converts.

He offers, indeed, no argument which would deter any young English nobleman, even were he so very sentimental as Lothair, from going over to Rome; but he very plainly insinuates that those who manage conversions to Rome have the most mercenary motives in view, and are wholly unscrupulous as to means. The heroine of the tale, Mrs. Colonel Campian, the Italian wife of an American, of the Southern States, who, having lost every thing in the rebellion, has become the spouse of the Pythoness of Roman republicanism—Mrs. Campian, who lives in delicious ease in England, and falls disguised as a soldier in Garibaldi's assault upon Rome, is one of the personages who must not be looked for beyond the perfumed page of Disraeli. The hero is in love with Mrs. Campian, the Italian free-thinker and red republican; with the Lady Corisande, the fair daughter of a proud English ducal house, and devoted to the Low English Church; and with Clare Arundel, the loveliest and choicest of Roman Catholic maids in Britain. Not to speak lightly, the hero is and is not in love with all of them at once. He is a kind of "little joker" of a lover. But as there may be those who have not read the story, the Easy Chair will not tell whom the much-wandering Lothair marries at last. Let them be assured that here is a novel as different as possible from the stern actual story of everyday life to which we are accustomed. It is a kind of fairy tale. Even its approaches to reality are so remote as to be glimmering and soothing. It is an aromatic reverie in a boudoir.

But if, upon the publication of this story, *Blackwood*, the mossy warder of ancient Toryism, turns and rends the most brilliant and able of living English Tories, in an article which restores the

old lustre to its pages, it is simply because the feeling of Mr. Bull upon the Hamburg steamer has been always the latent feeling of his party. It could not refuse to follow its only capable and audacious leader, but it inly chafed, and felt with scorn that an outcast had come to the throne. The cardinals of the blue blood were kneeling and kissing the foot of a pope who was born a muleteer. That is merely to say that Disraeli, in all these forty-five astonishing and picturesque years, has not inspired confidence. In the midst of his most dazzling political triumphs, as in the best of his books, there was always the same feeling that he wore a mask. The same distrust stole in and asked, "Does he really believe what he says? Has he any principles? Is he a Tory from conviction, or a soldier of fortune, with his sword at the service of the longest purse? The cynic strain, the exquisitely airy persiflage of the stories—what do they mean? Was that the courtly smile of Mephistopheles? Is the man mocking us?"

Yes, it is impossible not to feel that the son of the ancient race has repaid this distrust with superb disdain. His genius is alien in England. He is essentially lonely in the country which he has ruled, and all whose prizes that he sought he has seized. His is the air of a man who has solved "the Arian mystery," and who can show the proudest aristocracy and the most finished civilization a splendor and an antiquity which dwarf and deride them. He feels that the Hebraic tradition is the foundation of Christian development. He sees all Christendom named from the incarnation in the elder race. He finds the genius of that race unworn and conspicuously efficient in the life of to-day. He muses, like his Tancred and Contarini Fleming, until the busy West dissolves, and the East seems to him the sole fount of art and wisdom and progress and repose, and all else a garish modern hubbub.

He sees, and finds, and feels all this—or he seems to. He is a consummate artist in politics and literature, and therefore in many ways inscrutable. It is true that his Toryism is suspected; but it would be very remarkable if he were not a Tory. He abandoned the traditional policy of his party—but it was to save his party. The English Liberals did not, and do not, trust him. Why should they? In this very book he flouts and insults them. And if the Tories suspect that he is satirizing them—is it their fault?

"'Tirra lirra,' by the river
Sang Sir Lancelot."

THE Easy Chair receives with pleasure the protest of its correspondent, and heartily agrees that the editorial responsibility implies and demands the utmost patience and consideration for Scriptor. But is not gentle toleration of bores, whether of pen or tongue, a virtue which entitles to the Seventh Heaven?

THE FIERY PARTICLE.

A WORD TO MR. EASY CHAIR.

CHIVALROUS courtesy is not extinct. A fashion (an unsightly one) to pretend that it has passed away with other Old-World traditions prevails. But, positively, the quaint, picturesque old creature survives. This conviction induces me, Carolus Cambrensis, a Contributor, to entertain the preposterous hope that Mr. Easy Chair will allow me a footing on his hearth-rug, or that vacant chair opposite to his own, that I may

join issue with him in a courteous passage of arms, on equal terms. The tilting-ground is to be found in the May number of *Harper's Magazine*, and is entitled "A word to Contributors."

Impregnable as Cader Idris* are the foundations of the Easy Chair; incontestable the dictum of him who sitteth thereon. Granted: Scriptor is inexperienced, faulty, feeble, puerile. Scriptor attributes the inaccessible configuration of Olympian summits to divine antagonism, in short, to "personal feeling." Scriptor, like all little people with little to lose, waxes apprehensive of the loss of his MS. He chafes his fretful soul at the sublime repose of Olympus; he adjures Jove to "go to the ant;" reminds the Thunderer that "the early bird catches the worm." Scriptor believes that the gods have violated the Constitution, conspired against him in the Star-Chamber, and denounced him without benefit of clergy, trial by jury, *habeas corpus*, or any other of those ingenious resources devised for their protection by an ill-used race.

Sad, though true! And absurd enough, till we look closely into the case of Scriptor. He is very young. ΔΕΙΔΩΝ ΤΟ ΤΕΚΕΙΝ, O Zeus! Lingering throes of parturition still communicate a sympathetic quiver to that flaccid brain. Yet, O mighty parent of Pallas, these mortal failings do but obscure the light of a divine intelligence, small though it be. The mind, "that very fiery particle," sometimes will "let itself be snuffed out by an article," just and not ungentle though that article may be. "Parce, precor, precor, non sum qualis eram." Scriptor, the parent of an article, an ode, a narrative, "declined, not being available," is less even, less in self-control, endurance, dignity, than poor little Scriptor when his brain labored with that pigmy offspring. He is puzzled, hurt, humiliated, spurned. Perchance with the poet's far-reaching eye, in a fine frenzy rolling, he sees Ganymede by the chair of Jupiter, or descries Vulcan limping along some starry space, and compares ages with that one, legs with this, to his own credit. On a sudden the poor worm discloses "venom of the folded snake." Jove, invulnerable, commiserates this peevish transformation, and suffers the poor morsel of animated earth to return in peace to its pristine nature and habit, when, perchance, it yet may burrow into some delicate bulb, and suck thereout no small advantage.

Metaphors, like worms,† Mr. Easy Chair, are obscure in their origin, progress, and applicability to any useful end, except the bill of the aforesaid early bird and the prehension of a fish. Nor will I, for many more golden minutes, obscure the seat of this opposing chair. But again I crave your clemency, your patience. If the seed decay not, how shall it germinate? If puerile Scriptor do not experience the decomposition of vermal vanity, of delusive hopes, and self-conceit, how shall the living Author arise? Is it not even within the limits of the possible that the fretful puerilities of Scriptor, hurrying his imaginary Pegasus along the Olympic course, have raised a cloud of dust as high as the front of Jove himself, and so with human folly obscured for a moment godlike wisdom?

Do not reject my plea with a dictum that the Author, poet-like, is born, not made. One I remember who now is great, then small, callidâ juvenâ. He then held that baleful theory as an article of faith. Separating himself from his fellow-men by long hair and Byronic collars ("Oxford gills" were then "your only wear"), he declared himself to be a born Artist, Author, Word-painter. Weaving for himself a *nom de plume* out of the several letters of the words NASCITUR NON FIT, he signed himself "Tafis Rinnon Tuc," and became a thorn in the flesh to buffet editors. Of course there existed a dark "conspiracy to keep him out." His luck, his "very extraordinary luck" was that "nothing he ever wrote was accepted." The luckless years waxed and waned. So did the inconstant moons. The rains of deferred hope, disappointment, and vexation fell. They fell pretty heavily. Thought and feeling, drop-

* Cader Idris, the chair (or throne) of Idris.

† To illustrate the value of a scrap of immortality apparently buried in ephemeral matter, I may quote a saying of Professor Sedgewick, that his introductory essay to the study of the Paleozoic Rocks, when introduced to Europe between the tremendous preface of one German professor and the no less portentous appendix of another, was "like a grain of wheat between two millstones." Now the essay is a classic. Its prodigious foster-parents are lining ancient trunks.

‡ A critic might object to this similitude as inapt. To such a one I would suggest his reading the word "metaphor" for "worm" in Doctor Johnson's definition of the piscatorial pursuit. The general tendency to play "the early bird" with other authors' metaphors is too obvious to require notice.

ping like autumn leaves from the trees of knowledge and experience, formed a vegetable mould about and above him. Tasis R. Tuc sank in the soddened mass, vanished, decayed. After a while a bright young author germinated, bearing indications of leaf and bud.

An editor, somewhat dazed and weary of the glorious summer made by writers high in the popular zenith, sought the cool forest glade, and found this resurrection. Of Tasis R. Tuc's very extraordinary luck, of his hair, his collars, of those buried years, of those dreary rains, of all that vegetable mould, of the born artist's death and decomposition he knew nothing, but guessed much. He found a young sapling, vigorous and sprouting. He transplanted it with care to his well-tended shrubbery. He guarded and fostered its growth. And now, Mr. Easy Chair, multitudes find shelter beneath its spreading branches from the noon-tide glare of public life; find repose from the din of commerce and of politics; find a shadow of cool reasoning (played about by leafy smiles and whispers) from polemic heat. And all these happy loiterers combine to extol the wisdom of Jupiter, who discovered in its tender infancy this glorious tree, and rescued it from the thousand mischances which beset a sapling in that struggle for light and air and life which is common alike to the children of the forest and the sons of men.

MR. FITZ HUGH LUDLOW, well known to the readers of this Magazine, in which many of his most brilliant papers have appeared, sends to the Easy Chair the following letter:

NEW YORK, June 15, 1870.

DEAR EASY CHAIR,—To-day sailing for Europe, an invalid, with all the uncertainties of return which attend such a one, may I ask to say through you a word or two, in parting, to the class of our suffering fellow men and women for whom, as you know, I have spent a large part of my life—all that part, indeed, which is usually the leisure of a laborious profession?

In the book published two years since by the Messrs. Harper, under title of "The Opium Habit," whose earlier chapters were edited by, and the two closing ones original with me, I gave to the public as condensed a statement as my limits made imperative of the course of treatment which many years' medical and scientific study, together with an experience among opium-eaters scarcely to be surpassed in extent, had taught me was the safest, quickest, least painful, exit from a hell over whose interior penetralia at least Humanity had for years concurred to write, with a sigh, "*Lasciate ogni speranza.*" There I showed the possibility of a release, and, so far as could be done in such broad touches, sketched the means. There I promised a salvation I had repeatedly seen effected, and accumulated all the incentives and encouragements to seek it which I knew; but with these I was obliged to preach a Spartan—say rather a Christian—courage such as few women and fewer men can summon to their aid in the protracted agonies of the contest by which the opium-eater must win his freedom, even under the many palliating and relieving circumstances which I there revealed. I had not then found what I confess has been one of my life's ruling passions—a very *agony of seeking* to find—any means of bringing the habituated opium-eater out of his horrible bondage, without, or comparatively without, pain. Thus far I had failed in my wrestling interrogations of Nature for the antidote, the substitute, the agent, whatever it might be, by which opium might be so gradually replaced and eradicated as to present the slave, some bright celestial morning, with his manumission, before he could feel the blows which struck the shackles from his feet.

I ask you, dear Easy Chair, to rejoice with me that, in all probability, that wonderful discovery has now been made; that henceforth the salvation of the opium-eater, like that from any other chronic disease, may be accomplished in such a way that the cure brings not an increase but a relief of the original suffering; that the process of giving to him his new self may now be not a terrible volcanic throes that tears soul and body to pieces, but a gentle, painless change, like those milder forces of nature shown in the progress of the seasons, the unbinding of the frost, the return of the sun and gentle rains. A year ago I was almost in despair of such a blessing; but I must believe—must declare—what my eyes have looked upon.

I have had under my care a patient who had been an habitual user of opium for years—whose daily rations of morphia had now reached the terrible amount of thirty grains (a case quite astounding to minds not experienced among opium-eaters, but having numerous parallels in my acquaintance)—who abandoned the drug at once in its every form, and never touched it again from that moment (four months ago) to the present time. I have seen him going on with his daily avocations, suffering no pain which required him to lie down for a single day, feeling no temptation to seek opiates, although he constantly carried about his old morphia powders on his person, and had made the un-Spartan resolve to resume his relief if the new experiment for a moment failed. He was expecting anguish all the time for his first month of trial; but it never came, has not come, and is most unlikely to come now that, after all these months, his digestion has regained its vigor, his step its elasticity, his eyes and cheeks the freshness of health. Besides this case I have seen numerous others, when their various complications are considered, no less remarkable, and from many more have had letters, all joyfully unanimous in the testimony that their exit was painlessly accomplished, and that the opium-craving was not only appeased, but quite eradicated, by the process of cure. I have been compelled to confess that the life-long object of my search seemed most marvelously accomplished.

Were I staying in this country, instead of going abroad as my last chance for life and health, I would joyfully continue to answer the correspondence which floods me on this subject from all parts of the Union, and, at any expense to myself, make known this salvation to the most sorrowful sufferers of this world. Were this an article, instead of a communication receiving your hospitality, dear Easy Chair, and were Harper's a technical magazine, in which I could develop the process of substitution and elimination by which this marvelous blessing is accomplished, I would now speak more at length. It is now sufficient to say that the discovery is one which ranks in importance to human weal and woe with vaccination, chloroform, or any grandest achievement of beneficent science which marks an age. The many who can bear me witness how willingly I have responded to all inquiries for help to the opium-eater, by visit or letter, will be glad to know that during my absence such inquirers may apply to my noble-hearted and philanthropic friend, Mr. Henry Read, of Lowell, Massachusetts, who possesses all my information on the subject, and has kindly consented to let me roll off upon his shoulders the loving but heavy burden of answering such questions as might, if I staid here, be addressed to me.

By letting me say these parting words from your kindly elevation, my dear Easy Chair, you will bless thousands of sorrowful souls, and send one away to Europe far less sorrowful, because most hopeful, for them.

Your friend,

FITZ HUGH LUDLOW.

Editor's Literary Record.

NOVELS.

AUERBACH has been called the Charles Dickens of Germany, though with the least possible justification, since between the vivid painting from nature of the English master and the abstruse metaphysics, scarcely concealed beneath the thin guise of a romance, of the German, there is the least possible similitude. With more accuracy SPIELHAGEN might be described as the Walter Scott of Germany. He is a more

dramatic writer but a less profound thinker than Auerbach. His characterization is not less clear and distinct; his incidents and groupings are more effective. Auerbach often drags, Spielhagen rarely. One must study Auerbach; he may read Spielhagen. In his last novel, *Hammer and Anvil* (Leypoldt and Holt), the drama trenches on the melodrama; yet, though it approximates dangerously the edge of the sublime, it never degenerates into the ridiculous. Professor Lederer,

the wild Zehren, his brother the superintendent, the gruff-voiced, tender-hearted warden Süssmilch, the grim-faced, sooty-handed, warm-hearted Klaus, and George Hartwig himself, the subject of the autobiography, are all drawn with a master's hand. The old ruined castle, the wild life among the smugglers, the chase, the treachery, the capture, the escape, and the conflagration, are all wrought up with a power which insensibly reminds the reader of Walter Scott; with a descriptive power less vivid, indeed, but with a subtle penetrating analysis of motive and feeling superior to that of the great Scotch romancer. And the transition from the wild life of the woods to the quiet life of the prison renders each epoch in the story more effective by reason of the contrast between them. But Spielhagen's romance is better than his philosophy; his arrow is better feathered than aimed. He is the apostle of the idea of liberty, but of liberty in its most absolute and unlimited sense—of liberty as that word is interpreted by a German radical. So long as he confines himself to inculcating, as in "The Hohensteins," political freedom, he carries with him our sympathies, though not always our judgment, nor are we at all satisfied that the House of Hohenstein fairly represents the aristocracy of Germany, or Wolfgang and Peter the common people. But when he comes to teach—as he does, impliedly, in "Problematic Characters" and its sequel—that marriage is also despotism, and that one should be free to follow the course of his unchecked passions; or, as he does in "Hammer and Anvil," that the inmates of the prisons are unfortunate rather than guilty persons, and throws a halo of glory around the wild life of smuggling and freebooting, he writes more of a declaration of independence than we are prepared to assent to. It is true that the wild Zehren is killed, his daughter elopes, his castle is burned to the ground, and young George Hartwig escapes capture only to surrender himself to the authorities; but, despite this series of misfortunes, the sympathies of the reader are enlisted for the runaway boy, and against his stupid dolt of a teacher and his inflexible old Roman of a father; and the moral influence of a story depends not upon the fate which overtakes its characters, but upon the sympathies which are awakened in the reader's breast by the story of their lives. We should abhor Bill Sykes if he had escaped, and Old Fagin if he had been acquitted on the ground of "moral insanity," just as much as we do now; while the pitiful fate of the betrayed Malte von Zehren enlists our sympathies for one whose crimes we forget in the story of his misfortunes. Old novel-readers will find much entertainment and no harm from "Hammer and Anvil," but it is not a book for boys—a verdict from which we are not swerved by some admirable passages of genuine Christian philosophy.

As we took up CHARLES READE's last novel, *Put Yourself in his Place*, as a companion to an otherwise solitary dinner, the friendly waiter who attended us remarked, by way of opening a conversation, "That novel's all the rage, Sir; all the gentlemen and ladies has it, Sir;" and so, in fact, we found on looking round the steamboat on which we were traveling. Nor, on opening the book, were we surprised to find it popular. It is never easy, having taken up any one of Charles Reade's novels, to lay it down unfinish-

ed, though you often chide yourself for submitting to its singular fascination. This you may read without self-condemnation. There is a purpose in it, a strike against "strikes," though the purpose serves the novel, not the novel the purpose. It is sensational, of course; every thing Charles Reade writes is so. The incidents are quite impossible; but the heroism is not the mock-heroic. In this it differs from "Foul Play," as in its touches of genuine and pure sentiment it differs from "Griffith Gaunt." We laid the book down with the conviction that, though it could not rank by the side of "Edwin Drood," or even "Lothair," it deserved its popularity—was, at all events, the best product thus far of Charles Reade's pen. Harper and Brothers issue it in three editions, all fully illustrated.

Only a Girl (J. B. Lippincott and Co.) is an old story newly told. It is a book in every respect the opposite of the sensational—depends wholly for its interest on delicacies of color and drawing that can not be represented by any *critique*, nor even by any extracts that are not voluminous. It is from the German of WILHELMINA VON HILLERN, and is full of German quaintnesses, without being obscured by German mysticism.—In the *Vicar of Bullhampton* (Harper and Brothers) Mr. TROLLOPE's invariable heroine plays off one lover against another in the usual Trollope style, through three hundred pages of what is called romance, probably for the all-sufficient reason that it contains neither history nor philosophy nor poetry enough to give it a right of classification any where else.—The opening pages of *Breezie Langton* (D. Appleton and Co.) are so full of slang, both masculine and feminine, that we were unable to penetrate further than the fourth chapter.—D. Appleton and Co., who publish the last three mentioned books, continue their edition of GRACE AGUILAR's works, by the publication of *Woman's Friendship*, and *Home Scenes and Heart Studies*, the latter a collection of short stories good for Sunday reading, a kind of literature which is not too common.—We have three historical novels: *Antonia*, by GEORGE SAND (Roberts and Brothers), a tale of the last days of Louis XVI., in which history is quite subordinate to romance, and romance is the instrument of inculcating a semi-socialistic philosophy; the *Caged Lion*, by Miss C. M. YONGE (D. Appleton and Co.), a story of the times of James I. of Scotland, woven of double sets of threads, half romance, half history, with a charmingly frank and simple confession in the preface, which enables the reader to unravel the whole pattern, and say with precision what is real and what is imaginary; and Miss MUHLBACH's *Queen Hortense* (D. Appleton and Co.), which is, after all, only a history with a little imaginative filling in, but certainly not enough to make the drafts on the imagination very severe. Historical novels, as Miss Muhlbach writes them, are a novelty in literature, being, in fact, novels without imagination, and history without facts.—Almost simultaneously with the publication of Miss Muhlbach's novel, "Queen Hortense," the Harpers issue, as an addition to their "Red Histories," the romantic story of the same queen, from the pen of JOHN S. C. ABBOTT.—*Driven to Sea* (H. B. Fuller), neither a novel nor a juvenile, but half-way between the two, is neither very fresh in design, nor very striking in execution, nor

very healthful in its influence on the "boys of the period," who do not need to be taught that it is a glorious thing to get up a rebellion against home authority, and run away when it gets too strong for them.

RELIGIOUS AND PHILOSOPHICAL

PROFESSOR COCKER'S work on *Christianity and Greek Philosophy* (Harper and Brothers), somewhat inadequately described by him as a treatise on the "relations between spontaneous and reflective thought in Greece and the positive teaching of Christ and his Apostles," is the work of an original and independent, but not audacious thinker, and is written in a style whose clearness of expression almost rivals that of Sir William Hamilton. The ordinary estimates of Grecian religious philosophy are of two very opposite extremes: that of the half heathen scholars who attribute all that is admirable in Christianity to Greece; and that of the over-religious dogmatists who imagine that they honor the teachings of the Bible by endeavoring to demonstrate that no people ever possessed any glimmer of light or truth except such as they derived from its pages. We are assured, on the one hand, that the fatherhood of God which Christ revealed he borrowed from the philosophy of heathenism; and, on the other, that such notions of a God as the poor heathen Greeks possessed they obtained alone by traditions handed down to them from Hebrew sources. Professor Cocker holds a middle ground between these two views of the origin of religious truth—a ground which he expresses in the following thesis: "The universal phenomenon of religion has originated in the *a priori* apperceptions of reason and the natural instinctive feelings of the heart, which, from age to age, have been vitalized, unfolded, and perfected by supernatural communication and testamentary revelations." This thesis may perhaps be regarded as the text of his book, which is by no means devoted to a study of Greek religion, but which also compares with it the various theories of the origin of religious belief as exhibited by modern authors; and in the comparison discusses at considerable length some of the chief religious problems of the present day. His work will probably find its principal readers among scholars; and it is written, certainly, alone for those who are accustomed to think while they read, and to read for the purpose of stimulating thought. Nevertheless it does not assume, but affords a knowledge of Greek philosophy, and, apart from its value as a contribution to theology, will prove useful as a reminder to scholars and a compendium to others of so much of Greek philosophy as bears upon the doctrines of the Christian religion. The author gives evidence of that kind of learning which comes from long familiarity with a subject, and which no process of "cramming" can supply; of a learning, too, which, like that of Sir William Hamilton, is thoroughly digested, and quickens instead of impedes his own independent thought-power. We welcome his work as a valuable and permanent addition to American philosophical thought.

From the political discussions of the daily press, always partisan and often personal—from the debates of astute senators rarely able to rise above a discussion of party platforms, and avowedly more anxious to secure or to retain the su-

premacy of their party than to ascertain sound political principles or to administer the affairs of government upon them—it is refreshing to turn to such a book as *The Nation*, by E. MULFORD (Hurd and Houghton), which resolutely leaves unmentioned the transitory political issues of the day for a thorough, a clear, and a comprehensive discussion of the great principles which underlie—or, rather, which should underlie—all national life. What is a nation, what its true origin, what the source of its authority, what the relation of the people to the territory they occupy, what the basis of individual rights, what the ground of national sovereignty—these are some of the problems to which the author has brought a rare combination of talents, wide and varied reading, a strong and acute mind, a clear but condensed style, and a warmth of earnest patriotism foreign to most treatises on political science. The nation, according to Mr. Mulford, is neither a necessary evil, nor an historical accident, nor a jural society, nor an economic society, but a conscious moral organism; its origin is not in the might of the strongest, nor in the social instincts of humanity, nor in an imaginary social compact, nor in the false motto *Vox populi vox Dei*, but in the ordination of God, who, from the beginning, has set men not only in families but in governments; the right of property rests neither on immemorial possession nor on the acquisitions of labor, but on the fact that it is an endowment of God for the better fulfillment of the individual mission, for which purpose alone one has any real right to hold any property. Such are some of the positions which the author maintains with vigor—positions which may serve to illustrate at once the thoroughness of his treatment and the religiousness of his spirit. Avowedly a birth of the civil war, his book deserves, far above any thing in our literature, to be accepted as the expression of the American idea of nationality, and to be made the text-book of instruction in the fundamental principles of political science in our institutions of learning. Its appearance is the first and strongest indication that we have seen, though by no means the only one, of a tendency toward a reaction from the dominion of trading politicians, and a restoration of something like statesmanship founded on principle. A striking illustration of the author's independence of all partisan relations is afforded by his twelfth chapter, in which he maintains, on the one hand, that the right of suffrage is a natural right, inherent in every member of the nation who is a person (impliedly male or female), irrespective of property or literary qualifications; and that, on the other hand, while "the Republic is indeed to welcome the stricken and oppressed for conscience sake out of every land, and is to be as the city whose gates are open by night and by day, and not the least among its titles is that of the home of the pilgrim," yet to "admit to immediate representation whoever may come to its shores, who have no consciousness of the aim and destination of the nation, and no participation in its political spirit," is "no more just than to refer the decision as to the direction of a house or the disposal of an inheritance to some transient guest who may come to lodge overnight or take shelter in a storm." Mr. Mulford's analogy is at fault as regards our adopted citizens, who come not to lodge over-

night, but to become members of the household ; but we admire the intellectual independence of the man who wields so keen a sword with a double edge that strikes against all parties with impartiality and with neither fear nor favor, except the fear of being false to his own principles and his own convictions.

We have now, in *The Forty Days after Our Lord's Resurrection*, the sixth and closing volume of Dr. HANNA'S "Life of Our Lord" (Robert Carter and Brothers). The life of Christ has been made the text for so much irreverent criticism, and for so much of irrelevant dogmatizing—it has been so customarily written with a controversial purpose, and so rarely by an unprejudiced pen, that we gladly welcome such a work as this for the spirit which imbues it. We are not surprised, comparing it with the absurd romancing of Renan, and the laborious mysticism of Lange, and the ecclesiasticism and wordy devotion of Ellicott, that it has received the highest encomiums from the English press. And yet, despite its charmingly simple, though never brilliant style—despite its tender and reverentially affectionate tone—despite its freedom from all parade and pedantry of learning, and its rigid excision of all critical discussion—despite, too, some very pleasant and, on the whole, profitable homilies, in which the author never hesitates to indulge on occasion—we have laid down with disappointment the work which we took up with great expectations.

A true life of Christ must throw some light on either His inner or His outer life—that is, it must either give some new and fresh conception of His character and His teaching, as did the author of "Ecce Homo," or it must interpret both, by giving the reader a picture of the manners and customs of the age in which Christ lived, as Mr. Abbott has done in his "Jesus of Nazareth." A critical defense of Christianity, like Neander's work, is not a true life, though it may be in form a chronological narrative ; neither is a series of homilies, however admirable, though they may be based on a harmony of the Gospels. Dr. Hanna has not, we think, written either the inner or the outer life of Christ. He throws very little light on the latter. We turn to the account of the trial. There is little or no information concerning the forms of Jewish procedure. We turn to the story of the marriage in Cana. There is no graphic portraiture of the Jewish wedding ceremony. There is very little of history in the narrative which is not to be found in the Gospels themselves—almost nothing which is not to be found in the ordinary commentaries. Nor is there any remarkable subtilty of insight displayed in his interpretation of doctrine and his reading of character. There is but a very slight attempt to portray in any fullness the experience of either the temptation or the agony in the garden. The characterization of Judas is borrowed almost directly from the commentary of Dr. Adam Clarke, and is, if possible, less true to nature and the facts of history than even the common and superficial estimate of the traitor's singularly contradictory and enigmatical conduct ; and as little attempt is made to measure the almost equally enigmatical character of Pilate as is made by the evangelists themselves. In fact, the title of Dr. Hanna's work is misleading. It is not a life of Christ. It was not written as a

book, but was originally composed and delivered as a course of lectures to the author's congregation. As a history, it is entitled to no very high rank. As a series of practical discourses on the life of Christ, it affords an admirable illustration of homiletical preaching.

President M'COSH, in his text-book of logic, *The Laws of Discursive Thought* (Robert Carter and Brothers), has undertaken to fulfill the wish he expressed in 1868 for an "improved logic, founded on that of Aristotle, of the scholastics, and the various technical works of the seventeenth century, embracing all that is valuable in the Kantian and Hamiltonian reformation, but with a freshness and adaptation to the thought of the age, like the 'Logic' of Whately." The task of mediating between the old and the new peculiarly fits both his learning and his general tendencies of thought. Nothing delights him so well as to construct one perfect fabric out of the materials of two imperfect ones ; or to defeat an enemy, not by destroying utterly his stores and magazines, but by stealing away what is really valuable in them and filling therewith the vacant chambers of his own citadel. This habit of thought brings some personal disadvantages. He who learns from the enemy exposes himself to being called a traitor by the warriors of his party. Instead of seeing both sides lay down their arms and flock to his standard, he is likely to find himself between two fires. But by this method only can any branch of philosophy become complete and symmetrical. Nearly half the book is devoted to "The Notion." From the thorough investigation of this preliminary part of logic arise most of the peculiarities as well as the chief value of the treatise. Sometimes there is confusion of thought, but in general the author is very clear, and some of his distinctions and suggestions are valuable additions to the science of which he writes. He is occasionally drawn too far one side by extraneous metaphysics. Wide awake to the questions of the hour, as witness the implied plea for civil service reform, he somewhat too abundantly improves the opportunities which such a work affords for ethical and theological suggestions, though in the main to a wholesome purpose. His book abounds with practical illustrations, which relieve the subject from its proverbial dryness, though they do not always throw any light upon the topic under discussion ; and a certain lack of orderly arrangement leaves upon our mind the suspicion that while the idea of the book is the result of long investigation in a favorite field, its execution has been the work either of impatient haste or of odd moments snatched from more engrossing cares.

TRAVELS.

DR. SPEER'S work, *The Oldest and the Newest Empire: China and the United States* (S. S. Scranton and Co., Hartford), can hardly be called a book of travels, though it is written by one who, as a missionary of the Presbyterian Church both to China and to the Chinese in California, has had peculiar personal facilities for studying his theme, and has improved them. It is, however, in no sense a record of personal experiences, but a clear, comprehensive, and systematic treatise concerning a people whose influence on the destinies of this continent promises to be vastly

greater than that of the African himself. Dr. Speer gives, first, an account of China and Chinese life; next, a history of China from the patriarchal age to the present day; next, some chapters devoted to an account of the character of the Chinese as immigrants and laborers, with a somewhat too eulogistic description of their government; and, finally, a discussion of certain aspects of the Chinese question, and a prophecy of the Chinese future. There are few writers who have had better facilities for studying the character and institutions of the Chinese than Dr. Speer. His work may be regarded as an authority. In style it is rather bald and encyclopedic, but in real information it is both rich and reliable. To steer between wholesale condemnation and wholesale eulogy of John Chinaman seems just now a pretty difficult matter—a literary navigation which, on the whole, Dr. Speer has succeeded in accomplishing. He has fallen, however, into the common error of measuring the government of the Celestial Empire by its paper constitution. Is the municipal character of New York city to be judged by a perusal of its charter? It is far from being practically true that “the people are not subjects to be ruled by fear, but children to be inspired and controlled by affection and gratitude.” This pleasant paternal fiction is, indeed, the “theory of imperial power” in China, as it is in Europe. But there is, perhaps, no despotism in any civilized country administered more remorselessly, no country where there are so many petty and irresponsible tyrants. As little is it true that “the foundation of all preferment is planted upon education;” quite as little as that, in America, it is founded upon virtue and recognized capacity. A government nominally of schoolmasters and pedagogues, its offices are really farmed out to the highest bidder. The competitive examination is one of purses. And as there is no government more locally despotic, so there are few or none, except, perhaps, that of Russia, more personally corrupt. To sell justice is at least regarded as disreputable in America. In China, on the contrary, public opinion only condemns that mandarin who does not adhere to his bargain. In short, a nation without faith in God or hope in a future is a nation without a conscience; and the intelligence of China is atheistic. If, however, Dr. Speer falls into the charitable error of a too lenient judgment, it is a kindly one, and nations, as well as individuals, can better afford to think too well than too ill of their neighbors. We cordially recommend his treatise as of real value to all students of the Chinese problem.

A thoroughly genial, kindly, pleasant, readable book is HANS CHRISTIAN ANDERSEN'S *Spain and Portugal*, the fourth volume in Hurd and Houghton's very neat and tasteful edition of his works. There is just that flavor of romance and chivalry in Spanish history and Spanish character to awaken the quiet enthusiasm of this kindest of writers, just that poetic element in his character which seizes and portrays the bright side of that land of chivalry and dreams. That he hardly sees its darker side, or, seeing, passes it by in silence, is little ground of criticism. One would hardly go to Hans Christian Andersen to get a complete analysis of the most contradictory character in history, as the character of the Spaniard is. And one could, perhaps, find no

where in literature so appreciatingly portrayed that side of it which we practical Americans rarely perceive, which, indeed, we are hardly capable of appreciating, except as it is interpreted to us.

HEPWORTH DIXON is not altogether a trustworthy writer, and, on any disputed point in history or geography, there are a good many writers whose testimony we would rather take than his. But there are not a great many tourists, if there are any, who write a more genial and entertaining book of travels; and there is nothing of that kind of literature more agreeable for summer reading than Hepworth Dixon's *Free Russia* (Harper and Brothers). Professional book-maker as he is, he has at least the conscience to visit the lands he writes about. His visits are flying visits. He sees the surface of things; and neither has the intellect nor the time to study deeply the social problems on which he sometimes writes fluently, but never profoundly. If any one, therefore, takes up a work from his pen under the expectation of finding in it what one poor misguided critic seems to have anticipated, a more careful study of Russian civilization than in a parliamentary blue-book, which it is safe to say no other American reader but the critic has read or will care to read, he will be, like the critic, disappointed. But if he fancies a summer trip of three months through Russia—if he wants to see what can be seen by a keen pair of eyes from railroad cars and steamboat decks and hotel windows, and in convents and churches, and on farms and in villages, by such a tourist—he will have to go far to find a more genial, agreeable, entertaining traveling companion than Hepworth Dixon. The reader who wants to *study* Russia will have to look to some other teacher. The man who wants to read an entertaining book about Russia, with the assurance that he will get quite as good and true an idea of Russian life as he could get by a three months' personal visit, can find no better book than this gossip series of sketches of travel; as entertaining as a story, and as trust-worthy as most books of travel.

We have already given our readers, in the June number of the Magazine, a fuller account of the *Rob Roy on the Jordan* (Harper and Brothers), and a better idea of the most fascinating book of travels of the season, than we can do in a brief *critique* here. It is enough to say that it is a book of wild and singular adventure. Through countries where men travel only in caravans and companies, and then not too safely, Mr. MACGREGOR goes alone. Through waters which no boat ever touched before Mr. Macgregor takes his inseparable *compagnon de voyage*, his pet canoe. He plunges through boiling torrents choked with stones and fallen trees. He watches on the Ateibeh Marsh and the Hijaneh Lake against wild-boars, one crunch of whose jaws would have finished both the sailor and his fragile boat. He defies the Arabs, who chase him more than once in vain, and escapes them by an ingenious stratagem when made a prisoner. To-day he runs a blockade of Arab swimmers; to-morrow he runs through a group of buffaloes; one day finds him navigating in gorges where a single misjudgment would dash his boat in a hundred pieces on the rocks through which the angry torrent hastens toward its outlet; another sees him entangled

amidst an almost impenetrable net-work of papyrus; now he courts the dangers of a morass whose solitude has terrors even for the invincible Arab; now he confronts the greater dangers of an Arab mob. His courage is dauntless, his love of adventure a passion, and his book, or books (for this is his fourth, but, in all respects, most remarkable tour), constitute a novelty in the literature of travel.

MISCELLANEOUS.

PROFESSOR MARCH'S *Grammar of the Anglo-Saxon Language* (Harper and Brothers) is a valuable addition to the science of philology. In it he illustrates the forms of the Anglo-Saxon by those of the Sanscrit, Greek, Latin, Gothic, Old Saxon, Old Friesic, Old Norse, and Old High German. Beyond all question the terse forms of the Anglo-Saxon element afford the most potent words and phrases for popular address. In the increasing demand for compression in speech and article the sonorous eloquence of a Pitt would find far smaller audiences than in his own day. We should be glad to see other colleges following the example of Lafayette, which has endowed a professorship of the English Language, and other professors following the example of Professor March, who, in teaching the English language, exhibits it in its root forms. Mr. March's book has rendered comparatively simple what was before really an impossibility—the study of the most important element in our native tongue. In its department his treatise is not only without a peer; it is without a competitor.

DANTE GABRIEL ROSETTI is, as his name indicates, an Italian by descent, though an Englishman by birth. He is known chiefly to the English public by his brush, and yet even as an artist he has painted only for the select few. In the pre-Raphaelite movement he took an active, though not a prominent part, and outside of artistic circles is less known than either of his companions, Millais and Holman Hunt. In literature he has hitherto been chiefly known by a book of translations, and some fugitive pieces. For a long time he has promised what at length he has issued, a volume of *Poems*, republished in this country by Roberts Brothers. They are, in a word, Italian love-songs in English verse. As such we can neither award them a warm welcome nor accord them a high place. That both are given to him we do not wonder, for Rosetti is emphatically a "poet of the period." His very vices enhance his popularity. The sensualism of Lord Byron no longer finds purchasers in open market. Rosetti, who is at once the poet of passion and of mysticism, veils the one beneath the other, and so adds to the dangerous incitements of his verse by the seeming purity of his diction. As there are pictures more shameful by far than the nude statues of the ancients, so there are veiled hints and suggestions of passion more dangerous than open sensuality. Rosetti, as the poet of passion, possesses power; but power unconsciously used to debase the imagination, not to purify it; not always, but so far thus used as to flavor the whole book. There are some beautiful verses, some touching and tender ones, some pure and true; but, even in his best, the ardency of love—and he sings of little else—burns into a flame of passion dangerously hot, and the more dangerous

from the dramatic power with which he portrays it.

It is now considerably over thirty years since Mr. JACOB ABBOTT first appeared before the American public in what have proved the most popular religious works of the century, the "Young Christian Series." At that time the use of fiction in any form for a religious purpose was looked on with disfavor, and his first preface contained a sentence forestalling criticism by a quotation of the example of the Master. "The philosophy which underlaid the "Young Christian Series," and which has underlaid every thing else Mr. Abbott has ever written, was this, that for moral influence sympathy was far more important than instruction, and that a right depicting of a noble life or a noble deed was more influential than either exhortation or doctrine. This theory, which pervades not only the "Rollo Books," and the "Franconia Stories," and the "Harper's Story Books," and the various other series of juveniles which have made Mr. Abbott's name a household word in America, but which also interprets the meaning of the "Red Histories," which are truly "philosophy teaching by example," receives a new and in some respect more striking illustration in the *Juno Series* (Dodd and Mead), two volumes of which come before us in a style which does credit to the young and enterprising house, who, if this be a fair sample of their work, promise to raise the standard of Sunday-school literature very much above its present low level. The object of these books is to show how parents and teachers may by gentle measures obtain a sympathetic influence over the hardest and most rebellious natures; and the books will be a boon particularly to the parents who are perplexed and worried by children that they can do nothing with; and no less a boon to the children, if the example of Juno is fairly appreciated and honestly followed by their elders.

It is about ten years since a young man, visiting by chance the home of Washington Irving, and writing a very lively and genial description of his visit, found greatness thrust upon him by the fact that almost simultaneously with the publication of his article came the news of the genial old man's death—that man whose nature fitted so well the name of his home—Sunnyside. This was Mr. THEODORE TILTON's first considerable appearance before the public, since which time he has steadily and industriously, but certainly with fleet feet, climbed the literary ladder, till he now stands among the leading editors in the United States, more admired and more hated, more followed and more abused, than perhaps any other writer for the American press, except Horace Greeley and Henry Ward Beecher. Most men find the editorial charge of one successful newspaper enough for their energies and ambitions. Nothing less than two suffices for Mr. Tilton's. Every morning from eight till eleven he is to be found in the editorial rooms of the Brooklyn *Union* driving a busy pen, and between whiles discoursing with and dismissing visitors with brisk but easy editorial urbanity. An hour or more for a late breakfast or an early dinner, or rather that un-English meal which the French call *déjeuner*, and he is to be found again driving his pen as busily as before at home, or quite as often in the editorial sanctum of the New York *Independent*, which never misses from one to three

columns of his personal work, and which every week receives something of his personal supervision. We are glad to receive some permanent record of this busy man's editorial work in this series of winged editorials caught in their flight and caged in a book which their author and editor calls *Sanctum and Sanctorum* (Sheldon and Co.). That Mr. Tilton is a sharp and trenchant writer all the world, *i. e.*, all the American world, knows. That he has covered so wide a range of subjects, and proved himself capable of treating so happily, if not always profoundly, so many varied themes—art, literature, biography, politics, and theology—we had not realized till we sat down to glance over these reminiscences of his work during the last ten years.

When a wife, drawing aside the veil which hides the inner life of most men from public gaze, suffers the outer world to enter the private *sanctum* of a great writer, as Mrs. HAWTHORNE has done by the publication of *Hawthorne's Notes* (Fields, Osgood, and Co.), that all the world may see the unfinished thoughts and suggestive jot-

tings of one who never wrote for the public eye except with punctilious care, it would be but a sorry return to criticise what was not written and is not offered for criticism. This fragmentary collection of observations and hints, jotted down by Mr. Hawthorne during his four years' residence in England, is a delightful book for a half hour of summer desultory reading, when, in truth, you want not really to read, but rather to chat with your author on all sorts of themes, as chance may suggest them.—The same sort of quiet summer reading is furnished by Sir HUMPHREY DAVY's *Sabbonia* and his *Consolations in Travel*, first published in 1830, and now republished by Roberts Brothers. The first of these books, on trout fishing, is very like in style and spirit to Izaak Walton's incomparable work, which, doubtless, suggested it; the second is a curious combination of philosophy and fancy, in which, however, it must be confessed the scientist has got the better of the poet, and the imagination goes so heavily freighted with facts and philosophies as never to soar very high.

Editor's Scientific Record.

UNBOLTED FLOUR.

FEW of our readers are aware of the extent to which meal loses its nutritive qualities by the ordinary processes employed to render it white and light. With every increasing degree of fineness or whiteness something more is lost, until what are called the best family flours consist of little more than pure starch. After the removal of the thin outer husk of the grain (amounting to about five per cent.), which resembles fine straw, and is of no value for food, what is left is in exactly the proper proportion for nutriment. If, however, as is frequently the case, twenty per cent. of the hull is taken away, instead of eighty per cent. of nutriment left, we actually have not more than sixty or seventy.

GOMA OIL.

The Japanese colony, at Placerville, California, has lately engaged in the cultivation of an oil-plant, of the nettle family, called goma. The seeds of this plant are said to be so rich in oil that one hundred and thirty-six pounds of oil can be obtained from the product of an acre. The plant itself needs a great deal of moisture, which is to be supplied by means of irrigation. The young shoots form an excellent salad; the flowers are much sought after by bees; and the stems furnish a large amount of fibre. It is asserted that this goma oil, well prepared, is equal to the best olive oil, and does not become rancid so quickly, replacing the olive oil in all its technical applications. The price is expected to be considerably less than that of olive oil.

SAFETY PETROLEUM LAMP.

A new lamp for burning petroleum has recently been introduced in Germany, which is said to have many important peculiarities. The essential feature of the lamp consists in a reservoir of water in the upper portion nearest the flame, so that the body of the oil is not exposed to the danger of being heated by proximity to

the burning wick. The petroleum is in a reservoir below, and the pressure of the water forces it, drop by drop, up through a tube to the wick, supplying it exactly in proportion to the rapidity of combustion. The arrangement of the lamp is such that, if overturned by any accident, the water overflows the burning wick and puts out the flame immediately. It is claimed that when filled with two pounds of petroleum, and having a wick three-fourths of an inch in width, it will burn from sixty to eighty hours; consequently, needing to be filled only once in from ten to fourteen days. Another alleged advantage is that the wick can be turned down very low without emitting any of that offensive smell which always characterizes the ordinary petroleum lamps under similar circumstances.

PLESIOSAURUS IN AUSTRALIA.

Many of our readers are familiar with the peculiarities of the *Plesiosaurus* and *Ichthyosaurus*, gigantic fossil lizards, which characterized the Jura formation of Europe, and of which allies have lately been detected in the strata of our own country. According to a recent announcement, we are informed that one of these genera, *Plesiosaurus* was not long since found in New Zealand; but it occurs in the tertiary rocks of that continent, and not in a much older formation, as in Europe. The significance of this fact is one that will present itself to every geologist, as bearing upon the comparative age of Australia and other parts of the globe, and tending to prove the much later date of the emergence of Australia above the level of the sea. For the benefit of those to whom the name of this fossil may not convey a very definite idea, we may state, in popular phrase, that the *Plesiosaurus* united the head of a lizard with teeth like a crocodile, a neck of enormous length (far exceeding that of the swan in its proportions), the body of an ordinary mammal, the ribs of a chameleon, and the swimming paddles of a cetacean.

It also had a bony ring around the eyes. It probably swam like the swan, with the neck bent in an S shape, and lived, as is well known, upon fishes.

As the *Ichthyosaurus*, a very differently shaped animal, is generally found associated in England with the *Plesiosaurus*, it will be interesting to learn whether it also occurs in the same connection in New Zealand.

EASY METHOD OF BREAKING LARGE MASSES OF CAST IRON.

The following method is given for breaking up large masses of cast iron, as, for instance, those of two feet in diameter. A hole is to be bored into the mass about one inch in diameter and three or four inches deep, which is then filled with water, and a wrought iron plug inserted. If now the heavy hammer of a pile-driver is allowed to fall upon the plug, the water has no time to escape, and the mass is split asunder.

TEST FOR PURITY OF WATER.

A glass tube of about a yard in length, closed at the end by a cork, and resting upon a white dish of porcelain, is recommended for determining the purity of water, as the slightest tint is seen against the white ground, and the different shades indicate different ingredients. A green tinge is produced by minute algæ; a white opacity often by fungoid growths, iron salts by a peculiar ochry color. The apparatus is termed the chromiometer.

SONOROUS CHARCOAL.

By immersing charcoal in sulphuret of carbon, or carburetted gases of any kind, it is converted into a new form of carbon, which has the property of excessive metallic resonance, resembling the most sonorous metals, such as steel, silver, aluminium, etc., in giving a perfectly pure, melodious tone. The same substance constitutes a great improvement over the ordinary pencils used with the electric light, becoming heated and gradually incandescent throughout the entire mass, like the metals, and cooling like them when the heat is withdrawn. It is stated also, in this same connection, that when the vapor of methylated alcohol is passed over this carbon, heated to a red heat in a porcelain tube, the vapor becomes decomposed, and the walls of the tube are lined with a curious form of carbon, consisting of filaments about one-fourth of an inch in length, constituting a species of silky, mossy coke, of a silver-white color.

ARTIFICIAL GOLD.

This material is manufactured largely in the United States, into imitation jewelry and other articles, scarcely distinguishable from gold, except by the inferior gravity; and it is a matter of surprise to almost any one to learn that it does not contain a single grain of the precious metal. It is made by taking 100 parts of pure copper, 17 of pure tin, 6 of magnesia, 9 of tartar of commerce, 3.6 of sal ammoniac, and 1.6 of unslacked lime. The copper is first melted, and the other substances (excepting the tin) added, a little at a time, and the whole well stirred for half an hour, so as to produce a perfect mixture, when the tin is thrown in and stirred round until melted. The crucible is then

covered, and the fusion kept up for twenty-five minutes, and the scum taken off, when the substance is ready for use. It is malleable and ductile, and can be worked in any form, even into leaves like gold.

IMPARTING AN ARTIFICIAL FLAVOR TO FRUIT.

The French are in the habit of imparting an artificial flavor and fragrance to apples and pears by the following process: The fruit is plucked before being quite ripe, and is pricked all over with a fine needle; after which it is placed in a vessel, with essence of any kind desired. The exhalations of the latter are absorbed in a few seconds by the fruit, and the operation is repeated several times, until the fruit is ripe, when it will be found to have acquired the desired taste.

METHYLATED ETHER AS AN INTOXICANT.

It is stated that methylated ether is used very largely as an intoxicant, in the place of alcohol, in the counties of Londonderry, Antrim, and Tyrone, Ireland. The quantity taken at one time is from two to four drachms to the dose, which is repeated twice, thrice, or even four or five times daily. This practice is said to have affected the inland revenue to such an extent as to have diminished it nearly \$30,000 per annum. The attention of the insurance companies has been directed to the subject, as much risk of fire is incurred by the keeping of so inflammable a substance among persons ignorant of its properties.

CHANGE OF HABIT IN SWALLOWS.

It is stated by M. Pouchet that the window swallows in France have entirely changed their method of building their nests within the last forty years. Formerly the nest was in the form of a section of a sphere, with a circular entrance, concealed in a corner of a window. At the present time the nest is oblong and open at the top. Formerly the young could only re-enter the nest one by one; now they can all go in together.

HARD WATER FOR DRINKING PURPOSES.

Dr. Letheby, in an article on the water supply of London, states that water of moderate hardness, like that used in London, Paris, Vienna, and some other European cities, is always to be preferred to that which is entirely soft, as being best suited for domestic purposes, on account of being brighter to the eye and more agreeable to the taste. He also makes the singular announcement that the French authorities are so well satisfied of the superiority of hard water that they pass by that of the sandy plains, near Paris, and go far away to the chalk hills of Champagne, where they find water even harder than that of London; giving as a reason for the preference that more of the conscripts from the soft-water districts are rejected, on account of the want of strength of muscle, than from the hard-water districts, from which they conclude that the calcareous matter is favorable to the formation of the tissues.

Dr. Letheby further states that the mortality in England is greater, on an average, in places where soft water is used, other circumstances being equal, than where the water is hard; and it is suggested that the sparkling hard waters of the limestone districts are relished, not only be-

cause they are pleasant to the eye, but on account of some hygienic properties in the excess of carbonic acid they contain, and possibly because the percentage of lime acts medicinally upon the system. The Doctor concludes by expressing his preference for the very slightly hard water of London over a softer quality, although reprehending the use of water containing an excess of mineral matters.

SIGNIFICANCE OF WIDE DISTRIBUTION OF SPECIES.

Much diversity of opinion has been manifested among naturalists in regard to the significance of the simultaneous occurrence of forms of animals and plants, apparently identical, in two or more regions supposed to have no connection with each other; one party maintaining the identity of such objects, no matter what the extent of their distribution, providing no differences can be appreciated; the other insisting that the mere fact of such separation, without intermediate connection, is of itself sufficient to warrant their being considered as distinct species. The general feeling, however, at the present day, tends toward the identification of specimens, from widely remote localities, as being of the same species when no positive differences are appreciable; and even if some differences can be proved to exist, to ascribe them rather to the influence of physical causes in modifying one primitive species than to allow us to consider them as distinct. In many cases, too, the evidences of probable geological action has been invoked to show, for instance, why the fishes and some other marine animals of the western coast of Central America are, to a certain extent, identical with those of the eastern, by the fact that during the tertiary period North and South America were separated by water, bearing an archipelago of islands on its surface.

Dr. Carpenter has lately called attention to the fact that shells, recently collected by Mr. M'Andrew at the head of the Red Sea, are for the most part identical with species from the shores of Japan, and that other Japanese shells were the same as those of Teneriffe. Still other parallel instances were drawn between shells of the Mediterranean and of the North Pacific; and these identifications seem to point toward important connections by water, at a former period, very different from those existing at the present day. The fact, also, of the occurrence of species, as pleistocene fossils on the Atlantic slope of Central America, identical with living shells from the waters of the Pacific coast, has a further bearing upon the same question.

DREDGINGS OF THE "PORCUPINE."

We have already referred to the results of the dredging expedition of the British ship *Porcupine* during the past summer, especially those made at the maximum depth reached, of about twenty-four hundred fathoms. The scientific world is looking forward with great interest to the publication of the report of this exploration, which we are now promised in a reasonably short time. Meanwhile various articles have appeared from Dr. Carpenter and Dr. Jeffreys, giving some general statements of the observations. From a lecture given by the former gentleman, we learn that these observations show conclusively that,

contrary to a time-honored opinion, there is probably no depth at which animal life ceases to exist on the ocean bed; and that especially, as suggested by Professor Agassiz, wherever a rocky bottom occurs, there we shall find animal life in great profusion, while on the softer ooze it exists also, but perhaps in a lesser degree of development in point of number of individuals and of variety.

Another conclusion arrived at by the naturalists of the *Porcupine* is, that temperature exerts a much greater influence than pressure on the distribution of animal life, and that the same forms may occur through an enormous vertical range, so that the question no longer need be asked as to the depth at which a particular species is dredged, but what is the temperature of the water in which it occurs. It is found that when, as in certain cases, cold areas and hot occur side by side, at the same depth, the species are very distinct, but that the differences are more in the crustacea, echinoderms, sponges, and foraminifera, than in the mollusks, a large proportion of which are common to both areas. The fact that many of these forms of animal life exist in abundance on a sea bottom the temperature of which is at least two degrees below the freezing-point of fresh water, is one of striking interest, and equally so is the precise limitation of the globigerine mud and the vitreous sponges to the warm area.

Another fact developed by the surveys to which we have already called attention is the number of cases in which forms both generic and specific, heretofore known only as tertiary or cretaceous fossils, were brought up in a living state; and the inference is drawn that many more such species remain to be discovered. According to Professor Agassiz, while one plateau shows a preponderance of tertiary forms, a deeper one will lead us among those more cretaceous in character. All the observations made by this expedition, and those of the United States Coast Survey, tend to show that the cretaceous formation, so well known in its exhibition on the different parts of the earth's surface, is still in progress of deposition at the bottom of the ocean.

The hint of an improvement of the dredge during this expedition may not be without its importance to the marine zoologists in our own country; namely, that by attaching to its circumference a number of hempen tangles, the sea bed is swept as well as scraped; and many species, especially those having spines or prickles, are brought up entangled in the threads, that are not taken inside of the dredge at all.

EXTRACTION OF VEGETABLE ALKALOIDS.

It is well known to perfumers that ether and sulphide of carbon will take up the perfume of certain flowers, such as the jasmine, heliotrope, etc.; and that after evaporation of the solvent an extract is obtained which possesses all the odor of the original plant. This discovery, ascribed to Dr. Millon, has been applied to very general use for the purpose referred to, and its employment has lately been suggested for obtaining, in an isolated form, more convenient than otherwise, the medicinal principles of certain plants. The experiment has been tried with alleged success in the cases of digitaline, belladonna, stramonium, aconite, and other substances.

LOCUSTS IN A TELESCOPIC FIELD.

Among the phenomena noticed during the recent total eclipse of the sun in the United States, by one or more observers, was the occurrence of small particles crossing the field of view of the telescope, and in a determinate direction, and supposed by some to indicate the passage of a stream of meteoric bodies. As bearing possibly upon this appearance, it may be stated that during the observations of the eclipse of October 17 and 18, 1869, in India, Lieutenant Herschell, of the British service, had his attention attracted to certain shadows traversing the disk of the sun, which became bright streaks when they had passed beyond it. The meteoric hypothesis suggested itself to him, and he proceeded to investigate the subject more carefully, when he ultimately discovered that the whole was due to a flight of locusts, in vast numbers, and at a distance inappreciable to the naked eye. Should any such phenomena be observed hereafter it would be well to bear in mind the propriety of examining, as Lieutenant Herschell did, whether the objects seen require the same focus as the sun, as, if this were the case, their presence within the earth's atmosphere would be, of course, impossible.

FOSSIL BIRDS.

American geologists have been aware of the researches of Professor Marsh among the remains of fossil birds in the United States; in this following the example of Professor Alfred Milne Edwards, of Paris, in regard to the species of France. A paper recently published by Professor Marsh describes various species of extinct birds, among them five belonging to the cretaceous, a formation which in Europe has furnished only one or two. Now that attention has been called to this subject, it is probable that numerous species will hereafter be brought to light; so that we may before long have materials at our command for a work equal in extent to that in the course of publication by Professor Edwards.

VARIEGATED LEAVES.

Among favorite objects of cultivation in green-houses and ornamental gardens, of late years, are plants having variegated leaves; and no effort has been spared to secure the greatest possible variety. Any plant may, it is said, be variegated by inoculating into it the sap of one already variegated by means of ingrafting. The cause of this phenomenon, according to Mr. Morren, consists in the existence of minute corpuscles which have no green color like the ordinary corpuscles, presenting an analogy to albinism in the animal kingdom.

AFRICAN METEORITE.

It is stated that about the 25th of December last an immense globe of fire, measuring a yard in diameter, fell to the earth in the vicinity of Fezzan, and in striking emitted a shower of sparks, which exploded like the firing of pistols, exhaling a peculiar odor. This aerolite fell but a short distance from a crowd of Arabs, who were so much terrified that they immediately discharged their guns against the incomprehensible monster. The authorities of the country, on hearing of the facts, immediately sent orders

to their representatives at Fezzan to gather up the fragments and send them to Tripoli. This, it is now said, has been done, and the weight of the meteorite given at over three thousand pounds, although the statement requires confirmation.

CHLOROPHYL GRAINS.

We have already referred to the influence of solar light in causing the grains of chlorophyll to change their position in the cells of certain plants. This phenomenon, according to Rose, is not caused by the influence of the light upon the corpuscles themselves, but results from its acting upon the material surrounding the corpuscles in such a manner as to induce the motion in the corpuscles.

DELAUNAY'S TABLES OF THE MOON.

The present head of the French Observatory, M. Delaunay, was occupied for many years in the preparation of a new series of the tables of the moon, so much used in determining longitudes; and we are now informed that the Bureau of Longitudes has received a grant from the government of \$2400 a year for five years to meet the expense of publication. These tables, it is expected, will supplement and improve upon those made by Hansen, and published in 1857 at the expense of the English government.

FOSSIL BIRDS OF FRANCE.

A recent examination of the remains of birds in the tertiary deposits of Bourbonnais in France has shown, in a more striking manner than had previously been appreciated, the tropical character of the country during the period of that formation. These remains belong to genera totally distinct from those inhabiting France at the present day, resembling in many respects those of the tropical portions of modern Africa. The most remarkable of these fossils consist of species of parrots, of trogons, of swifts (such as those that construct the edible birds'-nests of the East), of the sand grouse, the marabout stork, and the secretary vulture, or serpent-bird. This serpent-bird, as is well known to ornithologists, is a species belonging to the rapacious order, but characterized by the extreme length of the legs; in this respect resembling the herons and storks, and constructed in all its details with special reference to attacking poisonous serpents and destroying them. The part played by the single living species, in this respect, is very important, and the discovery of a second miocene species would also indicate the existence at that period of poisonous reptiles in an abundance at present unknown in any part of Europe. The occurrence of flamingoes, of the ibis, and of pelicans, in the same formations had previously been established by M. Edwards; but these forms are less indicative of the peculiar paleontological conditions referred to than those first mentioned.

ANIMAL SUBSTANCES OF THE MATERIA MEDICA.

A late writer, in discussing articles of the modern materia medica derived especially from the animal kingdom, enumerates, among others, the sponge, the use of which is mainly confined to cleaning purposes, or in the application of substances to interior cavities; the red coral, which, however, has lately disappeared from the shelves

of the druggists; various forms of insects, first among them the Spanish fly and the cochineal insect; leeches, used in great quantity; the isinglass of fish; the oil from the liver of the cod and of some other species; the albumen of birds' eggs, used especially as an antidote to corrosive sublimate; the spermaceti of the whale, which furnishes stearine and other preparations; the ambergris of this same whale, due to the concretions formed in its intestines around the remains of cuttle-fish; the oil of the dugong, a marine mammal; the musk of the musk-deer; the civet of the civet-cat; the castoreum of the beaver; and the hyraceum of the Cape cony. In addition to these, the druggists of earlier days used frequently dried snakes and lizards; the calcareous concretions from the stomach of a crawfish; calculi of the ibex and of the goat; the scales of the crocodile, and many other substances.

ASPARAGUS SEEDS AS A SUBSTITUTE FOR COFFEE.

The extensive use of coffee and the expense of the better qualities, as also the occasional difficulty of obtaining all the varieties, owing to the interruption of commerce by war, etc., has induced the employment of a great many substitutes, such as roasted turnips, chicory roots, burned corn, pease, and other substances. But these, apart from giving a color resembling that of coffee and occasionally an odor similar to it, have no relationship to the original material, owing to the entire absence of the principle of coffee itself—the caffeine. A German author, having found that asparagus seed contains caffeine in very large proportion, now presents it to the public as the true substitute for coffee. He prepares it by crushing the red berries in a mortar, and allowing the mass to ferment for some days in a tub, and afterward turning out the solid portion upon a sieve with holes a little larger than the asparagus seeds. These seeds, after passing through the sieve, are again washed and dried. They have a dark brown appearance, and are horny externally like coffee, having a greenish tint inside and a peculiar aroma, similar to that of coffee, a fatty oil, and a nitrogenous alkaloid. On being roasted these seeds give out an aroma astonishingly like that of coffee; and when ground and prepared, the result can scarcely be distinguished from that of coffee of the finest quality.

USE OF CHARCOAL IN FATTENING TURKEYS.

Four turkeys were cooped up and fed with meal, boiled potatoes, and oats; four others of the same brood were treated in a similar manner in another pen, but with a pint daily of finely pulverized charcoal added to the food, and an abundant supply of the lumps of the coal. All eight were killed the same day, and those fed with charcoal were found to weigh about a pound and a half each more than the others, and to be of much better quality.

DECAY OF STONE BUILDINGS IN CITIES.

It has frequently been observed that the surfaces of various kinds of stones, especially the limestones, when used for building purposes in cities, in a short time become dimmed and discolored, and at no distant period show unmistakable signs of decay. This is more especial-

ly the case where coal is used in the largest quantity; and a careful examination has shown that it is due mainly to the quantity of sulphuric acid liberated by the combustion of this substance, amounting to seventy pounds or more for each ton of even the purest quality. This acid forms sulphates, and it is on magnesian limestones, or dolomites, that the effects are most marked, the resulting sulphate of magnesia being very evident in the scrapings of the surface. The carved portions of the stone, and those which arrest the dirt and dust, suffer most, from holding longer in contact with the stone the acidulated moisture of the air. The resulting disintegration of the stone is also facilitated by the crystallization of the sulphates within its pores.

A careful consideration of the chemical processes involved has led to the use of certain substances for the purpose of preventing the combination mentioned; and, as it would seem, with much success. An aqueous solution of superphosphate of lime was applied to the surface of the cleaned stone, either by brushing or immersion, and produced an insoluble exterior. The cost of the material is but trifling, a gallon of the solution furnishing two coats to about three hundred square feet of Caen or Portland stone. It should not contain any appreciable quantity of sulphuric acid. For treatment of dolomites or magnesian limestones baryta is added to the hardening salt, for the purpose of destroying any sulphate of magnesia already formed, giving rise to the very insoluble sulphate of baryta. When the superphosphate of lime is applied to the fresh surface of limestone, it has been found to add nearly fifty per cent. to the strength; at least, this was the case with the cubes of stone on which the experiment was conducted.

SINKING OF THE CHANNEL ISLANDS.

It is stated by a recent French writer that the islands of Jersey and Guernsey, in the English Channel, have sunk about forty-three feet in the past five hundred years.

PREPARATION OF CARBONIC ACID.

Carbonic acid, now extensively used for various purposes, besides the preparation of soda-water, is made cheaply on a large scale by the following process: A number of retorts are placed in a furnace, precisely as for the production of coal gas, and filled with a mixture of sulphate of lime or plaster of Paris and charcoal, the latter in a quantity sufficient to absorb all the oxygen of the sulphate of lime. The plaster of Paris is converted into sulphide of calcium, and carbonic acid gas escapes, and after purification by passing through water, is conducted into gasometers. A current of air passed over the hot sulphide of calcium reconverts it into sulphate of lime, and the process may thus be repeated indefinitely.

A HARMLESS GREEN FOR PICKLES, ETC.

We extract from a German journal the following recipe for a beautiful green color, to be used for sweetmeats, candies, and pickles, which, it is asserted, is entirely destitute of any poisonous qualities. It is made by dissolving five grains of saffron in a quarter of an ounce of distilled water, and in another vessel dissolving four grains of indigo carmine in half an ounce of distilled

water. After shaking each up thoroughly they are allowed to stand for twenty-four hours, and on being mixed together at the expiration of that time, a fine green solution is obtained, capable of coloring five pounds of sugar.

APPLICATIONS OF INFUSORIAL EARTH.

Infusorial earth (of which immense quantities exist in Maryland, Virginia, and elsewhere) is now used for many purposes in the arts, in addition to its furnishing an interesting field of investigation to the microscopist and naturalist. Sculptors' models, made of the usual clay, mixed with this earth, do not crack or spring, either in drying or baking. Added to sealing-wax it prevents the too rapid dropping when melted, and does not affect the color. The substances usually employed for the purpose, gypsum and bar-rytes, are open to many objections that do not apply to this earth. It is used to great advantage in polishing metals, and is an excellent article for cleaning glass, either windows or mirrors. For this latter purpose it is mixed with water and smeared over the surface, and afterward rubbed off with a piece of chamois leather. It is said to be superior to all other substances as a moulding sand, taking the finest and most delicate impressions. United with nitro-glycerine, it forms the new blasting powder, dynamite, so much safer than the explosive liquid in use.

ORNITHOPSIS—A FOSSIL LINK BETWEEN BIRDS AND REPTILES.

Among other interesting novelties recently brought to our notice by the paleontologists is a pterodactyl-like animal from the Wealden of England, and named *Ornithopsis* by Mr. Seeley, of Cambridge. According to this gentleman the animal in question belongs to a new order, intermediate between birds and the ordinary pterodactyl reptiles, and of gigantic dimensions. The reconstruction is based upon two large vertebræ, from which it is inferred that the animal was at least ten to twelve feet high, possibly several times that size, with a long neck, arranged like that of a bird. The vertebræ are constructed on the lightest and airiest pattern, and the pneumatic foramina are of enormous dimensions. It is probable that when further details of the entire skeleton of this genus are obtained it will be found that it does much toward bridging the gap between the known species of birds and reptiles, which most naturalists now consider so closely related.

POISONOUS NATURE OF PHENYL SUBSTANCES.

In consequence of the many inquiries on the subject, a recent writer gives the following statement of the nature of the poisonous effects of various chemical productions of the phenyl group: First, carbolic, or phenic acid acts upon the skin, turning it white, and producing inflammation and swelling. Second, phenol acts slightly at a low temperature, but more quickly and actively as the temperature increases. Third, pure rosolic acid and pure coralline are not poisonous, and produce no effect upon the skin. In an impure condition both substances may, however, act like poisons. Fourth, rosolic acid may act upon the skin, either by means of a percentage of sulphuric acid, or of rosol, according to the mode of its

preparation. Fifth, coralline prepared by means of impure rosolic acid and a superabundance of ammonia is poisonous when introduced into the animal economy, acting by means of the aniline combined in it. It has, however, no effect upon the skin. Sixth, when coralline acts at all upon the skin it is in consequence of containing phenol. Seventh, the impure and injurious rosolic acid can be purified by means of benzole.

EXTINCTION OF SMALL BIRDS IN NEW ZEALAND.

A curious cause is assigned for the gradual reduction in the number of the small native birds of New Zealand. Many are destroyed by cats, which, after having been introduced into the country, have run wild and become formidable beasts of prey. The European honey-bee is, however, to be looked upon as the principal culprit. A considerable proportion of the birds live upon the honey of the native flowers, which they obtain by protruding their long, fringed tongues into the corolla of the blossom. The bee, introduced some time ago into that country, has become very abundant, and of course feeds at the same time with the birds, and resents their intrusion by stinging the extended tongue whenever an opportunity presents itself, causing more or less distress, and very frequently death. This curious fact was first noticed by the aborigines, and has been verified, it is said, by accurate observers among the European colonists.

ANCIENT SHELL-HEAPS IN WALES.

Among objects of great interest to the ethnologist are the heaps of refuse shells found at various points along the sea-coast and interior waters of various countries, especially as the period of the formation usually dates back to a remote antiquity, far beyond the earliest historical records. Attention was first called to these shell-heaps on the coast of Denmark, where they received the name of *kjoekken'modding*; and a thorough exploration of them was made in that country by a commission of scientific men appointed for the purpose. They found evidence of very great antiquity in them, and considered them to be the offal of ancient villages, discovering in them, besides the shells themselves—always of the edible species abounding in the vicinity—bones of vertebrata, implements of stone or bone, fragments of pottery, etc. Many speculations have been entered into in regard to the date of these heaps, which, since their discovery in Denmark, have been detected in almost all other parts of the world; and although an absolute date could not be established for any of them, those of the country in question are supposed to precede the period of the lake dwellings of Switzerland, and probably to possess an antiquity of not less than three thousand years. A recent examination of heaps of this character in Wales developed the existence of the shells of the limpet, the purpura, and littorina, mixed with which were the bones of the ancient horned sheep, the short-horned cow, the horse, and the dog. From various circumstances connected with this heap, and some considerations in regard to geological and other changes on the coast, it was concluded that the probable period of its construction is to be found in the seventh and eighth centuries—an antiquity thus consid-

erably less than that ascribed to the kjoekken'-modding of Denmark.

These heaps are more abundant, perhaps, in North America than in any other part of the world, having been found along our entire coast, from the Gulf of St. Lawrence to Florida, and throughout many points of the interior, as well as on the coast of the Pacific. The examination of a considerable number of these has furnished no positive data as to their antiquity; but from the universal absence of articles of European origin in them, except as introduced at a subsequent period, we are entitled to consider them as antedating the settlement of the country by the whites. How far beyond this period they originated it is impossible now to tell; although, perhaps, when more extended researches have been made and compared together, some clew may present itself to such skillful ethnologists as Professor Wyman, Dr. Rau, Mr. George Gibbs, and others.

PHOSPHATE BEDS IN SOUTH CAROLINA.

Much interest has been excited within a few years past by the discovery of extensive beds of phosphate of lime at the mouth of the Ashley and Cooper rivers, near Charleston, these covering from three to four hundred square miles to a depth of from six inches to three feet, and resting immediately above a deposit of eocene marl. The phosphate consists mainly of nodules formed around eocene shells as a nucleus, and furnishing about sixty per cent. of phosphate of lime. Among the nodules in question are found sharks' teeth and eocene shells like those of the marl beneath, and, according to Professor Shaler, resembling the species found at Gay Head, on Martha's Vineyard. In the upper layer of this bed occur bones of the mastodon, of extinct horses and sheep, and bits of pottery. Although some geologists consider these as belonging to the same period as that of the phosphate beds themselves, in Professor Shaler's opinion they were introduced at a later period by the agency of water. Professor Shaler thinks that these beds were formed, after their upheaval, from the marls beneath them; that the drainage of surface water charged with carbonic acid acted upon the upper layer of the marl and removed the carbonate of lime, leaving the phosphate to accumulate in the nodules around the shells. He does not pretend to account for the original appearance of the phosphoric acid, which he thinks too great in quantity to have been derived from the bones of vertebrate animals. He suggests, however, that it might have been derived from seaweeds, some kinds of which are known to contain it in appreciable quantity, and possibly from some pteropod mollusks. Professor Shaler looks upon the phosphate beds in question as in the main much like that of the sea bottom off the southern coast, the recent dredgings and soundings from which have been found to contain an appreciable percentage of phosphoric acid.

GUARANA—A NEW STIMULANT.

Attention has been called of late years to the virtues of a drug known as guarana, which is used in Brazil as a stimulant and a remedy in many forms of nervous affection. It is said to be prepared from the seeds of a sapindaceous plant known as *Paullinia sorbilis*, which ripen in

October or November, and are then removed from their capsules and dried in the sun. Afterward they are placed in stone mortars over a charcoal fire, first slightly roasted, and then rubbed to a fine powder, which is moistened with water or exposed to the dew by night, and assumes the consistency of a paste. This is worked up into cylinders or balls, weighing from twelve to sixteen ounces, then dried in the sun or the smoke of the hut until they become dry and of a stony hardness, requiring the blow of an axe or hammer to break them. For use this preparation is rubbed on a grater or file, so as to be reduced to a powder, and then mixed with sugar and steeped in water.

A chemical examination of the substance proves its value as a drink, since it embraces the same principle as coffee or tea, and, in fact, contains four or five per cent. of the alkaloid caffeine, a proportion vastly greater than that of the coffee bean, which has but two per cent. of the same ingredient, or of tea, which has from six-tenths of one per cent. to two per cent. of the same. It is not at all improbable that in time this substance will come much more generally into use, especially for travelers, and for regions where transportation is expensive, and where concentration is an object, since so much larger a percentage of an important stimulant can be obtained by its use in a given weight than in any other way. It is said that at the present time about 6,000,000 pounds are prepared annually in Brazil, nearly the whole of which is used in that country. The plant from which it is derived is very abundant; and should a demand arise for it, it can be furnished in almost any reasonable quantity.

FOSSIL FEATHER.

The discovery of a fossil feather has recently been announced by Professor Marsh. It was obtained by Dr. Hayden during his geological explorations in Wyoming Territory during the past year, and is stated to be the first specimen of the kind on record. Whether it belonged to a true bird, or to some link between the bird and reptile, like the *Archæopteryx*, has not yet been determined; and additional collections from the same region will be looked forward to with much interest, as possibly likely to embrace such portions of the skeleton of the animal as may serve to settle its true character.

OZONE.

The result of some recent investigations upon ozone by Mr. Houzeau may be expressed in the following summary. As now understood by most authors, ozone is simply an allotropic condition of oxygen, but of considerably greater density, the ratio between the two being as 1.65 to 1. At the same meteorological station the chemical activity of the air due to the presence of ozone varies from one day to the next. In three meteorological stations, as at Paris, Rouen, and an adjacent locality, observations made at the same time of day, and with the same tests, showed very different indications as to the manifestations of ozone, from which it is inferred that locality exercises a very decided influence upon the chemical properties of the atmosphere. The seasons exercise the greatest influence upon the manifestations of atmospheric ozone, this being most decided in the spring and summer, and

comparatively feeble in autumn and winter, the greatest percentage being attained in the month of May. This result is established by eight years' successive observations. There is an intimate relation between the appearance of ozone, or its increased manifestation, and the great perturbations of the atmosphere, such as water-spouts, hurricanes, tempests, etc. The influence of the grander movements of the atmosphere upon the production or transportation of ozone extends sometimes to very great distances, even into regions where the existence of the substance is otherwise scarcely perceptible, showing that these commotions, which so frequently involve ruin and devastation, so far as the material works of humanity are concerned, nevertheless fulfill an important part in the economy of nature, as modifying and improving the condition of the atmosphere.

CHANGE OF CLIMATE OF FRANCE.

It is asserted by a French meteorologist, who has made careful investigations of the subject, that the climate of France, instead of becoming milder since the Middle Ages, has actually become more severe. This conclusion is based upon the record of observations in regard to the growth of the vine, the migration of storks, the period of spring vegetation, etc., and would seem to indicate a chronological coincidence, if not a relationship of cause and effect, between the variations of climate and the precession of the equinoxes.

FREEZING OF PLANTS.

Mr. Prillieux has shown that when plants are frozen icicles are developed in their interior, forming small columns perpendicular to the surface, and often penetrating the epidermis, being derived from the liquid contents of the cells. The cells themselves remain unaffected, so that there is no destruction, but simply a separation of the organs; and consequently the asserted death of the plant by freezing does not really take place to any considerable extent.

PRESERVATION OF LIME JUICE.

The virtues of lime or lemon juice as an antagonist to scurvy on ship-board are well known and officially recognized by the passage of laws in most nations requiring a certain proportion to each person on board as part of the ship-stores—this in Great Britain, for foreign-bound craft, amounting to one ounce a day per head, after the vessel shall have been ten days at sea. Much attention has therefore been directed toward securing so important an article from adulteration, as well as against its spoiling on the voyage, or while in store. The foreign substances fraudulently added are water, tartaric acid, bitartrate of potash, common salt, vinegar, and sometimes even sulphuric acid. Occasionally it is a solution of citric acid in water. These ingredients, if not all positively injurious, are yet without the desired medicinal effect, even the citric acid wanting the bicitrate of ethyl, one of the important constituents of the natural juice.

Various methods have been adopted for preserving the juice, one being the addition, as authorized by law, of not more than fifteen per cent. of proof spirit—an expensive, and not always satisfactory remedy. Quite lately, how-

ever, a Mr. Rose has suggested an application which promises to be of very great practical importance. This consists in the use of a small quantity of sulphurous acid, or rather, about two per cent. of bisulphite of lime—a well-known antiseptic. The contents of vessels closely sealed up after the addition of this substance seem to experience no change whatever—the oxygen developed in the liquid, and which would otherwise produce fermentation, being taken up as formed by the sulphurous acid of the lime, and gradually converted into sulphuric acid, which, combining with the lime of the salt and that existing naturally in the juice, forms sulphate of lime, which is precipitated to the bottom as an inert substance. One advantage of the use of bisulphite of lime over spirits as a preservative of lime juice, besides the greater cheapness, is the fact that, in its importation from foreign countries, no question can arise as to the duty chargeable on its alcoholic admixture.

CONDUCTIBILITY OF BODIES FOR HEAT AND FOR ELECTRICITY.

According to Von Lenz, the conductivity of different bodies for heat and electricity is proportional, one to the other, with the same temperature—the influence of temperature upon conductivity for heat and conductivity for electricity being the same.

CRUISE OF THE "PORCUPINE" IN 1870.

Our readers will doubtless remember the accounts, published in previous pages, of the very striking and important results obtained by the scientific corps on board the British steamer *Porcupine*, in the explorations of last summer made with reference to the fauna and temperature of the deep seas, a depth of 15,000 feet having been successfully explored. We are now informed that these experiments are to be repeated during the present summer, from the same vessel, which has been placed at the command of the Royal Society. It is understood that the first cruise will be along the Bay of Biscay and the coasts of Spain and Portugal, to the Straits of Gibraltar. In the beginning of August Dr. Carpenter will proceed into the Mediterranean, and endeavor to trace the direction of the currents at the straits. A photometric apparatus has been contrived by Mr. Siemens, for the purpose of ascertaining the depth to which solar light penetrates the sea; and other questions of considerable interest are to be investigated by the gentlemen of the expedition.

An improved method of registering the deep-sea temperature will probably be made use of during this new expedition, the results of which will tend to rectify and correct any errors of the previous season, thermometers having been prepared by inclosing the full bulb in glass, the space between the case and the bulb being nearly filled with alcohol. The effect of this arrangement is to prevent action in the way of compression upon the bulb at great depths, and thus avoid the erroneous indications that would result therefrom. Experiments have been made by Mr. Casella with this new form of apparatus under hydraulic pressure, and an equivalent to the greatest depth of the *Porcupine's* work of last season produced no perceptible effect upon the thermometer.

Editor's Historical Record.

UNITED STATES.

OUR Record closes on the 30th of June.—In the Senate, May 28, Mr. Sumner reported the Cyrus W. Field bill to aid in establishing interoceanic telegraph communication between California, the Sandwich Islands, Japan, and China; the line to be completed in five years. Among the incorporators are Peter Cooper, Professor Morse, Wilson G. Hunt, and Moses Taylor.

On May 31, a bill was introduced into the Senate by Mr. Chandler for the encouragement of ship-building. It provides for the refunding, by the government, to builders of iron vessels of duties paid on materials used in their construction; also, for the American registration of vessels purchased abroad for three years after the passage of the bill. The same day, in the House, Mr. Lynch's bill for the revival of American commerce was virtually defeated for this session, it being recommitted with its amendments.

The Senate in executive session, June 1, rejected, by a vote of 20 to 19, the reciprocity treaty negotiated with the Sandwich Islands at San Francisco, May, 1867. The treaty was to have continued in force for seven years from its negotiation.

The income tax was debated in the House on June 2. The next day amendments were adopted reducing the tax to 3 per cent., increasing the exemption to \$2000, limiting the allowance for house-rent to \$500, and prohibiting the publication of the income returns.—In the Senate, on the 24th, the income tax was utterly abolished by a vote of 34 to 23.

A Naturalization bill was reported by the House Judiciary Committee on the 9th. It reduces the period of residence to three years, and provides for proceedings for naturalization to be taken in the United States courts. The bill was recommitted on the 10th, and again presented on the 13th, when it was passed. As amended, it leaves the naturalization system in the State courts, but gives the Federal courts jurisdiction over all parties charged with fraud.

The Senate amendment to the Appropriation bill, placing female clerks in the departments, as regards pay, on the same footing with male clerks, was adopted June 11.

In the Senate, a bill fixing the apportionment for the next Congress, and increasing the number of Representatives to 300, was passed June 13.

The bill to provide a national currency of bank-notes, and to equalize the distribution of circulating notes, was debated in the House June 8. Pending the discussion, a motion to adjourn was carried, which had the effect to place the bill at the bottom of the list on the Speaker's table. The bill was, however, subsequently recovered from this position and passed. But a Conference Committee had to be appointed, which, on the 27th, presented its report in the House. The bill reported by the Conference Committee is essentially the same as the one originally presented, and of which we have given a synopsis in a previous Record. The bill was rejected on the 29th.

In the Senate, on the 16th, the House bill creating a Department of Justice, with the Attorney-General at its head, was passed.

The bill abolishing the franking privilege, which several weeks before had passed the House almost unanimously, was rejected by the Senate, June 21—yeas 26, nays 28.

In the House, June 24, the Georgia bill was adopted. It declares the State entitled to representation, a legal Legislature having ratified the Fourteenth and Fifteenth Amendments.

On June 13 President Grant, anticipating the action of the House on Mr. Banks's resolutions, transmitted to Congress a special message on the Cuban question. After alluding to the statement made in his annual message at the beginning of the session, the President says:

"During the six months which have passed since the date of the message, the condition of the insurgents has not improved; and the insurrection itself, although not subdued, exhibits no signs of advance, but seems to be confined to an irregular system of hostilities, carried on by small and ill-armed bands of men, roaming without concentration through the wood and the sparsely populated regions of the island, attacking from ambush convoys and small bands of troops, burning plantations and the estates of those not sympathizing with their cause. But, if the insurrection has not gained ground, it is equally true that Spain has not suppressed it. Climate, disease, and the occasional bullet, have worked destruction among the soldiers of Spain; and although the Spanish authorities have possession of every sea-port and every town on the island, they have not been able to subdue the hostile feeling which has driven a considerable number of the native inhabitants of the island to armed resistance against Spain, and still leads them to endure the dangers and privations of a roaming life of a guerrilla. On either side the contest has been conducted, and is still carried on, with a lamentable disregard of human life, and of the usages and practices which modern civilization has prescribed in mitigation of the necessary horrors of war. The torch of Spaniard and Cuban are alike busy in carrying devastation over fertile regions. Murderous and revengeful decrees are issued and executed by both parties. Count Valmaseda and Colonel Bolt, on the part of Spain, have each startled humanity and aroused the indignation of the civilized world by the execution each of a score of prisoners at a time; while General Quesada, the Cuban chief, coolly, and with apparent unconsciousness of aught else than a proper act, has admitted the slaughter, by his own deliberate order, in one day, of upward of 650 prisoners of war. A summary trial, with few, if any, escapes from conviction, followed by immediate execution, is the fate of those arrested on either side on suspicion of infidelity to the cause of the party making the arrest. Whatever may be the sympathies of the people or of the government of the United States for the cause or objects for which a part of the people of Cuba are understood to have put themselves in armed resistance to the government of Spain, there can be no just sympathy in a conflict carried on by both parties alike in such barbarous violation of the rules of civilized nations, and with such continued outrage upon the plainest principles of humanity."

In regard to outrages perpetrated upon American citizens, he says:

"We can not discriminate, in our censure of their mode of conducting their contest, between the Spaniards and the Cubans. Each commits the same atrocities, and outrages alike the established rules of war. The properties of many of our citizens have been destroyed or embargoed. The lives of several have been sacrificed, and the liberty of others has been restrained. In every case that has come to the knowledge of the government an early and earnest demand for reparation and indemnity has been made; and most emphatic remonstrance has been presented against the manner in which the strife is conducted, and against the reckless disregard of human life, the wanton destruction of material wealth, and the cruel disregard of the established rules of civilized warfare. I have, since the beginning of the present session of Congress, communicated to the House of Representatives, upon their

request, an account of the steps which I had taken in the hope of bringing this sad conflict to an end, and for securing to the people of Cuba the blessings and the right of independent self-government. The efforts then made failed, but not without an assurance from Spain that the good offices of this government might still avail for the objects to which they had been addressed."

In regard to neutrality, and the recognition of belligerent rights, he says:

"The duty of opposition to filibustering has been admitted by every President. Washington encountered the efforts of Genet and the French revolutionists; John Adams the project of Miranda; Jefferson the schemes of Aaron Burr; Madison, and subsequent Presidents, had to deal with the question of foreign enlistment or equipment in the United States; and since the days of John Quincy Adams it has been one of the constant cares of the government in the United States to prevent piratical expeditions against the feeble South American republics from leaving our shores. In no country are men wanting for any enterprise that holds out promise of adventure and gain. In the early days of our national existence, the whole continent of America, outside of the United States and all its islands, were colonial dependencies upon European powers. The revolutions which, from 1810, spread almost simultaneously throughout the Spanish American continental colonies, resulted in the establishment of new states, like ourselves, of European origin, and interested in excluding European politics and the question of dynasty and of balances of power from further influence in the New World. The American policy of neutrality, important before, became doubly so from the fact that it became applicable to the new republics as well as to the mother country. It then devolved upon us to determine the great international question, at what time and under what circumstances to recognize a new power as entitled to a place among the family of nations, as well as the preliminary question of the attitude to be observed by this government toward the insurrectionary party pending the contest. Mr. Monroe concisely expressed the rule which has controlled the action of this government with reference to a revolting country, pending its struggle, by saying:

"As soon as the movement assumed such a steady and consistent form as to make the success of the provinces probable, the rights to which they were entitled by the laws of nations as equal parties to a civil war were extended to them."

"The question of belligerency is one of fact, not to be decided by sympathies for, or prejudice against, either party. The relations between the combatants in their present state must amount, in fact, to war in the sense of international law. Fighting, though fierce and protracted, does not alone constitute war. There must be military forces acting in accordance with the rules of war, flags of truce, cartels, exchange of prisoners, etc., etc. And to justify a recognition of belligerency there must be above all a *de facto* political organization of the insurgents, sufficient in character and resources to constitute, if left to itself, a state among nations, capable of discharging the duties of a state, and of meeting the just responsibilities it may incur as such toward other powers in the discharge of its national duties. Applying the best information which I have been able to gather—whether from official or unofficial sources, including the very exaggerated statements which each party gives to all that may prejudice the opposite or give credit to its own side of the question—I am unable to see in the present condition of the contest in Cuba those elements which are requisite to constitute war in the sense of international law. The insurgents hold no town or city, have no established seat of government; they have no prize courts, no organization for the receiving or collecting of revenue; no sea-port to which a prize may be carried, or through which access can be had by a foreign power to the limited interior territory and mountain fastnesses which they occupy. The existence of a legislature representing any popular constituency is more than doubtful. In the uncertainty that hangs around the entire insurrection there is no probable evidence of an election of any delegated authority, or of any government outside the limits of the camps occupied from day to day by the moving companies of insurgent troops. There is no commerce, no trade—either internal or foreign—no manufactures. The late commander-in-chief of the insurgents, having recently come to the United States, publicly declared that 'all commercial intercourse or trade with the exterior

world has been utterly cut off;' and he further added, 'to-day we have not ten thousand arms in Cuba.' It is a well-established principle of public law that a recognition by a foreign state of belligerent rights of insurgents under circumstances such as now exist in Cuba, if not justified by necessity, is a gratuitous demonstration of moral support to the rebellion."

On the 14th the joint resolutions which had been reported by the majority of the Committee on Foreign Affairs were considered. These resolutions authorized and instructed the President to maintain a strictly impartial neutrality, and requested him to remonstrate against the barbarous manner in which the war in Cuba has been conducted. On the 16th a substitute offered by Mr. Bingham was adopted, 103 to 86, authorizing the President to remonstrate against the barbarous manner in which the contest is being conducted, "and, if he shall deem it expedient, to solicit the co-operation of other governments in such measures as he may deem necessary to secure from both contending parties an observance of the laws of war recognized by all civilized nations." Every Democrat, save one, voted in the negative.

As a preparation for the ensuing political campaign, an address to the people of the United States was signed and issued by the Democratic members of Congress, assembled in caucus for that purpose on the evening of June 23. It is an appeal to the people to elect members of the next Congress who shall favor a constitutional, economical, and honest government, and oppose a continuance of revolutionary, extravagant, wasteful, and partisan rule.

The State election in Oregon, June 6, for a Congressman, State officers, and members of the Legislature, resulted in a Democratic victory. This result insures the election of a Democratic Senator in place of Hon. G. H. Williams, whose term expires in 1871.

The Ohio Democratic State Convention met in Columbus June 1, and nominated a ticket for State officers, to be chosen in the October election, headed with the name of William Heisl, of Cleveland, for Secretary of State. The platform adopted denounces the present odious tariff, calls for the repeal of the income tax and other oppressive taxes, deplores the profligacy of Grant's administration, declares against land monopolies and the national bank system, calls for the taxing of the bonds, and condemns the truckling of the administration to Great Britain and Spain.

The Vermont Constitutional Convention, June 11, rejected the proposition for female suffrage. Only one member voted in its favor, against 231.

The President accepted the resignation of Attorney-General Hoar June 15, and the next day nominated Amos T. Ackerman, of Georgia, as his successor. The nomination was confirmed by the Senate June 23.

United States Senators whose terms will begin March 4, 1871, were elected in two States June 14. Senator Henry B. Anthony was re-elected from Rhode Island, and Senator Aaron H. Cragin from New Hampshire. Four Senators of the same class have already been chosen: Stevenson, of Kentucky; Morrill, of Maine; Cooper, of Tennessee; and Alcorn, of Mississippi.

On the 1st of June a delegation of Indians, the principal men of which were Red Cloud, Spotted Tail, and Swift Bear, waited on Commissioner Parker, at Washington, to confer with him in regard to Indian affairs in the Territories

of the Northwest. Red Cloud is the chief of the Sioux Nation. Spotted Tail complained that the government had not fulfilled its treaty obligations. The object of the delegation was to procure redress and protection. While these strange visitors were being entertained at Washington their brethren in the West were threatening war in the vicinity of Fort Buford, Dakota Territory.

The Cuban privateer *Hornet*, seized by the government at Wilmington, North Carolina, last fall, has been released to the original purchaser from the United States, Mr. Fernando Macia, who gave bonds amounting to \$50,000 that she shall not engage in hostilities against Spain, or otherwise violate the neutrality laws of the United States.

William Gilmore Simms, the Southern novelist, died in Charleston, South Carolina, June 11, aged 64 years.

EUROPE.

In the British House of Lords, on the 17th, the High Court of Justice bill, by which important reforms are introduced into the superior courts of law and equity in England, was passed. In the same House the Irish Land bill passed to a second reading. On the 24th an amendment to the Education bill, favoring purely secular education, was rejected by the House of Commons, 60 to 421.

Sir Charles Mordaunt, of England, has been defeated in his suit for a divorce from his wife, the decision against him resting on the ground that, owing to the continued insanity of Lady Mordaunt, she was in no condition to make legal reply. The case may be reopened whenever it shall appear that her recovery is hopeless.—Mr. Shirley Brooks, the novelist, succeeds Mark Lemon as editor of *Punch*.

Charles Dickens died at Gadshill, near Rochester, in Kent, England, on the 9th of June. The day before his death he was dining with his sister-in-law, Miss Hogarth, who, observing an unusual appearance in his face, became alarmed; but he said it was only a toothache, and that he should be better presently. He then asked that the window might be shut, and almost immediately relapsed into unconsciousness, from which state he never recovered before death. Mr. Dickens was 58 years old when he died. The remains of the deceased were, on the morning of the 14th, conveyed to Westminster Abbey, where they were received by Dean Stanley and other officials, and placed in the Poet's Corner, at the foot of Handel, and at the head of Sheridan, with Macaulay and Cumberland on either side. The usual flowers were strewn upon the bier, Dean Stanley read the burial-service, the coffin was deposited in its final resting-place, and the funeral of Dickens was ended. Upon the coffin-plate were inscribed the words:

Charles Dickens,
Born February 7, 1812,
Died June 9, 1870.

On Sunday, the 19th, Dean Stanley preached a commemorative funeral discourse.

The Right Honorable George Frederick Villiers, Earl of Clarendon, the British Secretary of State for Foreign Affairs, died June 26, aged 70 years.

At the beginning of the month the Spanish Cortes entered upon a discussion to determine the future ruler of Spain. On the 4th a propo-

sition was made that no candidate for king should be considered fairly elected unless he should receive a majority equal to one-half of the full number of deputies in the Cortes. It was voted to consider this proposition, 106 to 98. The proposition was carried on the 8th, 138 to 124. The successful candidate must therefore receive 179 votes.—A telegram from Madrid, dated June 5, states that Espartero had written a letter declining to become a candidate for the throne.—Isabella II. has signed her formal abdication of the throne in favor of her son, the Prince of Asturias.—Previous to the adjournment of the Cortes, June 22, a bill was passed by that body differing from Señor Moret's project in several particulars. All slaves over 60, instead of 65, years of age, are immediately liberated. Children under 14 years of age are to go with their mothers. Married couples shall not be separated, and punishment by the lash is absolutely prohibited.

A terrible conflagration broke out in Constantinople June 5, in the course of which over 7000 buildings were consumed. A number of families perished, being unable to escape from the network of flames in which they were immersed. A Turkish paper says that 2000 lives were lost. The residences of the American and British ministers, and the consulates of several nations, together with theatres, mosques, churches, and stores, were destroyed.

The French Chamber of Accusation of the High Court of Justice in France, on June 4, returned indictments against seventy-eight persons for conspiracy against the life of the Emperor and kindred crimes. The trials were to commence at Blois June 30.

A telegram from Vienna, dated June 5, announced that the Austrian Emperor had promulgated a decree inviting the world to a universal exposition to be held in that capital in 1873.

The Ecumenical Council has been during the month of June principally occupied with the discussion of the infallibility dogma. Seventy-two fathers—fifteen of them French prelates—signified their intention to speak against it. Bishop Dupanloup, in the course of the debate, made a very forcible speech against the dogma.

CUBA.

Oscar Cespedes, the young son of President Cespedes, who had been captured by the Spaniards, was, on May 29, executed at Puerto Principe.—A telegram from Havana, dated June 5, announced the capture by the Spaniards of the filibustering expedition which had sailed from New York in the *George B. Upton* to the aid of the Cuban insurgents. The *Upton* landed the men, arms, etc., at Punta Brava, a few miles east of Nuevitas. The Americans left in charge of the stores were attacked by the Spaniards and dispersed, losing ten killed, including Captain Harrison. Two were drowned, and three taken prisoners. A steam launch, six tons of gunpowder, 2000 rifles, 100,000 cartridges, and a large quantity of medicines, fell into the hands of the Spaniards. The prisoners were summarily executed. The *Upton*, on the 12th, in a second expedition, succeeded in landing men and military stores; but late advices from Havana announce the capture of the expedition, with its materials of war.

Editor's Drawer.

FROM every quarter of the country, and from many parts foreign, come monthly to the Drawer some hundreds of communications, containing things pleasant and witty jotted down for the delectation of our readers. Before us, for example, are letters from Marysville, California; Middlebury College, Vermont; Annapolis, Maryland; Chillicothe, Ohio; Honolulu, Hawaiian Islands; Buffalo, New York; Northfield, Minnesota; Austin, Texas; Lindsay, Canada West; Galveston, Texas; North Branch, Michigan; Oregon City, Oregon; St. Louis, Missouri; Jordan, New York; Washington, District of Columbia; Waterbury, Vermont; New Orleans, Louisiana; Sandusky, Ohio; Ottumwa, Iowa; Dale City, Iowa; Saco, Maine; Oskaloosa, Iowa; Thorndike, Massachusetts; Portland, Oregon; Chicago, Illinois; Ravenna, Ohio; St. Mary's Mission, Kansas; Fort Wayne, Indiana; Oakland, California; Piqua, Ohio; Moberly, Missouri; Petaluma, California; Bourbon, Indiana; Fort Klamath, Oregon; South Bend, Indiana, etc., etc.

The briefer pleasantries, and occasionally others, that are not exactly adapted to the Drawer, find their way to appropriate columns in *Harper's Weekly* or in *Harper's Bazar*. Scarce a letter comes bearing these funniments that does not contain a few introductory words expressing the delight which is felt in reading the Drawer, and the fine moral and physical results produced by its honest, hearty, laughter-provoking "quiddets and quilllets."

So, brethren, continue to send on your anecdotes, and thus administer to "the general joy of the whole company."

WE copy from a Number of Buckingham's *Boston Weekly Magazine*, published in February, 1805, the following epitaph, which, now that slavery is abolished, has an interest that it scarcely had when originally cut upon the stone:

EPITAPH

Upon an African, inscribed upon a Grave Stone in a Grave Yard in Concord, Mass.

GOD

Wills us free;

Man

Wills us slaves,

I will as God wills,

God's will be done.

Here lies the body of JOHN JACK,
A native of Africa, who died March, 1773,
Aged about sixty years.

Tho' born in a land of slavery,

He was born free;

Tho' he lived in a land of liberty,

He lived a slave.

Till by his honest, tho' stolen labours,
He acquired the source of slavery,
Which gave him his freedom.

Tho' not long before
Death, the grand Tyrant,
Gave him his final emancipation,
And set him on a footing with kings.

Tho' a slave to vice,
He practised those virtues,
Without which, Kings are but Slaves.

OUR eldest, a little fellow six years of age, is critical in the matter of "trotting buggies" and horse-flesh. His father's residence is suburban,

and beyond it lies the cemetery, "Forest Home;" the funeral trains passing to and fro being distinctly visible from the house. One day, after watching a funeral procession pass, Master Frank, lifting his little face, preternaturally grave, solemnly announced:

"Aunty Bell, I allus know when any body is dead."

"How do you know that, Frank?"

"'Cause, whenever I see a buggy with a door behind, then I allus knows it's a funeral."

ALAS that there should be so many poor souls who in this world and that which is to come look forward to nothing that is substantially comfortable and satisfying! Here, for instance, is a veritable descendant of Saint Martha, who came into a neighbor's house in Buffalo a few days since, downcast, wearying with many cares and cumbered with much serving: "So much to do! cleaning, working, cooking, washing, sewing, and every thing else! No rest! never was, never will be, for me!"

"Oh yes," said the good woman she addressed, "there will be a rest one day for us all—a long rest."

"Not for me! not for me!" was the reply. "Whenever I do die, there will be certain to be resurrection *the very next day!* It would be just my luck!"

Poor old dear! Too bad!

A CORRESPONDENT in Idaho incloses to the Drawer copies of some of the old district laws of that region. From the early settlement of the Pike's Peak region, in '58 and '59, until the autumn of '62, it was divided into mining districts, each district electing its own officers and enacting and enforcing its own laws. A few of these are as follows:

LOWER UNION DISTRICT.—Passed June 8, 1860.—*Sec. 8:* If any person or persons shall be guilty of stealing, the injured party may take sufficient property of defendant to satisfy all damage, and the defendant shall be banished from the district, and, failing to leave the district immediately on notice, shall receive not less than five, nor more than twenty-nine lashes. And in case the value of the property stolen be over \$100, he shall be hanged by the neck until he is dead. The injured party may proceed to retake his property and remunerate himself.

Revision of March, 1861, *Sec. 9.—Resolved:* That any person who shall be tried for stealing before the Miners' Court, if found guilty, shall receive not less than twenty, nor more than one hundred lashes. And for stealing a yoke of oxen, horse, mule, or pony, he shall be hung by the neck until he is dead; and in all cases the party having had property stolen shall be made good by the party guilty of stealing, if in his power. The president will in all cases appoint the person to whip, and the whipped person shall be banished from the mountains forever, and not complying within two hours, the whipping to be repeated.

Resolved: That no lawyer shall be permitted to practice law in any court in this district, under penalty of not more than fifty, nor less than twenty lashes, and be banished from the district.

BANNER DISTRICT, March 8, 1861.—No lawyer or pettifogger shall be allowed to plead in any court in this district.

TRAIL CREEK DISTRICT, Aug. 20, 1860.—No lawyer, attorney, counselor, or pettifogger shall be allowed to plead in any case or before any judge or jury in this district.

That seems to be more comprehensive and

specific. But what an absurd prejudice against lawyers!

The crime of perjury seems to have been regarded as a venial offense compared with the irregular appropriation of a mule. Thus:

Any person convicted of perjury shall receive twenty-five lashes on the bare back, and the sheriff shall perform said duty.

This is somewhat in the style of the rhymed advice of the noble Bushrod to his son, G. Washington:

"'Tis better to tell ten thousand lies
Than cut down one appeal tree."

It is a curious fact that the Territorial Legislature, at its first session, ratified and confirmed all the old district laws. It is also curious, in reference to the summary code quoted above, that very few persons, perhaps not one, is known to have suffered its penalties.

A NORTH CAROLINA friend notes down the following, that occurred at "our mess" during 1864: Our "contraband," Jim, is a genuine descendant of Africa in color, somewhat Christianized and ambitious, but a favorite waiter. We had been discussing the proposed celebration of the emancipation proclamation by the "John Brown," "Lincoln," and other leagues, when I asked Jim to which he belonged, how large it was, etc. He replied, "Oh, I's member of de Linkum League. Dar's a right smart lot of dem, too."

"Well," said I, "Cæsar [another contraband] came around yesterday with the subscription paper, and I felt interested to know how you are all progressing."

"D'yer see," replied Jim, "dey hel' a meet-in' las' night round yer t' Dick's, an' Cæsar p'inted de kermittie of de hul ter git de money, 'cause ter night dey's gwine to *buy der laws!*"

Evidently James had got confused about the passage of by-laws and the raising of money.

A LADY teacher, who writes from "Near Dixie," sends the following highly intellectual essay by one of her pupils:

Dogs.—Dogs aire very usefull things thaire aire several diferent sorts of Dogs thaire is the Newfound Land Blut Hown and the Pinter which is a very scillful dog in catching birds sum dogs aire very good for watchdogs while others are good for nuth in but to liabout and doo nuthing sum of them bite those aire the best of all those are the best watch dog of all Ow how plesent it would be to be at home an see Bruther an his pet dogs to see them play an scip a bout the yarde I am fare from home an cant see Bruther and his pet dogs but of all the dogs the Rat Tairerier is the best of all a dog bite is very danjerous sum foalkes have bin bit by them it makes sum foalkes sic that has bin bit I can just remember when a dog bit Pap it has bin a bout fore yeares ago The end.

THE player-folk may be interested in a paragraph in Hawthorne's recently published "English Note Books," which states that at a dinner-party which he attended (1855) at Mr. William Brown's, M.P. for Liverpool, a gentleman remarked that the Duke of Somerset, who was then nearly fourscore, told him that the father of John and Charles Kemble had made all possible re-

search into the events of Shakspeare's life, and that he had reason to believe that Shakspeare attended a certain revel at Stratford, and, indulging too much in the conviviality of the occasion, he tumbled into a ditch on his way home, and died there! The Kemble patriarch was an aged man when he communicated this to the Duke, and their ages, linked to each other, would extend back a good way. Kemble is said to have learned it from the traditions of Stratford.

AN anecdote in a former Number of the Drawer, attributing to an Indiana lawyer the miss-spelling of *f r o a d*, reminds us of the individual who was always charged with that little error. But he, by-the-way, was an Illinois lawyer, and, at the time of the "froad," prosecuting attorney of the — circuit. Ben F— was well known throughout Northern Illinois, and though his early education was defective, few shrewder or more dangerous antagonists could be found at the bar of that region. While acting as prosecuting attorney in the Circuit Court of P— County, Ben had procured the indictment of an old scamp for theft. The amount charged to have been stolen was five dollars, and at that time the penalty for stealing that sum, or upward, was imprisonment at hard labor in the penitentiary. For stealing less than five dollars the lighter punishment was confinement in the county jail and no labor. The evidence showed the stealing of a five-dollar bill of the State Bank of Illinois, and as every thing required for conviction was clearly proved, the effort of the prisoner's counsel was solely directed to proving that the bill was not at par—was not worth five dollars in coin. On this point several business men swore that the bill was not worth its face in gold, but all agreed that in ordinary transactions it would pass for five dollars. Upon this testimony the defense was energetic and protracted. Two young men talked three hours and nearly exhausted themselves. Ben took it very patiently. When the end of the defense came, and the counsel for the defense sat down perspiring, and with evident hope, from the look of the jury, that their point was gained, Ben arose quietly, and in his nasal, snuffling tones said: "Gentlemen, I hope the learned counsel won't get offended if I don't talk but just one minute. All I've got to say is just this: the prisoner don't pretend to deny that he stole our money, and all he asks of you is just to give him the privilege of stealing on't at a discount!" The jury sent the fellow to the penitentiary without leaving their box.

OLD "Daddy" Mingo Pinckney was one of the colored deacons of the May River Baptist Church, near Bluffton, South Carolina. One sultry Sunday in August, the church being crowded to hear a thrilling preacher, the intense heat of the weather proved too strong for Mingo's strict religious principles, and he fell without a groan into the arms of Morpheus. The preacher was thundering away from the text, "Plow up your fallow ground, and sow good seed." For some length of time the happy deacon merely nodded an unconscious assent to whatever the pulpit said, but at last, suddenly springing out of his sleep, he yelled out before the frightened assembly, "Look yeah, mass' preacher! You white

bucra always da holler out to we cullud folks, 'Plow up! hoe up! plant up!' as if liberty was all a cuss and a delusion! Now I tell you not a nigger in dis church shall hit a lick on de Lord's day!" That ended that.

MEDICAL certificates of physical disability are so frequently introduced into courts by lawyers that it may be pardonable to reproduce the following, written by an army surgeon during our late unpleasantness:

"Major William Watson:

"DEAR SIR,—Private Wilkins a member of your regiment is very unwell. He has been Sick for four weeks or more, and is stil in bed, and I do Honestly believe that his life will bee endangered for I have been his attending Physician. Verry resp,

"FELIX JONES M.D"

THE "glorious uncertainty of the law" is an old proverb. I recently had a new rendering from ex-United States Senator Nesmith, of Oregon, who said, speaking of the Supreme Court of the United States, "They have the last *guess* at the case."

A CITY correspondent contributes this to our juvenalia:

My little boy, six years old, and my little girl, eight, were looking at the clouds one beautiful summer evening, watching their fantastic shapes, when the boy exclaimed, "Oh, Minnie! I see a dog in the sky!" "Well, Willie," replied the sister, "it must be a sky-terrier!"

A YOUNG Minnesotian was recently made the proud father of a bouncing, handsome baby boy. The little fellow's tongue was slightly tied, and needed a little cutting. The fond "pap" remarked, "If it had been a girl I wouldn't have had it cut, *in these times!*"

A GENIAL rector of a village parish in Minnesota found it difficult to get his salary promptly. Latterly it was much behind. Going to one of his delinquent parishioners in the hardware trade, he looked over all his stock of cork-screws *very* fastidiously, seeking a large one of peculiar strength and size. To the inquiry, "What do *you* want of such a thing, any how?" the answer came, "My dear Sir, I want a cork-screw that can draw my salary!"

The payments are coming more promptly.

IN one of the towns of Michigan resides a legal gentleman of fine abilities, an eloquent talker, a thorough lawyer, and good fellow generally; but he tippleth too frequently, and this habit has retarded his advancement. His party had frequently promised him position, but the poor man's failing had as frequently rendered it inexpedient just at that time. Finally the time came when the Congressional nomination was within his grasp. He had a wife. She, too, wished to go to Washington. Other representatives took their spouses to the capital. She mentioned that fact to Robert.

"You expect to go, dear, don't you?"

"Yes."

"And do as other Congressmen do?"

"Yes," gruffly.

"Well, as other Congressmen take their wives, you'll take me?"

"I don't care; you may go."

"But, dear, you know I've never been there, nor never been out much. How do you think I'll appear among other great men's wives?"

"'Pear well enough! 'pear well enough!" replied Robert, beginning to get a little riled. "All great men have confounded fools for wives."

Unfortunately for Robert, the people did not see in Robert the representative the exigencies of the time demanded, and elected the other man. But what an atrocious sentiment Robert uttered!

AN editorial friend in Indiana mentions the following: Peter J. Sullivan, Esq., late Minister to Bogota, was recently employed to defend a rascal before the Police Court in Cincinnati. The prosecution was very bitter. After the city attorney had closed, Mr. Sullivan rose and said: "May it plaze the Coort, I have but one word to say in reply to the gentleman, and that is, that when his Maker sent him into the world he indorsed him 'widout racoorse.'"

Peter J. S. gained his suit.

A FRIEND in Wooster, Ohio, sends the following amusing instance of the simplicity of the African lad, as evinced in his first efforts to attain a knowledge of the English vocabulary. The boy, some seven or eight years old, Dan by name, was set to learn words in an old spelling-book that had been tossed about the house. He soon became interested in watching a race between a small boy and Time, as represented by an engraving in the book, and every spare moment of the day that he could find was devoted to the contemplation of the (to him) exciting chase. Night finally compelled the young African to lay aside the book which his race at the present day manifest so much pleasure in studying, and to retreat to his pallet, where, no doubt, he dreamed of "dat big fellow wid de mowin' seyye," as he called him, in pursuit of the poor frightened boy. Dan was up with the lark next morning, and the first thing he did was to get the Speller and look for his heroes of the race. He gazed intently for an instant at the picture, and then, with a wild scream of delight, exclaimed, as he danced all about the old kitchen, "He ain't cotched 'im yit! he ain't cotched 'im yit!—*Golly!* he ain't cotched 'im yit!"

WE are desirous of aiding a young gentleman who wishes employment in the tobacco way, and therefore append a letter from him, in which he very perspicuously sets forth his want:

"MASSILON, OHIO, Sep 17. 69

"SAR,—I vors in formt a few days sents that you vors in net of hans. i am a topaknest. haf resitet in Canton duren the Somar bott mi boss has ron outt Of stok ant dos notheng at the bisnas, ant I am dueng notheng at presant. ef you haf a set for me rit to me son ant a plith yours. i vork on inesheng,

"Yours re Spektfoul, HANS SCHLEIBER."

It is only in entirely new and free countries that the half-and-half style of justice is seen at its best. The best specimens originate in California, of which Yuba contributes this:

A fellow named Donks was lately tried there for entering a miner's tent and stealing a bag of gold dust valued at \$84. The testimony showed that he had been once employed there, and knew

exactly where the owner kept his dust; that on the night specified he cut a slit in the tent, reached in, took the bag, and then ran off. Jim Buller, the principal witness, testified that he saw the hole cut, saw the man reach in, and heard him run away. "I rushed after him at once," continued the witness, "but when I cotched him I didn't find Bill's bag, but it was found afterward where he had throwed it."

"How far did he get when he took the dust?" inquired the counsel.

"Well, he was stoopin' over half-way in, I should say," replied the witness.

"May it please your Honor," interposed the counsel, "the indictment isn't sustained, and I shall demand an acquittal on direction of the Court. The prisoner is on trial for entering a dwelling in the night time with intent to steal. The testimony is clear that he made an opening through which he protruded himself about half-way, and stretched out his arms and committed the theft. But the indictment charges that he actually entered the tent, or dwelling. Now, your Honor, can a man enter a house when only one half of his body is in, and the other half out?"

"I shall leave the whole matter to the jury. They must judge of the law and the fact as proved," replied the judge.

The jury brought in a verdict of "Guilty as to one half of his body, and not guilty as to the other half."

The judge sentenced the guilty part to two years' imprisonment, leaving it to the prisoner's option to have the innocent part cut off, or take it along with him.

OUR recent anecdote in reference to the member of a New England State Legislature, who wanted to know if he "drew boots and shoes," reminds an Ohio correspondent, who mentions the case of a gentleman elected to the Legislature of that State who promptly reported to the Court of Common Pleas of his county, and asked to be *sworn in and give bond* for the faithful performance of his duty. The same member reported a bill to compel farmers to cut down and destroy the *elders* in their fence-corners, upon which an unconverted member proposed to amend by inserting the word "Presbyterian" before the word "elders."—"Progress," etc.

To understand fully the following it is well enough to know that in Vermont, as in some other States, the office of assistant judge is sometimes filled by men of limited capacity and less legal attainments, the duties of the office being nominal. Some years since the Orleans County Court had closed a long and laborious session, presided over by Judge Poland, a gentleman of the highest legal attainments, and at the present writing a member of Congress from that State. On the trial of a lengthy and intricate case one of the side-judges was heard to remark to a friend, "The Chief Justice agrees with me in my opinion of the law in this case, and will charge the jury just as I should." Judge P. heard the remark and smiled.

This reminds the Drawer of a remark made recently by a couple of lawyers as to the various points to be made in a certain case where the result was quite doubtful, and where great importance was attached to the rulings of the Court.

"At all events," said the younger and more enthusiastic lawyer, "we have *justice* on our side." To which the older and warier counsel replied, "Quite true, but what we want is the *Chief Justice* on our side."

WE give the following story from "where rolls the Oregon, and hears no sound save its own dashing," *verbatim et literatim*:

"MR DRAWER—In this neighbourhood we have an old Yanky that hunts partly for a living he was in the Store at this place a few days ago telling about his Killing a Bear it Seems he was in the woods Some distance from home and Killed a deer between Sundown and dark feeling tiard he concluded to hang his deer up in a tree and come after it in the morning but when he Got back in the morning there had been a bear there a eat most of the deer and the Ballance he buried and when the yanky went Slashing around the bush awhile he come to an Open Space there he meets Mr. Bear, the Bear Gave two or three leaps towards him which brought the bear and yankey with in a few feet of each other, then the Bear Reared up Ready to Grab the yankey—the yankey Girked his Gun from his Shoulder and by a lucky Shot drove a Bullet through the Bears Brane—One of the men that was listening to the old Yankeys adventure asked him what his thoughts was Just as the Bear reared up Ready to Grab him he Said he thought old Mr. Bear you are in a bout as tight a place as you was ever in *if you only knowed it.*"

THE Drawer, in recent numbers, has given two or three specimens of original American preaching that might, perhaps, be open to the charge of being jocose. As an offset, we quote from a work published in England a few years since on "Post-Medieval Preachers," "many of whom did not make long extracts, but with one light sweep brushed up a whole bright string of sparkling Scripture instances." As an illustration, we quote the following beautiful passage from a sermon on the text:

"*Many are called, but few are chosen.*"

"Noah preached to the Old World for a hundred years the coming in of the flood; and how many were saved when the world was destroyed? Eight souls, and among them was the reprobate Ham. Many were called, but only *eight were chosen.*"

"When God would rain fire and brimstone on the cities of the plain were ten saved? No, only four; and of these four one looked back. Many were called, but *three were chosen.*"

"Six hundred thousand men, besides women and children, went through the Red Sea; the host of Pharaoh and the Egyptians went in after them, and of them not one reached the farther shore. And of these Israelites, who passed through the sea out of Egypt, how many entered the promised land? Two only—Caleb and Joshua. Many—six hundred thousand—were called; few, even *two were chosen.*"

"How many multitudes teemed in Jericho? and of them how many escaped when Joshua encamped against the city? The walls fell, men and women perished. One house alone escaped, known by the scarlet thread, type of the blood of Jesus, and that was the house of a harlot.

"Gideon went against the Midianites with thirty-two thousand men. The host of the Midianites was without number, as the sand of the sea-side for multitude. How many of these thirty-two thousand men did God suffer Gideon to lead into victory? Three hundred only. Many, even thirty-two thousand men, were called; *three hundred chosen.*"

"Of the tribes of Israel *twelve men only were chosen*; and of these twelve one was a traitor, one doubtful, one denied his Master, all forsook Him.

"How *many rulers* were there among the Jews when Christ came? but *one only went to Him, and he by night!*

"How *many rich men* were there when our blessed Lord walked the earth? but *one only ministered* unto Him, and he only in His burial.

"How *many peasants* were there in the country when Christ went to die? but *one only was deemed worthy to bear His cross*, and he bore it by constraint.

"How *many thieves* were then in Judea when Christ was there? but *one only entered Paradise*, and he was converted in his last hour.

"How *many centurions* were there scattered over the province? and *one only* saw and believed, and he by cruelly piercing the Saviour's side. Truly, '*Many are called, but few are chosen.*'"

THAT was not an inapt reply of the country clergyman who, on being asked if he studied the *fathers* before he began to write his sermons, said, "No, I rather study the *mothers*; for they have the greater need of comfort and encouragement."

"NAMES are things," was the trisyllabic remark of a celebrated British statesman. Even so in Maryland. Lawyer — was a candidate for the Legislature. On an election tour through the northern portion of Harford County he stopped at the house of an old farmer, who asked him what he was. The lawyer, not knowing the farmer's politics, and wishing to be on the safe side, answered, after a moment's hesitation, that he was a "Democratic Republican." "A what?" "A Democratic Republican," repeated the legal gentleman. "Well, Sir," said the man of the soil, slowly, "I am very fond of turkey, *very*; but I *don't* like turkey-buzzard."

AN Alabama friend sends the following "recommend" of a steamboat, by an indignant passenger:

STEAMBOAT SPINK.—Persons having business up the river will do well to patronize this fine, staunch steamboat. I only had to pay four dollars (!) to go up to Peters's Ferry, 12 miles. The South lost an immense sight of stock during the war, but the *hogs* are not all dead yet.

D. S. M.—

WE have an army reminiscence showing what odd conceits arise under circumstances of the gravest character. During the "disturbance" divine service was one evening held in front of the row of tents constituting a hospital ward. The chaplain, before giving out the hymn, stated that an eminent clergyman, while on his death-bed, called his wife to his bedside and asked her to sing to him that grand old hymn commencing,

"Rock of ages,
Cleft for me,"

and that as she sang its closing line he gently closed his eyes in death.

The hymn was then given out; but singers were scarce, and after three or four break-downs one verse was gotten through with.

One of the Eleventh Massachusetts lay close to the end of one of the tents, with a fractured

thigh. He had been greatly interested in the introductory remarks to the hymn, and when they finished the attempt at singing he turned his head to his comrade in the next bed, and, with sadness of tone, said, "Well, I don't wonder he died, if his wife sung it in that style."

THIS from a clerical friend at the "Hub." At a dinner-party recently given in that city one gentleman was late. The host said, "When the reverend gentleman comes in and is seated I will ask him a question, and his answer will be, as it invariably is, 'I make a distinction, Sir.'" The gentleman came in and was seated. The host said, "Your Reverence, is it ever lawful or expedient to baptize a child in soup?" "I make a distinction, Sir," was the reply. "If you mean soup in general, I should say, decidedly not! decidedly not!! but if you mean *this* soup in particular, I should say that it would make but little difference."

It seems to us that the following, from a country journal, is about the thing for an obituary:

"On the morning of the 14th of April, 1857, the angel of death entered the dwelling of H. J. C—, of J—, Maine, and bore away upon his pinions the happy spirit of N. C—, aged 29 years. Brother C— was a member of the Methodist Episcopal Church of — some five years previous to his death. Was a good Christian, a young man of amiable cast of mind, easy and happy in his addresses. The lustre of his character gave happiness in conversation, and commanded respect from distant acquaintance. His disease was pulmonary consumption. His sufferings were severe, which were borne with Christian patience; was happy even to the last; and while standing in the midst of the waters of death, 'shouted victory.' Our deceased brother was a temperance and a Republican Christian, and leaves a large circle of friends, and one, to whom he was engaged, dearer than all the rest, to mourn his loss.

JAMES HARTFORD,

"Pastor of the M. E. Church of Dixmont Circuit."

DOUBTLESS one of the best-known men in England is Mr. Vernon Harcourt, whose contributions to the London *Times*, over the signature of "Historicus," are notably able and brilliant; but, like many very clever writers, "Historicus" is not a very clever or companionable talker. There is a little story about him to the effect that four gentlemen were discussing the subject of bores, each declaring that he knew the most disagreeable man in the world, and, the dispute growing animated, it was agreed that the four bores should be brought together at dinner. Accordingly the day was appointed, and each gentleman agreed to bring his bore to the Star and Garter at Richmond, where covers were to be laid for eight. The hour arrived, and three carriages drove up to the door of the famous inn, each with but one occupant. Three of the four gentlemen had been disappointed in their man, through a previous engagement. At length the fourth carriage came, and out of it stepped Mr. Vernon Harcourt. "Hang the fellow!" said the other three in chorus, as the fourth gentleman followed, "he has brought *my* bore!"

THE Hon. Thomas W. Thomas, of Georgia, Judge of the Superior Court (now dead), was an eccentric genius, who told many stories of himself, and had more told of him. His favorite method of getting rid of worthless characters from the town where he lived was to get them into mock duels, and, if they stood fire, to let

the opponent fall as if dead, and alarm the shoot-ist by the terrors of the law. One summer a fellow was served in this way, and the last seen of him was at Craft's Ferry, on the Savannah River, saying, "For the Lord's sake, let me over—I've just killed a man in a duel, and all of his kin are after me!" And once over, he was seen no more. A few weeks later it was desirable to get rid of a drunken tailor, and the field of honor was again tried. This time the fellow coolly tried his pistol-barrel with a twig, and said, "Thar ain't no ball in here, and *I come to kill meat, I did.* Put in one." And it cost Thomas five dollars in corn-whisky to get the duel out of the tailor's head.

WE have been waiting for some time for Mr. Bonner or Mr. Wilkes to reproduce an old-time Bowery lyric, which, in its closing line, shows what can be got out of "that noble animal, the hoss:"

"I seen her on the sidewalk,
When I run with No. 9;
My eyes spontaneous sought out hern,
And hern was fixed on mine.
She waved her pocket-handkerchief
As we went rushin' by—
No boss that ever killed in York
Was happier than I.
I felt that I had done it;
And what had won her smile?—
'Twas them embroidered braces
And that 'ere immortal tile.

"I sought her at Wauxhall,
Afore that place was shet—
Oh! that happy, happy evenin',
I recollex it yet.
I gin her cords of pea-nuts,
And a apple and a 'wet'—
Oh! that happy, happy evenin',
I recollex it yet.

"I took her out to Harlem,
On the road we cut a swell,
And the nag we had afore us
Went twelve mile afore he fell.
And though ven he struck the pavement
The 'Crab' began to fail,
I got another mile out
By twisting of his tail!"

An elderly lady writes to us that, in a village of Western New York, in the year 1823, there was a youth who sadly wished to learn to dance, but had no fiddle to dance to. Nor did he know any tune but sacred ones. One day as she (then a young girl) was passing the barn she heard his voice, and looked in at the half-open door. Jeremiah was standing before a sheaf of wheat for a partner, and singing in a loud key:

"Lord, in the morning *Thou shalt, Thou shalt,*
Lord, in the morning *Thou shalt h-e-a-r-e!*"

and at the prolonged *hear* danced "hands around and down the middle."

Of course he learned to dance, and had a live partner to a fiddle at last.

In Tamaqua, the "Mountain City" of Pennsylvania, has resided for many years an old colored individual, by occupation a barber, who was one day complaining of his sufferings from dyspepsia, and attributed his ailment to the fact of having no teeth, by which he was unable properly to masticate his food.

"Well, Simon," said a by-stander, "why don't you get a set of false teeth? They wouldn't cost you much."

"False teef!" exclaimed Simon; "oh no,

Sah! no you don't! I'se had jest all de teef I want in *my* mouf! I'se suffered more wid de toofache den I ever did wid de 'spepsy, an' I was glad enuf for to git shet of my teef! You don't git no mo' teef into *my* mouf—no, Sah!"

WE notice in the English journals that Sir David Baxter has recently presented to the Society of Antiquaries of Scotland the sea-chest and drinking-cup which belonged to Alexander Selkirk (Robinson Crusoe), and were in his use during his sojourn on the island of Juan.

With these treasures, it seems to us that it would not be inappropriate to file a copy of Phoebe Cary's conundrum: Why was Robinson Crusoe's man Friday like a rooster?—Because he scratched for himself and crew so (Crusoe)!

By no means let it be supposed that the custom of making bridal presents is an institution of modern date, or that it is confined mainly to those possessed of wealth. A legal friend in the interior of Pennsylvania communicates to the Drawer a curious form of wedding invitation, composed by an affianced pair in Wales, in which the style of entertainment they propose to give is not only set forth, but whatever wedding presents their friends might "grant, out of their charitable hearts," would be "accepted with congratulation and most lovely acknowledgment:"

CARMARTHENSHIRE, Sept. 8, 1835.

We take the convenience to inform you that we confederate to such a design as to enter under the sanction of Matrimony on the 9th day of October next; and as we feel our hearts inclining to regard the ancient custom of our ancestors, we intend to make a Wedding Feast the same day, at our habitation, called *Ysgwynfach*, in the parish of Llangathen; at which place we hereby most humbly invite your pleasing and most comfortable fellowship. And whatever kindness your charitable hearts should then grant will be accepted with congratulation and most lovely acknowledgment, carefully recorded, and returned with preparedness and joy, whenever a similar occasion overtakes you, by

Your affectionate servants,
STEPHEN STEPHENS.
MARY REES.

P.S.—The young couple, with the young man's father and mother (Thomas and Mary Stephens), and his brother (John Stephens), desire that all debts of the above nature due to them should be returned to the young man on the said day, and will be thankful together for all additional favors.

RECONSTRUCTION has done much for our Southern countries. Verily is the bottom rail on top! "Here in Galveston," writes an old correspondent of the Drawer, "the metropolis of Texas, we are served with negro juries, negro constables, negro policemen, negro justices, and negro legislators. The country progresses, however, as the people raise cotton and sugar, and talk 'craps' instead of politics. In one of our reconstructed justices' courts a jury was recently impaneled to try a case of abusive and insulting language, in which a negro had only called a white man a — white, etc., etc. [language fit for a police report, but not for the Editor's Drawer]. The following is a *verbatim et literatim* copy of the verdict:

"Wy de jury findet noht gylte.
"THOMAS M'DONALD, Foreman."

That Fifteenth Amendment citizen received his early education in a German family, and his master lost \$1500 by the result of the war.

HARPER'S NEW MONTHLY MAGAZINE.

No. CCXLIV.—SEPTEMBER, 1870.—VOL. XLI.

THE MEDITERRANEAN OF THE PACIFIC.

PORT TOWNSEND.

IT is only a few years ago since the "Great Northwest" indicated the States of Minnesota, Illinois, Michigan, and the States between New England and the Rocky Mountains. Since that time the cry of gold has led thousands of our population across the Rocky Mountains and the glistening peaks of the Nevada range, to the sunny slopes and verdant valleys of the Pacific. Thriving cities have arisen on the plains where roamed huge herds of buffalo. The regions where half-savage Indians reared cattle, and where the traders and trappers of the Hudson Bay held almost undisputed sway, are now organized portions of the republic, with recognized laws and promising institutions. California is now a rich and settled State of the Union, with a future the greatness of which we can only conjecture. The river banks of Idaho and Montana are dot-

ted with camps of gold and silver miners—the hardy pioneers of a great and prosperous country. The broad prairies and the beautiful valleys of Oregon are filled with a sturdy race of agriculturists; the cars creep along the fastnesses where the Indian could scarce find a trail; and the steamers ply for nearly a thousand miles from the mouth of the Columbia—that Achilles of rivers. In Washington Territory, so long the debatable ground, and the scene of Indian massacres, the lumbermen are cutting their way into the old forests; and fleets of trading vessels are lying at anchor in its harbors. Nay, far north, beyond where the Nootka savage strings his shells, and the hardy Hydah shapes his canoe, Alaska is heard knocking at the gate of the republic, seeking entrance where so many others have entered in. "Westward

Entered according to Act of Congress, in the year 1870, by Harper and Brothers, in the Clerk's Office of the District Court of the United States, for the Southern District of New York

VOL. XLI.—No. 244.—31

the star of empire takes its way." Illinois is no longer in the far West. Minnesota and Nebraska are only frontier States on the way to the "true Northwest."

The railway linking the far West to the far East was opened in July last. The full significance of that important announcement can scarcely be estimated. It will change the aspect of a great and productive region. The Indian already stands aghast as he sees the line of cars—that greatest of all great "medicines"—rattling along the plains where he hunted the buffalo, and withdraws to the northward. He hears in the whistle of the engine the death-knell of all his race. The trapper hears it, and hurriedly gathers up his traps and little "fixins," and, with his squaw and half-breed brood, retreats before the surging flood of immigration. They hear, not afar off, "the rush of waves where soon shall roll a human sea"—a sea that shall sweep them before it.

These regions, of which many knew little, save by the tales that came floating back of the exploits of Jed Smith and Kit Carson, the hardy pioneers; of Skipper Gray, who first

breasted the breakers on the bar of the Columbia; of Captain Bonneville, who made his way to them by land; of Sutter, who found a bank of gold in his millrace; of old Downie, ycleped "Major," who always "struck it" where he slept—these regions have all been brought near by the railway. Thousands have left their homes in the East for a month's vacation and a trip to California during the last summer. They have been to see us and gone away again, to tell of our snow-tipped mountains, and giant forests, and rocky gulches, with the glittering gold, and pleasant corn-covered valleys and vine-clad hills. To us in the West it seemed as if New York and Philadelphia and Chicago had gone out "on the tramp." In August the writer met an authoress from New York in the Willamette Valley, a professor from Iowa away up at the Cascade Falls of the Columbia, a couple of Senators from Washington staging it through an Oregon forest, the Governor of Illinois at a social gathering in Portland, dined with the Vice-President on board one of the Oregon Steamship Company's vessels, near to the 49th parallel, had a drink with an Eastern

editor in one of the ice-caves of Washington Territory, and spent three of the happiest days of his existence with Seward and his party, on the pleasant waters of the Puget Sound.

And no sooner has one railway been opened than another is proposed. The engineers have already been out and made the survey. The Northern Pacific is spoken of as a rival to the Central Pacific, and the landholders and lot-holders of the Puget Sound are discussing the location of the great terminal city. The eyes of all are turned to a spot which is destined to play no mean part in the history of our national progress and civilization. Bills may be proposed and defeated, particular schemes may be discussed and delayed; but let any one take a look at the position and contour of the northwestern corner of our country, and he will be

MAP OF PUGET SOUND.

convinced of its importance, and foresee its manifest destiny. *There* is a great inland sea stretching up 200 miles from Cape Flattery, studded with fertile islands, surrounded by pine-covered heights, and nearer, by 800 miles, to China than San Francisco—and nearer, also, to New York. Instead of sage-bush desert and salt plains, there is a fertile belt, under which lies a bed of miocene coal, stretching all the way from Illinois to Washington Territory. Let any one consider the increasing commerce with China, of which we have merely tasted the first-fruits, and acquaint himself with the character of the country behind it, and he will perceive why so much attention has been directed to this part of the republic; he will be satisfied of the wisdom manifested in preserving intact the boundary line which terminates so near it, and discern a reason for the present anxiety to push through the Northern Pacific Railway.

If ocean steam is ever to become on the Pacific what it has been on the Atlantic—if our relations with Eastern Asia are ever to be what they have been with Western Europe (and why should they not?)—the Puget Sound must become one of the centres of the world's commerce. Ship-building lags in the East, through the difficulty and expense of importing lumber. The United States have never taken the proper position of a great commercial country in this industry. Survey all their coasts, and say where is its natural home. Where can safe harbors be most easily found? Where is timber the most abundant and of easiest access? The eye will at once rest upon the Puget Sound, with its endless windings and openings into the land—with its sheltering islands, and numerous natural harbors, where land, covered by the finest spars of the world, can still be had for the mere pre-emption. The writer has often passed up and down on its unruffled surface, and never did his eye sweep along its bays and pine-clad hills without his feeling something of its coming glory, and wishing to be spared for ten or twenty years to perceive the ships at anchor where now the whir of the duck alone breaks in upon the silence of the bay—to see the wretched "rancheree," where these Indians wallow in filth and lust, transformed into a smiling village—to realize that these shanties of the lumbermen and whisky saloons have become large cities. This impression was greatly confirmed last summer, when he accompanied the Hon. Mr. Seward and his family along the sound. The citizens at all the lumbering-mills and small cities gave right royal welcome to the "old man eloquent," and called for an address. He appeared to have looked through the present, and seized only upon the future. His mind was filled with *that*—the issue of what he saw; for he never addressed them as lumbermen or saw-drivers—he addressed them uniformly as ship-builders. He saw in their saw-dust streets and rude cabins the beginnings of the things that were to be. For as yet but few vessels have been built on the sound, and, at

the time, there was not one on the stocks any where.

That there will be a Northern Pacific Railway terminating somewhere at or near the Puget Sound is certain. The only question is, whether it will be on American or British Territory. The English are not blind to the advantages of the northern route, and are anxious to gain them for themselves. The imperial policy is to unite the North British possessions into one confederation before the feeling of annexation becomes stronger. British Columbia, the colony on the Pacific, insists upon a railway as one of the conditions. Already a company has been formed, and application made at Ottawa for a grant of alternate sections of land along the route proposed. There can be but one northern railway: which shall it be? One that will stretch through the more fertile northern belt, leading up a population to settle on the boundaries, and consolidating American interests, or a railway supported by British capital, and managed in British interests, building up a rival domain on the continent?

On the supposition that it will be American, we give this sketch of the region around the terminal point. We do not propose to discuss the merits of rival claimants, and having neither lot nor plot in any of the proposed locations for the "big cities of the future," give the result of observations during four years' residence near this Mediterranean of the Pacific, but more particularly during a holiday trip last summer with the "Seward party."

In July last Allan Francis, Esq., United States Consul at Victoria, Vancouver Island, a beautiful little British city that looks across to the Puget Sound, gave out that "Seward will be here on his way to Alaska." We hurried up, and prepared a suit of rooms and a reception for him. British and American citizens vied with each other in doing him honor. At last the big ship made its appearance in Esquimaux Harbor, near the city, having on board the Hon. W. H. Seward, F. W. Seward, Esq., and Mrs. Seward; A. Fitch, Esq., William Von Smythe, and Judge S. C. Hastings. This harbor is reckoned the third best in the world, the first being Rio Janeiro, and the second San Francisco. To greet him there was a good Western rush. If he could have eaten a hundred dinners, or drank a thousand drinks, they were ready for him. As it was, in the evening he spoke a few words on the recent "ice purchase," which he was going up to look at and lay quietly by. Captain Blinn and a few other proprietors of the lumber-mills on the sound were in Victoria, and proposed a "trip up the sound." They chartered the steamer *Wilson G. Hunt*, and we started from Victoria on one of the loveliest July mornings. For you must understand that the climate of this region is equaled only by the richness and beauty of the scenery. From April till October there are clear skies and sunny days. The

VICTORIA, BRITISH COLUMBIA.

earth is preserved soft and verdant by occasional showers that fall during the night, and the heat of summer tempered by the gentle breezes that are cooled as they pass across the snowy summits of the neighboring range, and play perpetually around the brow and cheeks. The winter is mild as an Eastern spring. Snow seldom visits, and never lies long on the ground. The rose-buds may be plucked in the open air at Christmas, and geraniums gathered at the New-Year. A singularly healthy and delightful climate has been reserved for the outlying corner of our land. No sweltering heats of summer cause sleepless nights. No savage winter frosts pinch and cramp the feeble frame. Never any where have we seen children so healthy and beautiful as within the limits of Washington Territory.

This morning, on which the *Hunt* started from Victoria, was a fair specimen—rich in suffused light, a feeling of refreshing softness in the air—the waters beaming as a silver sea. In the run across the Strait of Fuca the scenery disclosed was worth a journey from Washington to behold. Behind us were the blue heights of Vancouver Island; on our left numerous green islands; and behind them the snowy ridges of the Cascade range, topped by Mount Baker rising in solitary grandeur, and spreading his white breast to the sunlight. We had some pleasure in reflecting that the Stars and Stripes now floated from his highest peak, having been placed there by three adventurous mountaineers the summer before, who ascertained his height to be 10,781 feet. But to what are we forcing our way? There rises up before us a huge wall of rock and ice—a solid, snowy ridge stretching away down to Cape Flattery. The waters seem to flow into its very base. Apparently it would take a myriad giants to force a passage for us.

We sail on, and in time discover several little harbors amidst the clefts in its huge side, and an opening at its

eastern extremity. The nearest of these harbors, called Port Discovery by Vancouver, because it was the first in these parts he entered in the *Discovery*. It is guarded by a small island, called also by him Protection Island, because of its position. Our thoughts reverted to that Sabbath morning in May, 1792, when he cast anchor there, and landed with his officers on the island, surprised and delighted with its scenery. "On landing," he wrote in his journal; "on the island, and ascending its eminence, which was nearly a perpendicular cliff, our attention was immediately called to a landscape almost as enchantingly beautiful as the most elegantly finished pleasure-grounds in Europe. There was an extensive lawn covered with luxuriant grass and diversified with an abundance of flowers. To the northwestward was a coppice of pine-trees and shrubs of various sorts that seemed as if it had been planted for the sole purpose of protecting from the northwest winds this delightful meadow, over which were promiscuously scattered a few clumps of trees that would have puzzled the most ingenious designers of pleasure-grounds to have arranged more agreeably. While we stopped to contemplate these several beauties of nature in a prospect no less pleasing than unexpected, we gathered some gooseberries and roses in a state of considerable forwardness." While the features of the scenery are still the same as when Vancouver wrote, the scene has so far changed that where there was silence is now the hum of driving machinery. Man has been here "wi' his kittle o' steam;" and when we passed, the lumber-mills of C. E. P. Wood and Co. were giving employment to 300 hands, and turning out 70,000 feet of lumber per day.

Port Discovery is one of the expectants for the big city, so we mark its position and keep it in mind. The eastern end of the Coast range runs out into a long spit termed Point Wilson. We round this, and come in sight of Port Townsend. "What flag is that?" asks one. Mr. Seward was within hearing, and sharply answered: "That flag, Sir, is the custom-house flag of the United States. This must be the port of entry." And he was right.

Port Townsend is a city of two parts, differing widely from each other. One part is on the sands, and the other on the bluff that overlooks them. We may regard these as Port Townsend the Ancient and Port Townsend the Modern. Port Townsend the Ancient may again be divided into the East and the West. The East contains the "rancheree" of the Duke of York and his vassals. The West includes the Custom-house, the Masonic Hall, the Good Templars' Hall, the hotel, several whisky saloons, and other places of business. In Port Townsend the Modern are the Marine Hospital, the school-house, the church, and neat residences of the more prominent citizens. As we approached, the big cannon which they have lately secured vigorously blazed away, and the wharf was covered with the citizens, old and young, white and red. The boys called lustily for a speech from the old man. He did not see it at first; but, with a little coaxing, at last mounted the rostrum—the deck of the steamer—and said something like this: "You have got a splendid country here. What you need is population. Now don't be foolish and send any from your gate. Take all you can get—Boston man and Irishman, white man and black man, and John Chinaman, if he will come. You have room for all. You can make something of them,

THE DUKE OF YORK.

QUEEN VICTORIA.

and they will help you to cut down the forest, and enable this to become a great and prosperous place. God bless you, my boys, and keep you all honest and loyal!"

Port Townsend has hitherto enjoyed no enviable notoriety for smuggling and whisky drinking through the humorous descriptions of Ross Browne, and T. Winthrop. If they were here now they would find occasion to change their opinions. No better society can be found any where than here in the Ultima Thule of Uncle Sam's dominion, and no more enterprising band of citizens.

We saw amidst the throng an old friend of theirs formerly sketched in this Magazine—the Duke of York—the chief of the Clallam Indians. The Duke appeared also to have mended his ways, and to have renounced "potlun." Not drunk, he was out with the earliest to give

INDIAN GIRLS AND CANOE.

welcome to one of Uncle Sam's "Tyas Tayees," or big chiefs. Instead of having his feet dangling from under the "pississy" or blankets, he was rigged in veritable pants, and sported a Tyrolese hat with a red feather. "Halo tenas Tayee" (no small chief is he), and he lords it over his fishy vassals with despotic sway. No canoe can here be secured without a reference to the Duke of York and arrangement of terms with him. We present the portrait of him and family in their last stage of development. It is gratifying to know that his wives, Queen Victoria and Jenny Lind, still survive and are well. Queen Victoria does washing for the lieges, and is deemed honest and careful by her patrons. Jenny Lind, though long the court favorite, is both drunken and lazy.

Here, as elsewhere on this coast, we perceive the last of the red man side by side with the first of the white men—the dying race and the growing race strangely intermingled. At Victoria we saw the residence of the Governor and officials on one side of the harbor, and the "rancheree" of King Frisi and the dilapidated remnant of the Songhish tribe on the other. As we look over the side of

CHINOOK WOMAN AND CHILD.

our vessel at Port Townsend we see two Clallam girls in their Chinook canoe sitting at ease. Thus have the Duke of York and such as he sat at ease for centuries in their salmon-scented halls. In the midst of good opportunities, in one of the best fields of the world, they have lived out their time in idleness and sensuality, their industries never rising higher than skulking round the forest and shooting the elk, or sleepily dozing in their canoes, and spearing the salmon as he darted along; their pleasures never ranging beyond the hideous "potlatch," when, with wild screams and savage joy, the tribal crew mounted the roof of their "rancheree," and flung their long-stored blankets to maddened "tilicums" (companions) beneath. Their time has come, and their portion is another's. Even now they have lost the enthusiasm of the savage, without gaining the wisdom of the white man. They are letting their time-cherished customs drop as things of death. In this country of the Flatheads, where for centuries the Clallam belle has been rated according to the taper of her "caput," we find comparatively few mothers thus preparing their offspring for social position. Occasionally we see a Clallam conservative, some frowsy old crone from the Chehalis or the Querquelin, sitting with the instruments of torture applied to the hope of the family. Down at Cape Flattery, where they hunt the seal and gather the dog-fish oil, they preserve this ancient feature of their race. Our sketch shows the means applied. Some of them boast that the chignon is only an attempt on the part of other belles to copy their native graces. More than one have we seen with a piece of solid bark rolled up in their hair in imitation of the fashionable chignon.

On the whole, these dusky mothers take but little trouble with their offspring. The "tenas man" (small man), when born, is wrapped in a piece of old four-point blanket, covered over with the soft bark of the willow or dog-wood, laced up tightly in his cradle of wicker-work, and left to take care of himself. Kick or sprawl he can not, and his bawling pleases himself and hurts no one. Generally he is a contented little animal as he is tossed around in his basket, or swings from his pole or the branch of a tree in the great forest.

Port Townsend is another of the aspirants for future greatness. Its claims are: 1. Easy access from the sea. 2. The possession of a commodious and well-sheltered harbor. 3. The proposal by the Federal Government to erect fortifications around on Port Marrowstone, Port Wilson, Admiralty Head, and Port Partridge on Whidby Island.

Here we received on board an addition to our party, and steamed further up the sound between high sand-clay bluffs that rise on either side. Nine miles up we came to a city built on saw-dust foundations. Out here we name every place a city from a log shanty and an old horse upward. This city is named Port Ludlow. At the lumber-mill there are one

THE "TENAS MAN."

hundred hands employed, and they can turn out 40,000 feet of lumber per day. After other nine miles we touched at another city—the fac-simile of the former, named Port Gamble. What a pity they did not keep the old Indian name Teekalet! Here they have from 300 to 400 hands employed, and can turn out 100,000 feet in twelve hours.* The "boys" had no cannon; but they had loaded up a couple of anvils, and made them do duty instead. They also brought out their pet to show to "the Governor"—said pet being a two-year-old elk which they had caught and tamed. The pet is already a lusty animal weighing 400 pounds, and it took four men to bring him down—two at his head and two at his heels.

Near to the mills is the real Teekalet, a lodge of Indians who are fast dying out. Indeed, all the race are fast dying out except those collected on the reservations. After all the talk that has been made about the Indian policy, it is the only humane policy with these helpless creatures. It may not save them, but it protects them for a time from ills with which they are ill-fitted to cope. For instance, there are about 3000 Indians, representing twenty-five tribes, gathered on the Tulalip Reservations across the country, forty miles from this. There they are under the constraint of the Superintendent. The youths are taught to be useful by resident carpenters, blacksmiths, etc. The girls are gathered into schools, and taught the arts of reading, writing, and arithmetic, as well as the common processes of the household. Some of them can even play the piano and the melodeon. Among them there labors Father Chirouse, a missionary of the Roman Catholic

* This mill, owned by Pope, Talbot, and Co., has recently been greatly enlarged. They have a fleet of twenty-two vessels in constant service.

THE "MEMOLOOSE HOUSE," OR CEMETERY.

Church, who for twenty years has been their great "Sacra Tayee," and whose influence has been powerful for good. Even there they are decreasing at the rate of ten per cent., while here they are perishing speedily by disease and drunkenness. It is all very well to say that these scattered tribes, such as the Teekalet, preserve their ancient liberty. It is no blessing to them, and they are a bane to the white settlers around. Better drive them off to the reservations. These squalid creatures have little of the spirit of the old braves. They are singularly dull and uninteresting. Few of their customs have any romance about them, and all their arts are of the rudest kind. Their highest efforts are exhibited in their ranch-poles and grave-yards—the "Memoloose," or dead-houses, as they call them. We present a sketch of one near to this.

Leaving Port Gamble, or Teekalet, as we prefer to call it, we continue a winding course for sixteen miles, and reach a beautiful settlement named Port Madison, in the forest around the mills of Meigs and Co. This is a model establishment. The men, instead of burrowing in mean shanties, with their squaws hanging around, appear to have settled down in decent homes. There are all the pleasing manifestations of family life, and by the stringent regulation of the proprietors, not a drop of liquor can be sold in the place. Consequently all the drunk and disorderlies soon clear out, and those who remain call it the mint, as they can save money. The ordinary wages are from \$40 to \$100 per month, with board and house rent, here and elsewhere on the sound. At Port Madison there are two hundred hands employed, and they can turn out 40,000 feet of lumber per day.

"Lumbering on the sound" is the staple

employment of the floating population. There have drifted hither men of all kinds, from all parts. Some from the shores of Maine and New Brunswick, able to build a ship and sail her; and hardy wood-choppers from Canada and Nova Scotia generally make some of the mills their resting-place. The majority, however, merely seek in them the opportunity of recruiting for other schemes. "Big Larry" owns an interest in a claim in Cariboo, and winters here to prepare himself for future assessments.

"Chippis" has failed

in some more ambitious attempt, and settled down at a saw till he has money enough to try another. "California Peter" has been roving over the land, fluming a gulch at one time and trapping furs at another, and has turned in among "the boys;" but six months hence will turn up on board a cruiser on the coast of Mexico. In a few months the hands will be increased by an influx from Montana and the Blackfoot country, from British Columbia and the Saskatchewan. A roving, restless race, they are gathered only to be scattered. At each station there are two bands—those engaged at lumbering in the woods and those at the mills. The lumbering is usually done by contract. The leader, or "boss" of the band, makes an arrangement to deliver logs at so much per thousand feet. Forthwith he leads his men to a spot in the forest where the best logs may be found. This is not difficult to find, where the trees (the *Abies douglasii*) are from two hundred and fifty to three hundred and fifty feet high. The giant tree having been felled, is then cut into lengths, which are hauled by oxen to the water's edge, and piled together to form a boom. In course of time a tug comes along and bears away the booms to the saw-mill, where they are soon cut up into boards, and dispatched to San Francisco, Valparaiso, Honolulu, China, and Australia. The demand for the Puget Sound lumber has been steady, and is annually increasing. Several vessels may be descried at any time in the strait, either entering for or leaving with lumber.

We now have a longer stretch to Seattle, the next stopping-place. The conversation sustained made the way seem short. Men from Washington and men of the West regaled each other with their "experiences." Judge Hastings gave stories of early California days,

and the last from Rome, which he recently visited. We had received on board, at Port Townsend, J. G. Swan, Esq., long identified with Washington Territory, and one of the best informed in regard to its history. For several years he resided on the Querquelin River, near Shoalwater Bay, and thus described

“OUR FIRST ELECTION.

“We had reached that point in the history of the Territory when we were called upon to elect our officers for the Territory and the county. This was looked upon by the boys as a farce (what did we want of laws? we were a law unto ourselves); so among other officers

they elected John W. Champ justice of the peace, and Charles W. Denter constable. Now Champ was a *character* to serve as justice—sixty-five years of age, tall, wiry, and muscular, with an iron constitution that had withstood the rough and tumble of a long border life. He was fond of old rye, and was occasionally noisy and rough, though generally kindly and sensible. The constable, or ‘Big Charley,’ was a good-natured, lazy fellow, who had begun life as a lumberman in Maine, had then shipped on board a whaler, and like some old spar had been washed up into the bay without exactly knowing when, where, or how. Clever and handy, he yet preferred his ease and

LUMBERING IN WASHINGTON TERRITORY—PREPARING LOGS.

a bottle of whisky to any thing else. We thought justice and constable would do very well. Formerly we had been very peaceable, any little 'trouble' that arose being easily settled with a fist fight. But now that we had a Squire, every one seemed anxious to bring him some business, and it was not long before the justice held his first court.

"A man left in charge of a store was found to have stolen a small sum of money. Charley was ordered to proceed at once and arrest him. Charley started; but, afraid of resistance, did it in his own way. Walking in where the chap was sitting he asked him for a drink. Bowman said he had nothing. 'Well,' said Charley, 'old Champ has just got a demijohn of first-rate whisky. S'pose we walk down there and get some.' The other at once consented, and the pair went down to the Squire's. The boys began to collect, and at last the Squire, who had been out feeding his chickens and wetting his whistle, came in and took a seat.

"Order in the court!" said he; then, facing the prisoner, he addressed him thus:

"Well, this is a pretty how-d'ye-do; what have you been about, hey?"

"What have I been about?" asked Bowman, with surprise; "nothing in particular that I know of. Where's your whisky, Squire?"

"Where's my whisky?" said the Squire, now getting into a rage—"where's my whisky? Don't you know you're 'rested? And do you think to throw contempt on my court by asking for whisky?"

"I did not know I was 'rested; pray, what is the charge?"

"Why, you big loafer," said Champ to the constable, "didn't you show that paper to Bowman?"

"Yes, I did," said Charley.

"I never saw it," said Bowman.

"Champ then, expressing his disgust at Charley, ordered him to arrest Bowman forthwith, which he did, and produced the paper (which after all was simply a notice to quit, supplied by the sheriff by way of a ruse).

"Bowman read it, and remarked that it was not a warrant, and then inquired of what he was accused.

"What are you 'cused of?" said the Squire; "why, you're 'cused of stealing money."

"I should like to know who accuses me, and who are the witnesses against me?"

"See here, Bowman," says the Squire, "I don't want any witnesses; and as for who accuses you, why, I accuse you, and every body on the beach accuses you, and you know you are guilty as well as I do. There is no use of wasting time over the matter. I am bound to sentence you, and my sentence is, that you leave the bay in twenty-four hours, or receive fifty lashes if you are here after that time."

"He started for Astoria and was seen no more. The ends of justice were fully satisfied.

"Joe's case was the next. He was accused of setting a boat adrift. He protested that he

was innocent. It was suggested that it might have been taken by Jake for a day's fishing, and better confine the prisoner till Jake returned. This was agreed to, but where were they to confine him? Champ's hen-house was proposed, and into it Joe was thrust. Now Champ's hen-house was no slim affair, but a solid log-house as strong as a fort. In the afternoon Jake and the boat returned, so they went to liberate Joe. But here another case was presented, for they found him very quietly engaged in sucking eggs. This new felony enraged Champ more than the other. He was for flogging him immediately, but the boys put him on board a boat going out. Thus we rid ourselves of two thieves." Mr. Swan's description is true to the life of our Territorial beginnings.

Thus pleasantly the time passed, and we reach Seattle, sixty miles from Port Townsend. Seattle, the seat of a former tribe called by that name, has been a place of some importance since 1853. It acquired additional vitality through the discovery of coal a few years ago, and still more during the last few months by the popular belief that it is *the* place—the great terminus. The lands for miles around have been bought by speculators, divided into lots, and auctioned off in Victoria, through the Willamette Valley, and even in San Francisco. Nine months ago there were not more than 500 people in it, now there are 1000. The inhabitants had scarcely got over the excitement of a visit from the directors and officials of the North Pacific Railway, accompanied by George Francis Train, who had been with them a few days before. The two combined had been evidently too much for them. Train had given a lecture. Subject—George Francis Train. He described his orphanage in the city of New Orleans, his pious education by a Puritan aunt, his labors in the house of his uncle, Enoch Train and Co., Boston; his speculation in Melbourne, by which he cleared \$140,000; his wife's speculation in Omaha, which gives her half of all the lots in that city; and his palatial mansion in Rhode Island. He also spoke very freely of his election to the Presidency in 1872, and gave an invitation to come and see him at the White House. I do not know what else he can do, but assuredly he can lecture. The visit of the directors, much as the lieges were interested in the railway, was nothing to that of Train. His lecture was the theme of the day. They had just bade him good-by *en masse*, when they were called upon to welcome Seward. This they also did with a will. Having had one lecture, they were sure of another from Seward. The evening had come, and they pressed him hard to stay over. He would not do it, and got off from the speech by promising to shake hands all round. This was done in returning, and every man, woman, and child had been prepared for the ceremony. As the apparently endless circle swept past, his affability and gracefulness to each were very no-

ticeable. He told the writer afterward that he always calculated on doing this at the rate of *ten in a minute*. As it took him nearly an hour to do Seattle, he must have seen nearly the entire population.

The most prominent building in Seattle is the Territorial University, which occupies a commanding site upon the hill. Its site here was secured by the politic management of a few citizens, and the subject is rather a sore one to their brethren in some of the other towns, especially in Olympia, the capital. The University is a pretentious edifice, but boasts at present of only one professor and a limited number of pupils. They have discovered coal of good quality about ten miles from the city, near Washington Lake. It is a tertiary lignite of the miocene age. The analysis gives: carbon, 47.63; bitumen, 50.22; ash, 2.15. It is part of the great tertiary bed which extends from California northward through Oregon, Washington Territory, to the southern end of British Columbia and Vancouver Island, and which has already been wrought at Monte Diablo in California, Coose Bay in Oregon, and Bellingham Bay in Washington Territory. The seam, which pitches at an angle of 45° , crops out in several places around Washington Lake, and is about two feet thick. A company has already made two tunnels into it—one 170 feet long, and the other about 50 feet. Certainly, if Seattle were made the terminus of the proposed railway, King County could supply plenty of good coal and fresh water; but we shall see. The harbor is not quite so large as it seems, the half of it being a mud-flat; but this could be built over, and beyond there is good anchorage. Seattle has the invariable sawdust wharf and lumber-mill of the sound cities. They can turn out at the mill 30,000 feet of lumber per day. At Freeport, on the opposite side of the harbor, there is a mill of equal capacity. Seattle has considerably exercised the

SEATTLE, WASHINGTON TERRITORY.

"TACOMA," OR MOUNT RAINIER, FROM OUR CAMP 120 MILES AWAY.

land speculators in these parts. "Seattle lots" are offered for sale all the way to San Francisco at prices varying from \$50 to \$500. From this to Olympia, at the head of the sound, all the eligible lands have been taken up. This has been occasioned in great part by the fact that the "Snowqualmie Pass" is comparatively near—about eighty miles from Seattle. The old military road from Walla Walla (such as it was) came over the Natchez Pass further north; but it is now generally abandoned for that by the Snowqualmie. To reach the sound from the east the railway must cross the Cascade range, which is from 6000 to 10,000 feet high, and very steep. Much depends upon the pass. Although there had long been an Indian trail over the Snowqualmie, yet it was not thought much of till recently. A few years ago an enterprising band from Seattle went up and discovered that it was gentler in ascent, and the summit lower, than any of the passes previously in use. More recent explorations have established the fact that it is only 3700 feet high; and already the immigrant wagons—the prairie schooners—make their way through it in preference to the Natchez, which is 5000 feet high. The "Yakima," the long, rich valley of the Klickitat, leads up to it from Walla Walla, to which the line will probably come on the other side. This is also in favor of the Snowqualmie Pass being chosen; for it is in the region around the Cascades, and not at the Rocky Mountains, that engineering difficulties will be encountered. Great interest has thus been attached to the Snowqualmie, and the people of Seattle regard it as their hope and boast. There is an interesting waterfall 270 feet high on the river about sixty miles from town, and with great enthusiasm they treat their friends with a trip to the "Snowqualmie Falls." The trip is worth staying even a week to make.

We left Seattle late in the evening. The sound now presented the grandest of her scenery. The forests were on fire, and the flames glimmered and danced on the hills around.

The clear moonlight fell upon the waters and lent an air of witchery to the picture. We had now turned the corner of the Olympic range, which rises up in bold outline behind us. An opening in the woods here reveals Mount Rainier, ninety miles off on our left. This is the queen of the Cascade range, the fairest, stateliest, and purest of all its peaks. It has no rugged shoulders like Mount Baker, but rises up in a clean-cut sugar-loaf shape to a height of 14,000 feet. In its silence and solitariness it

speaks to the innermost depths of our nature. But, my reader,

"If you would see Rainier aright,
Go view it by the witching moonlight."

This was *our* good fortune, when all its transcendent loveliness was full disclosed. The impression created by its snowy gracefulness, its calm majesty, can never be effaced. We may wander to the farthest corner of the earth, but the *image*, the *look*, of that mountain in the moonlight will not wear away. All eyes were spell-bound by its beauty until the woods intervened and shut it out from sight.

Now another and different object becomes the centre of attraction. We are called out from the cabin to view a Western city in its infancy—the fledgeling of a summer, that is to rise and spread its wings with railway speed. It is well that the world should know the name of this future New York of the West. "Tacōm-ah" they call it now, though, before Governor Stevens and his "Memoloose" men came along, the Indians said Tac'-o-mah'. The Tacomites argue in this way: "It is almost certain that the railway must cross the Cascade range by the Snowqualmie Pass—now *if*," and on this hang the fortunes of the Tacomites—"if the railway come through this pass, Tacoma is the nearest point on the sea. From the pass to the water's edge there is much level prairie land; the grades would be easy on either side; the country is open, fertile, and full of coal; the line will be twelve miles shorter than the Seattle." The difficulty of ships going further up the sound is very much increased by the "Narrows" immediately beyond. The tides rush very rapidly through these, and impede the navigation. The harbor is spacious, and the anchorage, though deep, is good. The land is taken up all around. Tacoma on paper boasts of streets, and squares, and wharves, yet one sees merely a clearing in the forest—a few piles of lumber, one hotel, one store, two whisky saloons, and several un-

finished buildings. The hotel has been established by a Cariboo miner, H. N. Steele, one of the first that "struck it rich." He lost his luck there, but believes that here fortune will smile upon him, and that the "Steele Claim" in Tacamah will rival the old "Steele Claim" of Cariboo. Another enthusiast has established a saw-mill, which is driving away, and turning out plenty of lumber for the buildings that are to be.

After midnight we arrive at Steilacoom and cast anchor. The good folks have evidently given up hope of our arrival, and have all retired. Fort Steilacoom may be termed the modern ancient among the settlements. It formerly enjoyed some importance, being near to the fort of the Hudson Bay Company at Nisqually, and finally as a military post of the United States. The Hudson Bay fort at Nisqually, six miles from the city, was built by Dr. Johnil in 1846, and is still represented by a chief-trader and his staff—some old Scotchmen, a retinue of half-breeds, and an extensive vassalage of "Siwashes." It is an inclosure 240 feet square, surmounted by the ordinary bastions at the four corners, and boasts of three guns, a blacksmith's shop, a store, etc. The troops were removed from this post in 1866, and taken to Sitka, so the inhabitants are left to dream of future prosperity through the coming railway. Lots are going up.

We get away in the morning before the lieges are aroused. As we near a spot half-way between Steilacoom and Olympia, we hear a voice saying, "There it is—that's the place." "What place?" we ask. "*The place*—New Jerusalem—the site of the big city." We gaze, but we can discern nothing but wood and water. "That's it," reiterate several who appear particularly interested, and forthwith the captain of the surveying vessel takes out of his pocket the neatly engrossed plan of a large city, with wharves, squares, and streets marked on it—"New Jerusalem" being printed in luminous letters over it. And this will be the place, if eloquence and interest can make it. "New Jerusalem" is the nest-egg laid by several of the government officials and other knowing ones. They will have it here if they can. The view of New Jerusalem is not, however, very interesting at present, except on the map. Not even a hunter's shanty breaks its monotony.

Before breakfast we approach Olympia. The name may seem ambitious, but it is in no way inappropriate. Nestling among the hills, it looks out upon the snowy Olympus—the highest and most beautiful peak of the Olympic range. The harbor is peculiar. The tides rise and fall twenty feet; so that every day an extensive mud-flat is disclosed. While at certain periods some of the streets are under water, at others ocean steamers can not approach within four miles of the city. Still, the Olympians are calmly confident, and look with contempt on the claims of the other bantling cities to rival it. They think in this wise: "Olym-

pia fuit," ergo "Olympia fuerit." It *has* been the capital, the seat of government; it is the head of navigation; it is nearest to Portland, to or from which there must be a branch; it is the readiest opening to the sea; it has an extensive agricultural country behind it; therefore, "Floreat Olympia." These mud-flats where the Klootchmen gather clams shall yet be built up into spacious streets; these quiet waters in which the Clallam darts his fish-spear shall yet be covered with fleets from "Cathay, Cipango, and the Indies." If the directors can be won by beauty, they will plant here the mighty city. Already they have made the most of their site. The streets are delightfully shaded by rows of poplar and maple, and the trim dwellings look out from teeming orchards. Old Horace speaks about cutting off a pleasant half of the day in a shady place. Commend me to Olympia for this operation. Sitting in front of the "Tacamah," under the cooling shade of the trees, with a sherry-cobbler in hand, looking out upon the bay between the rising hills, one is "king o'er a' the ills o' life." Its attractions have secured better society than can be found in towns of its size any where. Houses are at a premium, and sleeping-room scarcely to be had. Blessings on thee, gem of the West! When we get old we shall seek in thee a resting-place!

If Athens had its Mars' Hill, Olympia has its equal in the shoulder that stretches two miles beyond, overlooking the extension of the bay, and filled with all goodly groves, and sheltering shady pools, where the silvery salmon grab the flies on the summer day. At the end of this shoulder the lively Tumwater leaps in with a sort of hop, skip, and jump, forming a series of three beautiful waterfalls, as a final effort before losing itself forever in the sea.

"A speech—a speech!" cries the deputation of citizens—said deputation backed by the citizens themselves. "To Tumwater!" roars Seward. A compromise was made: "Tumwater Falls first, a speech after." We made for the falls. No great roaring, brawling avalanche of waters are these. They are comely, picturesque, unique. From pool to pool they flow, their spray dancing on the sentinel pines around. The road passes down by a bridge beneath them, from which you can look up and see them all at once above you. But no time for poetry now; lunch and the speech are before us. The lunch was like other lunches—rather better; the speech an easy, kindly flow of good feeling, as from a father speaking to his children; and then the shaking of hands—hard hands and soft ones, hard ones preponderating.

When evening comes we return to the steamer, and start back. As morning breaks we are again at Port Townsend. We now sail northward, and all at once pass Muckleteo—also a candidate for future greatness—and next Whidby Island, another candidate. The harbor on the inside of the island has been strongly recommended in former surveys made by General M'Clellan and Governor Stevens for the

STREET IN OLYMPIA, WASHINGTON TERRITORY.

North Pacific Railway. It is separated from the main land—but only by the Swinomish Slough, a broad marshy tract, which settlers are now dyking and draining, and turning into fertile land—and by a narrow channel, which can be easily bridged.

The island, fifty miles in length, is fertile, and, in great part, cultivated by a hardy, happy race of Good Templars, who deserve all the good fortune that may come to them. Further on we pass Fidalgo Island, having similar claims. It is right in the teeth of vessels coming up the strait. Away on our right is Bellingham Bay, another candidate, and the last. The bay is a semicircle, six miles in length. Here there is a large coal-mine, skillfully worked, and already a small railway from the mine to the harbor. According to the Superintendent, and to others also, this railway is the extreme end of "The Great Northern." Bellingham Bay is the Liverpool of the West, and its proprietors the luckiest men of the continent. Before making up among the numerous islands, and over the line to the British possessions, let us settle the question of the city's site. We have had with us Von Smythe, one of the great engineers of the coast; at each stopping-place we have received on board interested advocates of the several sites; so surely we will be able to make it out. Port Discovery, Port Townsend, Seattle, Tacoma, Steilacoom, New Jerusalem, Olympia, Muckleteo, Whidby Island, Fidalgo Island, Bellingham Bay—which shall it be?

In scanning the line of the proposed route, we are sure of several points far eastward. It will cross the Rocky Mountains at Cadott's Pass, and run thence to Pend-O-Reille. By recent legislation in Congress, it is brought to

a point on the Columbia River, where it will connect with the line of river and railway communication already established by the Oregon Steamship Company. But this can be only a temporary, not the final termination. The route by Portland is circuitous, and, what is of more importance, no harbor can be found on that part of the coast unattended by serious obstacles to navigation. The mouth of the Columbia is barred by dreadful breakers. Shoalwater Bay and Gray's Harbor can not be entered by vessels of ordinary tonnage. It is therefore a necessity that the line of railway be completed to some point on the Puget Sound, where many desirable sites and harbors are presented, combining the varied advantages of good anchorage and shelter, easy access and defense, and plenty of wood, coal, and water. Where all are so good, it may be difficult to make the best possible selection. All the places within Port Wilson—Port Townsend, Seattle, Tacoma, Steilacoom, New Jerusalem, and Olympia—will be well defended by the proposed fortifications around that point. Of these, Port Townsend and Seattle have the best anchorage—from fifteen to twenty fathoms. From the fact that there must be a branch to Portland, Olympia, at the head of this inland sea, would appear to be the nearest and most convenient dépôt; but this advantage is balanced by the consideration that it is beyond the "Narrows," which adds to the difficulty and expense of bringing vessels to its harbor. Seattle, Tacoma, and Port Townsend have an advantage in this respect. If we look at the harbors beyond Port Wilson, we see, that while Whidby Island, Fidalgo Island, and Bellingham Bay can not be so thoroughly defended, they are of

easier access from the sea. This whole matter—the selection of the city's site and railway dépôt—depends really upon the pass chosen through the Cascade range. In these northern parts the passage through the Rocky Mountains is comparatively easy to that through the range nearer the coast. This range, as stated, rises steeply to from 6000 to 10,000 feet, and is a dividing wall. It seems decided that the route will be through Cadott's Pass, in the Rocky Mountains, near the Kostanie country, close to the 49th parallel. But whither after that? This depends upon the pass up the Cascades deemed most practicable. Now there are five to choose from: 1. The Cowlitz Pass, supposed to be 5000 feet high. 2. The Snowqualmie Pass, known to be 3700 feet high. 3. The Natchez Pass, 5000 feet high. 4. Cady's Pass, 5000 feet high. 5. The Skatchet Pass, near Mount Baker, supposed to be 3000 feet high. Now, if the railway be brought direct from the Kostanie, through the Spokane country, and over the Skatchet Pass (both deemed practicable, though not thoroughly explored and surveyed), then assuredly it must terminate at or near Bellingham Bay; and if brought through the Snowqualmie Pass (the best so far as surely ascertained), Tacoma is the nearest point on the sound, distant about sixty-five miles—Seattle, about seventy-five miles, being next.

And if it be determined to put the main line to Olympia, in order to let the branch to Portland strike off there, then in course of time an extension will be made up the west side of the sound along Hood's Canal to Port Townsend or Port Discovery.

This, my reader, is all that is known about either the passes or ports, and the probabilities soon to be realities, on this Mediterranean of the Pacific. And with this we dismiss a question that is exercising all the inhabitants of the Territory, and all the land speculators on the coast. Pity to spoil such a summer day with so much that savors of dollars and cents. We leave the railway and the city to come along when and where they like best, and plunge in amidst the numerous islands before us on our way to Nanaimo, where the good ship *Active* has taken in coal, and is waiting for Seward and his party *en route* for Alaska. We are threading our way through the Western Cyclades—lands every where, and yonder San Juan itself.

What is the San Juan question? This, my reader, is a red flag, which, with another called "the *Alabama* claims," is shaken occasionally in the face of John Bull to rouse his choler. Serious enough, for more than once it has been nearly the occasion of war between two great countries. In 1859, General Harney, on the part of the United States, planted on the island Captain George Pickett and a company of infantry. Governor Douglas, who resided in Victoria, and represented her Britannic Majesty, dispatched the *Satellite* and the *Tribune*, with

instructions to drive them from the island. The Americans in British Columbia threatened to organize as volunteers for the assistance of Captain Pickett, and to hoist the Stars and Stripes over the town of Victoria. Then there would have been war to the knife. Strange to say, just as the *Tribune* had left the harbor of Esquimaux, the commander, Captain Hornby, discovered in the Strait of Fuca the flag of Admiral Baynes, arriving to command the British fleet in the Pacific. He therefore waited for the instructions of his superior officer. The Admiral, seeing that the policy of Governor Douglas would bring about a collision which might result in war, at once countermanded the orders, stating that it was a question to be settled by the home governments.

After all—would the reader believe it?—the "San Juan Difficulty," as it is gracefully termed in these parts, has arisen from the mere scrape of a pen. Great Britain claimed Oregon north of the Columbia River; the United States claimed all south of latitude $54^{\circ} 40'$. In 1846 that grand compromise called the Ashburton Treaty accepted the 49th parallel as the boundary line. But this line, if drawn across, would have cut off the tail end of Vancouver Island. It was therefore stated in the treaty that, after leaving the main land, it shall go southward, *through the middle of the channel*, to the Strait of Fuca. The treaty appears to have been made under the erroneous impression that there was only one channel between the main land and Vancouver Island. At the time, the *Rosario Strait* was the best known, and the most commonly used; the Haro Strait has since been surveyed, and is the most direct and best channel. Now the island, or rather the islands, for there are thirty of them, lie between these two straits; so, *if the line passing through the middle of the channel* means the Rosario Strait, they belong to Britain; but if through the Haro Strait, they belong to the United States. *The channel?* Are we to understand the channel best known in 1845-46, while they were discussing terms, or the *main channel*, as now ascertained by survey? The mere insertion of the four letters H A R O would have prevented the "difficulty." More has been made of the question than it really deserves. San Juan, Orcas, and Lopez islands (each about ten miles long, and from one to three miles wide) are fertile; but, where land is so plentiful, we need not take their gain or loss as a matter of life and death; and we beg very respectfully to settle the whole difficulty, and submit the following proposal to all concerned: During the survey in 1858 a middle channel was discovered, called the Douglas Channel. If it were taken as the boundary, San Juan and a few islands would fall to the English; Orcas, Lopez, and all the others to the United States. San Juan is of more importance to the English than to the United States; for, though it does not command the harbor of Victoria, as was ignorantly stated by the British Foreign Secretary, yet it

NANAIMO, VANCOUVER ISLAND.

The time passed pleasantly while we made our way up through scenery which rivals that of the Hudson River for beauty. The islands come

mands the strait by which ships would pass from Victoria into British Columbia. At present the Americans have a garrison at one end, and the English at the other. There they are, ready to blow each other off at a signal from their chiefs, yet enjoying the most friendly intercourse—assisting each other to hunt the deer and fish the salmon.

"San Juan in sight, Sir," says the pilot, touching his cap to Mr. Seward; "shall I take the Haro or the Rosario channel?" "Take the English channel—I know all about our own." So we enter the Rosario Strait.

Anxious to get his opinion about the matter, I say, "What should be done with the San Juan question?" "Nothing should be done with it, Sir. Let it stand by. Our men will settle up the place, and the question will settle itself." "Cute old man!" I observe; and adjourn to the pilot-box to see how the pilot—a great brawny Kentuckian—would dispose of it. "How would you settle the San Juan question?" "That there island is ours—no doubt about it, Sir; and if the Britishers won't keep to the boundary line that they agreed on, I would just begin where we left off, and bring up the old one. 'Fifty-four forty, or fight!' Them's my terms."

so quickly after each other, and so close to each other, that it seems as if we were sailing on some magnificent inland river. Galiano, in particular, impressed us. It rises like a high perpendicular wall, 280 feet high, its basaltic columns cut and carved in every variety of form. At 4 o'clock we reach Nanaimo, and find the *Active* in waiting. This place has acquired some importance as the head-quarters of the Vancouver Coal Company. It is a village of five hundred inhabitants, including seventy or eighty miners. Last year the Company exported 50,000 tons, and declared a dividend of fifteen per cent. It is used all over the coast for steaming and domestic purposes. An analysis gives: carbon, 63.93; hydrogen, 5.32; nitrogen, 1.02; sulphur, 2.20; oxygen, 8.70; ash, 15.83. It was discovered in early days, by an old Indian, who has since budded into wonderful respectability, and been made a "Tayee," or big chief of his tribe. It was wrought for many years by the Hudson Bay Company, who transferred it, ten years ago, to the present Company. We took a stroll round the place, visited the mine, the school for Indians, and gathered a few fossils, which are very plentiful around.

In the preceding part of our journey we had seen the native tribes in their hovels near to the abodes of the white man. Although we

INDIAN SCHOOL AT NANAIMO.

had heard of the reservations, and the schools in more inland places, we had not seen the Indian under the guiding influence of the Saxon until we reached Nanaimo. The tribe is only a ragged fragment of the Cowichans, destined to fade away like all their fellows; but the camp is preserved in excellent order. Every man has his post and something to do.

At this place we saw, over the camp of the chief, the enormous roof-trees noticed on the west coast by Vancouver with much surprise. We can not understand how they managed to hoist these huge spars into their places. Two of the largest pines are felled for the uprights, and the roof-tree is stretched on them. The chief's camp is also distinguished by the carved pole in front. This is sometimes nearly 150 feet high, and marked with many a strange device. The entrance to the "rancheree" is usually an elliptic circle burned or cut in the lower end of the pole. In the sketch given of the camp of the Cape Midge Indians—the tribe next to the Nanaimoes—these roof-trees and poles are conspicuous.

After an afternoon thus spent, we returned on board the *Wilson G. Hunt* for our last dinner in her spacious saloon. Our San Francisco friends were to return from this point, so Mr. Seward determined to make an occasion of the dinner. Traveling in the West exhilarates the spirits and sharpens the appetite, so we were thoroughly prepared. There were dispensed soups made of the clams from the shores of the Territory, where they can be raked out at any season,

and of oysters from Olympia, where they can be shoveled out like potatoes from a heap; salmon, clear, bright, sparkling, which Von Smythe had engineered from their briny homes on the journey; mutton—the mutton of Vancouver Island, richest and best of all we know; venison from Juan, almost worth fighting for; peaches, luscious and fresh, from California the golden, and Champagne all the way from Auburn, the home of our gallant leader. The company, now scattered, will be ever worth remembering. The old Governor at the head; Frederick Seward at the foot, flanked by Judge Hastings, a pioneer and millionaire of California; Dr. Franklin, one of her Majesty's officers, who had fallen into the rank at Salt Lake; Consul Francis, the representative of his Majesty Uncle Sam in these parts; Dodge, Mayor of Sitka, who had come down to escort his chief to the field; Fitz, of Auburn, a friend of sixty years' standing; Von Smythe, of San Francisco; some officers of the Federal army; several ladies, blooming and beautiful; and the writer. What a "good time" we had away in this remote harbor!

"The Queen!" said the Governor, "in whose dominions we now are. Of all the queens I know, Isabella of Spain, Emma of Sandwich Islands, or her of Madagascar, the noblest and the best!"

"The President, and his representative Consul Francis."

Others followed; the "Star-spangled Banner" was not omitted; and each gave some an-

INDIAN CAMP AT CAPE MIDGE, VANCOUVER ISLAND.

ecdote of former life. The Governor's was called for.

"I remember in old times, when a Universalist preacher first came to Auburn, there was some commotion among the evangelicals. The ministers met, and agreed to preach strongly on the subject on the following Sunday. The Presbyterian, being minister of a leading denomination, prepared himself accordingly. 'My friends,' said he, 'one has entered our midst with heresy. An enemy is scattering tares, by teaching that *all will be saved*. But, my friends, we of this congregation *hope for better things*.' So," continued the Governor, "we have seen that magnificent sheet of water, the Puget

Sound, we have seen the little clearings in the great forest, and I think this must be the sentiment formed by all we have seen and heard: *We hope for better things*. We feel the shadow of the great future that is coming along to our people out here."

Vale! Vale! old chief. May you live to see it! The time came for parting; and the Governor, when we last saw him, wrapped in a huge camel's-hair robe, fur gloves reaching to the elbow, surmounted by a shaggy bear-skin cap, from under which peeped and glowed an enormous Havana, was stretched at his ease on the stern of the *Active*—

ON THE WAY TO ALASKA.

A SUNSET MEMORY.

ONCE, as fell the shades of evening,
At the close of the long day,
Sat we, in the lengthening shadows,
In the old time, far away—
Sat we, till the stars came gleaming
Through the twilight soft and gray.

We had watched the golden sunset
Fading in the crimson west,
While upon the glowing hill-tops
Clouds of amber seemed to rest,
Till the twilight closed around them,
In her hazy mantle dressed.

Then I listened to the story
That his lips so fondly told;
Words of passionate devotion,
Words of love that ne'er grow cold—
Filling all my heart with lightness,
Threading all my life with gold.

Always, when the sunset glory
Trails above the western hills,
All the music of that story
Through my inmost being thrills—
Tunes my sad heart to rejoicing,
And with peace my spirit fills.

Since I first Love's nectar tasted
Years have swept to Time's abyss—
All Life's choicest hopes been wasted;
But my visions now of bliss
In that other Life are founded
On the one glad hour in this.

Years may roll and tempests gather,
Storms may cloud youth's azure sky,
Brightest locks may blanch to silver,
Frosts of Time may dim the eye,
But a pure heart's first devotion
Always lives—it can not die.

SOUTH-COAST SAUNTERINGS IN ENGLAND.

[Saunter VI.]

DANE JOHN, CANTERBURY.

CANTERBURY.—II.

WHATEVER may be thought of the cathedrals, here is the chief of them, which has, in its time, given a support and retreat, with ample resources for investigation, to some of the best scholars of our time. But it must be added that few cathedrals can show such good reasons for their existence. Under the influence of Protestantism their history has been one of gradual decline. Four hundred years ago England was divided into twenty-one sees, including the two archiepiscopal ones of Canterbury and York. At the Reformation six were added; but of these two (Bristol and Gloucester) were united, and one (Westminster) suppressed, so that the addition amounted to four. How the system had shrunk may be gathered when this number among thirty millions is compared with the forty-five archbishops and one hundred and ninety-eight bishops who supervise the religious affairs of two-thirds as many people in Italy. Under one of the English bishops there are nine hundred clergymen. Their salaries are all more than that of the President of the United States, while the mass of the clergy are wretchedly paid, some livings in Scotland amounting to but two pounds annually! The most significant thing just now is the demonstration which has recently been given of the practical inutility of the episcopal

office. In 1868 four sees had been for some years practically vacant. The Bishop of Winchester, at eighty, was paralyzed; the Bishop of Salisbury was broken down in mind and body; the Bishop of Bath and Wells was the same; the Bishop of Exeter, aged ninety, had not been able to leave his house for twelve years. Yet it is shown that the diocese of either of them got along just as well as when they were in full activity. The bishops feel that this is a dangerous lesson for the clergy and laity to have learned. That they have learned it was shown when Lord Lyttleton proposed, in the House of Lords, to increase the number of bishops. It was estimated that it would cost £150,000 to establish a new see; and the bishops themselves declared that there was no hope of raising the money among the laity. The press declared that the country was too glad at the prospect of getting ecclesiastics out of the House of Lords to put new ones in. So Lord Lyttleton's bill was voted down by the Lords and laughed down outside. The tendency seems to me far more in the direction of cutting down the salaries of bishops, and virtually superseding them with a large number of superintendents of districts, somewhat resembling the presiding elders whom the Methodists find so efficient—men whose offices shall imply work rather than the dignity of peerage and palaces.

It is hardly an abrupt transition from the bishops to the tombs in Canterbury, concerning which I gathered much interesting matter from the venerable Canon. Among them is that of Henry IV. (1413), and of his second wife, Joan of Navarre, who outlived him by twenty-four years. Here he was brought from France at his dying request. The old Yorkist story, that only the coffin was entombed here—the king's body having been thrown in the sea, as a kind of Jonah, to produce a calm (which, of course, followed)—led to a curious scene here some thirty years ago. It was resolved to open the tomb. The result is given in the notes of one of the church dignitaries present on the occasion, which are so curious that I reproduce them here:

"On removing a portion of the marble pavement at the western end of the monument, it was found to have been laid on rubbish composed of lime-dust, small pieces of Caen stone, and a few flints, among which were found two or three pieces of decayed stuff, or silk (perhaps portions of the cloth of gold which covered the coffin), and also a piece of leather. When the rubbish was cleared away, we came to what appeared to be the lid of a wooden case, of very rude form and construction, which the surveyor at once pronounced to be a coffin. It lay east and west, projecting beyond the monument toward the west for about one-third of its length. Upon it, to the east, and entirely within the monument, lay a leaden coffin without any wooden case, of much smaller size and very singular shape, being formed by bending one sheet of lead over another, and soldering them at the junctions. This coffin was supposed to contain the remains of Queen Joan, and was not disturbed. Not being able to take off the lid of the large coffin, as a great portion of its length was under the tomb, and being unwilling to move the alabaster monument for the purpose of getting at it, it was decided to saw through the lid about three feet from what was supposed to be the head of the coffin. And this being done, the piece of wood was carefully removed, and found to be elm, very coarsely worked, about one inch and a half thick, and perfectly sound. Immediately under this elm board was a quantity of hay bands filling the coffin, and upon the surface of them lay a very rude small cross, formed by merely tying two twigs together, thus +. This fell to pieces on being moved. When the hay bands, which were very sound and perfect, were removed, we found a leaden case or coffin, moulded in some degree to the shape of a human figure; and it was at once evident that this had never been disturbed, but lay as it was originally deposited, though it may be difficult to conjecture why it was placed in a case so rude and unsightly, and so much too large for it that the hay bands appeared to have been used to keep it steady. In order to ascertain what was contained in this leaden case, it became necessary to saw through a portion of it; and in this manner an oval piece of the lead, about seven inches long and four inches over at the widest part of it, was carefully removed. Under this we found wrappers which seemed to be of leather, and afterward proved to have been folded five times round the body. The material was firm in its texture, very moist, of a deep brown color, and earthy smell. These wrappers were cut through and lifted off, when, to the astonishment of all present, the face of the deceased king was seen in complete preservation—the nose elevated, the cartilage even remaining, though, on the admission of the air, it sunk rapidly away, and had entirely disappeared before the examination was finished. The skin of the chin was entire, of the consistence and thickness of the upper leather of a shoe, brown and moist; the beard thick and matted, of a deep russet color. The jaws were perfect, and all the teeth in them except one fore-tooth, which had probably been lost dur-

ing the king's life. The opening of the lead was not large enough to expose the whole of the features, and we did not examine the eyes or forehead. But the surveyor stated that, when he introduced his finger under the wrappers to remove them, he distinctly felt the orbits of the eyes prominent in their sockets. The flesh upon the nose was moist, clammy, and of the same brown color as every other part of the face. Having thus ascertained that the body of the king was actually deposited in the tomb, and that it had never been disturbed, the wrappers were laid again upon the face, the lead drawn back over them, the lid of the coffin put on, the rubbish filled in, and the marble pavement replaced immediately. It should be observed that about three feet from the head of the figure was a remarkable projection in the lead, as if to make room for the hands, that they might be elevated as in prayer."

It is very remarkable that while there has never been any hesitation in England to open any distinguished tomb over which a mystery has hung—as those of Henry IV. here and William II. at Winchester—the curse of Shakspeare on any disturber of his bones has prevailed to prevent the exploration of the most mysterious grave of all. A gentleman of Stratford told me that the superstition of that neighborhood about the doggerel lines is so great that he thought even that peaceful village could get up a riot if an attempt were made to open the grave of Shakspeare.

One may think of the old memorial stones of Canterbury as boulders of history, each brought and deposited by some epochal glacier; and of all these the most interesting is that which passed by Cressy and Poitiers, by Nejara and Roncesvalles, bearing the "Prince Noir"—Edward Plantagenet—through all the zones of glory and bleakness, to the day when his body was laid here amidst a mourning never equaled in the history of England. Here lies buried England's long dream of ruling France! His effigy has the strong and handsome features of the Plantagenets. The figure lies in full armor, which still bears traces of the gilding which once made the tomb shine like gold. Above him hang his brazen gauntlets, helmet, shield and velvet coat embroidered with the arms of France and England—all now rusty, tattered, and claiming their part in the French inscription, written by the Black Prince himself, contrasting his former splendor with his form as wasted by death. The most interesting relic is the

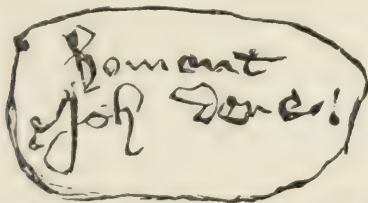

SHIELD OF THE BLACK PRINCE.

COAT OF THE BLACK PRINCE.

empty scabbard of the sword wielded in three great battles, which Oliver Cromwell carried away. I was reminded by it of the curious circumstance of John Brown's taking away from Colonel Washington's house at Harper's Ferry a sword which there is reason to believe was the sword of George Washington.* The motto and arms of the Prince of Wales appear here in their original form—*Houmout Ich diene*, and three entirely separated ostrich feathers. It is possible that doubts about the meaning of the first word led to its being discarded; though it is nearly certain that it is *Hoch muth*—the whole motto meaning, "With high spirit, I serve." Whether derived from it or not, the words recall at once the best story about the Prince—how, after conquering the French king at Poitiers, he invited the captive to his table, and waited upon him personally. Nevertheless the abbreviation seems to me happy, and *Ich dien* the right royal motto. The Black Prince used the words as a signature, as may be seen in va-

AUTOGRAPH OF THE BLACK PRINCE.

rious documents yet preserved. He sometimes used one, sometimes three ostrich feathers. The tradition that he won this coat of arms, with his spurs, in his sixteenth year, from the King of Bohemia, at Cressy, is certainly untrue. The Bohemian king's badge was a vulture. The ostrich feathers are traceable on the plate of Philippa, 1369, and were used by all the kings after Edward II. until the seventh Henry, when

* The same which a story, regarded by Mr. Carlyle as very mythical, says was sent him by Frederick the Great, inscribed "From the oldest general to the greatest."

they were appropriated, with his son Arthur, to the Prince of Wales. The old explanation of them is that they signify fleetness in war, but it is more likely to have been hat-plumes. In their ancient form the feathers seem to me to bear an intentional resemblance to certain ancient broadswords, and I can not help thinking that the present fashion of binding their quills together with a fillet is an improvement.

The finest thing to be seen in the architecture external to the cathedral is an old Norman staircase, the most beautiful specimen of ancient Norman work in England.

There are other old churches in the city well worth visiting. In the "Church of the Holy Cross," built in 1480, are some queer old carvings on wooden benches, one of which represents two men fighting, with a rose between them—an allusion to the famous struggle between the houses of York and Lancaster. In the church-yard of St. Alfege the tomb of Agnes Halke (1502) has these noticeable lines:

"In this church-yard, so was her chance,
First after the hallowing of the same,
Afore all others here to begin the dance,
Which to all creatures is the loth game."

Summerley, the antiquarian, refers this to the old habit of holding village dances in church-yards, still prevalent in parts of Wales. But undoubtedly the dance mentioned in the epitaph is the "dance of death," which was already a popular idea, and soon after Agnes's death employed the pencil of Holbein. It was probably based upon the Teutonic superstition of the magic pipe which made all dance who heard it—the call of Death being one that none

ARMS OF THE BLACK PRINCE.

NORMAN STAIRCASE.

could fail to heed. In St. Andrew's Church is the monument of Thomas Swift, rector (1592), ancestor of the famous Dean Swift. In St. Dunstan's Church is the vault of the Ropers, which contains the head of Sir Thomas More, who married one of that family. A gentleman who went down into the vault in 1835 saw the head in a leaden box open in front. In St. Mary's Church is the tomb of Ralph Brown, Mayor of Canterbury in 1507, who is represented kneeling at a desk, with the following inscription (which an alderman or mayor might think equivocal) underneath:

"All ye that stand op pon mi corse
Remember but Raff Brown I was,
All dyr man and mayur of thys cite—
Jesu upon mi sowll have pite."

Just beyond the ancient walls of the city, on the northeast, is to be found all that remains of the Monastery of St. Augustine—to wit, the ruin (it fell in 1822) of the tower of St. Pancras Chapel, which belonged to it. "The next thing," writes Somner, "is the chapel of St. Pancrace, built before Augustine came, and used by the king (Ethelbert), before his conversion to Christianity, for the place of his idol-worship; but after it, the first that Augustine, after he had purged it from the worship of the false, consecrated to the service of the true God, and dedicated to St. Pancrace. Wherewith the devil, all enraged, and not brooking his ejection from the place he had so long enjoyed, the first time that Augustine celebrates mass there, furiously assaults the chapel to overturn it. But

having more of will than power to actuate his intended mischief, all he could do was to leave the ensigns of his malice—the print of his talons on the south porch of the walls of the chapel, where they are visible to this day." It would gladden the heart of that devil to see that chapel, so solemnly dedicated to the boy-martyr of Rome, in its present condition—all that remains of it occupied by his own friends, the swine! The spot was originally a Saxon cemetery. According to the law of the Twelve Tables it was not permitted "to bury or burn a dead body within the city." This old custom—to which we are now returning—was first, and after a long struggle, abolished by the Canterbury bishops, who desired to have grand tombs in the cathedral, where they might

"lie through centuries
And hear the blessed mutter of the
mass."

The seal of the monastery, still preserved, represents St. Peter and St. Paul seated under canopies, and St. Augustine baptizing Ethelbert in a font like that in St. Martin's Church. It was attacked by the Danes in 1011. "When," relates Thorn, "the Danes destroyed the city of Canterbury with fire and sword, some of those sacrilegious wretches entered the monastery, not to say their prayers, but to carry away what they could lay their hands upon. One of them, more desperately wicked than the rest of his comrades, came boldly to the sepulchre of our apostle St. Augustine, where he lay entombed, and stole away the pall with which the tomb of the saint was covered, and hid it under his arm. But Divine vengeance immediately seized upon the sacrilegious person, and the pall which was hid under his arm stuck to the arm of the thief and grew to it, as if it had been new natural flesh, inasmuch as it could not be taken away by force or art until the thief himself came and discovered what he had done, and confessed his fault before the saint and the monks, and then begged their pardon. This example of Divine vengeance so affrighted the rest of the Danes that they not only offered no violence to this monastery afterward, but became the chief defenders of the same."

But the power of the saint could not prevail against Henry VIII., who seized the monastery for a palace for himself. In 1573, Queen Elizabeth kept court there. There, too, Charles I. was married to the Princess Henrietta of France. Charles II., on his passage to London after restoration, lodged there. It passed

to the Wottons, and by the marriage of one of them to Sir Edward Hales, to the latter family. In 1844, Mr. Beresford Hope, now M.P., purchased the site for £2100. The monastery was in ruins, and the place was occupied by an old court, a public house, a skittles-ground, and a brewery. Mr. Hope devoted his purchase—adding a considerable endowment—to the purpose of the great Missionary College now there. It was incorporated in 1848, by act of Parliament, as a College for Missionaries of the Church of England to the various dependencies of the British empire. The young men are admitted between the ages of eighteen and twenty-two, and study three years, at an annual charge of £35 each, which includes education and maintenance. There are forty-five dormitories, which seemed to be all filled, the furniture in them being comfortable, and the walls covered with texts in old English characters. It was easy to see by the character of the texts in any room, or perhaps the presence of a crucifix, the “wing” of the Church to which its occupant belonged. The buildings are new—the style following that of the old monastery—and very beautiful. The chapel is a gem, and represents the extreme of Low-Church plainness. The students assemble in it to hear prayers every day, and for Sunday services; and “the altar” is so little thought of that the officiating clergyman stands at either end of the room where the light happens to be best. It would be difficult to find a more exquisite retreat for study, and it is probable the teaching is very good. Dr. Reinhold Röst, of Jena, has recently been appointed Oriental lecturer and teacher of Sanscrit. But the teaching is not only linguistic or theological. What was once the crypt is now a large room where the students are carefully taught carpentering, etc., so that they may help the natives, or, on a pinch, build their own houses. Nay, more, each student is taught something of medicine, and must serve a year as an attendant in the neighboring hospital. It is to be hoped that these various accomplishments will not bring them to grief, as they did the poor missionary in New Zealand who was eaten the other day, out of sheer admiration for his talents—the belief of that region being, that he who eats a man appropriates his qualities. It certainly was pleasant to see these young gentlemen acquiring such serviceable arts on a spot once devoted to penances. On the inside facings of what may be called the cloisters, the names of the students are inscribed opposite the doors of their dormitories, as they leave, with the country whither they have gone; and under the little chapel is a crypt where tablets are raised to all graduates who have died. There is a very fine room which is at once a library, a museum, and, to some extent, a picture-gallery. In it there is the only authentic portrait of Archbishop Laud—a fat-faced fanatic he was, too—and, at the other end, the portrait of the patriarch of Hindu missions, whose face expresses

the beauty of his life and of his poetry—Bishop Heber. There is a pleasant picture of Gregory the Great, admiring the fair-haired children about to be sold in the market-place at Rome—the Angli who so reminded him of Angeli that he established this English mission, which is now engaged in multiplying itself in all parts of the world. The pictures of life in foreign parts seemed to me too pleasant to be true, and I could not help thinking of the seductive illustrations in the French papers, put forth when it was desired to attract soldiers for the late invasion of Mexico. The young missionaries will find something other than picturesque converts eager for baptism. A less pleasing, but probably truer, story is presented by the collection of ugly idols and horrible weapons on the shelves of the museum, returned by missionaries from various lands. On the whole, the impression one receives from the college is pleasant. The young men I saw were fine-looking, and I can only hope they will depend for their success upon the spirit of Heber and their ability to help and heal, rather than on the English gun-boats, for whose last furious propagation of the Gospel in China England has just had to apologize.

Canterbury rejoices in a pleasant little park, which surrounds a mound called Dane John, generally regarded as the old fortress from which the Danes besieged the city. I went there to call upon the most learned antiquarian of Canterbury, Mr. John Brent, who resides where his ancestors did six hundred years ago, and, like several of them, is connected with the civic government. It used to be a place where heretics and witches were burned among appropriate barbarian remains. These have now disappeared, and the beautiful lawn, bordered with quick-thorn, is ornamented with a sun-dial on a pillar, with sculptured “Seasons”—the work of Weekes, who was a native of Canterbury—a fountain with basin covered with mermen and dolphins, and a Russian gun captured at Sebastopol. Considerable numbers of copper weapons (“celts”), and some Roman remains, have been found here. The spot has witnessed scenes as terrible as any in this part of the country; nor need one go back as far as the martyrdom of Alfege or Mildred to find them. It is odd to find in the old city records such quiet and brief mention of events which shook the kingdom: *e. g.*—“1449. Citizens take Blucherd, a hermit, and head of an insurrection. His head was placed over the Westgate.” “1535. Pay 14s. 8d. for bringing a heretic from London. For a load of wood to burn him, 2s.; for gunpowder, 1d.; for a stake and staple, 3d.” “1550. Paid 23s. for the burning of Arden, and for the execution of Bradshaw.” “1660. Arrival of Charles II. Several witches executed.”

Through the city records we get peeps into several quaint old customs. Thus between 1273 and 1836 we find that the corporation were always assembled by the sound of a horn,

which is a plain importation from Germany, where the watchmen still use the horn in many places. Here are some curious entries: 1434. The city gives a present to the Romish cardinal, passing through on his road to France, of two dozen capons, value £1 4s. 8d.—1445. The Queen of King Henry VI., being at her devotions at the tomb of the Martyr, is received by the bailiffs at the hall in the Blean, at Harbledown, and by them is presented with a gift of £21.—1494. The corporation presents a purse of gold to Lady Elizabeth, wife of Henry VII.—1502. Jeremy Oxenbregge, the first person who obtained the freedom of the city by apprenticeship.—1516. A payment of 4s. for "one gallon of ypcoras," given to the Ambassador who brings over the Cardinal's hat from Rome for Wolsey.—1520. Henry VIII., Charles V., and Cardinal Wolsey are entertained by the Archbishop. All the city officers have new gaberdines on the occasion. A ducking-stool* is provided. A post is set up before the Court Hall to hang up letters referring to the board and lodging of pilgrims.—1536. No person allowed to sell less than six eggs for a penny, on pain of 12d.—1539. The Grand Jury present W. Sandford, parson of St. Peter's, for maliciously tolling the aive-bell after even-song, with a view to set up the Pope again.—1556. The Mayor is to provide for his wife, yearly, before Christmas, one scarlet gown and bonnet of velvet, under penalty of £10.—1558. Queen Mary arrives, and is presented by the corporation with twenty angels (£10).—1564. As many of the inhabitants as the Mayor shall think fit shall keep one armed pike, to be used in time of need.—1570. Assizes held in Canterbury. The Grand Jury present that they know of no one but behaveth himself according to the Queen's proceeding in that behalf, saving that within the cathedral and cloisters, during sermon time, there are divers that walk and keep prattle and talk there to the offense of good people.

There is a little museum here whose curiosi-

* The ducking-stool was provided exclusively for noisy or scolding women. It remained until the middle of the eighteenth century, when it was abolished, probably through the occasional drownings or deaths resulting from it. (Though I see from the *Sing Sing* reports that it survives in another form in New York.) It was a seat depending from a cross-tree over a pool or water-trough, into which the patient was let down thrice. Cole, the antiquary, writing in 1789, says: "In my time, when I was a boy, and lived with my grandfather in the great corner house at the bridge-foot, next to Magdalen College, Cambridge, and rebuilt since by my uncle, Joseph Cock, I remember to have seen a woman ducked for scolding. The chair hung by a pulley fastened to a beam about the middle of the bridge; and the woman having been fastened in the chair, she was let under water three times successively, and then taken out. The bridge was then of timber, before the present stone bridge of one arch was built. The ducking-stool was constantly hanging in its place, and on the back panel of it was an engraving representing devils laying hold of scolds. Some time after a new chair was erected in the place of the old one, having the same device carved on it, and well painted and ornamented."

ties present a singular illustration of the tendencies which the English have had, up to this generation, to explore all countries more than their own. There were hardly twenty antiquities from the locality of Canterbury, and not a great many from other parts of England, whereas the red Indian and Oriental specimens were numerous. The latter were chiefly contributed by the late "Viscount Strangford," according to their labels; though whether by the celebrated poet, diplomatist, antiquarian, and scholar—a descendant, too, of the Sidneys—who died in 1855, or by his son, who died a year ago, I could not tell. This last viscount, though a young man, was the finest English Oriental scholar. So rich and vast were his stores of information concerning Hindostan, Persia, China, and Japan, that when he died so prematurely those who knew him felt as if some ship freighted with incomparable treasures had sunk. His studies of Oriental poetry led him to take a deep interest in Walt Whitman, whose writings he conceived to resemble them; and of the many papers he wrote for the *Pall Mall Gazette*, one or two were on Whitman. I had the pleasure of conversing with him occasionally, and was struck with the fact that his recognition of the tendencies of Occidental thought was almost as acute as his knowledge of those of the East. It is probable that he was interested to add to the Canterbury-collection which his father began. The most interesting British feature of the museum is a collection of ancient Saxon ornaments—highly ornamented hair-pins and rings—which testified that our barbarian foremothers were not very unlike the Girl of the Period in the present day in their love of fine things. The collection contained some sham antiques, bronzes, etc., made by Flemish and French artists to sell as works of ancient art. That trade paid the rascals so well that they took rope enough to hang themselves. There was hardly a museum in Europe which was not cheated; and the vigilance became so universal that the trade died out. But it is wonderful how much genius was employed to make these things, which are not only often intrinsically beautiful, but made to look old or broken so ingeniously that their fraudulent character could only have been discovered, one would say, by tracking their evidences. The disposition to discover false fossils, when the bone caves began to be found, became so contagious among working-men that all geological diggings have now to be carried on under the eyes of men of science, lest some fellow should for a shilling alter the cosmogonies, and bring on new battles between Faith and Science.

I found, also, in the Canterbury Museum a curious picture and account of the Biddenden Sisters, who were the most famous twins before Chang and Eng. The account relates that they were named Eliza and Mary Chulkhurst, and were born joined together by the hips and shoulders, A.D. 1100, at Biddenden, Kent County. They were called "The Biddenden Maids."

A BIDDENDEN BISCUIT, 1773.

They lived together thirty-four years, when one of them died. The surviving sister was advised to be severed from the dead body; but she said, "As we came together, we will also go together," and so she died six hours after her sister. By their will they bequeathed to the church-wardens of the parish of Biddenden, and their successors, forever, certain pieces or parcels of land in the same parish, twenty acres in extent, for the poor. In accordance with this bequest, there are still made annually a large number of loaves of bread which are distributed on Easter-Sunday in that parish. Each of these loaves—of which I saw one in the museum—bears the print of the twin sisters.

As the time for the enthronement of the new archbishop drew near there were increased signs of the same in the streets. The clergy began to pour into our hotel with their wives and daughters. There was the evening before a number of gentlemen belonging to the city who also met there to consult concerning the arrangements and prospects of the forthcoming day. Each of them assisted his meditations with a glass of hot spirits and a pipe or cigar, "liquoring up" being a normal part of all such meetings in England. When the American clergymen came to England at the time of the formation of the Evangelical Alliance, they were, I have been told, so scandalized by the large quantities of wine provided at every dinner-table that some

of them could hardly eat, and broke out with protests. How speechless must have been their horror to find the occasional decanter provided even in the vestries of churches! But the English and Scotch parson interprets the motto *in vino veritas* literally, though not often excessively, and the layman follows his example. Next day I saw several of the jolly folk who had told good stories, especially about the clergy, over their toddy, engaged in the solemn functions of the enthronement. On the morning of the great day special trains came pouring in their clerical contributions until hotels and streets were fairly filled. Our hotel at breakfast time was a sight. All Parsondom and its wife were present. And, if the truth must be told, there is hardly any class in England which could furnish the *Saturday Review* with better sitters for the Girl of the Period than that of the wives of the younger English clergy. That girl with a very low body and big chignon is almost certain to be the rector's or curate's wife. The young graduate of Oxford or Cambridge, who has been presented with a good living in some country parish or village, attracts the young daughter of the wealthy squire—or even nobleman, it may be—by his superiority, both in scholarship and family, to other young men in the neighborhood. On his part he wishes to have a merry helpmate to make him forget his cares. And the result is that any ecclesiastical occasion like this brings ladies together, as in our breakfast-room, with all the gay plumage and mirthful chatter of a flock of birds in spring. So the young clergyman who, as I happen to know, wrote those famous papers about women in the *Saturday Review* (erroneously ascribed by some to Mrs. Linton), had probably only to look around him for his originals. It will not be wondered at, therefore, that when the cathedral doors were opened the building immediately swarmed with these magnificently dressed ladies. Had it been an opera the appearance of the ladies, except for their bonnets, could hardly have been different.

The late Archbishop of Canterbury—Charles Thomas Longley—who died in the autumn of 1868, in his 75th year, was the son of the Recorder of Rochester, and had reached the summit of ecclesiastical preferment by adhering to the beaten path of service to the Church. From Westminster School to Christchurch College, Oxford; thence to the curacy of Cowley; on to the rectory of West Tytherly; thence to the head-mastership of Harrow; and next, through the Episcopal chairs of Ripon, Durham, and York, to Canterbury, where he arrives in his 68th year. He was a man of the middle path; neither High-Church nor Low-Church; without eccentricities, without immobility; of no marked ability; without notable defects; not pliant, not stubborn. He was meant to do for the Church what Palmerston, who appointed him, was doing in the government—hold all parties together, and keep off the inevitable deluge as long as possible. This

DR. LONGLEY, THE LATE ARCHBISHOP OF CANTERBURY.

he did; and perhaps I should award him some marked ability for his success. There never was a man whose success was more the result of the commonest faculties perfectly utilized than Lord Palmerston's; and, similarly, though Dr. Longley had only the most ordinary gifts, his complete use of them availed for his task better than genius. He was Primate of all England; Visitor of All Souls and Merton colleges, Oxford; of Harrow School, Dulwich College, King's College, London; Visitor and Elector of St. Augustine's College, Canterbury; Patron of King's College, Nova Scotia; Governor of the Charter-house; and principal trustee of the British Museum. Besides the enormous patronage implied in these offices, he owned the patronage of 177 clergymen's livings. The see of Canterbury itself brings an annual income to the archbishop of £15,000.* With all this, he died almost without enemies in any division of the Church. In one respect he made an advance step—one in which the sympathy of all parties in the Church would indeed have to go with him, but nevertheless one implying an utter absence from his heart of all those conventional ideas of archiepiscopal dignity which had for so many years rendered his office barren. Up to his time it had been the custom, not often departed from, for bishops, much more archbishops, to leave parish work to their subordinates; but three years ago Dr. Longley personally addressed the working-men assembled at the Northgate in Canterbury. In a discourse preached in the Cathedral after the Archbishop's death, Dean Alford said his congregation on that occasion little knew what it had cost the aged prelate to appear among them. "It did not consist," he said, "in the physical effort, though that was great, and certainly not in the words which came warm from

his heart; but that which deserved especial honor was the breaking through the iron fetters of conventional precedent, and doing that which was not expected of an archbishop in fashionable society, but which was the chief duty of a pastor in the eyes of the Shepherd of Souls." For many generations those working-men have helped to give the archbishop his seventy-five thousand golden dollars per annum. When one looks upon the history of bishops there arises a vague impression that these shepherds have Bibles in which a certain admonition reads, "Feed on my sheep." But if it is pleasant to hear of an archbishop addressing the working-men, in the sweat of whose brows he enjoys his palace, it is a religious landmark that he could, in the year of Christ 1868, be seriously, and not at all ironically, praised for it! It is now nearly thirteen centuries since England became a Christian state—naming its first church after a saint who divided his cloak with a beggar—and with all these ages of faith thus far we have got—an archbishop is awarded "especial honor" for publicly exhorting laboring men and women! That is archiepiscopal heroism in the noon of the nineteenth century!

There was something touching in the long efforts of the old man to assuage the troubled waters of his Church to-day with the oil of a past generation. But though he could not conceive the forces at work in the Colenso or Mackonochie controversies, his eyes perceived with increasing clearness, as his end drew near, that the Church must do more for the poor; so, as nearly as an archbishop could, he washed their feet in the presence of his clergy. Nay, it is much also that he requested, when dying, that his funeral should be "without ostentation," just before he uttered his last words, which were the *Gloria in Excelsis*. On a November afternoon four bishops and many deans and noblemen gathered around his plain oak coffin in his palace at Addington. It bore only a simple cross of raised oak, and the inscription: "Charles Thomas Longley—born July 28, 1794; died October 27, 1868." There were no trappings of any kind; but there were violets, roses, and some white blossoms upon it. The coffin was borne across the lawn and through the field by his own servants to the church, the procession following on foot. They were great people following the Primate of all England to his final rest; and they followed him through heather and ferns—a little wood just tinted with the smile of autumnal change—through a wicket gate—across a park carpeted with eddying leaves—through a kitchen-garden lined with violets—across a little church-yard, into a tiny church. Few could enter to hear the burial-service read by the country rector, but a large number awaited under an old yew-tree, then followed to the grave, where he was laid by the side of his daughter, since whose death, the year before, the old man had steadily declined. There were certain touches about the scene

* The value of the principal sees in Great Britain is as follows: Canterbury, £15,000 a year; York, £10,000; London, £10,000; Durham, £8000; Winchester, £7000; Ely, £5000. These are the salaries of the bishops. The other bishoprics are worth £4500 and £5000 per annum.

whose beauty could best be seen against the back-ground furnished by the tombs of a long line of cardinals and archbishops in Canterbury Cathedral.

But who was to be the next archbishop? From the lowest hodman to the primate, nobody in England can fall at any post but enough start forward to step into his shoes. The appointment of the next archbishop rested with Mr. Disraeli; but the critical state of Church parties, added to the knowledge that Disraeli is full of surprises, led to great anxiety among Churchmen. It was hopeless for him to try and please both Low and High Church parties. As for the Broad-Church, they are confirmed optimists in such things, and will stand any thing, in their certainty that the stars in their courses are fighting for their cause. Mr. Disraeli chose the man whose appointment was most certain to be popular in London; the man to appoint whom meant an abyss never again to be bridged between him and the High-Church. Dr. Archibald Campbell Tait had, as Bishop of London, exceeded all other bishops in his unconventional and practical labors. He had visited cholera patients in hospitals with his wife; he had done much toward the raising of the million pounds in ten years to supply church accommodation to the poor, known as "the Bishop of London's Fund." No bishop had ever preached so much—and few so well—to the people. He was born in Edinburgh (1811), and went to Oxford with a good training in the Scotch schools; he had fought Dr. Newman successfully off of the position he had taken in Tract No. 90, that the Thirty-nine Articles could be honestly subscribed by Roman Catholics; he had succeeded Dr. Arnold at Rugby; had been dean of the very "Low" cathedral at Carlisle; had written articles for the *Edinburgh* and *North British Reviews*; and was altogether as objectionable a man to the Ritualists as could have been chosen. The fact that he was a Scotchman was in itself startling. This was so novel that the newspapers fished up from remote antiquity an old versified prophecy that when a Scotchman should be Archbishop of Canterbury men would burrow underground—a prophecy which the Underground Railway fulfills. Dr. Tait's preaching always drew crowds to St. Paul's, where I have several times heard him. While he was not eloquent, his sermons were always interesting and simple, and they were uttered in a good round voice which all could hear. He is a somewhat peculiar man in appearance. His hair is brown, his face fair and beardless as a boy's; and though he is somewhat wrinkled, his mouth has a youthful expression. He has an almost studied plainness—not to say bluntness—of manner, though eminently genial. In his Church politics he is a Low-Churchman, with a friendly leaning toward the Broad-Churchmen. The fact that an Archbishop of Canterbury should be personally intimate with such men as Stanley, Maurice, Alford, and Kingsley, is one too pregnant

DR. TAIT, THE ARCHBISHOP OF CANTERBURY.

with significance to be overlooked by any party in the Church. The fact that the oldest and most authoritative see in England had steadily set its face toward the Broad-Church was so certain to alarm the other parties, that the liberal clergy were resolved to celebrate Dr. Tait's enthronement with an unusual strictness of observance of the ancient forms and customs, though they found the machinery therefor somewhat rusty. They succeeded so far as to bring out in very startling distinctness the distance England has traveled from the era when the throne of Canterbury meant something, and the impossibility of piecing up a *bona fide* archbishop, in the old sense, in this age.

Soon after ten o'clock the gates were opened, and we all rushed in—not in a very orderly style—to get the best seats. In a very short time there was no unoccupied seat in the vast building,* save those reserved for the clergy. I was fortunate enough to get a seat in the choir immediately opposite the throne, and within sight of the old chair of Augustine. We had nearly two hours to wait before the ceremonies should begin. And there were things enough to employ one's thoughts. Far away, stacked in a dusty corner, were old worn out pulpits and stools and benches for knees. What voices had proceeded from those desks when their crimson was yet fresh? What were the thoughts of those who listened from the now disarrayed seats, or what aspirations in the hearts of those who knelt? Their human spirits seemed to say through the silence: "A little

* The following are the dimensions of each portion of the Cathedral, with the year to which each in its present condition belongs:

	Length. Feet.	Breadth. Feet.	Height. Feet.
Nave (1420).....	214	94	80
Choir (1174) including aisles..	150	40	71
Transepts—(1174) eastern		154	
(1379) western.....		124	
Chapter-house (1420).....	92	37	52

The cloisters are 134 feet square; the central tower, 234 feet high, 34 feet diameter; the western towers, 130 feet high.

while and your voices too shall be hushed." Time

"will leave no more
Of things to come than of the things before."

The beautiful windows clothed the throng in varied and gentle hues. When Henry VIII. cleared the Cathedral of other traces of Becket he had not the heart to break the windows which represented him; but Cromwell's men had no such scruple; they smashed whatever their pikes could reach. Nevertheless, many bits of the old glass were found and pieced together as neatly as possible. There was one old window where a green devil was very conspicuous, though his long tail had been abbreviated by Puritanic violence. Near him were two saints holding up what seems at first to be a bag of money, but on closer inspection proves to be a sheet full of the heads of saints, who are being borne aloft, while beneath them yellow and blue sinners are being thrust by the green devil into a monstrous animal mouth—the mouth of hell. I found more entertainment in examining the oldest window, through which is distributed the fragments of Becket, whom I found great difficulty in putting together again. His face was discernible, but one of his legs seemed to be doing service as a horse's tail.

The waiting crowd begin to give signs of their respective sensations and objects. There is the London *Illustrated News* man making his sketches, and the reporters generally hard at their notes. Two of them are conversing about the admirable statues far away, near the roof; the statues presently move and whisper to each other, and the architectural criticisms are revised. A stranger asked his neighbor, "What are the Archbishop's opinions?" The questioned man looked astonished, as if he had been asked what was the color of a triangle. "Of course," he replied, "as an archbishop he must represent all parties." Here a third put in—"It would be rather a row, I think, if the Archbishop should come out with some new views. Think of Colenso being Primate of all England! By Jove, Bill, that's an idea! When they make me Archbishop of Canterbury, I shall rise up in that throne, as soon as the ceremony is over, and announce that I have come to the conclusion that there is no God, and that none but atheists shall have any of my patronage." The fellow and his comrade put their faces down, red with laughter; but I remember that their responses were particularly vigorous when the services began. The general whispering was like the gentle roar of wind through a pine forest.

At last the first faint sound of distant singing is heard. A deep breath of silence falls softly over all. From far outside the Cathedral, floating in as on sinking and falling waves, come the voices of the little boy-choristers, chanting the Gregorian chant by which Augustine and his monks first marched from the sea-shore to this spot in the far centuries back. It seemed almost a ghostly procession of ages, marching

on through darkness and light, through danger and victory, the aged sinking in the rear, the young taking up the burden and the song. Nearer and nearer they come; the vague tones gather to words:

"Behold, he that keepeth Israel shall neither slumber nor sleep.

"The Lord himself is thy keeper; the Lord is thy defense upon thy right hand;

"So that the sun shall not burn thee by day, neither the moon by night.

"The Lord shall preserve thee from all evil; yea, it is even he that shall keep thy soul.

"The Lord shall preserve thy going out and thy coming in, from this time forth for evermore."

It were impossible to describe the effect of these notes of the yet invisible choir. The organ was yet silent, the throng breathless; only these tender voices, subtly pervading the air, sweetly blending with the hues of flaming windows, descending upon all hearts, and stirring the fountain of painless tears. Might it only never end, but go on with the blessed monotony of the sky! As it approaches, it seems to have touched the organ also, and, Memnon-like, there steal from its invisible recess responsive notes of exceeding softness. And at last the hither end of the procession enters the choir—and, alas! the spell is broken. The first thing seen is the ancient city mace, the manifest fellow, with its gilt and jewels, of that which Cromwell called a "bauble;" then the Mayor, with his huge gold chain, suggesting a cost of five hundred pounds; then legal functionaries with their gaudy crimson robes and hideous wigs and queues, just as one sees them in a masquerade; then curious officials in ermines and garter collars, glorified beadles come for the nonce out of their old wardrobes, where they have been sleeping since the last enthronement. At length flutters among the ribbons and stretchings of necks announce that one end of the Bench has been caught sight of; and sure enough there steps in the entirely magnificent Bishop of Oxford, a steeple in canonicals, whose stately ecclesiastical movement would hardly tell that he bears the name of Wilberforce. "How handsome he is!" suggests an enthusiastic lady near me. And, indeed, so far as a proud bishop can be, he is; but my own eyes find increasing pleasure in following the gray-haired line behind him—the bishops of London, Ely, Peterborough, Hereford, St. David's, and Honolulu—until they rest at last upon the best face of them all—that of the Archbishop of Canterbury.

"Dr. Tait looks very uncomfortable," was the comment of several. He did; and well he might. It were hard to imagine a severer ordeal for a plain, simple man. He has on a gown whose train stretches several yards behind him. Two young men in the finest evening dress, with rosettes stuck in their coats—looking as if they had just popped out of a ball-room—walked behind him, holding up the train. The Archbishop, generally tall and erect, is now bent; his face is pale, his step nervous; and I

felt assured that if he had obeyed his instincts he would have made the fops go about their business, and take the gown and train with them. But if that train should be omitted, some part of the cathedral estates might go with it. There are men in England who have to cut up various unseemly antics, at their silly ancestors' graves, every year, in order to hold on to their estates; and the revenues of Canterbury follow on the fulfillment of certain forms and conditions, which once seemed vital, albeit very frivolous now, if taken apart from their value in pounds.

And now the clergy file in to their seats, where they form a parterre of not unpleasing colors. They are all clothed in white, and each wears, falling on his shoulders, the hood, whose lining, denoting by its color the college where he graduated, is turned out. The Oxford M.A. hood is deep red; Cambridge is white and black; Dublin, blue; and there are many shades denoting M.A.'s, Fellows, and other university positions and degrees. Among any large number of Englishmen there will always be some odd characters. A smile passed over every face when, after all had been seated, a tall clergyman, evidently "from the country," entered in his ordinary dress and strolled up and down for some time, vainly seeking a seat. He must have been near seven feet in height, and was slender as a pole; his face was young and queer, his coat seedy, and he bore in his hand a strange portmanteau, nearly a yard long. He seemed so likely to produce a merriment like that of the dog on the Derby race-course when all have left it, that the beadles were compelled to secure him a seat. But no sooner had his case been settled than a successor appeared in the shape of a dwarfish little vicar with a huge wife, whose antediluvian bonnet and rustic finery came near producing an explosion among her aristocratic sisters. The clergy were more generally bearded than the laymen, though it is hardly twenty-five years since a beard was regarded in England as the sign either of a fast man or a socialist.

At length all wandering thoughts are recalled: the Hallelujah Chorus breaks with its Atlantic roll over us. One could hardly help pitying the poor choristers who, for the first time in their lives, had to sing under such exciting circumstances. Their little faces were flushed, their eyes shone, and the leader of the tenors had at last to leave with his nose bleeding. When the chorus was ended Dean Alford read the morning service in a sonorous voice which all could hear, and with an expression that all could feel. When it was finished the Archbishop was led by the Dean and Vice-Dean to the throne, which consisted of a seat arranged something like a small private box at a theatre, with a roof with Gothic turrets, rising to a spire. A civil officer, an auditor, with an aggressive wig, was most prominent next to the Archbishop: he listened to the mandate for enthronement, and gave orders that it should

proceed. The Archdeacon could not attend on account of extreme age, so his proxy stepped forward and repeated in a distinct voice the form of induction:

"I, Harrison, acting as proxy for James Croft, Master of Arts, Archdeacon of Canterbury, do induct, install, and enthrone you, the most reverend father in God, Archibald Campbell Tait, Doctor in Civil Law, Lord Archbishop of Canterbury, into the archbishopric and archiepiscopal dignity of the see of Canterbury, into the real, actual, and corporal possession of the same, with all and singular the rights, dignities, honors, pre-eminences, and appurtenances thereof; and the Lord preserve your going out and your coming in, from this time forth for evermore. Amen."

The Archbishop, evidently affected, arose and bowed silently. Then the Benedicite was sung, and the morning service proceeded with. But Dr. Tait was as yet only Archbishop of Canterbury; to become Primate of all England he must leave that fine throne of white and red, and pass to another. This other is a cold hard stone chair, made of three or four unadorned blocks, once white, but now stained dark with age. That is the real cathedral after all; for *cathedra* means a seat. That old stone chair is the seat from which Augustine and Becket gave laws to England. There were ages when the path to it was liable to be marked by such pools of blood as once stained the floor, over which Dr. Tait now passes with no greater trouble than the train and the young men in evening dress. A number of the most venerable prelates accompanied him to this hard and dismal seat, which represented supremacy over them all; and the same form of induction was used, except that the word "metropolitan" was substituted for "archiepiscopal." Afterward he was conducted to the Dean's stall, where he remained while the *Te Deum* was sung, and the Dean said the "suffrages," to which the choir chanted the responses:

"O Lord, save Thy Servant our Bishop,
Ans. Who putteth his trust in Thee.
 Send him help from Thy Holy Place,
Ans. And evermore mightily defend him.
 Let the enemy have no advantage against him,
Ans. Nor the wicked approach to hurt him.
 Be unto him, O Lord, a strong tower,
Ans. From the face of the enemy.
 O Lord, hear our prayer,
Ans. And let our cry come unto Thee."

At the conclusion of the suffrages a prayer was offered up by the Dean.

The procession of dignitaries, clergymen, and officials then left the Cathedral for the Chapter-house, where the Archdeacon placed the Archbishop in the chief seat, and said:

"I, Harrison, acting as proxy for James Croft, Archdeacon of Canterbury, assign and appoint this seat to you as Lord Archbishop of Canterbury."

The Archdeacon then administered the following affirmation:

"My Lord Archbishop,—You declare that you will maintain the rights and liberties of this church, and will observe the approved customs thereof, and, as far as it concerns your Grace, will cause the same to be observed by others, so far as such customs are not repugnant to God's Word, the laws, statutes, provisions, and ordinances of the realm, or to her Majesty's prerogatives, and not otherwise."

The Archbishop having said, dryly, "I so declare," the Archdeacon said :

"I, Harrison, acting as proxy for James Croft, Archdeacon and Canon of this church, do promise to pay canonical obedience to your Grace, Lord Archbishop of Canterbury, as my diocesan and archbishop."

Then the dean, the canons, the honorary canons, the six preachers, the schoolmasters, the auditor, the minor canons, the grammar master of the choristers, the surveyor, the organist, and lay clerks promised canonical obedience in like manner. After which the assembly was dismissed by the Dean; and afterward, in the audit room, an act of the proceedings was produced and signed, in the presence of, and attested by, a notary public.

When one reflects upon what that stone *cathedra* meant in times past, upon what grandeur and incense and genuflections this old building had witnessed on great occasions in the past, upon the tremendous power which once weighted the words "dignities, honors, pre-eminences" for Englishmen, it were about as hard to gather up again from these simple and almost bald forms a genuine Archbishop of Canterbury as to piece together again St. Thomas à Becket as scattered through yon Cromwell-smashed window.

Augustine's throne is now no throne at all. No layman in Great Britain would alter any transaction to the extent of sixpence in consequence of any order from it. The legal title remains; the moral title is gone. The English Church received the vast revenues in a day when it could fulfill the moral conditions they represented. Those possessions were accumulated from the hard earnings of generations of toiling men and women, who lavished them freely as a means of salvation for themselves and their children, through masses, intercessions, prayers; or to build and preserve gorgeous shrines, now vanished, at which their physical diseases, as well as their sins, might be healed. The ancient archbishop was made rich because he was a representative of God in England, on whose words eternal life and death depended. The whole was a contribution, not to Dr. Tait, but to God. By what right do men enjoy these things who despise the superstitions from which they are derived? Surely justice would devote every endowment of Catholic times to objects in which people believe now as implicitly as they once did in the shrine of Becket. To the people, now, schools, hospitals, and all institutions of charity and humanity are the only shrines at which they hope to be healed.

About the same time that Dr. Tait (and a kindlier man never sat there) entered on his throne and his £15,000 income, Catherine Spence was found starved to death in London, and by her side a tract, "On the Goodness of God!"

I left Canterbury more than ever convinced that an English cathedral can be little more than a vast pile of marl or lime in the centre of

a barren field. The best feature of the case is that the ablest men in the Church recognize the fact perfectly well. At a luncheon after the enthronement, given by Dean Alford, the new Archbishop made a speech, in which he spoke with much feeling of the earnestness and life which remained in the Church of England, and the good it could still hope to achieve; but he passed over in silence the conventional tributes to "our noble cathedrals," and the like. When that was over, a considerable number of the clergy visited old St. Martin's Church. There I saw Dr. Stanley and others gazing upon the beautiful window which represented the princely saint, on his richly caparisoned steed, dividing with his sword his splendid cloak, that he might bestow the half of it on the naked beggar kneeling near his horse's head; and I fancy that it must have inspired in some of them the hope of a time when the Church of England would be great enough to give at least so much of its magnificent vesture to the intellectually, spiritually, and physically starving.

THE DAISIES.

When the good year is old,
And somewhat weary,
Yet has enough of gold
To keep him cheery—
When earth, clad in her best,
Sits by her neighbor
The sun, and has a rest
From summer labor—
When prudent skies array
The world in hazes,
There comes the holiday
Of all the daisies.

They are the folk that won
September's graces,
And charmed the jovial sun
With their bright faces.
He let them linger late;
When they grew sober
He gave them leave to wait
And see October;
For all the quiet land
(Ere days were duller)
Would haste to make it grand
With dear-bought color.

So all, in fields and towns,
And each new-comer,
Dressed in old-fashioned gowns
They wore in summer,
Stay yet a while, behind
Blooms that were stronger,
And play with sun and wind
A little longer.
Still happy, still alert,
Still merry-hearted—
Dropped from September's skirt
When she departed—

Till winter comes so near
His shadow chills them,
And they lose half the cheer
September wills them;
Till their old friend the sun
Becomes forgetful,
And autumn has begun
To grow regretful;
Then they make haste to hide
Their altered faces,
And lie down side by side
In grassy places.

AMONG THE PEACHES.

GATHERING THE FRUIT.

WHO has not heard of Delaware peaches? Ay, and tasted of their nectarine sweetness? What summer or autumn traveler, by railroad or steamboat, is not familiar with the fruit peddler's cry, "Here's your nice peaches, Delaware peaches!"

In the months of September and October, we find the beautiful fruit in almost every city, town, and village throughout our own country, and in the towns far up in Canada. In the confectionery and fruit stores of European cities this delicious fruit is offered for sale in sealed cans, almost as perfect in flavor as though just taken from the trees; and peach brandy, with its rich, fruity aroma, is now taking the place of the more expensive foreign brandies.

Peaches grow in the Middle, Western, and Southern States, but attain perfection in flavor, size, and color nowhere as in the peninsula composed of the Maryland counties on the eastern shore of the Chesapeake Bay and the State of Delaware—a tract of land in the embrace of three great bodies of salt-water, and consequently subject to peculiar climatic influences. The middle and southern portions of this peninsula constitute the great orchard of this country, and may be said to supply with peaches the principal markets of the world. By reference to the map we will see that this favored locality is in a latitude a little higher than that of the fruitful land of Persia, of which

the peach is said to be a native; but the modifying influence of the Atlantic, in conjunction with the Delaware and Chesapeake bays, tempers the extremes of both heat and cold to such a degree that all semi-tropical fruits and plants flourish luxuriantly. Every breeze, from the gentle zephyr to the sea-born hurricane, is laden with saline particles that carry destruction to all the pestilent insect tribes that prey upon the fruit and the trees.

A general description of the peach region will fail to give the uninitiated a clear idea of the fruit, in its almost boundless profusion. We may see, from the highlands of the Delaware, steamer after steamer passing with their burden of peaches. Winding along the river banks, the railroad is ever noisy, during the season, with its long trains of peach cars, that keep the atmosphere redolent with fruity odors suggestive of the Edens whence they came.

This is, however, but a hint of the magnitude of the peach interest. To realize it we must see it with our own eyes, and become, as it were, a part of it. Therefore, declining to take passage in either cars or steamer, we will drive down in our own carriage, so that we may visit those interesting portions of the country remote from the highways of travel.

You are an old traveler, and therefore not unmindful of the comforts by the way. Hotels? Yes, there are comfortable hotels in the more

AT THE LANDING.

important towns throughout the district, but as we may not pass through the large towns we shall find only a few *taverns*, scattered here and there at long intervals. But we shall not want accommodations where the planters, and more important citizens, keep up the old-fashioned hospitality that opens the front-door to the respectable stranger, and makes him feel that he is welcome to the best the house affords.

We leave the city of Wilmington enveloped in the smoke of her factories and machine-shops, take a last look at the distant blue hills of the Brandywine and the Delaware highlands, marking the course of those rivers, and bowl along the charming river road to New Castle—the *old* New Castle of the original Swedish settlers, that has fallen so far short of their expectations of a great commercial centre—the metropolis of the New World. Through the old town we pass, without stopping to examine its venerable institutions, its court-house, its ancient church, its jail, with the whipping-posts lifting their cruel heads above the wall of the jail-yard, and proceed directly to Delaware City, twenty miles south of the Pennsylvania line.

Here we enter the peach region, and find a light, loamy soil, free from field-stone and gravel.

We first call at the mansion of the late Peach King, Major Philip Reybold. The good old gentleman has been gathered to his fathers, but his courteous son will welcome us, and show us the magnificent plantation of a thousand or more acres, now in the highest condition of fertility, and abounding in wealth of fruits and grains.

From the observatory on the mansion we overlook the Delaware River and the bay for many miles; see the old Fort Delaware, with its bristling guns; look across to Salem, New

Jersey, and many other towns and villages along the shores. Turning from the water, we see, clustering around the mansion farm, the beautiful homes of the Major's several sons and daughters, each dwelling an architectural model, and every farm in the highest state of cultivation, symmetrically divided into fields by handsome fences, and bounded by green hedges. Orchards of different fruits cover a large proportion of the surrounding country, and a vineyard, not far away, is loaded with purple clusters.

Half a century since, this whole neighborhood was an uninclosed wilderness, deemed unfit for agricultural purposes. The Major purchased a large tract, at a price almost nominal, gathered all the laboring force he could command, broke up the ground, fertilized it by a clover sward, planted peach-trees, and cultivated them for a couple of years, when they commenced bearing their great crops.

The peaches were first sent to the Philadelphia market in sail-boats, but all the small boats that could be procured were unequal to the transportation in the second year of bearing. Steamers were chartered—others purchased; new and more distant markets were supplied, including New York, Albany, Boston, and the principal towns of New England and Canada.

Yet thousands of baskets remained unpicked in the orchards. The ruling price for the best, in the Philadelphia market, was little over a quarter of a dollar the basket. They became a drug, and at one time a cargo of eight thousand baskets could not be sold at ten cents the basket. As a measure of relief the whole were thrown into the river.

Proceeding to Middletown, we pass through a continuous orchard, or a succession of orchards that seem to be one vast whole, the trees every

CANNING-ROOM.

where bending or broken with their loads of high-colored fruit. Middletown is on the Delaware Railroad, and is the central station in New Castle County. On the track there is a train of fifteen cars waiting for the day's pickings. Each car carries about five hundred baskets; and although early in the morning, the peach teams are already coming in from all directions. This fruit is destined for the New York and Boston markets. But a small portion of the Delaware peach crop is sent to Philadelphia, or the inferior markets in the vicinity.

From Middletown to Townsend, where another peach train is waiting, the whole available country is planted with peach-trees. The ordinary farm crops appear to be neglected, while the labor is wholly devoted to gathering and marketing the fruit. In the alluvial table-lands of this neighborhood the peach-tree finds all the elements for the production of fruit. It is new soil, and the trees are exempt from disease, and from such insects as render peach growing so precarious in other sections equally favored by climate.

The orchardist is generally satisfied with a yield of three or four baskets of marketable fruit from each tree; but here the average is seven to eight baskets from mature trees, and many orchards give even more.

The vineyards of France and the orange groves of Southern Italy are associated in our minds with pictures of natural beauty of the most pleasing character, and with all the romance incident to a voluptuous climate. But neither vineyard nor orange grove can compare in grace of foliage or brilliancy of fruit with a Delaware peach orchard, its massed fruit in the last condition of maturity. And the pickers! It is contrast of gay colors that gives the dress of the European peasant its picturesque beauty. Here, in the motley crowd of peach pickers, we have all colors in dress, and every shade of complexion, from the Caucasian red and white to the African ebony. Every style of dress, from

fashionable garments to the simplest coverings of nakedness. The dress most common with the men is a red flannel shirt and pantaloons tied around the waist by a twine string. A few have hats or skull-caps, and others have no head-covering but the mats of woolly hair. Shoes are luxuries reserved for full-dress occasions, or only worn on week-days when the sand-burs are so plentiful as to render bare-feet walking uncomfortable. The women are attired in short gown and petticoat, with a bandana handkerchief tied about the head.

The orchards increase in size as we proceed southward. Here they are composed of from ten thousand to one hundred thousand trees each, and cover from fifty to one thousand acres. Parties of pickers, called "gangs," are placed in different sections of the large orchards, and though completely hidden from each other by the low branches, their whereabouts may be readily ascertained by the laughter and negro melodies that are the inseparable belongings to negro parties.

By a slight detour we strike the Delaware and Chesapeake Canal, the northern outlet for the products of the Eastern Shore counties of Maryland, as well as for the farms along its course through Delaware. The plantations along the canal, and those extending several tiers back, are devoted to peaches. There is a landing on every farm, besides the public landings where the roads cross the canal. The boats that carry the fruit are drawn by four horses or mules, and have capacities for from five to seven thousand baskets.

A boat is now taking on its freight, while thirty or more wagons are waiting their turns to unload. The whole planked platform is crowded with tier upon tier of baskets and boxes, built up like a brick wall. An unmanageable ox team, whose driver is a little too anxious to await his turn, has pressed close up to the platform. A shout intended for another team starts this one, and it goes crash-

"SEE MY SMOCKSINS."

ing through the fruit, breaking and trampling the boxes and baskets. Here is confusion! A quarrel and a free fight, settled for the moment by the captain calling to them to "Quit foolin', and give a han' at the peaches."

All the pickers, except a few of the old women, come down to the landing with the last loads, to assist in the culling and putting the baskets on board the boat. The party here, consisting of over a hundred men, women, and children, are of the piebald order; but the darkey element is greatly in excess. The dark-eyes never weary so long as there is exciting business on hand. They are always ready for the "fun of the thing." Their ceaseless chatter, witty sallies, loud guffaws, and their more melodious camp-meeting ditties, give a liveliness to the scene quite charming to the stranger. Long before a wagon comes in sight it is heralded by the song of the driver, interlarded plentifully with "gee wo" and "haw buck" interludes.

In the crowd of barefooted darkeys there is one merry fellow who prides himself upon his "home-made smocksins," each composed of a half side of leather tied about his feet and ankles with leather thongs. He is regarded with much favor by the "cullud ladies," to whom he addresses many complimentary observations, set with high-sounding words.

About twenty-five thousand baskets are daily carried by the canal-boats in the flush of the season. In consequence of the easy motion and free ventilation the fruit may be sent from

the orchards almost perfectly ripe, and consequently commands a higher price than that sent by any other conveyance. In case, however, of stormy weather, they may be so long detained on the passage as to greatly affect the value of the cargoes.

All along the tow-path, in our drive of half a dozen miles, we notice that the landings are covered with peaches and the attendant teams, with the parties waiting to put the fruit on board. This is the universal harvest, and brings money to the purse of every one willing to work, plenty to every home, and good cheer to every board. To the family of the planter it means many luxuries, in the shape of pianos, new carriages, fast horses, and, perhaps, an additional farm or two.

Kenton, in Kent County, is the next point of particular interest, as we are invited to inspect the fine orchard of Mr. Gercker in that vicinity. We drive through Smyrna, renowned for its peaches rather than its figs, Blackbird, and a number of places that have names suggestive of importance, but are, in reality, mostly cross-roads, with the never-failing blacksmith-shop, or the combined store and groggery.

We pass orchard after orchard, walled in from the road by the impenetrable osage orange hedge that here grows luxuriantly. The country is nearly level, and the roads so straight that we look before us away to where the lines of green converge to a point. A level road is monotonous, and the miles seem to stretch to greater lengths than when the country is diversi-

fied with hill and dale, and rendered lifelike and cheerful by dancing streams.

But here is "Gercker's;" and the first sight shows that it is a model peach farm. We take a bird's-eye view of the thousand acres, and note the order and neatness of the plantation, laid out in square fields of one hundred acres each. The buildings are located in the central part of the only field not planted with peach-trees. A silver thread of water winds around the southern boundary, toward which the ground inclines. All other parts appear to be as level as a floor. The Delaware Railroad is within sight, and the station whence the fruit is shipped is marked by two large white tents, used by the employés while attending to the shipment of the peaches.

The trees are planted in parallel rows about eight paces apart, and from our perch upon the top of a high gate-post we look down upon a section of the orchard in full bearing, extending from near the house to the distance of over a mile. The branches of the trees are interwoven like intricate lace-work, yet preserving the distinct outlines by the color of the fruit. Here is a row of deep red fruit nestled amidst the green foliage that discloses the beauty it seems striving to hide. There, side by side, run a couple of rows of creamy white fruit, and still another with a wealth of golden-colored specimens, all ripe and tempting. We go down into the orchards for a closer view and a taste of the lavish abundance of delicious fruit. Standing at the entrance gate we look down the green aisles, arched by the laden boughs and carpeted by fallen fruit. Is not the appetite appalled by such superfluities of the richest fruit? Such a mass of wasting sweetness as would suffice the uses of a city! Does not the eye weary of contrasts of bright colors, and appetizing suggestions indefinitely multiplied?

Passing down the rows we pluck a white peach from the tree; it is large and round, with a delicate blush just perceptible on one

downy cheek. We bite into the mellow flesh, and find it a perfumed confection! Can the taste be more completely satisfied? We step across to where the trees display, as though on exhibition, specimens of monstrous size, each a "blotch of red upon a cloth of gold." We pick one of the largest from the ground; it had fallen from a topmost branch, where the sun painted it in brighter colors, and the free atmosphere invested it with all the perfect fruit essentials. The flesh is plethoric with honeyed juices more refined than the sugared specimen plucked from the tree. We realize that "the perfect fruit grows on the topmost branch;" and growing epicurean, hereafter select only such as occupy the most favorable positions on the tree. We gather a dozen such, and sit down to enjoy them at our leisure. We inquire of a sleek-looking darkey near if the fruit will make us sick. His reply is assuring. "Lord, marster, the more you eat the better; we gets fat on 'em."

Further on we meet a gang of pickers. Each gang is composed of fifteen men and a captain. No women are employed on this plantation. The average number of baskets picked to the hand is about seventy; where the women are employed they pick about fifty baskets each day.

Few of the pickers in the large orchards are residents of the neighborhood. They come down to the orchards in the beginning of the season, in parties large and small, from the unknown resorts to which the homeless congregate to pass the winter, from the back lanes of the cities, and from the hospitals and almshouses, generally presenting the lean, ragged appearance of semi-starvation. They engage to pick by the day, with board or half board considered as a part of the wages. The experienced prefer half board, which consists of a single meal—a dinner of unlimited salt pork and johnny-cake, peaches being substituted for the other meals. The healthful qualities of a

PARING-ROOM.

A PEACH BRANDY STILL.

fruit diet are evidenced in the improved physical condition of the pickers, who gain near a pound in weight each day. An excursion to the orchards, and a residence there of from four to six weeks, is, to this class of persons, equivalent to a summer at a fashionable watering-place for the *bon ton*. Each gang is followed by a wagon drawn by four horses or mules, and attended by three men, who load up the baskets and unload them at the station. The wagons carry from ninety to one hundred and ten baskets to the load, and the teams are kept on the trot. Eleven such teams are used on this plantation.

Wandering at our own sweet will through the orchard, our olfactory nerves were saluted by strong alcoholic odors, whereby we inferred the neighborhood of a peach brandy still. We found it in a secluded spot on the margin of the rivulet. Here, in the midst of great piles of peaches in all conditions, from uncolored immaturity to rotteness, was a fellow who "did not like peaches." The sour smells, the swarms of wasps and flies blackening the fermenting messes, led us to believe he spoke the truth.

The distillery is a building of modest architectural pretensions, being extemporized for the purpose from an old negro shanty. Five hundred gallons of brandy are daily manufactured, which commands ready sale at a good price.

A number of loafers are gathered about the still, presenting a scene, if picturesque, not at

all ornamental nor useful. They are without business here, and hang around as though charmed by the smell of the liquor, practically caricaturing Tom Moore's beautiful story of the Peri watching for glimpses of the glory beyond the golden gates of Paradise, and listening enchanted to the heavenly music.

The great bell at the mansion announces the dinner hour, and we hasten to the main entrance to see the gangs, commanded by their captains, file past in military order. The white boarders take their places around stationary tables, while the darkeys find accommodations on boxes and baskets outside. The system of social equality is not yet in perfect working order, and, strange to say, the objection is as strong with the darkeys as with the whites.

Sambo takes his hunk of salt pork in one hand and his johnny-cake in the other, and dispatches them with as much relish as though they were dainties, enlivening the meal by spicy conversation, the jolliest of jokes, and the loudest laughter, while his white compeers get through the meal in silence. Who says Nature has been niggardly in gifts to the darkey? He is endowed with a happy disposition, a spirit of contentment, that renders his life a continual pleasure under all disadvantages of race and color.

Among the pickers are two fiddlers and a portion of a brass band. The instruments are brought out after supper on fair evenings, and the resident party is enlarged by acquisitions from the whole neighborhood. A description

will convey to the reader but an imperfect idea of one of the extemporized "balls," as they are here termed. The musicians, with six pieces, occupy seats on the dining-table. A crowd of some hundred persons of all colors gathers in the yard, and awaits the signal for the dance. At the first few notes the figures are made up with cheerful activity, and the dancing begins. The excitement grows with the exercise, the music becomes more lively, and the lithe limbs, forgetful of the day's toil, move with ease and natural grace. The dancers, hatless, coatless, barefoot, continue in silence for a time. Presently a shout is heard; another, faster! faster! The music is quickened, they leap and shout as if possessed, the spectators catch the inspiration, and rush in. The hours fly unheeded, and the revelers are startled to hear the horn sounding the hour of bedtime.

In the early morning, just as the birds in the green hedges begin to make the air vocal, we start for Dover, the State capital, and the centre of the finest peach district in the world. The air is balmy, the sky serene, and the little woman, catching inspiration from the birds,

bursts forth into song, to which the darkeys on the road stop to listen so long as we are in sight. We are continually meeting darkeys on their way to the orchards. Sometimes the women carry their young babies, while other children toddle on behind. We inquired what they did with their babies while they were picking peaches. "Oh, we take the other chil'en along to nus 'em."

The rapid advance in the price of real estate has, within a few years, made many fortunes. Twenty years since the ruling price was from five to ten dollars per acre in the "forest," graded according to the value of the cord-wood and timber. It now presents no signs of its former wild appearance, but is highly improved by tillage and good inclosures. Handsome residences and tasteful grounds indicate comfort and culture, and the fields on every hand teem with luxuriant crops. The land is generally now valued at one hundred times its original cost, and the profits of a well-managed peach orchard will pay the advanced price in a few years.

The provident little woman has arranged

THE BALL AFTER SUPPER.

such toothsome fare that we prefer to lunch picnic fashion, out of doors, under the welcome shade of a way-side tree. The snowy cloth is spread by a cool spring or rivulet; Rena, our trusty little horse, released from harness to pick the herbage, never strays far away. After lunch we read or sketch, and the rustics on the road frequently stop to ask if we are peddlers!

At Dover is a large distillery and three canning establishments, capable of preparing twenty-five thousand cans of peaches a day. The canning houses of Richardson and Robins are the most complete, and are worked by steam, so far as is practicable.

In the paring-room, where two hundred hands are employed, monster fans are suspended from the ceiling and worked by steam, keeping the air always pleasantly cool. The cans are made by steam, the fruit distributed, carried to the boilers, and cooked by steam.

This firm prepares fruit and vegetables mostly for European consumption, and have more orders from abroad than they are able to fill.

From Dover the railroad carries a daily average of ten thousand baskets, while three large steamers ply between its port at Mahon and New York city during the season, and are unequal to the freight. To-day, hundreds of baskets are left on the wharf to perish, or to be sold to the distillers at a very low price. Yet the loaded wagons still come to the landing, and a mile away we see clouds of dust indicating the speed by which the driver hopes to get on board his last load.

The trees in this vicinity are large, and endure to a great age. An orchard outside the limits of the town, planted upward of half a century since, still bears fruit. We measured one patriarchal tree, bending under its load of delicious Early Yorks, that was forty-seven inches around the trunk, while its branches spread over a diameter of forty-two feet.

At some future time we will be pleased to continue our pleasant drive down through the peninsula to the ocean, and inspect the remaining sources of the great fruit supply of one hundred and fifty thousand baskets a day.

FREDERICK THE GREAT.

X.—THE INVASION OF BOHEMIA, AND THE RETREAT.

THE correspondence carried on between Frederick and Voltaire, and their mutual comments, very clearly reveal the relations existing between these remarkable men. Frederick was well aware that the eloquent pen of the great dramatist and historian could give him celebrity throughout Europe. Voltaire was keenly alive to the consideration that the friendship of a monarch could secure to him position and opulence. And yet each privately spoke of the other very contemptuously, while in the correspondence which passed between them they professed for each other the highest esteem and affection. Frederick wrote from Berlin as follows to Voltaire:

“October 7, 1743.

“MY DEAR VOLTAIRE,—France has been considered thus far as the asylum of unfortunate monarchs. I wish that my capital should become the temple of great men. Come to it then, my dear Voltaire, and give whatever orders can tend to render a residence in it agreeable to you. My wish is to please you, and wishing this, my intention is to enter entirely into your views.

“Choose whatever apartment in our house you like. Regulate yourself all that you want, either for comfort or luxury. Make your arrangements in such a way as that you may be happy and comfortable, and leave it to me to provide for the rest. You will be always entirely free, and master to choose your own way of life. My only pretension is, to enchain you by friendship and kindness.

“You will have passports for the post-horses,

and whatever else you may ask. I hope to see you on Wednesday. I shall then profit by the few moments of leisure which remain to me, to enlighten myself by the blaze of your powerful genius. I entreat you to believe I shall always be the same toward you. Adieu.”

Voltaire has given a detailed account of the incidents connected with this visit to his Prussian majesty. It is a humiliating exhibition of the intrigues and insincerity which animated the prominent actors in those scenes.

“The public affairs in France,” writes Voltaire, “continued in as bad a state after the death of cardinal de Fleury as during the last two years of his administration. The house of Austria rose again from its ashes. France was cruelly pressed upon by that power and by England. No other resource remained to us but the chance of regaining the king of Prussia, who, having drawn us into the war, had abandoned us as soon as it was convenient to himself so to do. It was thought advisable under these circumstances that I should be sent to that monarch to sound his intentions, and, if possible, persuade him to avert the storm which, after it had first fallen on us, would be sure, sooner or later, to fall from Vienna upon him. We also wished to secure from him the loan of a hundred thousand men, with the assurance that he could thus better secure to himself Silesia.

“The minister for foreign affairs was charged to hasten my departure. A pretext, however, was necessary. I took that of my quarrel with the bishop Mirepoix. I wrote accordingly to the king of Prussia that I could no longer en-

THE KING IN THE TOWER AT COLLIN.

dure the persecutions of this monk, and that I should take refuge under the protection of a philosophical sovereign, far from the disputes of this bigot. When I arrived at Berlin the king lodged me in his palace, as he had done in my former journeys. He then led the same sort of life which he had always done since he came to the throne. He rose at five in summer and six in winter.¹ A single servant came to light his fire, to dress and shave him. Indeed, he dressed himself almost without any assistance. His bedroom was a handsome one. A rich and highly ornamented balustrade of silver inclosed apparently a bed hung with curtains, but behind the curtains, instead of a bed, there was a library. As for the royal couch, it was a wretched truckle-bed, with a thin mattress, behind a screen, in one corner of the room. Marcus Aurelius and Julian, his favorite heroes, and the greatest men among the stoics, were not worse lodged."

The king devoted himself very energetically

¹ Voltaire is proverbially inaccurate in details. It was the king's invariable custom to rise at *four* in summer and six in winter.

to business during the morning, and reviewed his troops at eleven o'clock. He dined at twelve.

"After dinner," writes Voltaire, "the king retired alone into his cabinet, and made verses till five or six o'clock. A concert commenced at seven, in which the king performed on the flute as well as the best musician. The pieces of music executed were also often of the king's composition. On the days of public ceremonies he exhibited great magnificence. It was a fine spectacle to see him at table, surrounded by twenty princes of the empire, served on the most beautiful gold plate in Europe, and attended by thirty handsome pages, and as many young heyducs, superbly dressed, and carrying great dishes of massive gold. After these banquets the court attended the opera in the great theatre, three hundred feet long. The most admirable singers, and the best dancers, were at this time in the pay of the king of Prussia."

Voltaire seems to have formed a very different estimate of his own diplomatic abilities from those expressed by the king of Prussia. Voltaire writes:

"In the midst of fêtes, operas, and suppers, my secret negotiation advanced. The king allowed me to speak to him on all subjects. I often intermingled questions respecting France and Austria, in conversations relating to the *Æneid* and *Livy*. The discussion was sometimes very animated. At length the king said to me: 'Let France declare war against England, and I will march.' This was all I desired. I returned as quickly as possible to the court of France. I gave them the same hopes which I had myself been led to entertain at Berlin, and which did not prove delusive."

The fact was, that the diplomacy of Voltaire had probably not the slightest influence in guiding the action of the king. Frederick had become alarmed in view of the signal successes of the armies of Maria Theresa, under her brother-in-law, prince Charles of Lorraine. Several Austrian generals, conspicuous among whom was marshal Traun, were developing great military ability. The armies of Austria had conquered Bohemia and Bavaria. The French troops, discomfited in many battles, had been compelled to retreat to the western banks of the Rhine, vigorously pursued by prince Charles. The impotent emperor Charles Albert, upon whom France had placed the imperial crown of Germany, was driven from his hereditary realm, and the heart-broken man, in poverty and powerlessness, was an emperor but in name. It was evident that Maria Theresa was gathering her strength to reconquer Silesia. She had issued a decree that the elector of Bavaria was not legitimately chosen emperor. It was very manifest that her rapidly increasing influence would soon enable her to dethrone the unfortunate Charles Albert, and to place the imperial crown upon the brow of her husband.

Under these circumstances it was evidently impossible for Frederick to retain Silesia, unless he could again rally France and other powers to his aid. It was always easy to rouse France against England, its hereditary foe. Thus influenced, Frederick, early in the spring of 1744, entered into a new alliance with France and the emperor Charles Albert against Maria Theresa. The two marriages which he had so adroitly consummated constrained Russia and Sweden to neutrality. While France, by the new treaty, was engaged to assail with the utmost energy, under the leadership of Louis XV. himself, the triumphant Austrian columns upon the Rhine, Frederick, at the head of one hundred thousand troops, was to drive the Austrians out of Bohemia, and reseat Charles Albert upon his hereditary throne. For this service Frederick was to receive from the Bohemian king three important principalities with their central fortresses, near upon the borders of Silesia.

The shrewd foresight of Frederick, and his rapidly developing military ability, had kept his army in the highest state of discipline, while

his magazines were abundantly stored with all needful supplies. It was written at the time:

"Some countries take six months, some twelve, to get in motion for war. But in three weeks Prussia can be across the frontiers and upon the throats of its enemy. Some countries have a longer sword than Prussia. But none can unsheath it so soon."

Public opinion was then much less potent than now; still it was a power. Frederick had two objects in view in again drawing the sword. One was to maintain possession of Silesia, which was seriously menaced; the other was to enlarge his territory, and thus to strengthen his hold upon his new conquest, by adding to Prussia the three important Bohemian principalities of Königsgrätz, Bunzlau, and Leitmeritz. By a secret treaty he had secured the surrender of these provinces in payment for the assistance his armies might furnish the allies; but policy required that he should not avow his real motives. He therefore issued a manifesto, in which he falsely stated:

"His Prussian majesty requires nothing for himself. He has taken up arms simply and solely with the view of restoring to the empire its freedom, to the emperor his imperial crown, and to all Europe the peace which is so desirable."

Frederick published his manifesto on the 10th of August, 1744. Early in the morning of the 15th he set out from Potsdam upon this new military expedition. His two eldest brothers, Augustus William, prince of Prussia, and prince Henry, accompanied him. The army entered Bohemia in three columns, whose concentrated force amounted to nearly one hundred thousand men. Frederick in person led the first column, the old prince Leopold the second, and marshal Schwerin the third. Marching by different routes, they swept all opposition before them. On the 4th of September the combined army appeared before the walls of Prague. Here, as in every act of Frederick's life, his marvelous energy was conspicuous.

The works were pushed with the utmost vigor. On the 8th the siege cannon arrived; late in the night of Wednesday, the 9th, they were in position. Immediately they opened their rapid, well-aimed, deadly fire of solid shot and shell from three quarters—the north, the west, and the east. Frederick, watching the bombardment from an eminence, was much exposed to the return fire of the Austrians. He called upon others to take care of themselves, but seemed regardless of his own personal safety. His cousin, prince William, and a page, were both struck down at his side by a cannon-ball.

On the 16th the battered, smouldering, blood-stained city was surrendered, with its garrison of sixteen thousand men. The prisoners of war were marched off to Frederick's strong places in the north. Prague was compelled to take the oath of allegiance to the emperor, and to pay a ransom of a million of dollars. Abundant stores of provision and ammunition were

THE PANDOURS.

found in the city. It was a brilliant opening of the campaign.

The impetuous Frederick made no delay at Prague. The day after the capture, leaving five thousand men, under general Einsiedel, to garrison the city, he put his troops in motion, ascending the right bank of the Moldau. It would seem that he was about to march boldly upon Vienna. Wagons of meal, drawn by oxen, followed the army. The heavy artillery was left behind. The troops were forced along as rapidly as possible. They advanced in two columns. One was led by Frederick, and the other by young Leopold. The country through which they passed was dreary, desolate, barren in the extreme—a wild waste of precipitous rocks and bogs and tangled forest. The roads were wretched. No forage could be obtained. The starved oxen were continually dropping, exhausted, by the way; the path of the army was marked by their carcasses.

It was but sixty miles from Prague to Tabor. The march of Frederick's division led through Kunraditz, across the Sazawa River, through Bistriz and Miltchin. It was not until the

ninth day of their toilsome march that the steeples of Tabor were descried, in the distant horizon, on its high, scarped rock. Here both columns united. Half of the draught cattle had perished by the way, and half of the wagons had been abandoned.

The prospects of Frederick were now gloomy. The bright morning of the campaign had darkened into a stormy day. The barren region around afforded no supplies. The inhabitants were all Catholics; they hated the heretics. Inspired by their priests, they fled from their dwellings, taking with them or destroying every thing which could aid the Prussian army. But most annoying of all, the bold, sagacious chieftain, general Bathyani, with hordes of Pandours which could not be counted—horsemen who seemed to have the vitality and endurance of centaurs—was making deadly assaults upon every exposed point.

"Such a swarm of hornets as darkens the very daylight!" writes Carlyle. "Vain to scourge them down, to burn them off by blaze of gunpowder; they fly fast, but are straightway back again. They lurk in these bushy wildernesses,

scraggy woods; no foraging possible, unless whole regiments are sent out to do it; you can not get a letter safely carried, for them."

Thus Frederick found himself in a barren, hostile country, with a starving army, incessantly assailed by a determined foe, groping his way in absolute darkness, and with the greatest difficulty communicating even with his own divisions, at the distance of but a few leagues. He knew not from what direction to anticipate attack, or how formidable might be his assailants. He knew not whether the French, on the other side of the Rhine, had abandoned him to his own resources, or were marching to his rescue. He knew that they were as supremely devoted to their own interests as he was to his, and that they would do nothing to aid him, unless by so doing they could efficiently benefit themselves.

As is usual under such circumstances, a quarrel arose among his officers. Young Leopold proposed one plan, marshal Schwerin another. They were both bold, determined men. Frederick found it difficult to keep the peace between them. It was now October. Winter, with its piercing gales and ice and snow, was fast approaching. It was necessary to seek winter-quarters. Frederick, with the main body of his army, took possession of Budweis, on the upper Moldau. A detachment was stationed at Neuhaus, about thirty miles northeast of Budweis.

It will be remembered that prince Charles was at the head of a strong Austrian army, on the western banks of the Rhine. It numbered over fifty thousand combatants. The king of France had pledged himself to press them closely, so that they could not recross the Rhine and rush into Bohemia to thwart the operations of Frederick; but, unfortunately, Louis XV. was seized with a malignant fever, which brought him near to the grave. Taking advantage of this, prince Charles, on the night of the 23d of August, crossed the Rhine with his whole army. It was bright moonlight, so that every movement was as visible as if it had been made by day. But the French officers, glad thus to be rid of the Austrian army, preferring much that Frederick should encounter it in Bohemia than that they should struggle against it on the Rhine, went quietly to their beds, even forbidding the more zealous subalterns from harassing prince Charles in his passage of the river. It was then the great object of the French to take Freyburg. The withdrawal of prince Charles, with his fifty thousand men, was a great relief to them.

While Frederick was involved in all these difficulties, he was cheered by the hope that the French would soon come to his rescue. Unutterable was his chagrin when he learned, early in October, that the French had done exactly as he would have done in their circumstances. Appalling indeed were the tidings soon brought to him, that prince Charles, with his army, had marched unmolested into Bohemia; that he had

already effected a junction with general Bathyani and his countless swarm of Pandours; and, moreover, that a Saxon army, twenty thousand strong, in alliance with the queen of Hungary, was on the way to join his already overwhelming foes. It was reported, at the same time, that prince Charles was advancing upon Budweis, and that his advance-guard had been seen, but a few miles off, on the western side of the Moldau.

The exigency demanded the most decisive action. Frederick promptly gathered his army and dashed across the Moldau, resolved, with the energies of despair, to smite down the troops of prince Charles. But no foe could be found. For four days he sought for them in vain. He then learned that the Austrian army had crossed the Moldau several miles north of him, thus cutting off his communications with Prague.

Though prince Charles was nominally commander-in-chief of the Austrian forces, marshal Traun, as we have mentioned, was its military head. He was, at that time, far Frederick's superior in the art of war. Frederick had sufficient intelligence and candor to recognize that superiority. When he heard of this adroit movement of his foes, he exclaimed, "Old Traun understands his trade."

Prince Charles was now forming magazines at Beneschau, just south of the Sazawa River, about seventy miles north of Frederick's encampment at Budweis. Frederick hastily recrossed the Moldau, and, marching through Bechin, concentrated nearly all his forces at Tabor. He hoped by forced marches to take the Austrians by surprise, and capture their magazines at Beneschau. Thousands, rumor said fourteen thousand, of the wild Pandours, riding furiously, hovered around his line of march. They were in his front, on his rear, and upon his flanks. Ever refusing battle, they attacked every exposed point with the utmost ferocity. The Prussian king thus found himself cut off from Prague, with exhausted magazines, and forage impossible. He had three hundred sick in his hospitals. He could not think of abandoning them. And yet he had no means for their transportation.

The salvation of the army seemed to depend upon capturing the Austrian magazines at Beneschau. Marshal Schwerin was sent forward with all speed, at the head of a strong detachment, and was so lucky as to take Beneschau. Here he intrenched himself. Frederick, upon hearing the glad tidings, immediately started from Tabor to join him. His sick were at Fraunberg, Budweis, and Neuhaus, some dozen miles south of Tabor. Garrisons, amounting to three thousand men, had been left to protect them from the Pandours. As Frederick was about to abandon that whole region it was manifest that these garrisons could not maintain themselves. He dispatched eight messengers in succession, to summon the troops immediately to join him. The sick were to be left to their fate. It was one of the cruel necessities of

war. But not one of these messengers escaped capture by the Pandours. Frederick commenced his march without these garrisons. The three thousand fighting men, with the three hundred sick, all fell into the hands of the Pandours.

Frederick concentrated his army at Konopischt, very near Beneschau. He could bring into the field sixty thousand men. Prince Charles was at the head of seventy thousand. In vain the Prussian king strove to bring his foes to a pitched battle. Adroitly prince Charles avoided any decisive engagement. Frederick was fifty miles from Prague. The roads were quagmires. November gales swept his camp. A foe, superior in numbers, equal in bravery, surrounded him on all sides. The hostile army was led by a general whose greater military ability Frederick acknowledged.

A council of war was held. It was decided to commence an immediate and rapid retreat to Silesia. Prague, with its garrison of five thousand men, and its siege artillery, was to be abandoned to its fate. Word was sent to general Einsiedel to spike his guns, blow up his bastions, throw his ammunition into the river, and to escape, if possible, down the valley of the Moldau, to Leitmeritz.

Frederick divided his retreating army into two columns. One, led by the young Leopold, was to retire through Glatz. The other, led by Frederick, traversed a road a few leagues to the west, passing through Königgratz. It was an awful retreat for both these divisions—through snow and sleet and mud, hungry, weary, freezing, with swarms of Pandours hanging upon their rear. Thousands perished by the way. The horrors of such a retreat no pen can describe. Their very guides deserted them, and became spies, to report their movements to the foe.

On one occasion the king himself narrowly escaped being taken prisoner. One of his officers, general Trenck, gives the following graphic narrative of the incident :

“One day the king entered the town of Collin, with his horse and foot guard and the whole of the baggage. We had but four small field-pieces with us. The squadron to which I belonged was placed in the suburb. In the evening our advanced posts were driven back into the town; and the huzzas of the enemy followed them pell-mell. All the country around was covered with the light troops of the Austrians. My commandant sent me to the king to take his orders.

“After a long search, I at length found him in a tower of a church, with a telescope in his hand. Never had I seen him in so much perplexity and anxiety as at this moment. The order he gave me was: ‘You must get out of this scrape as well as you can.’ I had hardly got back to my post when his adjutant followed me with a new order to cross the town, and to remain on horseback with my squadron in the opposite suburb.

“We had just arrived there when it began to rain heavily, and the night became exceedingly dark. About nine o’clock one of the Austrian generals approached us with his light troops, and set fire to the houses close to which we were posted. By the blaze of the conflagration he soon discovered us, and began firing at us from the windows. The town was so full that it was impossible for us to find a place in it. Besides, the gate was barricaded, and from the top they were firing at us with our small field-pieces, which they had captured.

“In the mean time the Austrians had turned in upon us a rivalet; and by midnight we found our horses in the water up to their bellies. We were really incapable of defending ourselves.”

Just at that time, when all hope seemed lost, it so happened that a cannon-ball crushed the foot of the Austrian commander. This disaster, together with the darkness and the torrents of rain, caused the fire of the enemy to cease. The next morning some Prussian reinforcements came to the rescue of the king, and he escaped.

It was on the night of the 25th of November, cold and dreary, that general Einsiedel commenced his retreat from Prague. He pushed his wagon trains out before him, and followed with his horse and foot. The Austrians were on the alert. Their light horsemen came clattering into the city ere the rear-guard had left. The Catholic populace of the city, being in sympathy with the Austrians, immediately joined the Pandours in a fierce attack upon the Prussians. The retreating columns were torn by a terrific fire from the windows of the houses, from bridges, from boats, from every point whence a bullet could reach them. But the well-drilled Prussians met the shock with the stern composure of machines, leaving their path strewn with the dying and the dead.

The heroic general Einsiedel struggled along through the snow, and over the pathless hills, pursued and pelted every hour by the indomitable foe. He was often compelled to abandon baggage wagons and ambulances containing the sick, while the wounded and the exhausted sank freezing by the way. At one time he was so crowded by the enemy that he was compelled to continue his march through the long hours of a wintry night, by the light of pitch-pine torches. After this awful retreat of twenty days, an emaciated, ragged, frost-bitten band crossed the frontier into Silesia, near Friedland. They were soon united with the other columns of the discomfited and almost ruined army.

It will generally be admitted by military men that Frederick did not display much ability of generalship in this campaign. He was fearless, indomitable in energy, and tireless in the endurance of fatigue. But in generalship he was entirely eclipsed by his formidable rival. Indeed, Frederick could not be blind to this, and he had sufficient candor to confess it. Subsequently, giving an account of these transactions in his “Works,” he writes :

"No general has committed more faults than did the king in this campaign. The conduct of marshal Traun is a model of perfection, which every soldier who loves his business ought to study, and try to imitate if he have the talent. The king has himself admitted that he himself regarded this campaign as his school in the art of war, and marshal Traun as his teacher."

He then adds the philosophical reflection: "Bad is often better for princes than good. Instead of intoxicating them with presumption, it renders them circumspect and modest."¹

Frederick, leaving his army safe for a short time, quartered, as he supposed, for the winter, in his strong fortresses of Silesia, returned hastily to Berlin. It was necessary for him to make immediate preparation for another campaign. "From December 13, 1744," writes Carlyle, "when he hastened home to Berlin, under such aspects, to June 4, 1745, when aspects suddenly changed, are probably the worst six months Frederick had yet had in the world."²

His wintry ride, a defeated monarch leaving a shattered army behind him, must have been dark and dreary. He had already exhausted nearly all the resources which his father, Frederick William, had accumulated. His army was demoralized, weakened, and his *materiel* of war greatly impaired. His subjects were already heavily taxed. Though practicing the most rigid economy, with his eye upon every expenditure, his disastrous Bohemian campaign had cost him three hundred and fifty thousand dollars a month. The least sum with which he could commence a new campaign for the protection of Silesia was four million five hundred thousand dollars. He had already melted up the sumptuous plate, and the massive silver balustrades and balconies where his father had deposited so much solid treasure.

"It was in these hours of apparently insurmountable difficulty that the marvelous administrative genius of Frederick was displayed. No modern reader can imagine the difficulties of Frederick at this time as they already lay disclosed, and kept gradually disclosing themselves, for months coming; nor will ever know what perspicacity, what patience of scanning, sharpness of discernment, dexterity of management, were required at Frederick's hands; and under what imminency of peril too—victorious deliverance or ruin and annihilation, wavering fearfully in the balance, for him more than once, or rather all along."³

To add to the embarrassments of Frederick, the king of Poland, entirely under the control of his minister Brühl, who hated Frederick, entered into an alliance with Maria Theresa, and engaged to furnish her with thirty thousand troops, who were to be supported by the

sea powers England and Holland, who were also in close alliance with Austria.

Maria Theresa, greatly elated by her success in driving the Prussians out of Bohemia, resolved immediately, notwithstanding the severity of the season, to push her armies through the "Giant Mountains" for the reconquering of Silesia. She ordered her generals to press on with the utmost energy and overrun the whole country. At the same time she issued a manifesto, declaring that the treaty of Breslau was a treaty no longer—that the Silesians were absolved from all oaths of allegiance to the king of Prussia, and that they were to hold themselves in readiness to take the oath anew to the queen of Hungary.

On the 18th of December a strong Austrian army entered Silesia and took possession of the country of Glatz. The Prussian troops were withdrawn in good order to their strong fortresses on the Oder. The old prince Leopold, the cast iron man, called the old Dessauer, the most inflexible of mortals, was left in command of the Prussian troops. He was, however, quite seriously alienated from Frederick. A veteran soldier, having spent his lifetime on fields of blood, and having served the monarchs of Prussia when Frederick was but a child, and who had been the military instructor of the young prince, he deemed himself entitled to consideration which an inexperienced officer might not command. In one of the marches to which we have referred, Leopold ventured to take a route different from that which Frederick had prescribed to him. In the following terms the Prussian king reprimanded him for his disobedience.

"I am greatly surprised that your excellency does not more accurately follow my orders. If you were more skillful than Cæsar, and did not with strict fidelity obey my directions, all else were of no help to me. I hope this notice, once for all, will be enough, and that in future you will give no cause for complaint."

Prince Leopold was keenly wounded by this reproof. Though he uttered not a word in self-defense, he was ever after, in the presence of his majesty, very silent, distant, and reserved. Though scrupulously faithful in every duty, he compelled the king to feel that an impassable wall of separation had risen up between them. He was seeking for an honorable pretext to withdraw from his majesty's service.

Frederick had hardly reached Berlin ere he was astonished to learn, from dispatches from the old Dessauer, that the Austrians, not content with driving him out of Bohemia, had actually invaded Silesia. Amazed, or affecting amazement, at such audacity, he sent reiterated and impatient orders to his veteran general to fall immediately upon the insolent foe and crush him.

"Hurl them out," he wrote. "Gather twenty, thirty thousand men, if need be. Let there

¹ "In his retreat Frederick is reported to have lost above thirty thousand men, together with most of his heavy baggage and artillery, and many wagons laden with provisions and plunder."—TOWEE'S *Life and Reign of Frederick*, vol. i. p. 209.

² CARLYLE, vol. iv. p. 50.

³ *Id.*, iv. 76.

be no delay. I will as soon be pitched out of Brandenburg as out of Silesia."

But it was much easier for Frederick to issue these orders than for Leopold to execute them. As Leopold could not, in a day, gather sufficient force to warrant an attack upon the Austrians, the king was greatly irritated, and allowed himself to write to Leopold in a strain of which he must afterward have been much ashamed. On the 19th he addressed a note to the veteran officer couched in the following terms:

"On the 21st I leave Berlin, and mean to be at Neisse on the 24th at least. Your excellency will, in the mean time, make out the order of battle for the regiments which have come in. For I will, on the 25th, without delay, cross the Neisse, and attack those people, cost what it may, and chase them out of Silesia, and follow them as far as possible. You will, therefore, take measure and provide every thing, that the project may be executed the moment I arrive."

In this fiery humor the king leaped upon his horse and galloped to Schweidnitz. Here he met the old Dessauer. He must have been not a little mortified to learn that his veteran general was right, and he utterly in the wrong. Prince Charles had returned home. Marshal Traun was in command of the Austrians. He had a compact army of 20,000 men, flushed with victory and surrounded by countless thousands of Pandours, who veiled every movement from view. He had established himself in an impregnable position on the south side of the Neisse, where he could not be assailed, with any prospect of success, by the force which Leopold could then summon to his aid.

Frederick was silenced, humiliated. He returned to Berlin, having accomplished nothing, and having lost four days in his fruitless adventure. Leopold was left to accumulate his resources as rapidly as he could, and to attack the Austrians at his discretion.

Prince Charles had married the only sister of Maria Theresa. She was young, beautiful, and amiable. While the prince was conducting his arduous campaign on the Moldau, his wife, grief-stricken, consigned her new-born babe to the tomb. The little stranger, born in the absence of his father, had but opened his eyes upon this sad world when he closed them forever. The princess sank rapidly into a decline.

Charles, feeling keenly the bereavement, and alarmed for the health of his wife, whom he loved most tenderly, hastened to his home in Brussels. The prince and princess were vice-regents, or "joint governors" of the Netherlands. The decline of the princess was very rapid. On the 16th of December the young prince, with flooded eyes, a broken-hearted man, followed the remains of his beloved companion to their burial. Charles never recovered from the blow. He had been the happiest of husbands. He sank into a state of deep despondency, and could never be induced to wed

again. Though in April he resumed, for a time, the command of the army, his energies were wilted, his spirit saddened, and he soon passed into oblivion. This is but one among the countless millions of the unwritten tragedies of human life.

On the 9th of January Leopold, having gathered a well-furnished army of 25,000 men, crossed the Neisse to attack marshal Traun. The marshal did not deem it prudent to hazard a battle. Large bodies of troops were soon to be sent to reinforce him. He therefore retired by night toward the south, breaking the bridges behind him. Though Silesia was thus delivered from the main body of the Austrian army, the fleet-footed Pandours remained, scouring the country on their shaggy horses, plundering and destroying. The energetic, tireless old Dessauer could seldom get a shot at them. But they harassed his army, keeping the troops constantly on the march amidst the storms and the freezing cold.

"The old serene highness himself, face the color of gunpowder, and bluer in the winter frost, went rushing far and wide in an open vehicle which he called his 'cart,' pushing out his detachments; supervising every thing; wheeling hither and thither as needful; sweeping out the Pandour world, and keeping it out; not much fighting needed, but 'a great deal of marching,' murmurs Frederick, 'which in winter is as bad, and wears down the force of battalions.'"¹

We seldom hear from Frederick any recognition of God. But on this occasion, perhaps out of regard to the feelings of his subjects, he ordered the *Te Deum* to be sung in the churches of Berlin, "For the deliverance of Silesia from invasion."

On the 20th of January, 1745, Charles Albert, the unhappy and ever-unfortunate emperor of Germany, died at Munich in the forty-eighth year of his age. Tortured by a complication of the most painful disorders, he had seldom, for weary years, enjoyed an hour of freedom from acute pain. An incessant series of disasters crushed all his hopes. He was inextricably involved in debt. Triumphant foes drove him from his realms. He wandered a fugitive in foreign courts, exposed to humiliation and the most cutting indignities. Thus the victim of bodily and mental anguish, it is said that one day some new tidings of disaster prostrated him upon the bed of death. He was patient and mild, but the saddest of mortals. Gladly he sought refuge in the tomb from the storms of his drear and joyless life. An eye-witness writes, "Charles Albert's pious and affectionate demeanor drew tears from all eyes. The manner in which he took leave of his empress would have melted a heart of stone."

"The death of the emperor," says Frederick, "was the only event wanting to complete the confusion and embroilment which already ex-

¹ CARLYLE, VOL. IV. P. 54.

PRINCE LEOPOLD INSPECTING THE ARMY IN HIS "OART."

isted in the political relations of the European powers."

Maximilian Joseph, son of the emperor, was at the time of his father's death but seventeen years of age. He was titular elector of Bavaria. But Austrian armies had overrun the electorate, and he was a fugitive from his dominions. At the entreaty of his mother he entered into a treaty of alliance with the queen of Hungary. She agreed to restore to him his realms, and to recognize his mother as empress dowager. He, on the other hand, agreed to support the Pragmatic Sanction, and to give his vote for the grand duke Francis as emperor of Germany.

Thus Bavaria turned against Frederick. It was manifest to all that Maria Theresa, aided by the alliances into which she had entered, and sustained by the gold which the English cabinet so generously lavished upon her, would be able to place the imperial crown upon her husband's brow. It was equally evident that the sceptre of power, of which that crown was the emblem, would be entirely in her own hands.

Frederick had now France only for an ally. But France was seeking her own private interests on the Rhine, as Frederick was aiming at the aggrandizement of Prussia on his Austrian frontiers. Neither party was disposed to make any sacrifice for the benefit of the other. Frederick, thus thrown mainly upon his own resources, with an impoverished treasury, and a weakened and baffled army, made indirect application to both England and Austria for peace. But both of these courts, flushed with success, were in-

disposed to listen to any terms which Frederick would propose.

There was nothing left for his Prussian majesty but to abandon Silesia, and retire within his own original borders, defeated and humiliated, the object of the contempt and ridicule of Europe; or to press forward in the conflict, summoning to his aid all the energies of despair.

Old prince Leopold of Dessau, whom he had left in command of the army in Silesia, was one of the most extraordinary men of any age. He invented the iron ramrod, and also all modern military tactics. "The soldiery of every civilized country still receives from this man, on the parade-fields and battle-fields, its word of command. Out of his rough head proceeded the essential of all that the innumerable drill-sergeants in various languages repeat and enforce."¹

Dessau was a little independent principality embracing a few square miles, about eighty miles southwest of Prussia. The prince had a Lilliputian army, and a revenue of about fifty thousand dollars. Leopold's mother was the sister of the great elector of Brandenburg's first wife. The little principality was thus, by matrimonial alliance as well as location, in affinity with Prussia.

Leopold, in early youth, fell deeply in love with a beautiful young lady, Mademoiselle Fos. She was the daughter of an apothecary. His

¹ CARLYLE, vol. i. p. 302.

aristocratic friends were shocked at the idea of so unequal a marriage. The sturdy will of Leopold was unyielding. They sent him away under a French tutor, to take the grand tour of Europe. After an absence of fourteen months he returned. The first thing he did was to call upon Mademoiselle Fos. After that, he called upon his widowed mother. It was in vain to resist the will of such a man. In 1698 he married her, and soon, by his splendid military services, so ennobled his bride that all were ready to do her homage. For half a century she was his loved and honored spouse, attending him in all his campaigns.

With a tender heart, Leopold was one of the most stern and rugged of men. Spending his whole life amidst the storms of battle, he seemed ever insensible to fatigue, and regardless of all physical comforts. And yet there was a vein of truly feminine gentleness and tenderness in his heart, which made him one of the most loving of husbands and fathers.

His young daughter Louisa, bride of Victor Leopold, reigning prince of Anhalt-Bernburg, lay dying of a decline. A few days before her death she said, "I wish I could see my father at the head of his regiment, once again, before I die." The remark was reported to Leopold. He was then with his regiment at Halle, thirty miles distant. Immediately the troops were called out, and marched at rapid pace to Bernburg. With banners flying, music playing, and all customary display of military pomp, they entered the court-yard of the palace. The dying daughter, pale and emaciate, sat at the window. The war-worn father rose in his stirrups to salute his child, and then put his regiment through all its most interesting manœuvres. The soldiers were then marched to the orphan-house, where the common men were treated with bread and beer; all the officers dining at the prince's table. "All the officers except Leopold alone, who stole away out of the crowd, sat himself upon the Saale bridge, and wept into the river."

Leopold was now seventy years of age. On the 5th of February his much-loved wife died at Dessau. Leopold, infirm in health, and broken with grief, entreated the king to allow him to go home. He could not, of course, be immediately spared.

On the 15th of March Frederick left Berlin for Silesia. Stopping to examine some of his works at Glogau and Breslau, he reached Neisse on the 23d. On the 29th he dismissed the old Dessauer, with many expressions of kindness and sympathy, to go home to recover his health.

"Old Leopold is hardly at home at Dessau," writes Carlyle "when the new Pandour tempests, tides of ravaging war, again come beating against the Giant Mountains, pouring through all passes, huge influx of wild riding hordes, each with some support of Austrian grenadiers, cannoniers, threatening to submerge Silesia. Precursors, Frederick need not

doubt, of a strenuous, regular attempt that way. Hungarian majesty's fixed intention, hope, and determination is, to expel him straightway from Silesia."¹

The latter part of April prince Charles had gathered a large force of Austrian regulars at Olmütz, with the manifest intention of again invading Silesia. The king of Poland had entered into cordial alliance with Austria, and was sending a large army of Saxon troops to co-operate in the enterprise. Frederick's indignation was great, and his peril still greater. Encamped in the valley of the Neisse, assailed on every side, and menaced with still more formidable foes, he dispatched orders to the old Dessauer immediately to establish an army of observation (thirty thousand strong) upon the frontiers of Saxony. He was to be prepared instantly, upon the Saxon troops leaving Saxony, to ravage the country with the most merciless plunderings of war.

The queen of Hungary had purchased the co-operation of the Polish king by offering to surrender to him a generous portion of Silesia, after the province should have been reconquered. Indeed, there was great cause of apprehension that the allied army would make a rush upon Berlin itself. The aspect of his Prussian majesty's affairs was now gloomy in the extreme.

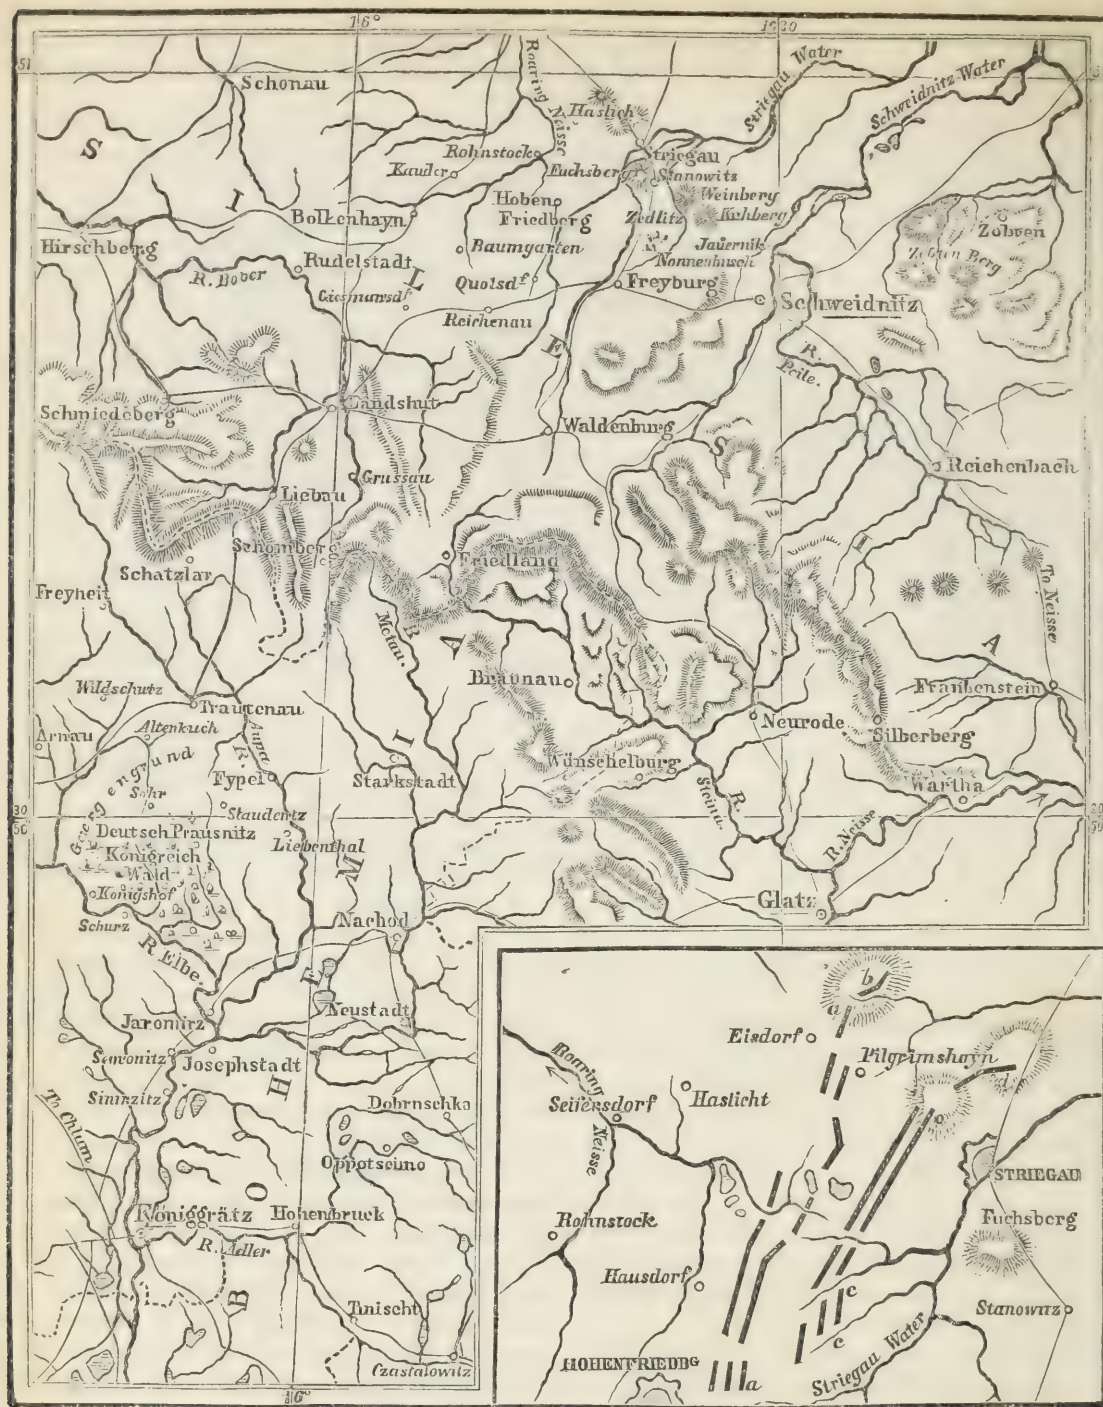

Frederick wrote to his minister Podewils in Berlin, under date of Neisse, March 29, 1745, as follows: "We find ourselves in a great crisis. If we don't by mediation of England get peace, our enemies from different sides will come plunging in against me. Peace I can not force them to. But if we must have war, we will either beat them, or none of us will ever see Berlin again."

On the 17th of April again he wrote, still from Neisse: "I toil day and night to improve our situation. The soldiers will do their duty. There is none among us who will not rather have his back-bone broken than give up one foot-breadth of ground. They must either grant us a good peace, or we will surpass ourselves by miracles of daring, and force the enemy to accept it from us."

On the 20th of April he wrote: "Our situation is disagreeable; but my determination is taken. If we needs must fight, we will do it like men driven desperate. Never was there a greater peril than that I am now in. Time, at its own pleasure, will untie this knot, or destiny, if there is one, determine the event. The game I play is so high, one can not contemplate the issue with cold blood. Pray for the return of my good luck."

The alarm in Berlin was very great. The citizens were awake to the consciousness that there was danger; that the city itself would be assaulted. Great was the consternation in the capital when minute directions came from Frederick respecting the course to be pursued in the

BATTLE OF HOHENFRIEDBERG, JUNE 4, 1745.

a. a. Austrian Army. b. Prince Weissenfels. c. c. Prussian Army. d. Dumoulin. e. Gessler's Dragoons.

event of such a calamity, and the places of refuge to which the royal family should retreat.

On the 26th of April Frederick again wrote to M. Podewils: "I can understand how you are getting uneasy at Berlin. I have the most to lose of you all; but I am quiet and prepared for events. If the Saxons take part in the invasion of Silesia, and we beat them, I am determined to plunge into Saxony. For great maladies there need great remedies. Either I will maintain my all or else lose my all. To me remains only to possess myself in patience. If all alliances, resources, and negotiations fail, and all conjunctures go against me, I prefer to perish with honor rather than lead an in-

glorious life, deprived of all dignity. My ambition whispers me that I have done more than another to the building up of my house, and have played a distinguished part among the crowned heads of Europe. To maintain myself there has become, as it were, a personal duty, which I will fulfill at the expense of my happiness and my life. I have no choice left. I will maintain my power, or it may go to ruin, and the Prussian name be buried under it. If the enemy attempt any thing upon us, we will either beat them or will all be hewed to pieces for the sake of our country and the renown of Brandenburg. No other counsel can I listen to. Perform faithfully the given work on your

side, as I on mine. For the rest, let what you call Providence decide as it likes. I prepare myself for every event. Fortune may be kind or be unkind, it shall neither dishearten me nor uplift me. If I am to perish, let it be with honor, and sword in hand."

Frederick was, with great energy, gathering all his resources for a decisive conflict in his fortresses along the banks of the Neisse. By almost superhuman exertions he had collected an army there of about seventy thousand men. The united army of Austria and Saxony marching upon him amounted to one hundred thousand regulars, together with uncounted swarms of Pandours sweeping around him in all directions, interrupting his communications and cutting off his supplies.

The mountain range upon the south, which separated Silesia from the realms of the queen of Hungary, was three or four hundred miles long, with some twenty defiles, practicable for the passage of troops. The French minister Valori urged Frederick to guard these passes. This was impossible; and the self-confidence of the Prussian king is revealed in his reply: "My friend, if you wish to catch the mouse, you must not shut the trap, but leave it open."

The latter part of May, Frederick, in his headquarters at Frankenstein, learned that an Austrian army under prince Charles, and a Saxon army under the duke of Weisenfels, in columns, by strict count seventy-five thousand strong, had defiled through the passes of the Giant Mountains, and entered Silesia near Landshut. Day after day he ascended an eminence, and, with his glass, anxiously scanned the horizon, to detect signs of the approach of the foe. On Thursday morning, June 3, an immense cloud of dust in the distance indicated that the decisive hour was at hand.

As this magnificent army entered upon the smooth and beautiful fields of Southern Silesia they shook out their banners, and with peals of music gave expression to their confidence of victory. The Austrian officers pitched their tents on a hill near Hohenfriedberg, where they feasted and drank their wine while, during the long and beautiful June afternoon, they watched the onward sweep of their glittering host. "The Austrian and Saxon army," writes an eye-witness, "streamed out all the afternoon, each regiment or division taking the place appointed it; all the afternoon, till late in the night, submerging the country as in a deluge."

Far away in the east, the Austrian officers discerned a Prussian column of observation, consisting of about twelve thousand horse and foot, wending along from hollow to height, their polished weapons flashing back the rays of the afternoon sun. Frederick, carefully examining the ground, immediately made arrangements to bring forward his troops under curtain of the night for a decisive battle. His orderlies were silently dispatched in all directions. At eight o'clock the whole army was in motion. His troops were so concentrated that the farthest

divisions had a march of only nine miles. Silently, not a word being spoken, not a pipe being lighted, and all the baggage being left behind, they crossed the bridge of the Striegau River, and, deploying to the right and the left, took position in front of the slumbering allied troops.

With the first dawn of the morning the two armies, in close contact, rushed furiously upon each other. There were seventy thousand on the one side, seventy-five thousand on the other. They faced each other in lines over an undulating plain nearly ten miles in extent. It is in vain to attempt to give the reader an adequate idea of the terrible battle which ensued. With musketry, artillery, gleaming sabres, and rushing horsemen, the infuriate hosts dashed upon each other. For fifteen hours the blood-red surges of battle swept to and fro over the plain. At length prince Charles, having lost nine thousand in dead and wounded, seven thousand prisoners, sixteen thousand in all, sixty-six cannon, seventy-three flags and standards, beat a retreat. Rapidly his bleeding and exhausted troops marched back through Hohenfriedberg, entered the mountain defiles, and sought refuge, a thoroughly beaten army, among the fortresses of Bohemia. Frederick remained the undisputed victor of the field. Five thousand of his brave soldiers lay dead or wounded upon the plain. Even his stoical heart was moved by the greatness of the victory. As he first caught sight of M. Valori after the battle he threw his arms around him, exclaiming, "My friend, God has helped me wonderfully this day."

"There was, after all," says Valori, "at times a kind of devout feeling in this prince, who possessed such a combination of qualities, good and bad, that I know not which preponderates."

The Prussian army was so exhausted by its midnight march and its long day of battle that his majesty did not deem it wise to attempt to pursue the retreating foe. For this he has been severely, we think unjustly, censured by some military men. He immediately, that evening, wrote to his mother, saying, "So decisive a defeat has not been since Blenheim," and assuring her that the two princes, her sons, who had accompanied him to the battle, were safe. Such was the battle of Hohenfriedberg, once of world-wide renown, now almost forgotten.

UP AND DOWN.

IT was high noon of a warm, balmy spring day, and Boston Common was full of fresh young life and verdure. The beautiful trees which adorn this fair spot of earth had just been crowned with their new leafy honors, and were beginning to cast a thin, misty, dream-like shadow over the tender green of the young grass, which rolled its soft, velvety mantle over bank and level; the newly expanded leaves and buds gave out a sweet, spicy odor, and the soft air was fragrant with that fresh, moist, earthy

smell which is so welcome in the days of early spring, and so suggestive of the coming glories of the vegetable kingdom that it seems ever to remind one of the first days of earth's creation, when Adam and Eve, sinless and happy, walked lovingly and admiringly, hand in hand, through a pure world, all light and joy and beauty, unconscious that there could ever come a time of sin, decay, winter, woe, and death!

The brimming little pond (which, tiny as it is, has a hold upon the affections of the Bostonians powerful as the clasp of infant weakness upon a giant's strength) was flashing and sparkling in its blue, diamond brightness; for the sunny sky which smiled down upon it was cloudless and blue. A cluster of "Boston boys," frank and manly, were now hovering around its dimpling surface, with laugh and shout, launching their trim, white-sailed boats; and then, while the fairy skiffs held their somewhat uncertain course over the water, just rippled by the soft breeze, the miniature ship-owners would run round to the other side, to be in readiness to receive them, long before they neared their doubtful port. Ah! well would it be for older merchants if they could do so too! For then the enterprise and sagacity which plan the voyage would not so often be frustrated by the stupidity, obstinacy, or dishonesty of some agent "on the other side of the water."

Upon the upper, or Beacon-street mall—which seemed, for the time, almost given up to their exclusive use—were multitudes of younger children, sent out for health and recreation in the sweet open air. Richly dressed little ones, arrived at the dignity of locomotion, were trundling hoops, or running races, or sporting like summer butterflies on the edge of the new grass; while their rosy-cheeked Irish nurses, in shining hair, huge barrel hoops, and sun-shades, followed them, or, seated on the benches, gossiping with others of their class and country, affected to be still zealously watching their little charges.

Solemn-looking babies, half crushed under the weighty magnificence of white satin hats and drooping feathers, drawn forth in fair array of pomp and circumstance, sat in state, holding on with both dimpled hands to the sides of their baby-carriages, or lolled idly among their downy cushions and gorgeous Afghans, in drowsy abstraction or listless indifference; while a class still younger—an "infantry up in arms"—enveloped in their elongated and embroidered robes, with dainty caps, and delicate laces, and satin rosettes, were carried backward through the world, glaring and staring over the broad shoulders of their nurses with round, shining, unspeculating eyes, in which the light of thought, feeling, and observation had never yet been kindled.

Along Beacon Street, down Park Street, through Tremont Street, passed a continuous throng of richly dressed and beautiful women; for it had been a week of storm and chill, and the "east wind," that scourge and terror of

Bostonians, had ruled with no very "brief authority;" and numbers, who had been pining in restless inactivity within doors, now availed themselves of the balmy spring day for a health-restoring walk or drive.

Invalids were sunning themselves on the broad gravel-walks, slowly pacing to and fro, with feeble steps and languid air; loungers and pleasure-seekers were idling on the way, curiously scanning, criticising, or admiring the female passers; and business men were hurrying by, exchanging rapid or silent greetings.

Belonging to this latter class were two young men who, standing where they met, stopped to exchange a few salutations, and then, imperceptibly, fell into more earnest conversation.

You may see with a glance that one is a Bostonian, the other is from New York; for while the difference would be difficult to explain, yet French and English are not more distinctly different.

They are gentlemen, both, and both have that air of refinement and polish which only society can give, and which would indicate a life of leisure beyond the need of business drudgery. Yet, listen to their conversation—the oft-repeated words, "stock, shares, dividends, investment, coupons, dollars," betray the merchant and the money-maker. Ah! will the blessed time ever come when the American merchant will have reached the ultimate goal of his ambition, and sit calmly down to enjoy the wealth which he has toiled to make? Or is the love of money of necessity so insatiable that it must ever outrun its successes, and grow with the very accomplishment of its own desires?

But as the gentlemen stand, still deep in conversation, a handsome carriage is driven down Park Street, and, as it turns into Tremont Street, the more stylish-looking man of the two smiles and bows familiarly.

Ah! a quick eye has caught the movement. The coach is checked, and a sweet, childish voice calls out:

"Papa! papa! May I—may I come to you?"

The gentleman smiled, and nodded in assent; and the servant, dismounting, opened the carriage door, and lifted out a fairy little creature of six years old, dressed with extreme richness, but with exquisite good taste—nothing overdone, nothing wanting.

The man placed the child upon the sidewalk surrounding the Common, and returned to the carriage. And the little thing, first gracefully kissing her dimpled white hand to her mother in the departing carriage, entered the inclosure, and advanced with a bright smile and eager steps toward her father, who held out his hand to receive her.

"Your daughter, I presume, Mr. Forrester?" questioned his companion.

"Yes," said the father, proudly. "My only child, Miss Lilian Forrester. Look up, my dear Lily, and speak to this gentleman. This is

Mr. Cabot, Lily, one of my friends. Speak to him, my little daughter." And as the fond father spoke he raised the child's hat, and displayed a face of sweet childish loveliness. A fair, fresh complexion, of true Saxon clearness and brilliancy, where the pure white and red were blended together as finely as on the petals of a flower; soft, dovelike eyes, bright and blue as the spring heavens above them; and long, dropping ringlets of soft, shining, golden hair.

The gentleman thus introduced looked upon the beautiful little girl in evident admiration. "She is very like her mother," he said, while an expressive look conveyed to the father the admiration he was too prudent to clothe in words.

"I used to know your mamma, Miss Lily, when she was a little girl, not a great deal older than you are now. Will you shake hands with me for her sake?"

The little hand, small and delicate as a white rose leaf, was at once confidingly laid in his extended palm.

"Thank you," said the gentleman, kindly, as he held the little hand in his. "I think I should like to keep this in trust for my little Arthur. When you meet him, Miss Lily, will you give it to him?"

"No!" said Miss Lily, very decidedly; "I don't like boy babies at all."

"Oh! but my son Arthur is not a baby, I assure you," said Mr. Cabot, laughing. "He is quite a young gentleman. Let me see—he has arrived at the mature and venerable age of ten years. Nay, I am not sure that he is not eleven. Why, bless your heart, he skates and takes a newspaper! What more could you ask? Will not that do?"

But Miss Lily did not commit herself by any reply.

"Why did not you stay with mamma, Lily?" inquired her father. "I thought you were going out for a drive this morning."

"Yes; but mamma had visits to pay, and I was tired," said the little girl, with a wearied air. "And, besides, I wanted to walk with you. You will take me for a walk, papa, won't you?"

"Oh yes! by-and-by, Birdie; but not just yet," said Mr. Forrester, smoothing the golden curls caressingly. "You see that I am engaged just now, and you must wait a while." And lifting her up on to a bench, he passed his arm around her waist, and resumed the conversation with his friend which her arrival had interrupted.

For a few moments Miss Lily rested patiently within her father's fondly encircling arm, watching with interest the passers-by; then she began to grow restless, and manifested her impatience by various little lady-like but unmistakable signs of weariness.

"Papa!" she said at length, "may I get down, please, and walk about alone?"

"No, no, Lily! I am afraid I should lose

you, among all these people; and I can not afford to do that."

Another interval, and then she spoke again:

"Papa! if you please, may I just go to that pond, and see what the little children are doing there?"

"Why, Miss Lily!" said Mr. Cabot, "I am surprised at you! Do you not see that they are all little boys? I thought you did not like boy babies!"

Miss Lilian pouted and blushed, and then remarked that she did not want to see the boys; it was only the little boats she wanted to see.

"In a few moments, little daughter," said her father.

Presently came the notes of street music, borne on the soft air, and the child could endure the restraint no longer.

"Papa! papa!" she said, while her little sandaled feet were keeping time to the distant music. "Papa—dear papa! have not you most done talking? There is the most lovely music! Oh, do please be quick, papa!"

"Do not let me detain you from your walk any longer," said Mr. Cabot, laughing. "'Music has charms,' we know. I will call and see you. You are at the Tremont House, I believe?"

"For a day or two longer—yes," said Mr. Forrester; "but we are here only for a very limited time, and shall leave Boston on Friday. I must be in New York by the 22d. But if you call on me before I leave town, I shall be happy to see you, and we will talk over this matter again. The speculation strikes me favorably. It certainly seems feasible, and I think it might prove a good investment;" and then, bidding his friend good-morning, the New York merchant took the eager hand of his little daughter, and walked down the Mall in the direction of the music.

They soon came up with the itinerants, whose distant melody had attracted the notice of little Lilian; and, as the instrument was of a sweeter tone than common, and the air, which was then a popular one, was played with more taste and judgment than usual, little Lily, who really loved music, begged her father to allow her to stop and listen to it—a request with which he readily complied. And as they drew nearer, the little group which had gathered about the music made way for them, until they could see the performers—a dark, foreign-looking, middle-aged man, who was playing, and a sadly wearied-looking little girl, a few years older than Lily, brown and sun-burnt, who, dressed in a tawdry pink silk frock, trimmed with beads and spangles, and with a crushed wreath of roses on her disheveled hair, was dancing, not ungracefully, to the familiar tune.

When the dance was ended, the child ran around the circle of spectators, much as a little monkey might have done, and, holding out her bare and dusky little hand, collected eagerly the small coin scantily bestowed upon her.

Mr. Forrester, having tossed the little girl a

quarter of a dollar, was about to resume his walk with his child. But at this moment the musician rang a small hand-bell as the signal for another dance, and commenced playing the "Cracovienne."

"Oh, I can not, I can not!" cried the poor overheated and weary child, flinging herself down at the foot of the tree, beneath whose shade Mr. Forrester and Lily were standing. "Oh! I am so hot—and so tired—and my head aches—and my feet are so lame!" and as she spoke she held up her poor little swollen and blistered foot.

"Oh, papa! she is so tired, and so lame," said little Lilian, with impulsive kindness, "May I help her, papa—may I?" And before her father could even comprehend the question, or conjecture the purpose, Lily had thrown off her hat, sprung into the circle, and nodding to the man to go on, she began the fancy dance, which was perfectly familiar to her.

Inspired alike by the music and the glorious weather, wholly unabashed by the many strange eyes bent upon her (or, rather, so entirely absorbed in pity for the poor crouching and astonished child, whose substitute she had so suddenly become, as to be wholly unconscious of the observation she had attracted), Lilian danced on in perfect time to the music—her sweet, innocent face glowing with exercise, and radiant with the loving impulse of her warm young heart.

Her beauty and grace, together with the unusual circumstance of a child so richly and fashionably dressed dancing in the open air, at noonday, to a common street musician, had gradually attracted an audience of a higher class than had witnessed the performances of her dusky little predecessor; and when, having finished the dance, Lily quietly picked up her broad hat, with its floating ribbons, and with a sweet gravity on her young face, held it first to her father, with the words, "A little money, please, dear papa!" Mr. Forrester could not resist the wish to aid her sweet, impulsive charity, and as the golden coin he tossed her fell into the soft blue satin lining of the hat, his example was readily followed by those around him, who seemed to comprehend the whole affair at a glance. Dainty white fingers, and delicate kid-covered palms shed their glittering tribute, until the frail hat, and the tiny hands which held it, bent beneath their burden.

Springing with sparkling eyes and glowing cheeks to the still crouching child, whose wide and glittering eyes had followed her motions with a sort of sullen, jealous wonderment, Lily poured into her bespangled lap the shining treasure she had won for her, with the simple words, "Now, little girl, you can go home and rest." And then, without waiting for one word of thanks from the evidently amazed little foreigner, she replaced her hat, quietly slipped her hand into her father's, and resumed her walk as if nothing unusual had occurred.

"That was a nice little girl, papa; only so very-tired."

"Yes, my darling," said the father, who had not the heart to blame what he could not quite approve, "I dare say she was; and it was very kind in you to wish to help her, my dear Lily; but I rather doubt if mamma would quite like to have you dance in the street without your hat. What do you think?"

"Oh! indeed I did not think of that," said Lily. "I suppose she would not. I will not do it again. But the poor little girl has to do it, and she was so very tired. Did I do wrong to help her? Oh, I am sorry if you think I did what mamma would not like."

"No, no, Lily! not wrong; certainly," said the father, who instinctively shrunk from teaching lessons of worldly wisdom to his pure and warm-hearted child; "it was not wrong, Lily; only—you know—you understand—I would rather not have you do it again."

More than a dozen years had passed since that bright and beautiful spring day. It was night, and one of the largest and most splendid opera-houses in Europe was crowded with an assemblage of rank, beauty, and fashion.

It was a benefit night, and the young beneficiary was a star which had suddenly shot up into the very zenith of theatrical and musical popularity.

This renowned personage was the Signorina L——, a young Italian girl, said to be of noble birth, whose wonderful musical talents had led her to the rank of prima donna; while her inimitable grace as a tragedienne, aided by her dark but splendid beauty, won her the admiration of hundreds who were incapable of a full appreciation of her rare musical powers.

Her unsullied reputation, defying alike the adulation of rank and wealth and the vitiated atmosphere of the green-room, had inspired general respect, and had thrown around her private character a dignity and perfect respectability not often accorded to, or even claimed by, females of her then somewhat doubtful avocation. She had just appeared in one of her most celebrated rôles, in which she had carried her audience along with her, sustaining the intense interest to the very last. But it was over now, the last note was ended, and there was—silence; but a silence which seemed even yet to be palpably throbbing with the last vibrations of that glorious voice.

Silence—through all that crowded and brilliant assembly. Silence—breathless silence, even in the gorgeous dress-circle, with its iris hues and sparkling radiance, where proud and graceful heads, as by common consent, were bent toward her like a wind-tossed prairie of living flowers!

And she stood in silence before them. The young prima donna, the spell of whose beauty and genius thus held them bound and mute, stood in silence before that myriad gaze, unawed, unmoved, unshaken; still keeping unchanged her Pythoness attitude, her wild, statue-like arms upraised, her resplendent eyes all ablaze

with passion, her superb figure towering in scorn and wrath, her pale, finely cut features stony and rigid, as if she were in very deed the embodiment of the fierce passion she typified.

For one moment; and then there was a rustling of silken robes, a light stir of glittering fans and wavy feathers, and a changing light in the many-hued audience, as if a soft wind had swept over that sea of flowers; and, low at first, but gradually swelling upward, came a heart-felt burst of emotion; louder, deeper, and more and more vehement, until the crowded house seemed literally to rock with the thunders of applause.

She heard it, she felt it, for a warm glow stole into the marble cheeks; the white, rigid lips relaxed, and trembled to a smile; the fierce eyes sunk softening beneath their long-fringed lashes; the imperious attitude grew into womanly gentleness; the wild, uptossed arms drooped into meekness across her bosom; and then, gathering her velvet robes about her, she bent to the audience in one long, low, graceful obeisance, and fled from the stage—fled as if for shelter from the tempest of applause which threatened literally “to bring down the house.”

Then louder and louder rolled the whirlwind of enthusiastic voices; but the fair prima donna heeded them not. Passing at once into her private room, unmoved by the tumultuous “bravos” and “encores;” deaf alike to the compliments and the entreaties of the stage-manager that she would return to the stage, if only for one moment, to acknowledge her triumph, and satisfy the demands of an audience so *recherché*, so *distingué*—the very *élite*—she went quietly forward and met her own attendants, who were always in waiting for her—a tall, powerful, but quiet-looking man, old enough to be her father, whose swarthy complexion and gleaming black eyes denoted his Italian birth, and a middle-aged woman, whose high cheek-bones, high shoulders, high hips, and high voice, spoke the French servant, half dressing-maid, half *bonne*.

As the young prima donna approached them, Luigi took from the arm of the Frenchwoman a cloak, lined and trimmed with costly fur, and carefully wrapping it around the fair Italian's shoulders, he led the way to a private door, where her carriage was in waiting; and helping his young mistress and Gabrielle into the coach, he mounted outside, and gave the order, “Home!”

We will leave the stage-manager bowing his perfumed ambrosial curls, and warmly gesticulating to an excited audience, with his white, jeweled fingers pressed upon that particular portion of his comely person which is considered (according to the laws of theatrical usage) to denote the locale of a heart full to overflowing; and while he assures his distinguished auditory that the “prima donna is unfortunately unable to comply with their most flattering request, that she is obliged to leave—has, in fact, already left the house”—we will follow the young Italian to her lodgings; where, pre-

ceded by one of the English waiters of the hotel, and followed by her own two attendants, she mounted the lofty staircase, and walked slowly and gracefully through the long corridor toward her own suit of apartments; her eyes bent thoughtfully upon the bouquet of magnificent roses she had brought with her from the opera-house, and humming, half audibly, and quite unconsciously, the music of one of her favorite operas.

Suddenly the light step was arrested, the murmured music ceased, and the signorina stood with head thrown back and hand upraised, as if to command silence. Instantly the little *cor-tège* stood still.

“What was it?” she said, turning to her attendants; “that noise—what was it?”

“Niente, signorina!” answered the Italian Luigi, with a deprecatory shrug of his shoulders.

“Nothing, my lady,” said the English waiter.

“Ce n'est rien, n'importe, mademoiselle,” said the French Gabrielle.

“It was something: I heard it,” said the prima donna, her fine, pale features growing paler with excitement. “Listen!”

There was another pause, unbroken by a sound, while the young Italian still maintained her attitude of fixed and painful attention; and then again Luigi declared his conviction that it was “Niente.” The Englishman suggested it was but the creaking of a door-hinge; and Gabrielle intimated her opinion that it was only “une bouffée de vent,” and that it was too cold for *mam'selle* to be standing thus in the corridor—would *mam'selle* please to proceed to her own apartments?

But mademoiselle did not please; she silenced them all with one wave of that imperious hand.

“It was not a puff of wind—it was not the creaking of a door. I heard it; it was a woman's voice; a cry of distress; a long, low wail of pitiful anguish. It curdled my very blood. I must know what it was—tell me who occupies that chamber,” she said, addressing the English waiter. But the man thus questioned either was or affected to be profoundly ignorant upon the subject; and again the signorina's two attendants urged her to proceed; but she heeded them as little as the “deaf adder” heeds the voice of its victim.

“Go! call up your master; bid him come to me at once!” she said, turning to the English servant, with white lips and flashing eyes, which would be obeyed, and brooked no delay; and in a few moments the head of the establishment was bowing obsequiously before her (for the prima donna was a celebrity that brought honor to his house, and was lavish to a fault with the wealth which flowed in upon her like a spring-tide).

“Who occupies this room?—this one?” she asked him, abruptly, indicating as she spoke, with a quick sweep of her hand, the door of the chamber near which they were standing.

"It is at your service, madam," said the proprietor, bowing low.

"Who occupies it?" was the earnestly reiterated question.

"No one after to-night, madam. I will place it at your disposal to-morrow."

"I ask who occupies it now?" said the prima donna, with an earnestness which could not be mistaken, and a directness which would not be evaded.

"Only a young American girl," said the proprietor, with a gesture of contempt. "But she will leave the room immediately, and I will have the honor to arrange it for madam early to-morrow."

"I do not need the room; but this person—an American—a young girl, did you say?" asked the prima donna, earnestly. "And she is in distress?"

"I dare say; I should think so," said the master of the establishment; and he added something in an under-tone, which the fair Italian did not quite comprehend; only she noticed that the two words "American" and "cheats" were in rather close and disagreeable juxtaposition.

"Silence!" she said, in a tone of command, and with a gesture which would have done credit to a Siddons.

"I know the Americans, and you do not! The Americans are no cheats! the Americans are my friends—I love them all; I owe all I am and all I have to an American; I honor them. Tell me the history of this young girl."

With views of the American character considerably modified (at least in expression) by the timely discovery of this amiable weakness on the part of his distinguished inmate, the master of the hotel gave the required information. The father of the young girl was an American, who had been traveling with this his only child; he was said to be immensely rich; he came to him with the reputation of being a millionaire at the very least; engaged his best rooms regardless of terms; paid like a prince; lived in luxury there for a week or two; then there came letters—a great crash in New York (the time of the money panic), his house had gone down with the rest—a total wreck! nothing saved! they were ruined—they were beggars!

The sudden shock threw the father into a brain-fever; he died; the daughter had no friends, no money; she was unable to pay up his bill; she was a beggar! Madam must see his house was no home for beggars; she must go; she should leave the room the next morning; he had lost enough by them already; the law ought to protect him from such imposition!

"La povertà non vuol léggi," murmured the young Italian, bitterly; then she added in English, "I must see this young person; show me into her room."

"The room is in disorder now, madam," said the proprietor. "I have had much of the furniture removed; but to-morrow, if you please."

"Now!" said the prima donna, advancing.

"To-night!"

"My lady!" remonstrated the Englishman.

"Signorina!" expostulated the Italian Luigi.

"Mademoiselle!" pleaded the French Gabrielle.

Carelessly putting them all aside with one wave of her hand, the prima donna approached the door, while her two attendants exchanged anxious glances.

"Parbleu! aussitôt dit, aussitôt fait," whispered Gabrielle.

"Parole assai; che sarà sarà!" murmured Luigi.

The signorina knocked with a light but determined hand. No answer.

"It is a friend; will you not admit me?" she said, in those clear, golden tones which a delighted public coined into actual gold for her. Still no answer.

The prima donna turned to Luigi. "Open the door for me—I would enter."

"Signorina!" said the more cautious and worldly-wise attendant. "Signorina, in un—"

How Luigi would have terminated his sentence must remain forever a mere matter of conjecture, for, glancing as he spoke at the face of his resolute mistress, he probably read something in her set mouth and flashing eyes which reminded him that delays were dangerous, and hastily substituting the words, "In un batter d'occhio, signorina!" which was as far as possible from his original intention, he flung open the door.

The room thus suddenly displayed was, as the Englishman had asserted, one of the best in the house; it was high and spacious, but being nearly divested of furniture, its very size and loftiness added to its bare and desolate aspect.

It was wholly unlighted, save where the radiance of the full moon, streaming in at the curtainless window, traced a clear outline of the casement upon the bare, uncarpeted floor.

Within this radiant portion of the room, as if some mysterious and undefinable influence drew her near the only visible thing that looked lovingly and pityingly upon her, crouched the desolate American girl, her crossed arms resting upon a chair, her head bent down upon them, and her face wholly concealed, while her disordered hair, all unbound and gleaming in the spectral moonlight, fell rippling in loose golden waves to the floor.

Stepping hastily to the side of the kneeling girl, the signorina laid her hand lightly upon her shoulder, and said, in the softest tones of that wonderfully flexible voice, and in her low, sweet, Italianized English:

"It is a friend—listen! I would speak with you." But there was no motion, no answer. The signorina drew back in sudden terror.

"It is death!" she said, with white, quivering lips. "She has perished here alone, and of want!" and she looked shudderingly round the desolate room.

"Non! non! mademoiselle," said the more practical Gabrielle, who, as lady's-maid, had had experience in such cases.

"Cette n'est pas la mort; elle s'évanouit. Help thou me, Luigi; doucement, doucement!" And between them they raised the poor girl, and bore her tenderly out into the lighted corridor.

"Bello! bello! oh, signorina! che bello!" said Luigi, admiringly, as, the long golden ringlets streaming in a shower over his arm, the gas-light revealed the pale marble face, with its pure, statue-like features.

The prima donna stooped, looked for one moment full and fixedly into that deathlike countenance, and then, with a cry of joy almost fierce in its expression, she snatched the furred mantle from her own shoulders, and wrapped it with tender care around the unconscious form which Luigi supported.

"Bear the young lady into my apartment at once—quick!" she said.

In vain were the "parbleu!" of Gabrielle, or the "basta!" of Luigi.

"Am I to be obeyed or not?" she asked. Luigi glanced at her face, met the quick, impatient gaze of her flashing eyes, and with an obedient "Ora e sempre, signorina!" he lifted his pale burden and walked onward.

"It is my sister," said the prima donna, turning back in explanation to the wondering proprietor. The Englishman glanced from the proud, dark, haughty beauty of the young Italian, with her Juno figure, her meteor eyes, and midnight hair, to the pale, pure, finely grained complexion, willowy form, and long golden tresses of the unconscious American, and an incredulous smile half curled his lip; but his interest was concerned, and if the signorina had asserted that the pale stranger maiden and herself were twin brothers, he would not have ventured to contradict her, or openly avow his doubt; and when the Italian, added, briefly, "Let all the young lady's things be conveyed into my apartments, and call me a physician immediately, and I will be answerable for the amount of your bill," he felt that he had reaped the reward of his forbearance, the smile changed its expression, he bowed with obsequious gratitude, and in ten minutes the poor desolate girl, who half an hour before had not one friend in that wide city, was the unconscious object of the tenderest care and the most watchful medical skill.

Gabrielle was right; it was not death, but a deathly swoon. Probably the girl had fainted at the very moment when there broke from her pale lips the wild wail of desolate anguish which had so fortunately found its way at once to the ear and to the heart of the pitying Italian.

A long illness was the consequence of the sad events which had so tried the feelings of the young American, and during two or three weeks she lay unconscious, while her Italian benefactress watched over her in devoted and unwearied love, aided by Gabrielle, whose heart

had gradually melted, and warmed to the beautiful and helpless sufferer.

But youth and a good constitution, aided by skill and kindness, triumphed at length; and the delighted prima donna had the pleasure of seeing the object of her compassionate devotion rapidly recruiting in health and strength; and she hung over her with sweet and joyful caresses.

"You have told me that we have met before," said the invalid one day, languidly stretching out her thin, trembling, white hand, in answer to the affectionate inquiries of the young Italian; "but I can not recall our meeting; tell me, if you please, where and how we met."

"Not yet, caro," said the Italian girl, smiling. "You are not strong enough to talk or be talked to yet. Wait a little longer, and you shall know all about it; but not yet. You must trust to me a little longer."

In the mean time the signorina, now that her fair patient's improvement had released her from her anxious attendance in the sick-room, held long and confidential interviews with her man of business, and one fine day she entered her apartment with some papers in her hand.

"Are you quite well enough, do you think, to talk a little upon business now, caro?" she said, caressingly lifting the heavy waves of golden hair, and fondly pressing her lips to the fair, pure brow beneath.

"Quite, quite well enough, dear friend. I am impatient to talk to you," said the sick girl. "I have much that ought to be said, much that you ought to know. I—"

"Stop, stop," said the signorina, smiling kindly into the sweet, earnest blue eyes; "it is I who am to talk, and you, dearest, may do the listening. First, then, I believe that you have friends in America. Is it not so?"

"I had many," said the young stranger, sadly; "but having lost every thing else, I dare not count upon having them still."

"Adversity is the fire which tries the mixed metal," said the Italian, curtly. "Let the dross go; the pure gold will remain to you purer than before; have faith in this. You would wish to return to your country—to your friends?"

"Wish!" said the poor girl, her soft eyes filling with tears. "Yes; but what are my wishes worth now? I am penniless."

"Not so!" said the Italian, quickly. "In this libretto you will find there is provision for your future wants. Nay, start not, caro, nor blush. It was but a debt fairly due to you, which circumstances have enabled me to recover just when you most needed it. I do not ask you to remain with me and unite your fate with mine—but as she spoke her rich voice trembled, and her dark eyes grew humid and shone luminous through tears—"for I know that your heart is pining for your home and your early friends; and, more than that, I know that our lives are unfitted to run on side by side. My career would be as painfully irksome to you as

the repose of yours would be monotonous to me. The quiet you would covet would be stagnation to me. I should die deprived of the excitement which is my daily life. I do not ask you to sympathize with me in this—you can not; but I ask you to remember it has been my life from childhood; the shrinking delicacy of character which I can admire in you was crushed out of me as a little child; and I have lived ever before the public eye, sustained by the breath of the popular admiration, from which you, my gentle one, would shrink in dismay. Yet hear me;" and as she spoke she drew up her glorious figure to its full height, and raising her head proudly, she fixed her clear, luminous, truthful eyes full on the face of her young companion.

"Hear me! In all that relates to pure womanly virtue, true womanly honor, my life has been as unsullied as your own! There is no stain upon the hand I offer you in friendship, no taint of dishonor in the wealth I have conveyed to you; you believe this?" she said, still keeping her searching glance full upon the face of the listening American.

"I do—I do," said her companion, fondly clasping in her thin white fingers the hand held out to her so proudly.

"I thank you," said the Italian, tenderly; "and I believe you! Your generous faith in me you shall never have cause to repent. But listen farther—your passage home I have engaged; in one week more you will leave for America, your glorious fatherland, the birthplace and the home of freedom! And if there the breath of fame should ever chance to waft my name to your ear, you will remember that I was not forgetful or ungrateful!"

"Ungrateful!" said the wondering girl. "What claim have I upon your gratitude—I, the object of your generous charity? You have spoken thus before; this debt, too; what was it? Tell me then, dear friend; where have we met before, and when?"

"Look!" said the prima donna; and springing up, and humming the formerly popular tune of the "Cracovienne," she danced that once familiar but now half-forgotten fancy dance, while the sweet blue eyes of the American girl opened wide in bewildered recollections.

Gradually it came back to her, like portions of a recovered dream: Boston—the Mall—the street musician—the little, tired, bespangled child—the very feeling of the air on that sweet spring day, so long ago—the smell of the leaves, the warmth of the sun; and, as the Italian at the close of the dance flung herself down, and crouching, held out her hand as did the over-wearied child, Lilian Forrester burst into tears of surprise and awakened memory.

"Yes, 'caro,' said the prima donna, again springing up, and approaching the weeping American, "I was that little, miserable, motherless, neglected child; your bounty gave my

poor but talented father the means of beginning my musical education, and it was by your childish hand that I was led into the path which has brought me to distinction and opulence! You will not pain me by refusing to share a portion of the wealth which, but for you, I should never have won. You were generous as a child, surely you will not be less generous as a woman! Years have passed over me, and I am so changed that I have almost lost my own identity; but your face, though unseen from that day, was never forgotten; your childish image haunted me. We met, and I knew you instantly. Surely it was God's own providence which brought me to you in your hour of need, as you had come to me in mine! And now when He thus sends back to you, by my hands, the bread which you in your sweet young charity cast upon the waters, will you turn away and perish in your proud hunger? They call me proud and cold, caro; and so I am, for the blood and the pride of the old nobility are both in my veins, and the two generations of poverty through which they descended to me have weakened neither. Yet see, dearest, I am kneeling before you—do not, oh, do not deprive me of the sweetest pleasure my wealth has ever brought me!"

Who could resist those tender, pleading words, rendered doubly tender by the sweet intonations of that matchless voice, and heightened by all the charm and witchery of her rare and exquisite grace of manner? Certainly not the poor lonely girl whose life she had just saved—who, having been engulfed and swept away by that mighty flood-tide of commercial ruin, had been snatched from the seething waters on the very brink of doom, and restored to life and hope by her generous compassion. Ah, no! she could only throw herself into those fondly extended arms and weep out her full heart's gratitude and love.

In a week more the two young beings, whose life paths, so widely different in their commencement, had yet met and crossed each other at such strange angles, stood together upon the deck of one of our ocean steamers.

"Adieu! caro," said the Italian, as she returned the clinging embrace of her friend; "we shall meet again somewhere, I am sure of it. And see, dearest! this is my parting gift, my 'buona-mano;' take it; it is for you. And now, caro! adieu until we meet again—if not on earth, then surely—" And with an attitude more expressive than words, she raised her hand slowly and pointed heavenward.

The "buona-mano," as the signorina termed it, was a transfer into safe hands of a handsome competency for life in trust for Lilian Forrester; and when, a few years later, Lily became the wife of Arthur Cabot, if she did not bring him the dower of a millionaire's daughter, still, thanks to the prima donna, she was not a portionless bride.

A DAY AMONG THE QUAKERS.

A LONG a portion of Lake Erie's southern shore, where an enchanting variety of cedar groves, rocky bluffs, a shell-dotted beach, and houses rich in architectural beauty offer a long succession of enjoyment to both the heart and eyes of a tourist, there rises above all else a land light-house, founded upon a rock and built of purest granite. Near by, it looks a tower of strength; afar off, it seems like a huge white finger pointing upward; yet, near or far, it stands out from amidst all surroundings with a distinctness, or an individuality, that makes it a nucleus around which all other associations of the shore scenery gather. The following, in bold relief, from the adventures of a few weeks' summer wandering, is a single episode, *whose details I give with careful truthfulness*:

The time was July, 1868; the day, a Sabbath; and the place, an out-of-the-way settlement in Central Ohio.

Grace Newton, whom Ruth Clifford and I were visiting, had told us of a little colony of Quakers, not very far off—anti-progressive ones—who held on tenaciously to the faith of their fathers, and had no companionship with the villagers who worshiped once a month in the Methodist chapel, “down the road;” and when she proposed to have Dick harnessed in the spring wagon, and drive us to Oakhill Meeting-house, four miles distant, we offered no opposition. The wagon had no top. The sun's rays were almost scorching. A portable seat, in the middle of the wagon, accommodated Ruth and me, under shelter of an umbrella, while Grace, in her character of Jehu, occupied a low-backed chair in front.

That ride was guiltless of any monotony. Bouncing, jolting, half shaken to pieces, now down in a rut, then heaved over a stump, now plashing through a stream which ran across the road, then rolling through a foot in depth of soft clay, down a steep hill, with a cry from Grace, “Hold my chair, girls, or I'll slide out!” Thence up one, with another call, “Push me front, girls, or I'll slide back!” And every few minutes, as the low-hanging tree boughs brushed against us, dodging our heads to escape the fate of Absalom, we might well be thankful when the last long graveled hill was ascended, and the low, weather-beaten, board meeting-house stood before us. Its surroundings reminded me of a Southern camp-meeting; for every tree near by sheltered a carriage of some kind, while a corral of horses switched off flies in a long shed, built for their accommodation.

“How long has meeting set, boys?” asked Grace of two little urchins, who were slyly creeping around a rock with their Sunday hats full of dead-ripe blackberries.

“Jes half 'n hour,” said one.

“Then we will disturb the preacher,” said Ruth.

“Blissful ignorance!” exclaimed Grace. “It

is easy to see you were never in a Quaker meeting. Follow me, doing just as I do.”

The interior of the building was separated in half by a partition containing numerous holes a foot square, which divided the sexes. The pews were elevated like those in a theatre, the very young people being packed near the ceiling, and the elders occupying those nearest the floor. It may seem strange that Ruth and I had never seen Quakers at worship; but this was really our first opportunity; nor had we any but the crudest idea of their formula. Nothing human could have looked more sanctimonious than the brethren and sisters, each with folded hands and downcast eyes, as they sat in a silence so profound I grew nervous with hearing my own heart beat.

“For what are they waiting, Grace? I can not endure this another quarter of an hour,” I said.

“Oh, do be still!” she replied, in the faintest of whispers. “They are waiting on the Spirit; it will soon move some one, I hope.”

Waiting on the Spirit! Why, its presence was visible to me wherever I looked through the opened door. A voice from out the ripening grain seemed crying, “Lo! 'tis here.” The birds that soared toward the sun half warbled, “There, up there.” The soft wind caught the sweet refrain, and murmured, “Every where.” Only man was silent.

The church took its name from a gigantic oak which stood just in front of the door, stretching out its “hundred arms so strong” so near at some points that the leaves lay against the whitewashed boards. Its trunk was hollow, and an old ram, panting from the excessive heat, had thrust his head and shoulders in it for relief in the cool darkness. I studied the hind-quarters of this venerable mutton until I had counted every knot upon its woolly back; then, by way of diversion, again sought the faces of the elderly sisterhood. Than some few, nothing in the ripe maturity of modest womanhood was lovelier. With downcast eyes, hands folded quietly in their laps, and scarcely any perceptible heavings of the motherly bosoms beneath their spotlessly white neckerchiefs, they looked, each one, an impersonation of that peace which “passeth understanding;” but statues were scarcely quieter. Presently I espied a middle-aged man, whose broad brim covered his eyebrows, move his hands once or twice, as though washing them in an invisible basin; then he crossed and uncrossed his feet, sighed heavily three times with inspiration deep enough to fill the lungs of a blacksmith's bellows, finally rose, opened his mouth, and spoke. Written words can not describe his nasal intonations, nor the peculiar inflections of his unpleasant voice. His theme was the uselessness of mere learning as a means of spiritual advancement—and his abuse of the rules of rhetoric and grammar the strongest argument in proof of the sincerity of his belief. How he sweated as his excitement increased! How he sawed the air with

his long arms, and see-sawed from heel-tip to toe! "Yes, my brethren—ah—and you, my sisters—ah—labor not for the meat which perishes—ah—take no scrip in your hand—ah—nor money in your purse—ah (ironically speaking—ah)—and then may be, like St. Paul—ah—you'll be gifted with an un—n—n—n—atural eloquence."

Such was the peroration of his half hour's discourse, when he resumed his seat under a silence which would have been most flattering to the orator of any but a Quaker meeting. Whose voice would be the next to arouse the attention of that waiting and undemonstrative audience? The query was answered by the old ram, who, walking straight up to the front-door, put his head in it, made a brief but deliberate survey of the congregation, and then, uttering a loud, prolonged baa-a, returned to the shelter of the oak. Oh, the laughs that were choked back, and the rosy lips that were bitten into a deeper carmine the few next minutes! But the elder who had spoken suddenly ended the restraint by shaking hands with the neighbor next him, which was the signal for the universal hand-shaking that closes every meeting. It may have been an outside show—I know not; but the show, as such, was the most suggestive of that Christian fellowship which should unite those who cherish the same faith I ever saw.

"How is thee, Grace Norton?"

The voice was that of the elder who had spoken in the meeting.

"I am well. This is my friend Ruth Clifford, Nathaniel Grubb, of whose coming I told thee. How is Aunt Betsey?"

"She took cold last Lord's-day when it rained on us. If this was not another Lord's-day, I would like to tell thee what she says about that honey thee is wanting to buy. Thee can have six pounds of it at forty cents a pound, and that is dead cheap."

"Ah, Friend Grubb!" I thought, "'ye pay tithe of mint and anise and cummin, and have omitted the weightier matters of the law.'" I turned to watch the approach of a fair old lady in drab silk bonnet and spectacles, who was nearing us with a face radiant in kindness. Ruth, who also saw her, with her usual impulsiveness, sprang forward and grasped her extended hand.

"Are you not Aunt Phoebe Haddam?" she said. "You must excuse my boldness, but my friend Grace Norton has written to me so often of your kindness to her, when she was sick and a stranger, I felt I would know you if I ever saw your face."

"Thee is right. That is my name; but thee overrates a simple act of duty, my child."

They were acquainted already, which resulted in an invitation to us three to come home and dine with her, adding, "I know father will be glad to converse with thee."

Grace and Ruth eagerly accepted it, allowing me, at my request, to return to Snowden

with a Quaker family and be entertained by little Gay, the daughter of Grace.

What Ruth saw and heard, and what I missed in not sharing her eventful visit, I will tell as it was told to me. Grace and she followed in the spring wagon close behind the barouche which contained Aunt Phoebe, her daughter Rebecca, and son Simon, who was driving. The distance was two miles, through a long strip of woodland and most delicious shade.

"These Haddams are the most interesting Quakers I know," said Grace; "but the folks around here think Uncle Samuel, the husband, a little queer, and not quite sound of mind. He rarely goes from home now, having a disease in his eyes which makes him almost blind—but you must not allow me to prejudice you against him, for his character is irreproachable. Indeed, I know very little of him but from hearsay."

This explanation, kindly as it was given, dampened Ruth's ardor, and made her rather shrink from the visit now so near. They entered a lane, and soon reined up before a small white cottage, whose yard was encircled by a thick hedge of Osage orange. Not another house was any where visible. The spot could scarcely have been more isolated had it been in the centre of the Great Sahara, but there the resemblance ended, for whatever of beauty there is in undulating hills covered with verdure, patches of woods, running water, and browsing kine, were there in profusion.

"Don't wait here in the sun, Ruth; just follow the path to the house," said Aunt Phoebe.

Grace stopped to help Simon tie up "old Dick," and Ruth walked on up an avenue of blooming hollyhocks to where a door stood wide open. How white was the sanded sill, and how neat the home-made rug which lay just at the entrance! Seeing no one, she stepped in, when suddenly from an arm-chair there arose a tall, slender old man, who confronted her. His appearance was remarkable. His dress was of fine white linen, without spot or color, except that of the narrow black ribbon knotted under his broad, unstarched shirt-collar. His thin hair was white and fine as spun glass, and his face—the skin of which was fair as a girl's—of most benignant and intellectual expression. His eyes alone were not visible, being protected by large green goggles. Ruth stood an instant motionless. Such a vision of majestic old age, in such a place, she had never dreamed of seeing.

"Thy footsteps are those of a stranger. Enter. Thou art welcome," was his salutation.

Ruth advanced, laying her hand in his large, soft palm, with a few simple words of greeting.

"Thy hand is that of a gentlewoman, and thy voice is low and pleasant. Who art thou?" said he.

"My name is Ruth Clifford. I have come from the capital of Pennsylvania to visit my friend Grace Norton. I accompanied her to

meeting this morning, and was invited home to dinner by Aunt Phœbe Haddam."

"Thou hast come, then, from the great world of which I know so little. God—ever blessed be His holy name—has seen fit to take away my sight; but I have witnessed the coming of the Lord, and mine eyes have seen the salvation of His people, so I am content," and clasping his hands, his lips moved as if in prayer.

Ruth's emotions were those of awe, reverence, and admiration commingled. She recalled Grace's language, that Uncle Samuel—for of course this was he—was "a little queer," and wondered whether he might not only be that, to some minds, incomprehensible thing—a religious enthusiast. His articulation was very distinct, every word having a purity of finish which would have been marked in the diction of a professed elocutionist. How much more astonishing, then, from the lips of this unassuming, humble Quaker farmer, who had doubtless never been beyond the limits of his native State.

Before he again spoke, his old wife, with her daughter and Grace, came in.

"Now, dear, thee must feel at home," said Aunt Phœbe, taking Ruth's hat. "We are plain people; but thee and Grace are truly welcome. Has thee felt lonely this morning, father?" she asked, pushing aside a stray lock of his silvery hair with which a breeze was toying. "Did thy poor eyes pain thee much?"

His smile was perfect, as he replied:

"Oh no, mother; I forgot my eyes. *His* words came to me very clear: 'For our light affliction, which is but for a moment, worketh for us a far more exceeding and eternal weight of glory; while we look not at the things which are seen, but at the things which are not seen; for the things which are seen are temporal; but the things which are not seen are eternal.' I thank thee for bringing the young woman home. I will enjoy her speech."

"I am the one to feel grateful, Sir. May I call you Uncle Samuel?"

"Yes, if it pleaseth thee."

"Well, Uncle Samuel, I have traveled over several thousand miles since I left home, but never before got into a place like this. Every thing charms me, and I am glad of the privilege to just sit still and hear you talk."

"Hush, hush! Thou must not flatter!" Yet the old man's tones expressed pleasure withal, for Ruth's were full of earnestness.

Aunt Phœbe's kind heart was gratified.

"I see thee can entertain each other," she said, "so I will get the dinner."

Rebekah and Grace went to assist her, and Ruth and the old man were left alone.

He broke the silence first, saying:

"Hast thou seen General Grant, and dost thou think him a good man? I have longed to hear his voice, and daily pray to God that he will strengthen his hands, and make him worthy of the great work to which he is called."

Ruth said she knew him only through his works, but felt that he, perhaps more than any living American, would perfect the grand schemes left unfinished by the death of Lincoln.

At that name the old man's face lighted up with a beauty almost angelic. Turning toward Ruth, who sat near his chair, and laying his hand lightly on hers, he said, eagerly:

"Hast thou seen Mr. Lincoln?"

"Yes, Sir," replied Ruth. "Once, when living, I stood so near him that every line of his face was as visible to me as yours now. It was the last time he ever addressed an audience as Abraham Lincoln, the citizen; for a few days afterward he was inaugurated President of these United States. Once again I stood very near him; but it was to look upon his coffined form lying in state in our Capitol. Did *you* ever see him?"

"Ah! yes, yes; and a sadder face than his was *then* I never looked upon."

Ruth's face was luminant with curiosity.

"Why, Uncle Samuel! Where was he? What were the circumstances? Do tell me!"

"Perhaps thou wilt not sympathize with me. I rarely speak of these things save among my own people. In what light dost thou view the colored race?"

Now the freeing of the slaves and the education of the freedmen had long been among Ruth's hobbies; so when called upon to "rehearse the articles of her belief," she did it so promptly and forcibly that no one could doubt her philanthropy nor ardent desire for justice to that long-suffering and terribly wronged people.

Uncle Samuel was now in his element. Cut off by old age, blindness, and his isolated home from the busy world, only echoes of the mighty questions which were agitating the greatest minds of our country had reached him; and to have unexpectedly a companion, young, full of ardor and enthusiasm, dropping down, as it were, upon his very hearth-stone, was a pleasure such as rarely occurred in his quiet life.

"Now tell me, Uncle Samuel. When and where did *you* meet Mr. Lincoln?"

"I scarcely ever speak of it now, my child," he said, folding his thin hands, his face becoming sweetly grave and his words falling very slowly.

"My quiet life has known few storms. I have loved God as my first, best, and dearest friend, and he has ever dealt most tenderly with me. I always abhorred slavery. During the first years of the great rebellion, when I read and heard what was the condition of the poor enslaved negroes, I tried to think it was a cunning device of bad men to create greater enmity between the North and South; but when I read Mr. Lincoln's speeches I thought so good a man as I believed him to be could not lie, and then I resolved to go and see for myself. At one of our First-day meetings I spoke my intention to the brethren, but although feeling as I did upon the subject, they said it was rash for me to expose my life, for I could do

no good by such means. Nevertheless I went, traveling on horseback through most of the Southern States. My life was often in great danger, but there was an invisible arm ever between me and the actual foe, and after some weeks I returned, saying the half had not been told me of the sufferings of those poor, *poor*, despised, yet God-trusting and God-fearing, people."

Here his voice expressed a fullness of pity which could come from no source but the depths of a loving and large heart.

"That summer (it was in '62) I plowed and reaped and gathered in my little harvest as usual. Day by day I prayed at home and in the field that God would show his delivering power as he had to the children of Israel; but nothing seemed to come in answer.

"Now and then, during the beginning of the war, news reached us of a battle having been fought by our men, and a victory gained, but still the poor colored people were not let go. Then one night I had a singular dream, and I said, 'Yea, Lord! thy servant heareth.' I soon made ready and said to mother:

" 'Wilt thou go with me to Washington to see the President?'

" 'Where thou goest, I will go,' she answered.

"My good friends called me insane. Some said this trip was even more foolish than the last; that I knew no one in Washington, and would never gain access to the great President.

"The good Lord knew I did not mean to be fool-hardy, but I had that on my mind which I was to tell him, and I had faith to believe that He who feeds the sparrows would watch over me.

"Art thou tired, child?"

"No, no, Sir. Please go on."

"We left here on a pleasant September morning—the first time that mother had been from home thirty miles in fifty years, and now hundreds lay before us. Before we went out of the door we prayed that God would guide our wanderings, or, if He saw best, direct us back again. Every one looked at and spoke to us kindly on our journey from near Cincinnati to Harrisburg, and, when we got out there to change cars and rest a while, we felt that so far the Lord had prospered us. It was remarkable that a man who was at the *dépôt* (and a pleasant manner he had, too) said:

" 'Friend, do you stop here?'

"I answered, 'Yes. We are weary, and will rest to-night.'

" 'Come home with me, then,' he said. 'My wife was born a Quaker, and will be glad to entertain you.'

"We went. His home was beautiful. The Lord had abundantly blessed him, and that night I was calm and happy. We got to Washington the next evening. It was early candle-light, and there was so much confusion mother clung to my arm, exclaiming:

" 'Oh, Samuel, we ought not to have come here. It is like Babel.'

" 'Have faith, mother,' I said. 'The Lord will send help if we are doing right;' and we walked away from the cars.

"Under a gas-post a man was standing, reading a small letter. I stepped before him and said:

" 'Good friend, wilt thou tell us where to find President Lincoln?'

"He looked us all over before he spoke. We were neat and clean. Soon his face got bright and smiling, and he asked us a few plain questions. I told him we were Friends from Ohio, who had come all these miles to say a few words to Mr. Lincoln.

"He bade us come with him, and, taking us to a great house called Willard's Hotel, put us in a little room away off from the noise.

" 'Stay here,' said he, 'and I will see when the President can admit you.'

"He staid a long time. Meanwhile a young man brought us a nice supper, which was very kind and thoughtful in him, and when the gentleman came back he handed me a slip of paper which read: 'Admit the bearer to the chamber of the President at nine o'clock to-morrow morning.'

"My heart was so full of gratitude I could not speak my thankfulness. That night was as peaceful as those in our little home in the meadow.

"The next morning the kind gentleman came and conducted us to the house in which the President was. Every body whom we met seemed to know our new friend, and touched their hats to him. I was glad so many people seemed to like him. At the door he left us, promising to return in an hour. The room in which we were now shown was full of persons, all waiting to see Mr. Lincoln. Mother said, 'Ah, Samuel! we will not get near him to-day. See these anxious faces who came before us.'

" 'As God wills,' said I.

"It was a sad place we were in. There were soldiers' wives and mothers sitting about, and not a soul from which joy and pleasure did not seem to have fled. Some were even weeping, and I thought what a fearfully solemn thing it was to hold much power. They found in some way that I would soon see the President; then how they begged me to intercede for them with him! One poor mother whose only boy was dying with home-sickness—here Uncle Samuel's voice got husky with the sad memory, and tears fell from his sightless eyes upon his withered hands.

Ruth reverently brushed them off, and in a few minutes he proceeded:

"When the summons came for us to enter (it was in advance of the rest) my knees smote together, and for an instant I tottered. 'Keep heart, Samuel,' said mother, and we went forward. I fear thou wilt think me vain if I tell what followed."

"No fear, Sir. Please proceed."

"It seemed so wonderful; for a minute I could not realize that such humble people as

we were should be there in the actual presence of the greatest man in the world. Then he received us so kindly. I can not express his manner. He shook hands with us, and placed his chair between us. Oh, how I honored the good man! But I said:

"Mr. Lincoln, wilt thou pardon me that I do not remove my hat?" He smiled, and his face all lit up as he replied:

"Certainly; I understand about it."

"The dear, dear man," and again Uncle Samuel stopped, as though to revel in the memory of that interview.

"What then, Sir?" Ruth was impatient.

The answer came with a solemnity indescribable.

"Of that half-hour's conversation it does not become me to speak; I will think of it through eternity. At last we had to go. He took a hand of each of us in his, and said, looking straight in our eyes, 'Father, mother, I thank you for this visit; God bless you!'"

"Was there ever greater condescension than that? At the last moment I asked him if he would object to just writing a line, certifying that we had fulfilled our mission, so we could show it in council. He sat down at his table—Wilt thou open the upper drawer of that old secretary and hand me a little tin box therein?"

Ruth obeyed, placing in his now trembling fingers a small square box, bright as silver. Taking from it a folded paper he bade Ruth read. The words were *literally* as follows:

"I take pleasure in asserting that I have had a pleasant and profitable intercourse with Friend Samuel Haddam and his wife, Phœbe Haddam. May the Lord comfort them as they have comforted me.

ABRAHAM LINCOLN.

"September 20, 1862."

"Oh, Uncle Samuel!" exclaimed Ruth. "I can scarcely realize it, that I should, away out here in this *almost* backwoods, read words traced by our beloved Mr. Lincoln's own hands. How very singular!"

"Not more than the whole event was to us, dear child, from first to last. The following Monday, the preliminary Proclamation of Emancipation was issued. Thank God! Thank God!"

It is impossible to depict the devout fervor of the old patriarch's thanksgiving.

"We found our friend," he continued, "waiting for us. When we showed him the testimonial, he nodded his head in affirmation, and said,

"It is well."

"We soon left Washington, for our work was done, and I was satisfied *now* to go home again. Our good friend escorted us to the omnibus which took us to the cars, having treated us throughout with a hospitality I can never forget. May God care for him as he did for us."

"Did you learn his name, Sir?"

"He is high in the estimation of men, and his name is Salmon P. Chase."

The dinner in that peaceful Quaker house was like all else about it—real and informal. Simon proved himself worthy of his noble parentage, and Rebecca, who was engaged in teaching a Freedman's school, some miles from home, was as companionable as earnest in her philanthropic work. Uncle Samuel was happy. He had revived once more *the event* of his life, and electric currents of an awakened vitality were flashing through his sluggish veins. He sought to amuse Ruth, by having Simon open a cupboard and place in her hands, one by one, curious fossils, shells, minerals, and other articles of *vertu*, the gleanings of his leisure hours. His knowledge of geology was astonishing, and in each mineral he read a record of God's unerring wisdom.

But evening was approaching, and old Dick having been reharnessed, the parting from so much that was endearing had to come. Ruth felt it was no mere hand-shake of courtesy which grasped her so firmly, when Aunt Phœbe, in her motherly way, thanked her for the pleasure their visit had afforded them. The last "good-by" was for Uncle Samuel. As Ruth approached the venerable saint he arose.

"My child! I thank thee for thy sympathy, which will ever be to me a sweet memory. We will not meet again here; I am very near home, and only wait my Father's summons. Live near to Christ. There alone is the Way, the Truth, and the Life." Then laying his hand upon her head, he added: "The Lord bless thee and keep thee; The Lord make His face to shine upon thee and be gracious to thee: The Lord lift up His countenance upon thee and give thee peace forever. Amen." And stooping, he kissed her forehead.

"I can not possibly describe to you the grand simplicity of that pure old man," added Ruth, when her recital was ended. "I have quoted our conversation, word for word; but could no more give you his pathetic tones than I could arrange in bars and notes the song of a lark. God alone knows to what extent Mr. Lincoln was influenced by that half-hour's conversation to the performance of that great deed which set a nation free; but I can not help feeling I have read a page in that wonderful man's history which would have been sealed to me but for my unexpected meeting with that precious old Quaker."

THE MESSAGE.

On, bear a message, gentle wind—
And linger not upon thy way—
To one who longs for me to-day;
Her ear, by city noise undinned,

Will hear thy gentle whisper, hear
And understand thy fairy tone,
Which speaks of one who sits alone,
Whom thoughts of her alone can cheer.

I will not give thee words to bear;
In passing thou hast read my heart;
Bear that to her, who has the art
To spell the utterance of the air.

SE-QUO-YAH.

IN the year 1768 a German peddler, named George Gist, left the settlement of Ebenezer, on the lower Savannah, and entered the Cherokee Nation by the northern mountains of Georgia. He had two pack-horses laden with the petty merchandise known to the Indian trade. At that time Captain Stewart was the British Superintendent of the Indians in that region. Besides his other duties, he claimed the right to regulate and license such traffic. It was an old bone of contention. A few years before, the Governor and Council of the colony of Georgia claimed the sole power of such privilege and jurisdiction. Still earlier, the colonial authorities of South Carolina assumed it. Traders from Virginia, even, found it necessary to go round by Carolina and Georgia, and to procure licenses. Augusta was the great centre of this commerce, which in those days was more extensive than would be now believed. Flat-boats, barges, and pirogues floated the bales of pelts to tide-water. Above Augusta, trains of pack-horses, sometimes numbering one hundred, gathered in the furs, and carried goods to and from remote regions. The trader immediately in connection with the Indian hunter expected to make one thousand per cent. The wholesale dealer made several hundred. The governors, councilors, and superintendents made all they could. It could scarcely be called legitimate commerce. It was a grab game.

Our Dutch friend Gist was, correctly speaking, a contrabandist. He had too little influence or money to procure a license, and too much enterprise to refrain because he lacked it. He belonged to a class more numerous than respectable, although it would be a good deal to say that there was any virtue in yielding to these petty exactions. It was a mere question of confiscation, or robbery, without redress, by the Indians. He risked it. With traders, at that time, it was customary to take an Indian wife. She was expected to furnish the eatables, as well as cook them. By the law of many Indian tribes property and the control of the family go with the mother. The husband never belongs to the same family connection, rarely to the same community or town even, and often not even to the tribe. He is a sort of barnacle, taken in on his wife's account. To the adventurer, like a trader, this adoption gave a sort of legal status or protection. Gist either understood this before he started on his enterprise, or learned it very speedily after. Of the Cherokee tongue he knew positively nothing. He had a smattering of very broken English. Somehow or other he managed to induce a Cherokee girl to become his wife.

This woman belonged to a family long respectable in the Cherokee Nation. It is customary for those ignorant of the Indian social polity to speak of all prominent Indians as "chiefs." Her family had no pretension to chieftaincy, but was prominent and influential;

some of her brothers were afterward members of the Council. She could not speak English; but, in common with many Cherokees of even that early date, had a small proportion of English blood in her veins. The Cherokee woman, married or single, owns her property, consisting chiefly of cattle, in her own right. A wealthy Cherokee or Creek, when a son or daughter is born to him, marks so many young cattle in a new brand, and these become, with their increase, the child's property. Whether her cattle constituted any portion of the temptation, I can not say. At any rate, the girl, who had much of the beauty of her race, became the wife of the German peddler.

Of George Gist's married life we have little recorded. It was of very short duration. He converted his merchandise into furs, and did not make more than one or two trips. With him it had merely been cheap protection and board. We might denounce him as a low adventurer if we did not remember that he was the father of one of the most remarkable men who ever appeared on the continent. Long before that son was born he gathered together his effects, went the way of all peddlers, and never was heard of more.

He left behind him in the Cherokee Nation a woman of no common energy, who through a long life was true to him she still believed to be her husband. The deserted mother called her babe "Se-quo-yah," in the poetical language of her race. His fellow-clansmen as he grew up gave him, as an English one, the name of his father, or something sounding like it. No truer mother ever lived and cared for her child. She reared him with the most watchful tenderness. With her own hands she cleared a little field and cultivated it, and carried her babe while she drove up her cows and milked them.

His early boyhood was laid in the troublous times of the war of the Revolution, yet its havoc cast no deeper shadows in the widow's cabin.

As he grew older he showed a different temper from most Indian children. He lived alone with his mother, and had no old man to teach him the use of the bow, or indoctrinate him in the religion and morals of an ancient but perishing people. He would wander alone in the forest, and showed an early mechanical genius in carving with his knife many objects from pieces of wood. He employed his boyish leisure in building houses in the forest. As he grew older these mechanical pursuits took a more useful shape. The average native American is taught as a question of self-respect to despise female pursuits. To be made a "woman" is the greatest degradation of a warrior.

Se-quo-yah first exercised his genius in making an improved kind of wooden milk-pans and skimmers for his mother. Then he built her a milk-house, with all suitable conveniences, on one of those grand springs that gurggle from the mountains of the old Cherokee Nation. As a climax, he even helped her to milk her cows; and he cleared additions to her fields, and work-

ed on them with her. She contrived to get a petty stock of goods, and traded with her countrymen. She taught Se-quo-yah to be a good judge of furs. He would go on expeditions with the hunters, and would select such skins as he wanted for his mother before they returned. In his boyish days the buffalo still lingered in the valleys of the Ohio and Tennessee. On the one side the French sought them. On the other were the English and Spaniards. These he visited with small pack-horse trains for his mother.

For the first hundred years the European colonies were of traders rather than agriculturists. Besides the fur trade, rearing horses and cattle occupied their attention. The Indians east of the Mississippi, and lying between the Appalachian Mountains and the Gulf, had been agriculturists and fishermen. Buccaneers, pirates, and even the regular navies or merchant ships of Europe, drove the natives from the haunted coast. As they fell back, fur traders and merchants followed them with professions of regard and extortionate prices. Articles of European manufacture—knives, hatchets, needles, bright cloths, paints, guns, powder—could only be bought with furs. The Indian mother sighed in her hut for the beautiful things brought by the Europeans. The warrior of the Southwest saw with terror the conquering Iroquois, armed with the dreaded fire-arms of the stranger. When the bow was laid aside, or handed to the boys of the tribe, the warriors became the abject slaves of traders. Guns meant gunpowder and lead. These could only come from the white man. His avarice guarded the steps alike to bear-meat and beaver-skins. Thus the Indian became a wandering hunter, helpless and dependent. These hunters traveled great distances, sometimes with a pack on their backs weighing from thirty to fifty pounds. Until the middle of the eighteenth century horses had not become very common among them, and the old Indian used to laugh at the white man, so lazy that he could not walk. A consuming fire was preying on the vitals of an ancient simple people. Unscrupulous traders, who boasted that they made a thousand per cent., held them in the most abject thrall. It has been carefully computed that these hunters worked, on an average, for ten cents a day. The power of their old village chiefs grew weaker. No longer the old men taught the boys their traditions, morals, or religion. They had ceased to be pagans, without becoming Christians.

The wearied hunter had fire-water given him as an excitement to drown the cares common to white and red. Slowly the polity, customs, industries, morals, religion, and character of the red race were consumed in this terrible furnace of avarice. The foundations of our early aristocracies were laid. Byrd, in his "History of the Dividing Line," tells us that a school of seventy-seven Indian children existed in 1720, and that they could all read and write English ;

but adds, that the jealousy of traders and land speculators, who feared it would interfere with their business, caused it to be closed. Alas ! this people had encountered the iron nerve of Christianity, without reaping the fruit of its intelligence or mercy.

Silver, although occasionally found among the North American Indians, was very rare previous to the European conquest. Afterward, among the commodities offered, were the broad silver pieces of the Spaniards, and the old French and English silver coins. With the most mobile spirit the Indian at once took them. He used them as he used his shell-beads, for money and ornament. Native artificers were common in all the tribes. The silver was beaten into rings, and broad ornamented silver bands for the head. Handsome breast-plates were made of it ; necklaces, bells for the ankles, and rings for the toes.

It is not wonderful that Se-quo-yah's mechanical genius led him into the highest branch of art known to his people, and that he became their greatest silversmith. His articles of silverware excelled all similar manufactures among his countrymen.

He next conceived the idea of becoming a blacksmith. He visited the shops of white men from time to time. He never asked to be taught the trade. He had eyes in his head, and hands ; and when he bought the necessary material and went to work, it is characteristic that his first performance was to make his bellows and his tools ; and those who afterward saw them told me they were very well made.

Se-quo-yah was now in comparatively easy circumstances. Besides his cattle, his store, and his farm, he was a blacksmith and a silversmith. In spite of all that has been alleged about Indian stupidity and barbarity, his countrymen were proud of him. He was in danger of shipwrecking on that fatal sunken reef to American character, popularity. Hospitality is the ornament, and has been the ruin, of the aborigine. His home, his store, or his shop, became the resort of his countrymen ; there they smoked and talked, and learned to drink together. Among the Cherokees those who have are expected to be liberal to those who have not ; and whatever weaknesses he might possess, niggardliness or meanness was not among them.

After he had grown to man's estate he learned to draw. His sketches, at first rude, at last acquired considerable merit. He had been taught no rules of perspective ; but while his perspective differed from that of a European, he did not ignore it, like the Chinese. He had now a very comfortable hewed-log residence, well furnished with such articles as were common with the better class of white settlers at that time, many of them, however, made by himself.

Before he reached his thirty-fifth year he became addicted to convivial habits to an extent that injured his business, and began to cripple his resources. Unlike most of his race, how-

ever, he did not become wildly excited when under the influence of liquor.

Se-quo-yah, who never saw his father, and never could utter a word of the German tongue, still carried, deep in his nature, an odd compound of Indian and German transcendentalism; essentially Indian in opinion and prejudice, but German in instinct and thought. A little liquor only mellowed him—it thawed away the last remnant of Indian reticence. He talked with his associates upon all the knotty questions of law, art, and religion. Indian Theism and Pantheism were measured against the Gospel as taught by the land-seeking, fur-buying adventurers. A good class of missionaries had, indeed, entered the Cherokee Nation; but the shrewd Se-quo-yah, and the disciples this stoic taught among his mountains, had just sense enough to weigh the good and the bad together, and strike an impartial balance as the footing up for this new proselyting race.

It has been erroneously alleged that Se-quo-yah was a believer in, or practiced, the old Indian religious rites. Christianity had, indeed, done little more for him than to unsettle the pagan idea, but it had done that.

It was some years after Se-quo-yah had learned to present the bottle to his friends before he degenerated into a toper. His natural industry shielded him, and would have saved him altogether but for the vicious hospitality by which he was surrounded.

With the acuteness that came of his foreign stock, he learned to buy his liquor by the keg. This species of economy is as dangerous to the red as to the white race. The auditors who flocked to see and hear him were not likely to diminish while the philosopher furnished both the dogmas and the whisky. Long and deep debauches were often the consequence. Still it was not in the nature of George Gist to be a wild, shouting drunkard. His mild, philosophic face was kindled to deeper thought and warmer enthusiasm as they talked about the problem of their race. All the great social questions were closely analyzed by men who were fast becoming insensible to them. When he was too far gone to play the mild, sedate philosopher, he began that monotonous singing whose music carried him back to the days when the shadow of the white man never darkened the forests, and the Indian canoe alone rippled the tranquil waters.

Should this man be thus lost? He was aroused to his danger by the relative to whom he owed so much. His temper was eminently philosophic. He was, as he proved, capable of great effort and great endurance. By an effort which few red or white men can or do make, he shook off the habit, and his old nerve and old prosperity came back to him. It was during the first few years of this century that he applied to Charles Hicks, a half-breed, afterward principal chief of the nation, to write his English name. Hicks, although educated after a fashion, made a mistake in a very natural way.

The real name of Se-quo-yah's father was George *Gist*. It is now written by the family, as it has long been pronounced in the tribe, when his English name is used—"Guest." Hicks, remembering a word that sounded like it, wrote it—George Guess. It was a "rough guess," but answered the purpose. The silversmith was as ignorant of English as he was of any written language. Being a fine workman, he made a steel die, a fac-simile of the name written by Hicks. With this he put his "trade mark" on his silver-ware, and it is borne to this day on many of these ancient pieces in the Cherokee nation.

Between 1809 and 1821, which latter was his fifty-second year, the great work of his life was accomplished. The die, which was cut before the former date, probably turned his active mind in the proper direction. Schools and missions were being established. The power by which the white man could talk on paper had been carefully noted and wondered at by many savages, and was far too important a matter to have been overlooked by such a man as Se-quo-yah. The rude hieroglyphics or pictoriographs of the Indians were essentially different from all written language. These were rude representations of events, the symbols being chiefly the totemic devices of the tribes. A few general signs for war, death, travel, or other common incidents, and strokes for numerals, represented days or events as they were perpendicular or horizontal. Even the wampum belts were little more than helps to memory, for while they undoubtedly tied up the knots for years, like the ancient inhabitants of China and Japan, still the meagre record could only be read by the initiated, for the Indians only intrusted their history and religion to their best and ablest men.

The general theory with many Indians was, that the written speech of the white man was one of the mysterious gifts of the Great Spirit. Se-quo-yah boldly avowed it to be a mere ingenious contrivance that the red man could master, if he would try.

Repeated discussion on this point at length fully turned his thoughts in this new channel. He seems to have disdained the acquirement of the English language. Perhaps he suspected first what he was bound to know before he completed his task, that the Cherokee language has certain necessities and peculiarities of its own. It is almost impossible to write Indian words and names correctly in English. The English alphabet has not capacity for its expression. If ten white men sat down to write the word an Indian uttered, the probabilities are that one half of them would write them differently from the other half. It is this which has led to such endless confusion in Indian dictionaries. For instance, we write the word for the tribe Cherokee, and the letter *r*, or its sound, is scarcely used in their language. To-day a Cherokee always pronounces it Chalaque, the pronunciation being between that and Shal-

SE-QUO-YAH.

akke. On these peculiarities it is not the purpose of this article to enter, but hasten to George Gist, brooding over a written language for his people.

His first essay was natural enough. He tried to invent symbols to represent words. These he sometimes cut out of bark with his knife, but generally wrote, or rather drew. With these symbols he would carry on a conversation with a person in another apartment. As may be supposed, his symbols multiplied fearfully and wonderfully. The Indian languages are rich in their creative power. By using pieces of well-known words that contain the prominent idea, double or compound words are freely made. This has been called by writers treating this subject, the polysynthetic. It is, in fact, a jumbling of sentences into words, by

abbreviation, the omitted parts of words being implied or understood. There is one important fact which I will merely note here that is generally overlooked. These compounded words, to a large extent, represent the intrusive or European idea. The names the Indians gave many of the European things were mere *definitions*. Such as "Big Knives," etc. Occasionally they made a dash at the French or English sounds, as in the word "Yengees" for English, which has finally been corrupted in our language to Yankees.

Of course an attempt at fixed symbols for words was an unhappy experiment in a language one prominent element of which is, the facility of making words out of pieces of words, or compounded words. Besides this difficulty, no language can be taught successfully by means

of a dictionary, until the human memory acquires more power. Three years of hopeless struggle with the mighty debris of his symbols left him, although in the main reticent, a mighty man of words. But his labors were not lost. Through that heroic, unaided struggle he gained the first true glimpses into the elements of language. It is a startling fact, that an uneducated man, of a race we are pleased to call barbarians, attained in a few years, without books or tutors, what was developed through several ages of Phœnician, Egyptian, and Greek wisdom.

Se-quo-yah discovered that the language possessed certain musical sounds, such as we call vowels, and dividing sounds, styled by us consonants. In determining his vowels he varied during the progress of his discoveries, but finally settled on the six—*a, e, i, o, u*, and a guttural vowel sounding like *u* in *ung*.

These had long and short sounds, with the exception of the guttural. He next considered his consonant, or dividing sounds, and estimated the number of combinations of these that would give all the sounds required to make words in their language. He first adopted fifteen for the dividing sounds, but settled on twelve primary, the *g* and *k* being one, and sounding more like *k* than *g*, and *d* like *t*. These may be represented in English as *g, h, l, m, n, qu, t, dl* or *tl, ts, w, y, z*.

It will be seen that if these twelve be multiplied by the six vowels, the number of possible combinations or syllables would be seventy-two, and by adding the vowel sounds, which may be syllables, the number would be seventy-eight. However, the guttural *v*, or sound of *u* in *ung*, does not appear as among the combinations, which make seventy-seven.

Still his work was not complete. The hissing sound of *s* entered into the ramifications of so many sounds, as in *sta, stu, spa, spe*, that it would have required a large addition to his alphabet to meet this demand. This he simplified by using a distinct character for the *s* (*oo*), to be used in such combinations. To provide for the varying sound *g, k*, he added a symbol which has been written in English *ka*. As the syllable *na* is liable to be aspirated, he added symbols written *nah*, and *kna*. To have distinct representatives for the combinations rising out of the different sounds of *d* and *t*, he added symbols for *ta, te, ti*, and another for *dla*, thus *tla*. These completed the eighty-five characters of his alphabet, which was thus an alphabet of syllables, and not of letters.

It was a subject of astonishment to scientific men that a language so copious only embraced eighty-five syllables. This is chiefly accounted for by the fact that every Cherokee syllable ends in a vocal or nasal sound, and that there are no double consonants but those provided for the *tl* or *dl*, and *ts*, and combinations of the hissing *s*, with a few consonants.

The fact is, that many of our combinations of consonants in the English written language

are artificial, and worse than worthless. To indicate by a familiar illustration the syllabic character of the alphabet of Se-quo-yah, I will take the name of William H. Seward, which was appended to the Emancipation Proclamation of Mr. Lincoln, printed in Cherokee. It was written thus: "*O [wi] P [li] 4 [se] G [wa] 6 [te]*," and might be anglicized Wili Sewate. As has been observed, there is no *r* in the Cherokee language, written or spoken, and as for the middle initial of Mr. Seward's name, *H.*, there being, of course, no initial in a syllabic alphabet, the translator, who probably did not know what it stood for, was compelled to omit it. It was in the year 1821 that the American Cadmus completed his alphabet.

As will be observed by examining the alphabet, which is on the table in the engraving, he used many of the letters of the English alphabet, also numerals. The fact was, that he came across an old English spelling-book during his labors, and borrowed a great many of the symbols. Some he reversed, or placed upside down; others he modified, or added to. He had no idea of either their meaning or sound, in English, which is abundantly evident from the use he made of them. As was eminently fitting, the first scholar taught in the language was the daughter of Se-quo-yah. She, like all the other Cherokees who tried it, learned it immediately. Having completed it without the white man's hints or aid, he visited the agent, Colonel Lowry, a gentleman of some intelligence, who only lived three miles from him, and informed that gentleman of his invention. It is not wonderful that the agent was skeptical, and suggested that the whole was a mere act of memory, and that the symbols bore no relation to the language, or its necessities. Like all other benefactors of the race, he had to encounter a little of the ridicule of those who, being too ignorant to comprehend, maintain their credit by sneering. The rapid progress of the language among the people settled the matter, however. The astonishing rapidity with which it is acquired has always been a wonder, and was the first thing about it that struck the writer of this article. In my own observation, Indian children will take one or two, at times several, years to master the English printed and written language, but in a few days can read and write in Cherokee. They do the latter, in fact, as soon as they learn to shape letters. As soon as they master the alphabet they have got rid of all the perplexing questions in orthography that puzzle the brains of our children. It is not too much to say that a child will learn in a month, by the same effort, as thoroughly, in the language of Se-quo-yah, that which in ours consumes the time of our children for at least two years.

There has been a great clamor for a universal language. We once had it, in our learned world, in the Latin, in which books were locked up for the scholars and dead to the world. Language is the handmaiden of

thought, and to be useful must be obedient to its changes as well as its elemental characteristics. For the English of three hundred years ago we need a glossary, and to carry down his immortal thoughts in their pristine vigor, must have, every two hundred years, a Johnson to modernize a Shakspeare. To probe the causes of the change of language, to ascertain why even a *written* language is mutable, to pick up this garment of thought and run its threads back through all their vagaries to their origin and points of divergence, is one of the grand tasks for the intellectual historian. He, indeed, must give us the history of ideas, of which all art, including language, is but the fructification. To say, therefore, that the alphabet of Se-quo-yah is better adapted for his language than our alphabet is for the English, would be to pay it a very wretched compliment.

George Gist received all honor from his countrymen. A short time after his invention written communication was opened up by means of it with that portion of the Cherokee Nation then in their new home west of the Arkansas. Zealous in his work, he traveled many hundred miles to teach it to them; and it is no reproach to their intellect to say that they received it readily.

It has been said the Indians are besotted against all improvements. The cordiality with which this was received is worthy of attention.

In 1823 the General Council of the Cherokee Nation voted a large silver medal to George Gist as a mark of distinction for his discovery. On one side were two pipes, the ancient symbol of Indian religion and law; on the other a man's head. The medal had the following inscription in English, also in Cherokee in his own alphabet:

"Presented to George Gist, by the General Council of the Cherokee Nation, for his ingenuity in the invention of the Cherokee alphabet."

John Ross, acting as principal chief of the Cherokee Nation, sent it West to Se-quo-yah, together with an elaborate address, the latter being at that time in the new nation.

In 1828 Gist went to Washington city as a delegate from the Western Cherokees. He was then in his fifty-ninth year. At that time the portrait was taken, an engraving from which we present to our readers. He is represented with a table containing his alphabet. The missionaries were not slow to employ it. It was arranged with the Cherokee, and English sounds and definitions. Rev. S. A. Worcester endeavored to get the outlines of its grammar, and both he and Mr. Boudinot prepared vocabularies of it, as did many others. In this way, by having more and better observers, we know more of this language than many others, and affinities have been traced between it and some others, supposed to be radically different, which would have appeared in the case of some others, had they been as fully or correctly written.

Besides the Scriptures, a very considerable

number of books were printed in it, and parts of several different newspapers existing from time to time; also almanacs, songs, and psalms.

During the closing portion of his life, the home of Se-quo-yah was near Brainerd, a mission station in the new nation. Like his countrymen, he was driven an exile from his old home, from his fields, work-shops, and orchards by the clear streams flowing from the mountains of Georgia. Is it wonderful if such treatment should throw a sadder tinge on a disposition otherwise mild, hopeful, and philosophic?

One of his sons is a very fair artist, using promiscuously pencil, pen, chalk, or charcoal. He served, as a private soldier, in the Union army in the late war, and there, in his quarters, made many sketches. His power of caricaturing was very considerable. If a humorous picture of some officer who had rendered himself obnoxious was found, chalked in unmistakable but grotesque lineaments, on the commissary door, it was said, "It must have been by the son of Se-quo-yah."

In his mature years, at Brainerd, although approaching seventy, the nerve or fire of the old man was not dead. Some narrow-minded ecclesiastics, because Gist would not go through the routine of a Christian profession after the fashion they prescribed, have not scrupled to intimate that he was a pagan, and grieved that the Bible was printed in the language he gave. This arose simply from not comprehending him. They persisted in considering him an ignorant savage, while he comprehended himself and measured them.

In his old days a new and deeper ambition seized him. He was not in the habit of asking advice or assistance in his projects. In his journey to the West, as well as to Washington, he had an opportunity of examining different languages, of which, as far as lay in his power, he carefully availed himself. His health had been somewhat affected by rheumatism, one of the few inheritances he got from the old fur peddler of Ebenezer; but the strong spirit was slow to break.

He formed a theory of certain relations in the language of the Indian tribes, and conceived the idea of writing a book on the points of similarity and divergence. Books were, to a great extent, closed to him; but as of old, when he began his career as a blacksmith by making his bellows, so he now fell back on his own resources. This brave Indian philosopher of ours was not the man to be stopped by obstacles. He procured some articles for the Indian trade he had learned in his boyhood, and putting these and his provisions and camping equipage in an ox-cart, he took a Cherokee boy with him as driver and companion, and started out among the wild Indians of the plain and mountain, on a philological crusade such as the world never saw.

One of the most remarkable features of his experience was the uniform peace and kindness with which his brethren of the prairie re-

ceived him. They furnished him means, too, to prosecute his inquiries in each tribe or clan. That they should be more sullen and reticent to white men is not wonderful when we reflect that they have a suspicion that all these pretended inquirers in science or religion have a lurking eye to real estate. Several journeys were made. The task was so vast it might have discouraged him. He started on his longest and his last journey. There was among the Cherokees a tradition that part of their nation was somewhere in New Mexico, separated from them before the advent of the whites. Se-quo-yah knew this, and expected in his rambles to meet them. He had camped on the spurs of the Rocky Mountains; he had threaded the valleys of New Mexico; looked at the adobe villages of the Pueblos, and among the race, neither Indian nor Spaniard, with swarthy face and unkempt hair. He had occasion to moralize over those who had voluntarily become the slaves of others even meaner than

themselves, who spoke a jargon neither Indian nor Spanish. Catholics in name, who ate red pepper pies, gambled like the fashionable frequenters of Baden, and swore like troopers.

It was late in the year 1842 that the wanderer, sick of a fever, worn and weary, halted his ox-cart near San Fernandino, in Northern Mexico. Fate had willed that his work should die with him. But little of his labor was saved, and that not enough to aid any one to develop his idea. Bad nursing, exposure, and lack of proper medical attendance finished the work. He sleeps, not far from the Rio Grande, the greatest of his race.

At one time Congress contemplated having his remains removed and a monument erected over them; it was postponed, however.

The Legislature of the Little Cherokee Nation every year includes in its general appropriations a pension of three hundred dollars to his widow—the only literary pension paid in the United States.

THE OLD LOVE AGAIN.

By ANNIE THOMAS.

CHAPTER VII.

HOW NINA SAID "NO."

SIR ARTHUR and Lady Delany were in a bankrupt brother baronet's house in Eccleston Square for the season, which was nearly over now. A house of an august exterior as to frontage and door-step, but young as aristocratic houses go, and thin as regarded its walls.

In this house Nina found them domiciled when she went up to them from Ardleigh Vicarage. The house was gaudily furnished wherever it was liable to public inspection, but it was meagerly, not to say miserably, wanting in that portion of it which was ceded to Nina. The first night of Nina's return home Lady Delany had delicately alluded to this fact.

"Your room is not very comfortable, but it is only for a short time, Nina," she had said; and Nina had replied:

"My room is very uncomfortable, but, as you have put me there, don't trouble yourself to apologize about it;" which remark repeated, made things pleasant for Lady Delany with Sir Arthur, when he remonstrated about his only daughter being put up in an attic.

"My dear, I spoke to her about it, and she begged me not to trouble about it at all. You see, I don't like to be without a good spare room or two, in case of emergency." And so Sir Arthur was satisfied.

It was but for a short time that Nina had to endure this minor evil. At the end of a fortnight they moved away to the secluded, half-ruined, ill-furnished château which Sir Arthur Delany had taken near Pont de Brigne. But during that fortnight strange and agitating tid-

ings were sent to Nina from Ardleigh. A hurried letter from Mrs. Eldon one day told of Mrs. Barrington's having given birth prematurely to a son. The following morning's post brought the news of the unfortunate woman's death, from some untoward neglect in the attendance that was being given to her.

"It is all very distressing," Mrs. Eldon wrote; "still, dear Nina, I must remind you, in case you should be tempted or driven into thinking of doing any thing rash, that Mr. Barrington is free." Nina did remember it, and did think about it very much, as she crossed from Folkestone to Boulogne one rough morning, and felt herself to be at the point of death very often through much tossing. But it faded away from her memory a good deal when they got to their new home, and she was subjected to the combined influences of change of air, scene, food, and society.

The house Sir Arthur Delany had taken was a grim mansion in the midst of once beautiful but now grass-grown and dilapidated grounds, in which terraces, and avenues, and weird pools, and balconies, and steps that led to nowhere, and giant *tazzas* that held nothing now, were scattered in ghastly profusion. Ages ago, when Louis the Fourteenth was reigning, together with powder, and puff, and patch, and hoop, and fantasy generally, this old place must have been in high meretricious esteem. It was devised and made for the use and abuse of pretty creatures in blue and pink silks and satins, with unnaturally whitened hair and blackened faces. Modern ideas, and the times and the drapery of four years ago, were all out of place there. But somehow the very incongruity grew pleasing to Nina, who fashioned out

many a tale to fit the silent, black pool, over which elms and willows drooped, as, day after day, she wandered along its border alone, and laughed to herself over the means Lady Delany had taken to force her (Nina) into marriage.

Pont de Brigne was so pretty in its seclusion, its stagnation almost, in this late autumn weather! Not a breath ever reached it, save on Sundays, from the busy town, Boulogne, only three miles away. As the life in it went on now, so, to all appearance, it must have gone on for many generations. A lovely, lazy river wound its shining course through meadows and gardens where, on old time-embrowned walls, big pears ripened and grew fat, and fell down upon beds of flowers and onions—for the useful and beautiful were in close communion. The only noisy things in the village were the plashing mill-wheel and one screaming swan, that floated by day on the bosom of the silent pool, and dozed by night upon its banks. This swan was Nina's sole companion down in the solitude by the black water—her sole companion for a week or two.

At the expiration of that time Mr. Manners came to join their quiet party; came without knowing that Nina was one of them again, and staid with a fresh, fond pleasure when he found that she was there.

His was rather an awkward position, too, when all the circumstances of his case are considered. Six months ago he had asked her to be his wife, and she had refused his request. Then he had asked her to take time to reconsider her determination, to withdraw her definite refusal, and to nullify it by saying "yes," or repeat it by saying "no," at the expiration of a certain time. That time had expired now, and still she had sent him no word as to her sentiment. And now, while he was half hopeful, half fearful, while he thought her far away in English Ardleigh, he came upon her suddenly and unexpectedly in French Pont de Brigne.

It was all owing to Lady Delany's diplomatic talents that the meeting was managed. Nina was very much in her young ladyship's way; not that Nina interfered with one of Lady Delany's pursuits, or curtailed one of Lady Delany's pleasures. Still Lady Delany wanted to get rid of her, "in case," as she phrased it, "we should ever get so tired of one another that we should take to quarreling; being younger than Nina, you know she may get jealous of me, if years roll on and she finds herself still single and slighted." So, in order to avoid this unpleasant contingency, she favored Mr. Manners's suit, and furthered his wooing both with zeal and discretion.

He walked in upon them early one morning, having crossed the night before; and as soon as he saw her, he read in Nina's face that she had not been prepared for his appearance. Still he gathered hope as he looked; there was no displeasure mixed with the surprise she could not quite conceal.

Indeed, it would have been hard for Nina, who was beginning to find it dull in this meagerly furnished house, where she had neither society nor books, to look or feel displeased at the advent of a man who came fresh from the world of both. This latter-day lover of hers was different in all respects from the idol of her youth. He was about thirty-six or seven at this time, and he had lived an active, thoughtful life in a city where activity and thoughtfulness leave their traces on heart and brain—ay, and on hair too. He was a little bald just above his forehead, and he was more than a little gray. Still his face was unfurrowed, and his eyes were clear and bright, and his figure was only well-filled out; he was not "stout" yet. He spoke cleverly and curtly about all the topics of the day, rarely, if ever, using an unnecessary word, and never by any chance allowing feeling or prejudice to influence judgment. Altogether, he offered as marked a contrast to unstable Gerald Barrington mentally as he did physically—and physically Gerald Barrington had the best of it.

About twelve o'clock Lady Delany suggested that they should all walk out and show him the place. Nina acquiesced in the plan readily enough. She knew it was part of it that she should be left alone with Mr. Manners, and she was willing that it should be so; willing to get the explanation over as soon as possible. So, when Lady Delany made some transparent excuse for leaving them, Nina felt glad that her hour had come.

"I saw by your face that you had no share in the 'general wish' for my presence which Lady Delany expressed when she invited me here," he said, as Nina took him down some terrace steps, and proposed that they should plant on a broken wall by the dark pool, under a weeping-willow.

"No, I knew nothing of the invitation; I dare say if I had known that it was to be expressed I should have shared in the general wish."

"Even though you would have felt sure that the expression would justify me in reminding you that you are my debtor—you owe me an answer."

She could not doubt as she heard the touching, deepening, quiet tone, and saw the wistful eagerness in his face, that the man, composed as he was, had staked much of his happiness on her possible answer. She could have made it without any hesitation, she felt sure, if only she had not just heard that Gerald Barrington was free. For after that concession of hers—that indiscreet concession which she had made to his wish that she should meet him, and hear what he had to say for himself—what might not Gerald Barrington expect? "I owe him something too," she thought, sorely, as she reflected on how she had incurred the debt. "It would seem heartless to grasp now at what would prevent my ever paying the debt; besides, this wish to marry Mr. Manners is not born of love."

UNDER A WEEPING-WILLOW.

Still, if it was not "born of love," it was very hard to kill it, and to say "no," as she believed herself in honor bound to say, and did say.

"I ought to have given it long ago," she said, in reply to his statement that she owed him an answer. "It is only because I have been feeling all the importance to my own happiness of giving great thought to my answer that I have been so slow and so full of hesitation. Mr. Manners, I must say as I said before—it can't be as you do me the honor to wish it to be. I must stay as I am—I must, indeed; don't cease to be my friend; don't leave us now, and leave us disliking me."

CHAPTER VIII.

MR. MANNERS BESPEAKS NINA'S INTEREST.

MR. MANNERS did not take offense and his departure after that second refusal from Nina. He was much too calmly sensible and thoroughly well disposed toward the young lady to do any thing of that sort. He thoroughly and sympathetically understood all the difficulties and disagreeables of Nina's position; and he knew well that if he went away hurriedly Lady Delany would know that all hopes of the marriage were over, and that Nina would suffer for that knowledge. So he staid on even longer

than he had intended staying when he did not know that Nina was there, and came imperceptibly to be regarded and treated as one of the family by them all.

The long autumn days would have been long indeed, and the dreary evenings in the meagerly furnished saloon would have been dreary indeed to Nina, if it had not been for his presence. The long walks through the rather flat surrounding country, and the long hours' fishing in the pretty winding river, would have been robbed of half their quiet charm if she had not had his companionship. More than ever she regretted, as he became more and more essential to her comfort daily, that she had compromised herself by giving Gerald Barrington that meeting at Sedgwick. Not that she had compromised herself in the eyes of the world—that she refused to consider she had done; but that she had given him such a tacit reassurance as should justify him in thinking that the old deep interest in him might be regenerated.

It came about very gradually, so gradually that somehow it seemed quite a natural thing, when one day, as they were walking together, Mr. Manners broached the subject of Gerald Barrington. "You have seen him again this summer," he said; and Nina asked, quickly:

"How do you know I ever saw him at all—how do you know any thing about him?"

"Oh! a man is sure to hear of such things in connection with the woman he loves," Mr. Manners said, quietly. This was the first time he had spoken of his feelings concerning her since he asked for her definite answer down by the black pool.

"Yes," then she said, laughing confusedly; "I saw him again this summer, and saw his wife too."

"She is dead now?"

"She is," Miss Delany said, briefly.

"And when a time of conventional mourning has expired he will seek you again," he went on; and Nina shook her head and said she had "no right to think that."

"He is sure to do it," Mr. Manners repeated. "I wish I could feel equally sure that you would never listen to his proposals again. This I say quite without any regard to my own feelings toward you, which nothing can alter; but out of a conviction I have that he would not make you happy."

"One never can be sure of being happy with any person. You do not know Mr. Barrington. Why do you say such things of him?"

"Not out of empty jealousy. As far as I am concerned myself, it would be a bitter trial to me to see you married to any man—even to the man I thought most highly of; but that would be a suffering that I would willingly endure to-day, even to see you safe from Mr. Barrington."

"You have heard something against him," Nina said. "What is it? Not that I am likely to see him again."

"Oh yes, you are; of course you will see

him again. There is nothing to prevent such a catastrophe now; and I should not regret the probability if I did not think him a dangerously weak, unstable man—one who is utterly unfit to direct you. I have never heard any thing against him, save that he married in intemperate anger against you, and then had not sufficient self-respect to behave with consideration toward his wife. Probably you regard this latter as a venial error; but I don't."

Nina walked on in silence, and presently Mr. Manners resumed:

"I have ventured to say this to you to-day because I may never have another opportunity. I am going to leave to-morrow."

"Where are you going?" Nina asked, with a half-offended air.

"To Paris."

"Oh! to Paris. We are not gay enough for you, naturally."

"Would you like to hear my real reason for leaving?"

"Yes."

"It is this: Your father asked me this morning if you and I had made it all right; and I was obliged to tell him that you had very decidedly made it all wrong. He then seemed to think that it was better I should go. It rests with you to indorse or reverse his opinion by giving me your own."

"I suppose he is right," Nina said, in a low voice, feeling that she would give much to feel free to reverse the decree.

It was not pleasant at dull little Pont de Brigne after Mr. Manners left. Lady Delany, who had borne the solitude while there seemed to be a probability of her point being carried, sulked now that the probability had vanished. Heavy rain set in. Sir Arthur was seized with a mild attack of rheumatic gout, and, sadder than all else, there came mournful tidings from Ardleigh Vicarage. Poor Frank Eldon had caught typhus fever in one of his visits to a sick parishioner, and, after struggling vainly against it for a few days, had died, leaving Gertrude desolate indeed.

"As soon as I can think and act," the poor young widow wrote soon after her husband's funeral, "I shall leave this place, where I have known my greatest happiness and greatest misery, and go back to my own friends. When I am settled you must come and stay with me; but it would break my heart to see you here where I last saw you with my own dear Frank." This was in October, just as the Delanys were about to migrate farther south for the restoration of Sir Arthur's health; and from that time until their return to London, after Christmas, they heard nothing more from Ardleigh or Gertrude.

When they re-entered London one January night, Nina felt sure that now it must all soon culminate. Before long she would be called upon, and compelled to decide her own fate. Gerald Barrington would hear of their being home, and he would come and claim that which

she had given him a right to claim. As she thought this she regretted more bitterly than ever those hours at Sedgwick, which had been so sadly misspent in strengthening his belief in her unchanged love for him. But it was worse than idle to indulge in these regrets now. He would surely come, and she would surely have to marry him, and make the best of her mistake. While, as for John Manners, she did hope fervently that he would never marry a woman "who was not worthy of him," and she took some comfort from the thought then occurring to her that he was very unlikely to find such a one.

The crisis Nina had half expected and half dreaded did not come just yet. She was not put to the test of seeing Gerald Barrington, or, indeed, of hearing any thing about him. Mr. Manners came on the old familiar footing of intimate friend; but he never mentioned Mr. Barrington or his own former hopes and wishes. Nina could not help feeling disappointed and neglected. "They neither of them want me now," she thought, bitterly, as she remembered how eager each of these men had been for her in days gone by.

She could not help speculating curiously, sometimes, about Gerald Barrington and what had become of him. Was he at Ardleigh End still? There was no one of whom she could ask this question, for the widow Gertrude Eldon had left Ardleigh just before the Delanys came back to England. Moreover, if Mrs. Eldon had still been resident in the place, Nina would have hesitated about asking any question relative to Gerald Barrington, of a lady who had thought so little—not to say so ill of him as Mrs. Eldon thought. "I shall see her in time, when the sharp edge of her grief has worn off," Nina thought; "and then, in speaking of poor Frank's parish, she will be unable to avoid mentioning that one parishioner." Then Nina would sighingly wish that his poor wife had lived—that she (Nina) had never seen him as a married man—that, in fact, a goodly portion of the past could be erased altogether.

In the middle of the winter season a new element was introduced into her life. John Manners's mother came to live in town, bringing with her a pretty young niece, whom she had almost adopted. As a friend, John Manners asked Nina to see a good deal of his fair young cousin, Edith Graves. "I think you are the best companion a young girl could have," he said to her, frankly. And Nina told herself that if he had the faintest tinge of love remaining for her, he could not judge her so dispassionately and kindly, after her having refused him twice. "He is quite cured," she thought, bitterly; "he will fall back on that blue-eyed nonentity as contentedly as if I had never existed for him." And thinking this, she did begin to long for some sign from Gerald Barrington. A couple of defections in one year is surely too much for any woman to bear placidly.

CHAPTER IX.

TWO MEETINGS.

WHEN Mrs. Manners left her country home, for the sake of giving pretty Edith Graves a sight of life as it is lived in London, the good old lady made a considerable sacrifice. She had a deep-rooted dislike to small rooms, neighbors, smoke, German bands, tan-yards, and other minor evils to which flesh is heir in London. Nevertheless, she hurled herself into the midst of the possibility of all these things for the sake of the girl whom she loved as a daughter already, and whom she hoped to see bud into that relationship in law.

"You ought not to keep Edith mewed up all her life among the butter-cups and daisies, mother," John Manners had said on the occasion of his last Christmas visit to his mother's house. And on that hint Mrs. Manners spoke, begging him to find her a comfortable habitation in one of the least offensive suburbs of the great city, wherein, she never doubted, wary women were always lurking about seeking to devour him, and where Edith's sweet presence might prove a foil to their meretricious attractions.

So it came to pass that a house was taken for Mrs. Manners in the Victoria Road, Kensington, and that when midwinter was past she came there to dwell with Edith; and when she had been settled there a reasonable time Lady and Miss Delany came to call upon her.

Now the mother had never heard of these friends of her son's; and when she saw them an idea came into her head that they were among the dangerous ones of the earth, from whom Edith's pure little presence might preserve him. They knew too much about John altogether to be pleasant to her. So she made herself rigid at them, and counseled Edith not "to want to go gadding about with them;" and intensely aggravated her son by saying, "One couldn't wonder at a girl situated as Miss Delany was hunting after a husband."

And little pale, brown-haired, blue-eyed Edith, whose mouth and mind and hands were all small to match—little gristle-boned Edith—lashed out her little weapon of flagellation upon Miss Delany, and said, "Miss Delany seemed so lazy, never seemed to care to read any thing good, or to work any thing useful;" which accusation was true in a measure, for poor Nina was out of gear in these days, and found herself incapable of settling to any thing.

But as time wore on, and the lassitude which is nearly every one's portion in the English spring assailed the denizens of the little house in the Victoria Road, and as they found that acquaintances are not speedily picked up or friendships formed in exclusive suburbs, Mrs. Manners and Edith both came to regard Nina as rather a welcome presence. Perhaps this change in their sentiments was due to the fact of John's having always discreetly refrained from expressing pleasure when she did come or pain when she staid away. He was, in fact, apparently

utterly indifferent to her, and this indifference militated hugely in her favor with the women of his own house. So the year and the change rolled on slowly and surely together, and spring was merging into summer, and the bedding-out plants were arranged for the season in ribbon borders in Kensington Gardens, and London was getting very full again; and all this time Nina heard nothing of Gertrude Eldon or (which was far more annoying and puzzling to her) of Gerald Barrington.

The bright-faced beauty had almost resigned herself to the painful probability of being an old maid, for, as it would have been her will and pleasure now to marry John Manners, and as it was clearly (to her mind) her honorable duty to marry Gerald Barrington if he ever asked her again, it was out of the question that she should give her hand to any other man. She was growing resigned, though not reconciled, to the prospect—to the prospect of that fate for herself, and also to the prospect of the far fairer fate which seemed to be looming before Edith Graves, when the whole of her future was rudely broken up and disturbed.

One June day she was sitting in Mrs. Manners's little drawing-room bay-window waiting for Edith, who was up stairs preparing for a walk in Kensington Gardens. Nina was there in obedience to a request of John's, that she would get his mother and Edith out to hear the band that afternoon, and he had added weight to this request by promising to join them at the lower end of the "Row," if they would walk so far. While she was waiting her gaze wandered idly over to the opposite house, which had been unoccupied for a long time. She saw that the shutters were open, that delicate pale green French chintz curtains were shrouding the windows, that bronze railings had been put up to form little window-gardens, and brightly flowering plants were already blooming there. In fact, that there was a general air of refined occupation about the house.

"Oh yes," Mrs. Manners said in answer to some question Nina asked presently; "it is taken, but I don't know who by. I haven't heard her name, but I've seen her passing in and out while the house was preparing. Ah! they're a precious lot about here, I feel pretty sure. Ladies living alone with golden hair and little broughams I never feel sure of."

"Has this one golden hair and a little brougham?" Nina asked, laughing.

"She has the golden hair, but not the little brougham yet," the old lady said, sententiously. "She is a most lovely woman, I must say—in deep mourning; there she is at the window."

Nina looked across hastily, and then started to her feet, crying out, "I know her—it's Mrs. Eldon!" and then, without further explanation, she ran out, and across the road, and knocked eagerly for admission to the presence of her old friend.

There was a great scene of gentle recrimination and involved explanation when they met. Gertrude had not written because at first she had been broken-hearted, and latterly too busy. She had staid a long time at Ardleigh, for the present vicar was an unmarried man who didn't want the house, and was just as well satisfied to remain in lodgings, while it had suited her convenience to stay at the Vicarage. Then she had gone back to her father's house. But her mother was dead, and it was unpleasant, after being the mistress of a house of her own, to submit to the household authority of a younger sister. So she had resolved upon taking a small house in an accessible part of London, and she had succeeded in getting this, and wasn't it charming?

It was very charming; small, but exquisite. Brilliant, as women's rooms ought to be, with plate-glass and delicate-hued chintzes and flowers. A perfect little temple of refinement and beauty it appeared, and Gertrude was a mistress worthy of it. In her deep mourning—deep, though she wore no widow's cap—she seemed of a fairer beauty than ever. And her youth asserted itself so, in spite of the traces of mental suffering and heart-sickness that were still upon her face.

And at last she asked:

"And what of you, Nina, since we drifted away from each other? I have always been half expecting, wholly hoping, that I should hear of your marriage. Am I to hear of it now?"

Nina blushed an angry blush, and shook her head.

"Let us speak of something else," she said.

"Mr. Manners was with you when you wrote to me from Pont de Brigne," Mrs. Eldon persisted.

"He is with us constantly now; but I might as well hope to—I mean *wish* to—marry a star as to marry him." Then, for a moment, she longed and feared to hear something of Gerald Barrington. But the word was not spoken, and she fancied that Gertrude had forgotten him and his folly, and her (Nina's) share in it.

They talked then idly for a time of what had happened, and what might happen; but it was all spoken in a vague and undefined way that left Nina with a feeling of uncertainty upon her as to what Mrs. Eldon wished to do, and thought of doing. "It's a dear little house, isn't it?" she had said to Nina when the latter had made the tour of dining-room and double drawing-room, and bed and dressing room, and had duly admired the arrangement of them all.

"Yes," Nina said, "it is a dear little house, and I think a particularly nice neighborhood to settle down in. I think you very wise to have come here, instead of burying yourself in the country."

"I dare say I shall like the country again," Mrs. Eldon said. "I did enjoy it thoroughly while I was happy, you know."

"Like it again! Why, you don't think of

moving, do you, after so completely establishing yourself here?" Nina asked, in some surprise.

"Oh! one never knows how soon changes may take place," Mrs. Eldon said, drooping her head, and half averting her face from Nina's inspection. And then she inquired who Nina's friends over the way were; and when she heard that they were "the Manneses," she put on that look of quizzical interrogation which is so specially hard to bear when the interrogated one has nothing to tell.

"Then I shall see Mr. Mannes at last," Mrs. Eldon said.

"Probably you will if you watch for his coming and going."

"But you will introduce him to me."

"Indeed, I am not on such terms as to promise to introduce him to any one specially," Nina said, in an agony.

"Do you remember how I urged you to do as he wanted you to do when you were staying with me at Ardleigh?" Mrs. Eldon asked.

"Yes, I do," Nina answered; "and I was infatuated then and disregarded your advice. Well, I'm not going to complain now, but I will tell you, for your satisfaction, that you were very right in saying that I was throwing away the worthy substance for an unworthy shadow. I was an unaccountable goose, all things considered." Then she remembered that Mrs. Mannes and Miss Graves were waiting for her, and went away quickly before Gertrude could reply to her half confession.

The last strains of the band were borne to them upon the still hot air long before they reached the spot where John had appointed to meet them. "Of course he will have given us up and gone back to town long before this," his mother said, testily—for Edith was looking very pretty, and Mrs. Mannes had hoped her son would have been impressed with that prettiness. Now the old lady felt that all her own trouble and Edith's toilet had been thrown away.

"I am sorry that I should have caused the delay," Nina said, apologetically; "but Mrs. Eldon and I have not met since her husband's death. I was bewildered at sight of her."

"Humph!" Mrs. Mannes said. "Her husband's death? How long ago is that, may I ask?"

"He died in the autumn of last year."

"A gentleman calls at the house very often," Edith struck in; and Mrs. Mannes shook her head, and remarked that in her day widows conducted themselves as such, and wore caps, and didn't advertise the fact of being solitary, idle, and well off, by perpetually attending to rare flowers outside their windows.

They did not meet Mr. Mannes. Evidently he had given them up, as evidently he did not care to see her, Nina thought. As for his mother and cousin, they were openly aggrieved, not at his not being there then, but at Nina's having prevented their being on the spot before. Altogether Miss Delany was not sorry

to part with them, and to make the best of her way back to Eccleston Square.

She was walking slowly along on the left-hand side of the Row, carelessly watching the rapidly increasing throng of equestrians who had come in for the afternoon ride, when her attention was caught by a gentleman who was coming slowly toward her, close inside the railings. Almost before she had time to realize who it was, she found herself bowing to Gerald Barrington, who had raised his hat and passed on without pausing, or giving the slightest indication of a desire to pause.

It was coming upon her, then, this crisis in her fate, which she had half dreaded, half expected, for so long a time. The old love was to the fore again, and he would soon find her out and test her truth, and—he must not find her false.

Her knees trembled under her now as she walked on, feeling that he would surely overtake her presently, when he had recovered the senses which must have been slightly scattered at sight of her. He would overtake her again presently; and she was very glad, after all, that she was so faultlessly dressed this day, though the dress had been designed to please the eyes of John Mannes, and not of this old love of hers, who had been so strangely fettered, and was now so strangely free.

She went on and on—now faster, now slower—now with a feeling of thanksgiving that no one knew and could remark upon her—now with a self-consciousness that she was concentrating the attention of riding and sauntering London upon herself; and still, through all these phases of feeling, she walked on undisturbed, for that rider did not draw rein by her side. At length she found herself up close to the entrance by Apsley House, and there she did pause for a moment and look round.

There was nothing to be seen of Gerald Barrington, and with her heart strangely agitated, but still a little lighter, she went out through the gateway, and got herself home.

She was going to a party that night—a charade party that was to merge into a dance—and she was going under her step-mother's auspices. Lady Delany was always good enough to avow herself to be "in despair" about Nina in these days. But this night she was in very well-developed and special despair. "Nina looks positively old," Lady Delany said mournfully to her husband. "She has got a set, serious expression on that is absolutely ruinous to her face; and what will become of my child if Nina stays home, costing so much?" Then, finding her husband grossly insensible to his eldest daughter's appearance and his youngest daughter's prospects, Lady Delany tried the effect of her eloquence on Nina herself.

"At least, take a little eau-de-Cologne for your eyes," she said; but Nina preferred going with her eyes dark with thought to brightening them with spurious art.

When the charades were over, and other girls were standing about after the manner of

THE MEETING.

their age and sex—standing about in accessible places, hopeful of the right men asking them for the first waltz—Nina got herself into a small ante-room where was peace and quiet, and a comfortable divan. The lamps burned low in this temple of flirtation, thanks to the humanity of the hostess, and Nina leaned there for a while, fancying herself to be quite unobserved. Presently the seat by her side was taken by Mr. Manners. “I did not expect to meet you here,” she said; and then he apologized for not waiting for them at their trysting-place in the park; and she told him of her meeting with Mrs. Eldon.

“Life is so full of upsetting encounters,” she said, trying to smile.

“It’s not an upsetting encounter with me to-night, is it?” he asked, laughing. “You’re looking terribly depressed, or is it merely the dim religious light that gives you that appearance?”

“I am depressed. You would pass your evening more as you came to pass it if you went and danced.”

“But not so pleasantly as if I stay here with you.” Then he put his arm along on the back of the sofa just behind her shoulders, and Nina felt many shades less desolate, and a

strong conviction that he was going to say something important.

"Another old friend of yours is in town, too, Nina. Am I telling you news, or did you know it already?"

IN WALL STREET.

I WELL recollect the day I first arrived in New York. I came in the Camden and Amboy boat, and landed early in the morning. My worldly effects were packed—mother did it—in a long hand-bag made of bright Venetian stair-carpet. I remember I also had a blue cotton umbrella, quite new, with a yellow brass tip. Passengers coming from the boat with me regarded me with interest, and I was modestly pleased with this silent recognition of a promising young man entering upon the scene of his future fortunes. I could not help observing, too, that the hackmen paused a moment in their vociferations as I passed. They knew better than to offer the extortionate luxury of a ride to a sturdy fellow who was bound to make his own way. These were my emotions. Of course I knew very well that the best men in New York come from the country, and I was one of them. I supposed that the reason I was regarded with distinction was my manly and business-like appearance; but now I think of it, I should say that it was only the colors; for I remember that a suspicious-looking urchin offered on the pier to carry my things for me, and indeed undertook to take them from me; and when I resisted he forbore, and raised a great laugh by saying, "Well, go it, Rainbow!"

A few years' experience of city life modified my ideas, and my appearance too, doubtless; but after all, on the day I entered Wall Street in search of a situation in a bank, I felt more trepidation than in my first arrival, or in all my intermediate vicissitudes. That day stands out in my memory, with a few others I shall speak of, like two or three bright nickel cents in a tray of old coppers. It was a very hot day, fifteen years ago. On account of adverse circumstances I considered myself as rather "under the weather;" and I approached the great Rhino Bank, where I had some reason to believe that I should be at once engaged to fill a vacant situation, with the anticipation that I was reaching a haven of rest—that I was to land on the *terra firma* of a good salary in a hard-money business, after I had been battling with the waves and tides of desultory and temporary vocations.

I had a wholesome awe of a bank. In my estimation the president was the incarnation of cash. The directors were doubtless all philosophic and learned political economists, wielding the laws of trade so adroitly as to turn every thing into gold for their stockholders' benefit. I thought the business was the embodiment of all that was right, correct, unquestionable; that the most honest men, the most intuitive financiers, the most infallible accountants,

composed its officers and clerks; that the ledgers were spotless and pure, guiltless of scratch or erasure; and as to mistakes, if one of the clerks should make one, he would cut his throat right away from ear to ear, as the only way of avoiding the consciousness of an unutterable disgrace.

But this was before I had been *inside* the bank counters. I had watched the tellers and clerks as I had entered a bank on dealers' errands. I had seen them through their respective wickets, wrapped in dignity and surrounded with wealth. I had enjoyed the distinction of a customary nod from the receiving teller, and had been on speaking acquaintance with the book-keeper A to I. The bank clerk naturally considers himself at the head of all clerkdom. Have you not observed with what hauteur he exchanges recognition with an acquaintance outside the railing who daringly ventures to attract his attention? Well, I had been such an acquaintance, recognized to the envy of others; and now I expected to get within the rail, and stand among the perfected few who dispense money for the outside world.

Crude and silly as this feeling was, there is some foundation for it in fact; but I did not then know how exaggerated it is. I had not then seen how diverse the characters of the men who came together every morning to make up the *personnel* of the bank; how surely there will be found among men of integrity and fidelity others of assurance and an overbearing demeanor, which enables them for a time to conceal the want of those qualities. I had not seen from how many different associations, and with how many different purposes or no purposes, these men came together for the day, held to the same scene of labor for a quarter or a third of their time by a common paymaster, to separate again and scatter to their own likings after a few hours. I had not seen how the keen ambition of one plays upon the good-nature, the indolence, or the blunder of another; how vicious associations outside the bank occasionally reach in, and claim for their own one who had not before shown the evil side of his character to his employers; and how steady-going old stagers drudge on with the routine of their work, while others come and go. The force and decision evolved by the intensity of competing labor within a large bank make the ordinary chances and changes "as good as a play" to witness. Every thing is done with a snap. If a man is discharged, he is shot out into the street like a load of coal. He doesn't have a month to think about it. If a man wishes to leave, there are five or six pushing for his stool, and it is touch and go.

The banking-room in which I was engaged was not in the modern style. A long, narrow, dingy entry led from the street back to a rear building, whose windows were shut in on every side by gloomy brick walls. The air was close, and savored both of soiled money and of subterranean odors from the regions beneath, which

light and winds never penetrated. The counters and desks were in old mahogany, presenting an eminently respectable appearance outside. Inside were homely dusty cupboards, dead papers, empty ink-bottles, old ledgers, pieces of carpet, ink-spots, and spittoons.

Catching a glimpse of these things, with which I afterward became so familiar, I passed into the directors' room, and was ushered into the presence of the president.

Let me give you the portrait of this singular man. President Borrowbie was a portly person of fine presence. His hair, long and silken, was growing gray. On his smooth face the absence of whiskers was set off by the profusion of his shaggy eyebrows, which gave a fierce shade to his soft, mild eyes. He was supposed to be president by virtue of a large family interest in the stock, not because he was like any other bank president I have seen. His manner possessed all the vigor of a sharp, brusque spirit, but was modulated into courtousness by a native grace, and by a benevolent disposition. All his relations with Wall Street were of a time gone by, and he was then beginning to feel antiquated, which resulted in his taking a great interest in young men. He prided himself on his knowledge of character; and though he sat as handsome, and almost as silent, as a ship's figure-head, at all ordinary business, judiciously yielding to younger men, he came out strong whenever a new clerk was to be employed or a new depositor was introduced.

His conversation with me I shall never forget—it was so characteristic of him. After making some commonplace inquiries as to my capacities and references, he said:

"Well, young man, please be seated. I want to ask you some questions. I do this with all the young men who apply, though not many of them tell me the truth. They generally say what they think will please me. You can do just as you like."

To this I made no reply, because I did not know what to say. He looked at me quizzically, and seemed to enjoy my embarrassment. I next observed him looking into my hat. I wondered what there was in it to attract his attention. I afterward learned that it was one way he had of forming an idea of the cast of character by comparing the diameters of the head.

"Can you do work in a hurry?" said he.

"I have not been accustomed to," replied I, cautiously.

"Hm! Wall Street is a driving place."

As this was not a question, I made no reply.

"Can you make good excuses?"

I began to think it was not strange that some people answered his questions as they thought would best please him. For myself I could not tell for the life of me which answer would please him.

"Good excuses?" I began, inquiringly.

"Yes; when you make a blunder can you get well out of it?"

I reflected that if I should claim the virtue, it would not speak well for my accuracy; and if I should disclaim it, it would not speak well for my shrewdness.

So I laughed at this ingenious dilemma, and said, "Well, really, Sir, I should think the best way of getting well out of blunders in Wall Street to be not to make any. That's *my* ambition."

He looked at me as if I had uttered a very Utopian sentiment; but I felt the elation of having succeeded in saying that which pleased him, notwithstanding his worrying.

"Are you quick at figures?" he asked.

"Yes, Sir."

"Tell me the error in that," and he handed me a sheet. "Take your time," he added, as if it were a sort of crucial test of accuracy.

Between the desire to prove myself quick at figures and the ambition to make no blunders, I found my thoughts wandering; I went astray on the column, felt he was looking at me, blushed, began again, and finally returned him the paper, saying I thought there was no mistake.

"Well," said he, quietly. "You *think* there is none; perhaps there is not. I will get somebody else to look over it who will *know*."

I felt as if I could have sunk through the floor.

"And now," said he, turning the conversation, "about your references."

Here for a moment I hoped to make up my lost ground; but I was disappointed.

"We don't care anything about those," said he. "Connections, and all that, are very good in some places; but they don't count for much in Wall Street. A recommendation from Boston or Philadelphia is only a stamp on a foreign coin. What we want is the bullion, and we'll put *our own* stamp on it here. Do you see? What we want is the pure metal. We know it when we see it; and we have our own dies to give it currency."

He looked at me in his kindly and quizzical way, and I felt great doubts whether I was bullion or brass. After my weak answer as to the account, I was inclined to think it must be the latter.

At this juncture the cashier came in, and I at once saw that the question of my engagement practically depended on him, though he was guided more than he would acknowledge by the president's opinion. After some further conversation I was set at work.

I went out of the president's presence impressed more deeply than ever with the necessity of the utmost accuracy, celerity, and certainty in banking business; and I entered on my duties with a most intense ambition.

Although the clerks laughed among themselves at the old gentleman's notions, the bank under his administration certainly had a smaller proportion of unfortunate employés than any other institution I have known.

In the intervals of the first few days' work the clerks asked me what the president said to

me. "Did he tell you his teller story?" asked one.

"No," interposed the note teller; "he never tells that story except to a new teller." This book-keeper was one of the queerest specimens of humanity you would meet in a long journey. He would look up at you with a cynical squint of his eye, as if he were mentally taking your average value, and then give you a short, crusty answer.

"What is his teller's story?"

"When the bank was first started the paying teller overpaid a man five hundred dollars on a large check, and the man came back in the afternoon to return the money. The teller was not aware of his mistake, and Borrowbie overheard the conversation, and came out to see what was going on. He interposed, and made the depositor take back the money which he had given to the teller, saying, 'If you have five hundred too much, Sir, you must have got it somewhere else.'

"No; I am sure it must have been here that I received it."

"Impossible, Sir; impossible! We have made no mistake. You will find it came from somewhere else. We can not take it."

"The depositor went to his counting-house, and in the course of the next few days advertised the accuracy and honesty of the new bank to a good deal more than the value of five hundred dollars.

"Borrowbie called the teller to his own desk, drew his own check for \$500, and handed it to him, saying, 'There, young man, that will square your account. Now remember! *This* bank makes *no mistakes*, young man. *This* bank *NEVER* makes a mistake.'

"That's the way he puts it to the tellers," said the book-keeper. "He says 'twas the making of the bank."

"Not exactly honest," said I, timidly.

"Well, the question is, whether you're guilty of deception in making a man a present of a thing by denying that it belongs to you. If you've given it to him, it don't."

I was not then so adept in the casuistry of banking, and did not see through the fallacy.

"He hasn't had to draw his check often for that purpose, has he?"

"What, for *these* tellers?" said the book-keeper, with a roguish sneer. "I can't say how often they make mistakes; but this I can tell you, they never thank any body for rectifying an overpayment. It makes 'em cross all day."

At this sally at the proverbial unthankfulness of bank clerks when mistakes made to their own disadvantage are corrected by others, the book-keeper plunged into his ledger.

President Borrowbie was very methodical, precise, and punctual. I well remember the first time he ever missed an appointment. It was considered a sign of his decadence. The attorney of the bank, a pert fellow, came in one afternoon to call him to attend a reference or

trial in a lawsuit. He found him reading a newspaper. "I declare," said he, "I forgot all about it."

"Why, Sir," said the attorney, with the gratification a small man sometimes shows when he finds a great man napping, "I thought you never forgot any thing."

"Young man!" said the president, "I have forgotten *more things than you ever knew*."

THE RUNNER.

My first regular employment in the bank was that of runner. The runner's business is to present drafts, for acceptance and collection, to merchants and other men of business in all parts of the city. He has to travel the city through; from egg-cellars in the Erie Buildings to the sail-lofts in the fifth story in South Street—from a ship-chandler in Burling Slip to a Senator at the Astor House. He has to collect school-bills, rents, dividends, coupons, calls for installments on railroad stock, etc. So behold me at work—and irksome work it was!

The runner must get through his day's route and be back to the bank in double quick time, so as to make his returns to the tellers, who may be waiting for his items to close up their day's work. Consequently he has sometimes to stretch his legs in order to return in good season. That summer I thought I should give out. The weather was very hot, and, after having gone rapidly through my route and returned to the bank, I would go home, drop on a lounge, and not be able to get up again for the rest of the day, so exhausted did I feel. However, in a few months I conquered this, and became somewhat hardened to the work. After that I got on better. Let me attempt to describe a day's experience:

After entering the drafts (to be presented to firms and individuals for acceptance or payment) and the notes (to be presented at the different banks for certification as to genuineness) in a book for that purpose, and then arranging them for greater convenience in passing over the route (which is through the lower part of the city, and then up town as far as the drafts lay, and then back to the bank), I started out.

Passing from the bank around into Broad Street, I would leave a draft for acceptance, say at No. 30. Then, calling at 13 New Street, a draft would have to be presented for payment. Probably there would be two or three persons before me, so I would have to wait patiently until I could be waited on. Then on to 57 Broadway, to get a draft which had been left the previous day for acceptance. As like as not the person who had charge of it is out, or the draft has not been attended to, and then I have to wait until it is attended to; or, if I know the parties, trust to their promise that it will be sent up to the bank before 3 o'clock, as after that time non-accepted or unpaid drafts must go to protest. The next place is 20 Beaver Street. Here the parties are out; so I must

leave a notice for them to come up to the bank and pay it, say at 2 o'clock, at which time I expect to be back. Then on to No. 29 Whitehall Street. Here I leave a notice of a protest of a note (left for collection) not paid. The next place in order may be No. 18 South Street, a flour house, for a sight draft to be paid. Thence into Front Street, and call at one of the provision dealers, with a draft for acceptance. Sometimes the parties are obliging, and knowing that the draft is correct, accept it at once, and save me the trouble of calling next day. Sometimes the draft, if drawn at two or three days' sight, will be accepted, and dated by mistake the day after it has been left. This must be attended to, for if not seen to in time it will have to be taken back to be corrected. From this place I pass on to Wall Street, and get a sight draft paid by one of the auction houses. Then to Water Street, to leave a time draft for acceptance on one of the large hat manufactories. Then up Burling Slip to Pearl Street, to get a note certified at the Seventh Ward Bank, and to the Fulton Bank for a like purpose. Here the teller gives it back to me with the answer, "No funds." Sometimes it will be handed back with the answer, "No account," or that he has just certified a check to take it up with. From there it is likely I will have to go away up to the head of Cherry Street, to one of the iron foundries, with a draft for acceptance. Thence my route will take me to the ship-yards up town, to collect a sight draft. Probably I shall have to hunt all over the yard before I find the proprietor, and then as like as not he will give it back, saying, "I sha'n't pay it." I now jump into a stage and ride across to the Bowery, corner of Grand Street, to have a note certified there.

By this time it is 1 o'clock, and I begin to be impatient to get back, as it is becoming late, and I am still some distance up town. By the time I get over to Broadway I have become quite short and crusty, and don't stand on much ceremony. I dash into a place and out again as fast as possible, taking advantage, whenever I can, of a ride by stage or car to get ahead. So I pass down town in a zigzag course, down one street and through another, and so around to Wall Street again, and am back as near 2 o'clock as possible.

This lasted for some years. Sometimes I would become tired out, and resolve to leave. Then I would recover from the fatigue, gird up my loins, and at it again.

The runner has not only to be careful out of doors, to get along with the customers so as to give no offense, but he must take care inside to keep on good terms with the tellers, that there shall be no blow-ups between them. It is in the power of the teller to be very annoying, if he is so inclined.

Outdoors, the runner must also, in order to expedite his business, be acquainted with the short turns, the ins and outs of the streets, etc.

At the times of which I am now writing,

there was, in the lower part of Wall Street, the private banking house of an English firm, where they did every thing in true, bluff, dogged English style. I went there one day to get a draft cashed; it was near the end of a long day's running, and, as I was pressed for time, I watched the teller as he counted over gold pieces for a hundred and fifty dollars, to see that he counted them right, and then I dropped them into my pocket without a second counting, and rushed on. When I got back to the bank my funds were five dollars short. I was in a cold perspiration at the discovery; no counting or figuring would bring me out right. Here was a blunder, and my proud ambition was broken. I conjectured that the mistake was at B. and Co.'s, and I made excuse to leave the bank and run down there; but the hour of three had struck, and their door was closed, and rattling at it for admission brought no answer. I went back in a condition of despair. It was only five dollars, but it was a blunder. And to me who had then only sixty-three cents available means, five dollars looked like a small fortune. Being both proud and verdant, I was at my wits' end. As I walked hopeless into the bank, I saw a glimpse of President Borrowie alone in the directors' room. The thought struck me, and I marched in without a moment's consideration, and pulling out my watch—a silver relic of time gone by—said to him: "Sir, I am afraid I have made a mistake; and if I have, I've no excuse. Will you be so good as to take my watch, and let me have five dollars until Saturday?"

Not a muscle of his face moved as he looked at me, and I looked at him watch in hand. I have often laughed since at the ridiculousness of my position, thus endeavoring to get my week's wages discounted in the directors' room on what was not very good security for ten shillings.

The good old man seemed to comprehend the situation. Without a word he took the watch, put it in a little drawer and turned the key, and then laid a half eagle on the desk before me. I went out in silence, and made my returns to the teller, where I was scolded for delay. That night I did not sleep much, though I felt a sort of exultation in having squeezed through. Among my first errands in the morning I went to B. and Co.'s.

"Do you remember," I said to the teller, "paying me a hundred and fifty in gold yesterday—"

"Here's your five dollars," he burst out, tossing it out, without allowing me to finish my sentence. "Now be off; you kept us here all night trying to find your mistake."

I seized it, too glad to retort, and disappeared. The first opportunity of finding the president alone the same day, I tendered him the identical gold piece. I said: "The man who made the mistake has rectified it, and I thank you, Sir."

He looked around to see that no one saw the

transaction, produced my watch, and took the money.

I remember that, as I turned to go out, he said I might shut the door; and, thinking he wished to speak with me, I closed it and returned toward him.

"You may shut it *from the other side*, Mr. Tillmann, if you please," said the courtly old gentleman. It was his polite way of piercing me with the conviction that such assistance would not be open to me a second time. I could have worshiped the old man for his goodness.

INSIDE.

Inside the bank the clerks were of a great number of nationalities—"braw Scots fra abune Abairdeen," American, and Irish; and among others a bluff Manxman, a subject of "his Majesty the King in Man."

There were the usual number of petty jealousies, and attempts to rule or ride one over the other, and as usual the weakest had to go to the wall.

What would the teller care for the comfort or convenience of the runner? This or that thing must be done by 3 o'clock, at any cost; for *he* was in a hurry to get away. The very next day, likely, the same thing was not of as much consequence—so arbitrary and overbearing does a person in such a situation become.

After getting in and making his returns to the tellers, the runner would have to enter notes that had been left during his absence, in the collection pass-books, and then prove the third or note teller's book.

If he was quite smart and wished to push ahead, he would count money for the second or third teller, or enter the deposits, or do some other work by which to ingratiate himself in the good opinion of those above him.

One of the smartest clerks was the general book-keeper. He would fly around the bank, picking up an item here, another one there, as he went around, apparently hardly doing any thing at all; then, summing these figures up, he would have his proof all correct.

He was very rapid in his movements, and would dart around and around the room again before he settled at the place he aimed at.

One of those who had to take his place temporarily complained that he "didn't see how the 'gen. book.' could make out his proof with a figure here and another there—hardly any thing at all—on a sheet of paper!"

Too many bank clerks have not enough to do, while others have too much put upon them. Some, who are "smart," soon get through their work; and others, who are "shirks," are much engaged in helping their superiors, to procure favor with them, leaving their own duty to take care of itself until it is thrust by those superiors on the less ambitious and more assiduous subordinates. There are always some fags upon whom neglected work falls.

Others lay their plans to rise by prying out the weak points of a superior. Woe to the un-

happy fellow-clerk who stands in the way of such a one! Our friend is bound to "rise" or be promoted by some means—good or bad; and if the person in his way "gives place" to his lordship, well and good; if not, he had better go at once, unless it should happen, as it sometimes does, that he is the hardest one of the two; then, indeed, ensues a crafty struggle for "getting ahead."

"When Greek meets Greek, then comes the tug of war."

One thinks nothing of dogging the other's steps; listening to his talk while pretending to get an item to post; prying into his desk, *to get a pen or rubber*; looking to see if his ledgers are kept added up, or any other trick by which he may expect to catch his rival tripping. If our friend should succeed in his labor of love, he walks rough-shod over the one above him.

After a while I obtained the place of assistant to one of the book-keepers.

Here the duties are not so laborious, but more irksome. The checks for the day, of the accounts in the ledger, have to be entered in a book prepared for the purpose, and then proved, to see if the morning exchanges are right, and likewise the afternoon checks for the same purpose. Then the dealers' books had to be balanced; and sometimes there were very many checks. Then, if there was a difference, it might be some time before it could be found. One or two cents sometimes consumed hours of hard work in looking up. After that the checks had to be sorted away in a place prepared for that purpose. This was a troublesome business; but if one of the checks got mislaid, it was like hunting a needle in a haystack to find it.

One day, while I was busily writing at my desk, the quiet that reigned was rudely interrupted by a cry of "Stop thief! stop thief! stop him!"

Every one sprung up in astonishment as the sounds reverberated through that hollow and lofty chamber. I stood up at my desk, and saw streaming from the cashier's desk, along down the passage-way by the wall, a long line of men gallantly headed by the cashier in person—and, presto! they were gone before I could get my scattered senses together! I could hear them clattering out through the hall, with a "view-halloa," and then the noise died away in the distance. One of the first to join in the chase was young M——, a lazy, idle favorite. He ran around, and gave a spring over the counter, passing through the paying teller's gate as if he had been shot from a cannon. Would that I had the pencil of a Hogarth or the pen of a Walter Scott to picture or chronicle that ever-memorable chase!

The fugitive, after knocking down two or three of his pursuers, was obliged to surrender to superior numbers, and was brought back in triumph. But the triumph was brief. The man explained that he had picked up a check

in the street, and had merely presented it to see if it were worth any thing before he should take the trouble to search for the owner; that the teller seemed to regard him with suspicion, and sent for the cashier; so, becoming alarmed at the turn things seemed to be taking, he abruptly departed, and this sudden movement gave rise to the hue and cry.

The cashier came back heartily ashamed of his share in the transaction; and as I had remained quiet, moralizing on the propensity of human nature to follow every poor hare that runs, I enjoyed my own complacent reflections on the result.

In the course of time I became assistant to the second (receiving) teller. This was a very hard and trying situation. It was a place to prove one's disposition, with nothing but steady work the best part of the day. The routine of this desk was as follows: The teller, after taking the deposit, handed it over to the assistant, to sort the checks and bank-notes into as many different pigeon-holes or boxes as there were banks with which the exchanges were made. The bills were counted and made up into packages, and then, with the checks, were put down on a slip of paper headed with the name of the bank to which the exchange was to be sent. Sometimes there would be great stacks of bills to be sorted and counted; and then, again, there would be no end to the checks to be put down on the slips. Frequently both these things would occur on the same day, and then there was nothing but drudgery for that day. I have known it to continue thus every day in the week.

The worst part of the day was about 3 o'clock P.M. Then the late and lazy depositors, with the large brokers, would come thronging in, and form a long line at the receiving teller's counter. Then there would be a long and tedious half hour till 3, when the teller ceases to take in the deposits. Sometimes a dealer's boy would try to put in his deposit ahead of the line. This would cause a beautiful explosion.

A smart teller, with his assistant, can get through his work by half past 4 to 5 o'clock. One of our tellers was a queer customer. What enormous quantities of tobacco he did consume in different ways—smoking, chewing, and snuffing! There was always a hecatomb of Mrs. Miller's boxes under his desk. What a strange being that man was! He was a droll fellow, with all his faults; and he made himself apparently very important, although he was indolent.

Any one would suppose that the business of the bank would come to an end without the presence of B——. If he was called away to the paying teller's desk, a customer would come in, and at once the question would be anxiously asked, "Where's B——?" "There he is, at the paying teller's desk." "Oh!" the dealer would say, as if much relieved, and as if then it was all right.

He was very free with his money, giving it

right and left with great profuseness. He would buy every thing that came along, and his desk was always crammed with as heterogeneous and nondescript a lot of things as one would often see; all pitched in any how, from a child's whistle to a can of honey. And couldn't he be lazy! Bless you! it did him good to loaf around, read the papers, talk politics, and chew tobacco. I verily believe that he came into the world purposely for this. He was never intended to work, not he! And then, if he had forgotten to attend to something that should have been done, and was scolded about it, with what an air he would button-hole the scolder, and accosting him as "Well, party," would tell a droll story, and would send him off laughing, having already forgotten all about the trouble.

After 3 o'clock there would be a little cessation in the labor, and those of the clerks who had not finished their work would light their cigars and puff away for dear life. Again B—— would be in his glory. Such droll remarks, such questionable stories he could tell. He would keep the rest in a roar of laughter all the time. Pretty soon one would say that tobacco did not agree with him; he did not feel well. Another would produce a white handkerchief, and, blowing the smoke through it, would laughingly show the black mark of the deadly nicotine. Then they would all puff away with renewed zest.

THE TELLER.

The functions of the paying teller are perhaps the most important of all the executive business of the bank. All the money of the bank is charged to him, and all checks are credited to him; and in this sense it might be said that all the business of the bank counters is done in his name. It all has to go through his head.

Your genuine paying teller is between twenty-five and forty. He is (in business hours) a grave fellow, with an intense look. If you did not see him through his wicket, you might take him for an active young lawyer of the most serious ambition. He is never corpulent. We do not grow fat by the intense mental preoccupations of counting all the money of a thousand great business houses with accuracy every day. He has generally dark hair, usually fine, and often thin. Imagine a fat, rolling person, with a tawny or yellowish gray head, and plump, heavy hands, trying to play paying teller! He would find it very hard to get his mind on it. The fine, yet strong, nervous organization of the genuine paying teller goes through a day's work as a racer goes over the course. He is bound to keep neck-and-neck with all Wall Street.

Perhaps some of my readers have never visited a bank except on the rare occasion of presenting a check to the paying teller. Perhaps you first wandered about, not knowing who was paymaster, and asked the wrong person, who pointed with his pen-tip to a little wicket in the high railing opposite the very door where you

entered. You handed him the check, he looked at it, and turned it over, and said, after looking at you a moment: "Madam, will you please indorse it?" In that moment he had to make up his mind whether he would disappoint and inconvenience you by refusing to pay it unless you could find some one who knew both him and yourself, and could prove your identity, or whether he would pay it and run the risk of losing the money if this stranger should turn out a forger. Your prepossessing appearance invited confidence, and his gallantry accepted the risk; yet perhaps you, ignorant of what was passing in his mind, contemned him for a curt, ungracious fellow.

"Indorse it?" you responded, inquiringly; "oh yes; let me see, how do you do it? Certainly. Ah! Would you be so kind as to do it for me, Sir?"

How provoking that the gloves would *not* come off, and the parasol *would* tumble down. By this time, too, there were other people waiting their turn.

"Impossible, madam," replies the teller, without a smile at the ignorance you disclosed. "It is to your order, and it must have your signature on the back. You will find a pen at that desk."

Then came the momentous question whether the signature should be lengthwise or across, and which way was right side up. This done, somehow you returned to the wicket and tossed in the check, saying, "There it is."

When any one speaks to you when you are counting money it throws you all out. "There, I've got to begin again." The teller knows how to be deaf. He is counting bills so fast that his fingers vibrate like the spokes of a wheel-in motion. He finishes it, knowing that he is correct, hands the pile of bills to the customer next you, and then, taking up your check without looking at you, his mind hears for the first time the words that his ears heard some seconds before. The teller turns to the book-keeper, and learns that the gentleman who drew the check has not enough funds in bank to meet it. It would be proper for him to decline to pay you any thing. The bank always pays the whole or none. But if the drawer of the check is a good customer who is sure to make a sufficient deposit in the course of the day, it would not do to mortify him by a refusal. But he may have been a good customer up to to-day, and this may be the day on which he is to fail; for almost every body in commercial business fails one day or other, and it is not the custom to give any previous notice. The teller must determine his action on the instant. There is no stopping to think. He takes the risk. You are already impatient that he has turned away; and when he returns and counts out the money, you think it is a great deal of trouble for a very small matter; and you would think it was much more if you had appreciated the questions the teller had to determine, and that yours was but one of a long

series of such transactions running in an unbroken course through the day.

Just before my advent at the Rhino Bank the great Crupler, who was then well known as a large builder, kept an account with us; and getting tired, perhaps, of making money by the slow process of adding brick to brick, he tried his hand on our teller.

He came into the bank one day at the busiest hour of the day (just before 3 o'clock), and, letting the paying teller see him at the receiving teller's desk with his deposit-book in his hand, to induce him to believe that he was making a deposit, he then came around to the paying teller's desk, and taking his place in the line, when his turn came to be served got a couple of checks for a considerable amount certified. This was the easier to be accomplished, as he had heretofore always been correct in his bank account.

This over-draft cost the paying teller his place at once, and almost ruined him. The officers had no mercy on him. However, he is now in a very good position in spite of the petty behavior of the officials.

One of the tellers used to relate this story: "An old depositor came in one Monday and complained that the Saturday previous, in cashing his check, I had given him only four twenty-dollar bills for a hundred. He related how he put the bills in a wallet, and took nothing out till Monday morning, when he found the deficit. I referred him to the cashier, and the cashier, while believing my statement that I had not made such a mistake, said that he knew him to be an honest man, and was very set in his opinions, and that it would be better to pay him the twenty dollars than to offend him by discrediting his word. So I paid him, and he went away quite complacent. A few days afterward he came in with a sheepish smile, and gave me back the money as he passed through the room, saying he would explain it to the cashier. It seems that his wife, who had, as he said, often found fault with him for carrying rolls of bills about him, instead of keeping his money 'skewered up at home as she did,' took the bill out of his wallet Saturday night unknown to him, to prove to him, as she said, that he did not actually know how much he had, and might lose it without knowing it was gone. Having, as she supposed, made out her demonstration, she gave him back the lost bill in triumph on Monday night."

THE PANIC.

In October, 1857, occurred the suspension of specie payments. For some time there had been an apprehensive talk of trouble, and at last some of the smaller and weaker banks out of the "street" began to totter, and then to fall one after the other. We first heard of one here and another there. First it was the Banking Association, then the Bowery, then the People's Bank, and so on. Although it was fine weather and sunny mornings, yet every man's face wore an ex-

pression of gloom and fear, and trembling speculators with ashen lips whispered to each other the news of the latest disaster, or begged of cautious and frightened money-lenders for impossible accommodations, based on securities which a few days previous would have been considered ample. Values, at least all speculative values, disappeared like the frost-work on a window-pane on a winter's morning. Rich men suddenly became poor. Credit vanished. No man knew whom to trust. Crowds of anxious depositors gathered in front of the banks, and other crowds who had no deposits joined them out of sympathy, and they all groaned in unison as one institution after another closed its doors. It was something like knocking the underpinning from under a building—if you struck away one of the props, the house would begin to shake and tremble, and then one part after another would be displaced, until the whole mass would come down in one undistinguishable ruin. However, one or two stood the storm, and loomed up like some grand columns amidst the surrounding crash.

If you went into the street you would see that something strange was happening. People in business who knew each other well now began to be suspicious, and to glance at each other with apprehension.

At some of the banks you saw long lines of those who were making a "run on the bank," and were drawing specie for their bills, extending and stretching until the last comer would be far out in the street.

Some of the customers, fearing ruin, withdrew their accounts from the banks, and when all was over had much trouble in getting them back again.

At our institution, the first day, Monday, October 12, we were not much troubled. But on the second day, early in the morning, Tuesday, October 13, it commenced. The customers came streaming in, one after another, to see if they could get their change. In would come a pompous individual, with more money than sense, and would slap down his bills:

"I want the gold for that!" quite shortly.

"Certainly," said the paying teller, courteously (for he could be quite pleasant if he chose).

The gold was taken up, put into his pocket, and he departed.

Next came a laboring man, who would timidly ask:

"Please, Sir, can I have gold for that?"

"Yes," said the teller; and paid him in gold.

Then came along an unsophisticated individual with a bewildered air, nervously fumbling with his bills, until his turn came to be paid, when he threw down his money, with:

"Give me the gold."

"Very well," the teller said, and passed over the specie.

It was comical to see the perplexed look of the man as he received it. He gaped at the teller, turning the money over in his hands,

and, looking as if he could not believe the evidence of his senses, he departed, as if he was unable to fathom the mystery.

Those inside stood enjoying the scene, for there was hardly any thing done except at the paying teller's desk. He stood paying out with much rapidity the specie, which the specie clerk was busily counting, and the assistant teller was bringing to him. Never was there a more relieved man than he was when 3 o'clock came and he could shut his gate, though I believe he paid stray customers who came in afterward. He was well-nigh used up.

Among other calls we had one from that contrary-minded depositor who, I believe, always turns up at every bank when there is a run—the man who wants his money if he can't have it, and don't want it if he can.

He was a little old man, and in a high state of nervous excitement, oscillating between fear and hope. He threw down his check. "There," said he, in terror, "give me that balance in gold."

By the time it was counted out he had swung back toward reassurance, and he said, "So you've got it, have you? If it's all safe, I don't know as I want it. I thought you was breaking, and I came to draw my money because I was afraid I couldn't get it."

The teller put out his hand as if to receive it back, but this was enough to throw the poor man into consternation again. "No," said he, decidedly. "I tell you what, if you want it, I want it;" so he pocketed his money and went off. He was seen in the banking-room again in the course of the day, and I have no doubt he had come back to deposit his gold again; but seeing the run continue at the paying teller's wicket, he was seized with panic again, and retired. On the third day, Wednesday, October 14, there was a general suspension of specie payments by all the banks.

EXAMINATIONS.

About every six months there would be a vague feeling among the clerks that it was time for an examination of the cash of the bank. Once a year there was an examination of the effects of the institution; and then, at the end of six months from that time, the cash of the tellers only was looked over. But what passing glances were bestowed on the money! You might almost as well attempt to tell what was the matter with a man by making an examination of his face. How could the few moments given to this purpose effect the end proposed? A hop, skip, and jump, and away they go. For see how it was usually done: On a set day, which the clerks generally found out beforehand, the officers in the morning let the tellers know that their cash will be examined. Then there is a hurry through the day to get through in season, so that the directors may not be kept one moment (and, as a matter of course, they are kept waiting the longer).

As soon after 3 o'clock as possible, the first

one that proves sends up his tray with his cash, etc.; this is taken charge of by, say, three of the directors; then the next teller the same; and then the last one, if there are three tellers. After they had been examined, a sad lot of packages was returned to us. We usually had to set to work to rub out the pencil marks all over the figures before we could go on to prove the exchanges. Frequently the packages of bills had all to be restrapped again before they were in presentable order. And if there was a difference of a cent or two found (which they had not given us time to look for), it was accounted a serious result.

Two or three other directors took hold of the gold and examined that; that is, they would weigh one or two bags, making a terrible jingling with the scales, kick two or three others, and probably count the number of bags in the vault. After this tedious process, which was usually done with cigars in their mouths and their hands in their pockets, their work was about done. The rest of the unexamined bags might be filled with sand or lead for aught they knew. While this was going on the porters and clerks stood by with smiles on their faces. How can a couple of hours of investigation ascertain with much correctness the true state of the tellers' accounts? If they were overhauled unexpectedly the next day, it might have been found that a part was borrowed for the occasion. Such borrowing is occasionally practiced. If two or three days were devoted to the subject, probably then some approximate idea might be obtained of the state of the case.

DEFALCATIONS.

There are many varieties of tickets—tickets to the theatre, opera tickets, and pawn tickets, tickets to concerts, ball tickets, and tickets of leave, railroad tickets, soup tickets, and discharge tickets. And when I entered the bank I learned of another sort of ticket. I allude feelingly to the "charge ticket," the blessed means by which a foolish clerk anticipates his pay, and consequently finds little or nothing due him at the end of the month. The clerks were suffered to take small sums from the drawer, according to their needs, putting a ticket representing the amount in its place. The tellers would put tickets in each other's drawers. It was nothing but tickets, tickets, tickets. Frequently a clerk, at the end of the month, would be paid by his tickets instead of money.

The improvidence this begets is a bitter mischief. And it is the thin end of the wedge of crime. The receiving teller at one time seemed to take the money out of the drawer for his own uses as if it were his own. Very rarely was he seen to take any out of his own pocket. The clerks get so accustomed to it at last as to consider the money of the bank a common stock to be dipped into at pleasure. When this is permitted in *any* of the servants of a bank, who can wonder at their contracting loose ways

of living? When, by a common understanding, men allow each other to overstep the boundary, it would be strange if some of them did not wander on forbidden ground till they were lost.

At one time, when our bank was under a management both careless and partial, one of the tellers often left his money around exposed on the counter. One package disappeared, and then another. He was reprimanded by the officers, but as he was a protégé, they accepted his explanation that one of the parcels, which an express porter alleged he had delivered to him, was not so delivered; and a suit was brought against the express company in consequence. But the teller kept his place, although the contingent fund of the bank had to suffer for the amount in the end.

At another time, the bank porter, after the paying teller had gone for the day, found a package of five or six thousand dollars on the floor under his counter. This he had slung carelessly at his tin trunk, without troubling himself to see whether it went in, or over behind. The second teller, who was still in the bank, quietly put the money into his own trunk till morning, and then good-naturedly restored it to the first teller. If he had been of the disposition of some of our clerks, he would have made such representations to the officers that the careless teller would have lost his place, and the other might probably have gained it by promotion.

When slack management offers constant opportunity for speculation, and the ticket system offers temptation, there is sure to be trouble. My maxims for economy and success in the internal administration of a bank are: pay the best salaries, and enforce incessantly a thorough accountability, without indulgence or excuse. Pay well and watch well, will make the bank go well.

We had our defalcation during the oil fever. Then every one was getting rich; money was lying around in great bales two feet square. Three of us went to the Treasury one day and brought over as many great bundles of greenbacks as we could carry. The bundles lay around the place like bales of goods. One of our dealers brought in a wheel-barrow load of it, and we refused to take it. Quantities got to be a nuisance at last, and we clerks hated the sight of it.

Possibly we might have felt differently had it belonged to us.

But to return to the defalcation. Two of our fellows took advantage of the flush times to "put the bank through pretty handsomely," as we say in Wall Street.

The teller was a dissipated fellow, but he generally managed to come to time at bank hours. I have, however, known him to come down in the morning suffering so much from the effects of his last night's "good time" that he was unable to do any thing at his desk, and I would have to attend to his work as well as my own. A quiet laugh and significant winks

would be exchanged among the clerks. This was well known to the president and cashier, I think; yet very little notice was taken of it, except "blowing him up" sometimes.

He was an habitué of the concert-saloons and other such resorts, where he was very popular as a valuable patron. He would frequently have trouble with the associates he thus formed, the point of the difficulty of course being their unsatisfied desires for money. The men and the "ladies" he consorted with lived on him.

It is accounted a great thing by these carrion crows of New York, as I call them, when they light on a bank clerk. The vultures are always on the watch. I was taken out once by a casual acquaintance to drive into the country, and was treated generously, as I innocently supposed, until I found out that the object of the excursion was to entrap me, and use me as a siphon to discharge the contents of the bank into the possession of these harpies.

"Pop," as we used to call the teller, found that his boon companions began to black-mail him in the street and at the bank. One I well recollect, who used to come in of an afternoon, after the clerks were gone, and we two were getting out our proof. Pop called him Tim, and told the porter and myself that he was a great fisherman. Tim, who did not look to me as if he were very fond of water, sometimes brought a string of fish, which we subsequently found out was only a cover for the money that the teller paid him.

There was another person, a woman dressed in black, wearing a thick veil, who frequently came to see him. They had a sharp controversy at one time, as if the teller was resisting her demands. He explained it to us afterward by saying that he had hired a house of her, but, in consequence of want of repairs, he had refused to take it, which made her angry. They disputed "hot and heavy" for some time, until, as I supposed, Pop was compelled to "come down." In the version he gave us, he said he had compromised the rent.

This teller, too, was shiftless. He was continually removing from one abode to another, changing from housekeeping to boarding, and from boarding to housekeeping. Such a life costs much money.

When, beginning with tickets, he had dipped into the funds of the bank as far as one hand could reach, he needed a coadjutor, and, in looking around, he found him where I never should have looked. He fixed on a young man who was the smartest in the bank—a married man, of a religious family, member of a church, neat and careful in his personal appearance—in short, the very opposite of the teller. How these two men ever came together in a fraud has always been a mystery to me; I can only conjecture that Pop gained the other through first infecting his mind with the oil fever.

However it began, in collusion they were. The teller gave this confederate large amounts

of money to invest in stocks, expecting to realize by their rise, and thus retrieve himself. The time, alas! never came. Losses followed losses, till more than a hundred thousand dollars were gone. This went on season after season, in spite of such examinations as the officers of the bank made every half year. And every morning the paying teller would return him his money, unexamined and not unstrapped, just as he had given it in the night before. The clerks, however, began to have suspicions. Sometimes they would ask him: "Well, Pop, who was that scaly-looking fellow to whom you loaned some money? Did you make him give you a ticket?" Then there would be a laugh all around.

All things must have an end. If this fraud had not come to an end, our bank would soon have done so. One day, in consequence of the absence of several clerks, this confederate had to take the paying teller's place, and thus could not keep his own affairs in trim to avoid a disclosure. The poor fellows were both ruined.

These explosions come so often that the public are getting used to them. Newspaper men don't think a defalcation good for a respectable sensation unless it mounts above a hundred thousand, or has some peculiar romantic circumstances. But, on the other hand, there is more embezzlement than the public are told of. For every fraud that swells to the proportions of a public event, and agitates the surface of commercial credit, there are two or three going on in silence, sapping the foundations, and, when discovered by those interested, concealed from the public. A very prosperous man in Wall Street was asked how it was that he had never made any mistakes in his affairs, but every thing with him succeeded. "I make as many mistakes as other people," he replied; "but I don't talk about them." The more careless a bank is in allowing itself to be defrauded, the more unwilling it is to have its suffering known.

When will employers learn that, for places of trust, it is better economy to pay liberal salaries to secure first-rate men, than to employ unsound stuff at stipends inadequate for reputable domestic and social life, and that give no margin for better luxuries than whisky and meerschauts?

I affirm that, in any community, if the faithful services of intelligent men are wanted in a permanent employment, in the nature of a trust, they must be paid a compensation sufficient to enable them to live in a home of their own, with a family of their own, in a manner agreeable to the wholesome tastes and desires of men of such a degree of intelligence. I do not assert that it is *unjust* to pay less if the employé consents to serve for less. I affirm that, in the long run, the faithful service can not be had for less. It is a vain attempt to elude inevitable social laws, and although the yearly salaries may be kept down to a few thousands, the occasional penalty of a few hundred thousands is an inevitable offset.

WAS IT H, OR K?

A WARM, lazy, summer afternoon. A tall, handsome, manly looking fellow is stretched on the grass at the feet of a bright, pretty woman, who sometimes crochets, and sometimes leaves off to watch the listless figure that does nothing but pull apart the clover leaves. She is only two years his senior, but his aunt, and married; so she is not his lady love, but his best woman friend, whom he loves dearly, and trusts entirely. She has just returned from a three years' stay in Europe; so now they are trying to "talk up" this long intervening time that has separated them.

"John," she says, after there has been a long, quiet pause, "there's one thing you haven't spoken about. I've been studying your face ever since I came back. There's a pained, hard look often in it now that I am sure some woman put there. And, besides, here you are at thirty not married yet, though there's nothing earthly to prevent, and you've been a perfect devotee of the sex ever since you were a baby in petticoats! So, John dear, I know there is a romance you have never even mentioned to me." And as she spoke she laid her little soft hand caressingly on his hair.

He turned his head, and met her loving glance with a softened look on his face; then he said, slowly, "Your woman's instinct has hit the mark, as usual, Kate. I think you love me, and there's no other woman in the world that does" (his mother was dead); "so I will tell you about it now, because I'm in the mood, and may never be again, and, besides, I trust *you*, Kate." And he took the little hand and kissed it reverently. Then, throwing himself back on the grass, leaning on his elbow—such a becoming attitude for a handsome man!—he began:

"It isn't so much of a story, after all, dear, and it all hinges on just the being able to tell if a single letter were an H or a K. The one romance of my whole life was in it, though; and since it failed, why, all the real brightness of my youth has gone forever. Strange God should let such trifles, such insignificant mistakes, have power sometimes to wreck a whole life! Just after you went abroad, you know, I went to California on some professional business. The first day out, as I was standing on the deck, smoking, I put my hand into my pocket for my cigar-case, and pulled out instead a small parcel, which, on opening, I found to be a morocco miniature-case. 'This is queer,' I said to myself, 'but interesting!' Then I remembered that the night before, when I was busy packing—my room at the same time half full of fellows who had come in to say good-by—that a servant had brought me this package, just left at the door for me, he said. Thinking it was the new cigar-case I had ordered, I thought no more about it just then, but tucked it into my pocket, and had forgotten all about it till now. I opened eagerly the case, and there was a photograph, a vignette, of such a

lovely woman! I certainly never saw a more charming picture; and you will admit that, in my long apprenticeship to the sex, I have grown critical, and am by no means easily pleased.

"The shoulders were turned away coquettishly, as if to hide their lovely outlines, but the face looked back on me with an air of archness that was captivating. The mouth was delicate, but full of character; the eyes, which met mine with the glimmer of a far-off smile in them, were large and very dark, contrasting strongly in color with the hair, which was light, and thrown off carelessly, in little waves, from a wide, low forehead, like a statue's. The whole face was that of a young, beautiful, spirited girl, already dangerous in her consciousness of womanly power."

"Ah, John!" whispers the aunt, coaxingly; "your description fascinates me. Will you not show me the picture some day?"

"No," answers the young man, with a heavy sigh; "because I gave it back to her long ago. Well, you can fancy my amazement at thus coming into possession of such a picture, the original of which I had never seen in my life. As there was no note with it, I turned with keen curiosity to the wrapper, which I had hastily torn off without looking at. Alas! one half only was lying at my feet; the other had blown into the water, where I could just discern it now, a little brown speck, for which I would have given almost any thing. For on the half I held was written, in a stylish, feminine hand, 'Mr. John H—'; there the wrapper was torn across most provokingly; for, looking at it narrowly where the lower part of the H was torn, it looked almost as though it might be a K, after all. How I pored over that wretched capital! If it were an H, in spite of the mystery—making it all the more charming—it belonged to me; if it were a K, then some unlucky being had, through a blunder of somebody, lost a picture that must be worth the world to him. Finally, I decided that it must be an H; and feeling a presentiment that some romance for me was connected with it, I took the greatest care of it, wearing it always in my breast pocket, and spending many an idle moment in California in studying it. I had to be for many months among the mines, where I had not a single friend; and when I grew almost heart-sick with seeing only the hardened, coarse, even brutalized faces of the poor women one finds there, it was such a blessed relief to take out this picture, which carried me straight back to civilization and home, with its soft, refined features, and its sweet, pure eyes! Then one day, by a strange chance—Providence, I ought to say—it gained for me a new charm, since it saved my life. I was riding alone, one dark night, through a gloomy pass, when the well-aimed ball of some hidden desperado struck directly on my breast; but the case of the little picture, which was there, broke its force, and saved me. The photograph itself was not materially hurt either, though the case was split to pieces. After that

the feeling I had for it amounted almost to a superstition. I staid in California a year; then, my business being successfully accomplished, I returned home to New York. Of course there were many thoughts crowding into my mind as we steamed up the harbor the morning I arrived; but, laugh at me as you will, uppermost among them was the feeling, or presentiment, or whatever you choose to call it, that I was coming home to find the original of my picture, and so meet my fate. I wouldn't for the world, though, have confessed as much to any one, and I never showed the picture. Nevertheless, it is the truth that I took the most unheard-of pains to discover the fair unknown, and I never went any where without a faint hope of seeing her. I stared at every woman I met with light hair and dark eyes, hunted through photograph saloons, and always looked into every body's album—a thing that ordinarily I detest—but all my efforts were in vain; and finally I gave up the whole thing as a mystery it was useless to puzzle my brains over. But at last, one day—

"Ah!" exclaimed Kate; "now she's coming, I know. I was beginning to grow impatient for her."

"Yes," he answered, with a smile at her earnestness; "now she's coming, Kate, and this was the way she came. I was hurrying home one afternoon in a sudden, blinding snow-storm that had just come up. In front of me were two young ladies rushing along under an umbrella, evidently overtaken, like me, by the tremendous storm. The wind was blowing their clothes about in the most uncereemonious manner, evidently to their dismay—though one of them, I noticed, had the prettiest foot and ankle I ever saw—and beneath their closely tied blue veils they were laughing heartily as they tried to hold up their umbrella, and at the same time keep their footing on the icy sidewalk. I was watching them with much amusement and interest, especially the taller one, who was very graceful in spite of her difficulties, when a sudden gust of wind came sweeping round the corner, whirled the umbrella out of their hands, and brought them both down on the ice at my feet with a crash. The short one laughed and bounced up before I could help her, but the other reached out and took my outstretched hand with a little moan. 'I think I have sprained my ankle,' said she, in a soft, piteous voice. At that I lifted her gently with both my arms, and, as I did so, her friend exclaimed, joyfully, 'Oh, bless you, Mr. Haller! I'm so glad it's *you*!' and, to my surprise, it was my old friend, Mary Allyn, the jolliest, drollest creature, too."

"Laura! are you kilt entirely? Oh dear, she can hardly stand! Mr. Haller, just hold her up long enough for me to introduce you to her—Miss Stanley. Now what are we to do?"

"You don't mean to tell me," exclaimed Kate, with animation, "that it was Laura Stanley?"

"Yes," said the young man, quickly. "Why, do you know her?"

"Only by reputation, before I went abroad, as a great beauty and a most fascinating woman. She had such a host of suitors! So it was *her* picture you had? No wonder you were bewitched, John! Now go on, for I am ten times more interested than ever."

"Well, fortunately, a carriage was passing. So I hailed it; and, taking the half-fainting girl in my arms, put her into it, and Mary and I took her home. Just as we had seated ourselves in it, I supporting her carefully one side, Mary tenderly holding up the poor little foot the other, her veil came off, and there, to my utter bewilderment and delight, was the long-sought original of my picture, her head actually resting on my shoulder! There were the same wonderful dark eyes, the same light, wavy hair tossed back from the low, wide forehead, even the same brooch—an odd, foreign affair—at her throat! It was lucky for me that Mary was entirely occupied with her friend. Otherwise I don't know what she would have thought of my perfectly amazed and probably ludicrous expression as we drove slowly along. I am sure I couldn't have told whether I was in heaven or earth. She did utterly bewitch me that day, Kate, not only with her beauty, but her brave endurance of the pain—which, as soon as the faintness passed off, she made light of—and her naïve, sweet ways, the frankness with which she accepted my aid, and then the lovely blush with which she thanked me when, having carried her safely into her home, I left her."

"Of course I went home in a state of ecstasy, sat up half the night poring over her picture, and dreaming glorious dreams of the future; and of course, the very next morning, I presented myself at the Allyn mansion, ostensibly to inquire after Mary's health and condition, really to find out every thing possible about Miss Stanley. Mary was overflowing in her expressions of gratitude, both for herself and her friend; and after informing me that the sprain had proved very slight, raised me to the seventh heaven by rehearsing the thousand and one complimentary things that she insisted Miss Stanley had said about me. I told her that, as I didn't believe a word she was saying, we would change the subject, and asked how it happened that I had never met her friend before."

"She has lived in Philadelphia till lately; has been a great belle there; but her father, who is a lawyer, and not well off, has moved now with his family to New York."

"She is very beautiful, and will find no lack of admirers here too."

"Ah!" said Mary, quickly; "but she is already engaged."

"Do you know, Kate, that when she said that I honestly felt as though some one had suddenly stabbed me. I don't think I showed it, though, in my face, and I said, quietly,

"And who is the fortunate man?"

"'Mr. John Kuler, a Cuban on his mother's side—such a little, dark man! furiously jealous, they say, if she but smiles on any one else—and without an earthly attraction, that ever I could see, for a girl like Laura Stanley, unless it's his immense wealth, and his old family—one of the best in the city, you know.'

"I had heard enough, as you may suppose, Kate, and walked home, calling myself a fool, and vowing never to look at, or care for her picture again. 'My little romance is over,' I said to myself, as I put the case carefully away. 'I might have known it would be so; so here's the end of it all for me. Ah, Kate dear, it would have been well for me if that had been the end of it.

"In August, finding the city hot, and needing a rest from business, I went for my vacation to—never mind the name—one of the fashionable resorts that summer. You know the sort of place—a large hotel filled with gay people, wide piazzas running all round the house, delightful for promenades in the morning, dangerously fascinating for the same in the evening; romantic pine woods (with lovers' walks in them every where) close by, charming drives in all directions, capital opportunities for rowing and sailing on the lake. In short, if ever a place was designed by Nature for every sort of good times—specially flirtations—that was the place. However, I didn't feel like flirting."

"For the first time in your life, then," suggests the aunt, quietly.

"Besides, there was really nobody worth one's while; all the first-class girls were dull and homely; all the pretty ones dreadfully second-class. So I kept by myself, and enjoyed nature outdoors rather than art in."

"Art,' meaning their complexions, I suppose," says Kate.

"Certainly; also their 'tricks and manners.' One evening, however, there was an unusual stir in the house at a party of arrivals; and, lounging into the office to look at the book after they had registered their names, I will acknowledge that my heart gave a thump when I read, 'Mr. and Mrs. Stanley, and Miss Laura Stanley, of New York.' The next morning she appeared at breakfast, looking like a divinity, in the prettiest white morning dress. I took one rapid, sweeping glance, as she came in with a quiet, unembarrassed air, though there wasn't a woman in the room whose eyes were not taking her all in critically, and could find no fault in her, from the top of her head, where a coquettish blue bow fastened her lovely hair—"

"Wonder where she bought it?" asks Kate, wickedly.

"Every spire of it was her own, madam. It all came down once when we were riding horseback together, and it looked like a mass of gold in the sunshine. I helped her put it up."

"No doubt you did," says the aunt.

"As I was saying," continued the young man, not deigning to notice the remark, "she was faultless down to the tips of her little bronze

slippers. The table at which I sat was directly opposite hers; and when, to my astonishment, during the meal, she happened to catch me looking at her, and recognized me at once with a sudden lighting up of her splendid eyes, and a charming bow and smile, I'm free to confess, Kate, that, 'scarred old veteran' as I am, I blushed up to my eyes with pleasure, like any boy of seventeen, and just fell head over ears in love with her there and then—Mr. John Kuler or any body else notwithstanding. Oh, what weeks of enchantment those were that followed! Some way we were wonderfully congenial, as we found, in all our ways of thinking, in our tastes, and in our likes and dislikes. She was cultivated and clever, and it was a pleasure to talk over my favorite books with her. She had, too, as keen a sense of the ludicrous as I. What a bond of sympathy that is, Kate! I couldn't love Venus herself if she had no sense of humor. And whenever any thing grotesque or absurd occurred, my eyes instinctively sought in hers the quick glance of amusement that was sure to respond. I am sure I had no thought of a flirtation. It was simply that I could not keep away from her; and I never came without meeting a welcoming glance or a reproachful 'Where have you been all the time?'—said time being perhaps from breakfast to dinner, when I had resolutely kept away, lest I should weary her. So, at last, we were almost inseparable. Oh, the long, merry walks we used to take in the fresh morning air, and the quiet, dreamy hours we spent sailing on the lake at sunset—she looking like a picture, in her broad straw hat and white dress, leaning over the side to dip her little hand in the water while she talked, and her cousin—a plump little chit of seven, who always went with us for propriety—lay curled up asleep at her feet! Then there were sunny afternoons in the pine woods, when I read to her, and glorious moonlight nights on the piazza, when the mere enjoyment of being together in such beauty was full of romance, and a dangerous luxury. Every day I felt more and more that for me, and perhaps for her, it was growing too sweet—only a sin and a snare—and I would resolve to break the spell, and tear myself away; but I could not."

"Did you never say a word about her picture?"

"Not a word. An odd thing happened, though, that I must tell you. Her mother, one day, was showing me her album—a very fine one—when some one remarked that the photograph of Miss Laura was very poor. 'Ah!' said her mother, sighing; 'I wish you could have seen the one she had taken for Mr. Kuler once! It was superb! He never got it, though, poor man! for it was lost in the most mysterious manner.'

"My heart beat guiltily under the picture, at that moment reposing in my breast pocket—you see it had resumed its old California place—and I will confess that I felt like a thief and a pick-pocket; but I calmly scrutinized the photo-

graphs, and asked, 'What could have become of it?'

"We suppose the servant must have left it at the wrong house; but though Mr. Kuler made no end of inquiries and fuss, it was never found. She had another taken for him, but it was not half so good.'

"I wonder what lucky wretch did get it?" said one of the gentlemen, laughing.

"Some unprincipled scamp, probably," said I; and there the matter dropped."

"I declare!" said Kate, laughing; "I think you were a brazen-faced villain! You ought to have given it up on the spot."

"Not I," said the young man. "John Kuler had one, and that was enough for him, since he had the original too. This was mine by right of possession, and I was highly gratified to learn that of the two I had the *best*, and I meant to keep it."

Kate shook her head disapprovingly. "John, you are incorrigible. But tell me. Where *was* her lover all this time? And then the gossips, the tabbies—did they let you alone?"

"Her lover was in New York, I suppose, attending to his business. As for the gossips—well, they *were* busy with us, that's a fact, but she cared not one whit for them. I think her mother used to remonstrate with her sometimes, too; but she was headstrong and willful, and as long as she was happy in the present—and I know now that those were halcyon days for her as well as me—she would not face the future. All at once there came the end—as there always does come the end, I find, to every thing sweet in this life." And the sigh with which John spoke the words was long and deep.

"We had just returned from a delightful walk, and were resting merrily on the piazza together, Laura fanning herself with her straw hat, when her little cousin ran to her with a letter. She opened it, and glanced through it; then I saw a shade pass over her face, and she pressed her lips closely together, turning her face away, as if to conceal it.

"When she spoke again it was in a constrained voice: 'Mr. Kuler comes this afternoon; will remain till we go back to town. I shall not be able to ride on horseback with you to-day, as I promised, Mr. Haller.'

"Was she glad or sorry that her lover was coming? I could only guess from her face, and that was hard and set. For myself, my heart gave a sudden bound, as I thought, 'She does not care for him; she loves me.'

"Mr. Kuler comes to-day, and I go to-morrow,' I said, watching her face.

"She rose to go in, then suddenly turned and gave me her hand—the softest, prettiest little hand in the world, I think. 'Don't go to-morrow. I want you to stay. Will you?'

"What could I answer, Kate, with her face looking up so into mine, but that I would do any thing or every thing in the world that she asked me? Another minute, and I should have told her all—of her picture I had cher-

ished so long, of the love I felt for her now. I am sure she must have seen from my face what was coming, and perhaps was frightened at what she had done; for she escaped from me without another word. At dinner she did not make her appearance, and I heard her mother tell some one that 'Laura had a fearful headache!'

"All the afternoon I was out rowing desperately, making time such as I never did before, while my brain was in a whirl. I was sure she did not love this John Kuler whom she had promised to marry. I dared to hope, and I think she had given me every reason to hope, that she did love me. Why should she keep her engagement, and be miserable? At the first opportunity I resolved to lay myself at her feet, and run my chance of an acceptance—perhaps of a refusal, with a scathing rebuke.

"Coming in late to tea, my eye glanced at the Stanleys' table. There sat Laura, exquisitely dressed, and brilliantly beautiful (though with a little heaviness about her eyes, and an excited flush on her cheeks), talking and laughing gayly with Mr. Kuler, who sat beside her. As Mary Allyn had said, he was a little, dark man, with a fiery eye and a Cuban face. She looked up, and just nodded at me with an air of cool indifference that almost stunned me, making me feel all at once that I had been all day only dreaming the wildest dreams. You see, Kate, she was so deep; like all you women, too, 'light as fair weather.' I could almost hate myself that, in spite of all, I could not help loving her. She had virtually brought me to her feet; she was sure of the power she had over me; she even acknowledged to herself my power over her; but for all that, now that her lover had come, a better *parti* than I, she had determined to go back to her allegiance, and to show me that I was to be nothing to her any more.

"How that cool little nod angered me, and roused my pride! I resolved, as I quietly drank my tea, that now I would *not* go to-morrow, and so beat an inglorious retreat before this victorious rival. All the evening I danced and flirted mildly with a pretty young widow, who had just come, leaving my love, unmolested, to her fate. I had my revenge, however, in the uneasy glances I saw her throw in our direction, and especially in seeing that she and Mr. Kuler, who sat by themselves in a duly engaged manner, did not seem to be enjoying themselves supremely, as after so long an absence might have been expected. He looked moody, and talked little—he had a high, unpleasant voice—while she, instead of being all sparkle and animation, as usual, had a preoccupied air, and wore a forced smile. Once or twice I saw that she actually looked bored. You see, Kate, I had not been studying her face so long in vain, and I could read it now—or thought I could—like an open book.

"The next day Mrs. Stanley, a managing old woman, who had been distressed of late lest I

was interfering with her cherished plan, introduced me complacently to her future son-in-law. I noticed, by-the-way, that he regarded me with no benignant expression; and I soon found—Kate, don't think me a conceited fool for saying so; it was the simple truth—that, barring his immense wealth and aristocratic family, he was a man I should have nothing to fear from as a rival in Laura Stanley's heart. Well-bred, but narrow-minded and opinionated, without one particle of originality or enthusiasm, given to long, pointless stories and the dreariest platitudes in conversation, just the man to weary utterly a quick, intellectual, brilliant girl like Laura Stanley. From my heart I began to pity her. I felt that she was dooming herself to a life of horrible ennui, or else one of reckless misery, perhaps of sin.

"We had nothing but the most ordinary intercourse for several days; there was no chance for a *tête-à-tête*, and I sought none. I was wretched, but I doubt if I was more so than she, in the mask of happiness she was forced continually to wear. Wednesday came—I had made my plans to leave Friday, as Laura knew—a sailing party was gotten up, the Stanleys were going, so was I. Perhaps she was desperate, ennuyé with her lover; at any rate I saw that she had one of her reckless days on. When the party were assembling on the piazza it happened that I was a little late, and so was she, and we met in the hall. It was a cool day; she had on a short dress of bright 'navy blue,' fitting her closely, and showing off her round, lovely form to perfection, and a little black sailor hat trimmed with blue set jauntily on her light hair; nothing could have been nattier or more becoming than her costume. I gave her a look expressive of my entire approval; she answered it with a bright, coquettish laugh—how she loved admiration, that girl!—and a saucy 'Glad your lordship's pleased, I am sure.' Then all at once her tone and expression changed and grew grave. I think it was partly in her ever-varying moods and ways that her charm lay—you never knew what she was going to say or do next; and she said, in a low voice, reproachful and tender:

"*Why* have you been so cruel to me? You have hardly spoken to me for days. Shall I save a place for you by me in the boat to-day, as I used to?"

"Mr. Kuler scowled when, after helping the ladies aboard, I jumped lightly into the boat, on the other side of Laura. But I cared not for his scowls, neither apparently did she; so I held her parasol over her, and beneath its protecting shade we laughed and talked and enjoyed ourselves together in the old way, till the sail was over, and the boat was returning to the landing-place.

"*'I have been so happy and so wicked all the afternoon,'* she said to me, almost in a whisper, bending over the side and dipping her hand in the water as she spoke; *'and this evening I must be good—and miserable!'*—this last in an almost inaudible voice, full of sadness.

"*'Miserable, not only for this evening, but for all the days of your life. Is it not so?'* I answered, looking at her steadily. *'Why not free yourself, and then be good as well as happy with me always? You know I love you!'*

"*'Hush!'* she whispered, without raising her head; and I saw her very neck grow crimson beneath her hat. *'You must not say that to me now. It is too late. I have not the courage; I fear my father and my mother and the world. Besides, you do not know me. I am intensely ambitious and worldly, and wealth and position give power. He loves me too—and—and after a while I dare say I may care for him. Promise me that you will leave me—that you will never tempt me again. I am not so strong in myself as I believed. I can not bear it.'* And her head sank still lower, and I saw her tears drop into the water.

"There was a choking in my throat that prevented my answering at once. She put up her hand hastily to her eyes with an impatient gesture, as though angry with herself, and then gave a sudden start and exclamation, looking at her finger. Her engagement ring (a magnificent solitaire) was gone! Mr. Kuler, who had been busy collecting the Stanley shawls, sprang to her side at her scream of dismay, and there ensued a general scene of confusion, in which every body was occupied in looking and lamenting. But the ring (which must have slipped off her finger in the water) could not be found. Mr. Kuler looked darker than ever, poor Laura pale and distressed—the loss of the ring giving her an apparent reason—and altogether it was a dreary party that returned to the house. For myself, I simply felt that love and the romance of life for me were over. I loved this woman profoundly—as I can never love any woman again. She had led me on to declaring myself, and then had rejected me—not because she did not return my love, for I felt that in every nerve of her body, in every emotion of her soul, she did; but she was not true enough to herself, not noble enough to give up the world for love. Now nothing remained for me but to go away and try and live this passion down, throwing myself heart and soul into my profession, and finding in that, if I could, a mistress, an absorbing occupation.

"I was sitting in my room smoking while I mused gloomily of these things and looked at the little picture which had so strangely been bound up with my life, when I was startled by a hand on my shoulder, and, turning, saw Mr. Kuler, who was saying:

"*'Mr. Haller must have been very deep in thought since he did not hear me, though I knocked twice. I—'*

"Then he stopped short. I had closed the case quickly when I heard his voice, but not quickly enough, it seemed. His voice changed and his eyes grew dangerous. *'You are fortunate in being the possessor of a picture Miss Stanley told me was lost.'*

"His insolent tone angered me, so I coolly put the picture back in my pocket. 'I was occupied, and did not hear you. Can I do any thing for you this evening?'

"He looked as if he could have stabbed me on the spot. 'For me nothing *now*. I will see you later in the evening,' his voice quivering with suppressed passion. 'The ladies sent me to tell you that they are waiting for you in the little parlor.' And he strode out of the room.

"The rehearsal for some theatricals we were getting up was to be that evening, and I had entirely forgotten it. I went down stairs; but, as nobody seemed to be prepared, the rehearsal did not come off. I was heartily glad of it, and taking my cigar I went out on the piazza. It was a wild, gloomy night, so no one was out there; and I paced up and down in the darkness and dreary wind, which suited my mood so well, going over the day's events and revolving what I must now do about the picture, since it was known to be in my possession. An hour or more had passed in this way, when I heard low but excited voices at the further end of the piazza. Turning in that direction I saw Miss Stanley leaning against a pillar, her head thrown haughtily back; while before her stood Mr. Kuler, evidently under the greatest excitement, talking in angry, reproachful tones, his voice husky with rage. I caught the words 'treachery, revenge, you have deceived me.'

"Then Laura answered, indignantly, 'Can you not believe me when I say that I never gave him the picture?'

"Instantly I walked up to them, and placed myself before Mr. Kuler. 'Your opinion of me,' I said, with all the calmness I could command, 'is a matter of utter indifference. But I wish to exculpate Miss Stanley from all blame whatsoever as regards her picture, which you have unfortunately seen in my hands.' Then, in the simplest, most direct way, I told the story of the picture, and what it had been to me in California, and ever since, and how it saved my life. Laura listened with intensity, her bosom heaving, her hands clasped closely together, as if she were holding herself down. Then—it was almost like wrenching my heart out, Kate—I took out the picture and gave it to her.

"'Your picture can never be any thing to me now, Miss Stanley; and I have no right or title in it—have never had; so I restore it to you. Good-night!'

"She felt, for my voice betrayed it, that it was also 'farewell,' and that all was over between us.

"'Good-night,' she said, softly, and put out her hand.

"As I held it for one passionate moment I saw that her face was pale with repressed emotion, and she was trembling all over. As I turned and left them, Mr. Kuler attempted to stammer out something, perhaps an apology; but I did not wait to hear it, and I went up to my room. There was one of those tall, old-fashioned clocks at the head of my stairs, and

all night long, Kate, as I lay awake, I heard that clock tick, and I thought of Longfellow's

"'Forever—never! Never—forever!'

"As soon as it was daylight I got up, packed my things, and by six o'clock was rushing on in the train to New York."

Here the young man made a long pause.

"Well?" said Kate, gently, after waiting a while.

"Well," he answered, with a long sigh, "you must be tired, and there is not much more to tell. I never saw her but once more, and that was after she was married. She sent me cards, but I did not go to the wedding, which took place that very fall, and was a grand affair. There was a long description of it in the paper, and of how 'the happy pair' had gone to Europe. They spent the winter in Paris, where they were very gay, and 'the beautiful Mrs. Kuler' was mentioned in all the accounts of the court balls. It was at a great party after she returned that I saw her. She was the most distinguished-looking woman in the room, but less brilliantly beautiful than she used to be, I thought. She seemed a little worn and weary, and there was a look about her that made you think that in solitude her face would be very sad. They say that her married life is very unhappy, that she is recklessly extravagant, and her husband close even to meanness, and terribly jealous. I was standing behind a pedestal of flowers, where I could watch her unseen, as I thought. Her hair was powdered, and without a single ornament, and heightened wonderfully the brilliancy of her magnificent eyes. Her neck, which was round and white as a Juno's, was flashing with diamonds; and all her movements had a sort of haughty grace. Suddenly she glanced in my direction, and our eyes met. She started and colored; then her face lighted up with one of her old sweet smiles. I started forward to go to her, but at that moment some one came and claimed her hand for the next dance, and I went home. Just that one look she gave me had set all my pulses to beating wildly. I felt that she had not lost one jot of her old power over me yet; and I did not dare to trust myself within the range of her influence again, and revive the misery that I had been striving so hard to forget. But I can not forget her, Kate, and I never shall."

WITH A FLOWER.

THOUGH but one blossomed spray I bring,
In that bright hair to twine,
I would that every budding thing
Of June and summer should be thine;
While heart's-ease all her purple wine
Should press for thee, wild roses red
All their cool, fresh spirit shed
Round thee, and forget to cease
Long as sunbeams in the fleece
Of heaven weave their shining strand;
And at last a heavenly hand
Give thee, give thee
Lilies of eternal peace!

ANNE FURNESS.

BY THE AUTHOR OF "MABEL'S PROGRESS," "AUNT MARGARET'S TROUBLE,"
"VERONICA," ETC.

CHAPTER I.

I ALWAYS liked going to my grandfather's. His house had an atmosphere of stillness and mystery that was alluring to me. No doubt my childish imagination magnified and distorted many things there, as the eyes of an infant are not able to see objects as we see them with our adult vision. Neither mind nor eyes attain their just focus at once.

In my own home, where there were the constant movement and occupation incident to a country house situated on a large and well-stocked farm, the servants wondered greatly that "Miss Anne" should like going to Mortlands—Mortlands was the name of my grandfather's place; and I have more than once overheard them opining to each other that it was very bad for a child to be moped up in a house like that, without a young or cheerful face for her eyes to rest on from sunrise to sunset; and a queer lot that lived there, too, by all accounts! Such speeches only aroused a contemptuous resentment in me. Perhaps, too, they served to put Mortlands in a more alluring light than ever, by their vague hints of something strange about grandfather's household, which appealed to my inborn love of the marvelous.

My father also found it somewhat singular that his little girl should be so fond of staying at a dull place where there were no pets or play-fellows. But my mother never expressed any surprise on the subject. Mother and I had a silent sympathy on that, as on many another, point of feeling.

Mortlands was situated on the extreme edge of the suburb of a country town in the north of England, which I will call Horsingham. Between it and the nearest house, going townward, was a space we called the Park, which was simply a large meadow, bounded by a hedge, with ancient elms growing in it at intervals—trees that might have been the veritable "hedge-row elms with hillocks green" of *L'Allegro*. In the other direction there was no dwelling within two miles of Mortlands.

The house had once stood on a considerable estate belonging to it; but that was before my time, or grandfather's time either. When he first inhabited it, it had long been shorn of its territorial glories. The only land still attached to it was a large, irregular, rambling garden inclosed within high stone walls.

This garden was my delight. I used to spend many long hours in it; sometimes with a story-book, curled up on a moss-grown old seat of rustic wood-work; sometimes wandering about the alleys, enacting imaginary scenes with imaginary companions. During these hours I was mostly alone, and this circumstance had a

great charm for me. I was left absolutely to my own devices, and as I was a child of a very active and vivid fancy, my own devices amply sufficed to amuse me.

I have thought sometimes that to explore the long-silent haunts of memory is like prying into one of the Etruscan tombs they tell of, whose walls were once covered with bright pictures of the busy life which that solemn, rock-hewn chamber shut out forever.

There are the familiar implements of household use—the spent lamp, the earthen pitcher, the moulded vase. There, too, is found the tarnished ornament of Beauty, or the diadem of Command. There, from the fitfully faded paintings on the wall, start out the most familiar scenes in strange distinctness; while, not a yard apart, some great event—a king sitting in judgment, a battle with chariots and horses, or a nuptial ceremony—is barely decipherable.

The pomps and vanities, the grave alliances, the cruel combats—nay, even the solemn symbols of worship, perish and disappear. Besides, kings, heroes, gods—all are fading. We take our little taper, and step awe-stricken into the long-unbroken darkness, and peer and gaze—Who was this? What was that? Here sits a royal figure on his throne, whose courtiers have fallen away from him. Yonder are two pledging their troth before the priest, and the clasp of their outstretched hands is interrupted by a crumbling gap, across which a bloated spider runs swiftly. But lo! as we shift the dimly burning light, some coarse, common scene starts into life, and we see the butcher's shambles, or the slave grinding corn, as vividly as the day they were painted!

Thus, out of the hazy past, certain days and certain things reveal themselves with capricious distinctness to my memory. For example, I was accustomed to be at Mortlands in all seasons of the year; yet the place is indissolubly associated in my mind with a soft, gray, autumnal sky, the smell of fallen leaves, and the faint chime of church bells wafted from a distance through the moist air.

My grandfather was called Dr. Hewson; my mother was his only surviving child out of a numerous family; and his wife had been dead many years before I was born. He was considered a very skillful physician, and had a large practice in Horsingham. He had the reputation of being very eccentric; and the household at Mortlands was considered "odd" and "out of the way."

The accusation of eccentricity was chiefly founded, I believe, on grandfather's withdrawal from society. He lived a very retired life. Except in his quality of doctor, the Horsingham world knew almost nothing of him. Now,

when a man plainly evinces a distaste for our company, it is a strong presumption of some twist in his mind; or even, it may be, of some cloud on his conscience, since it is evident to us all that our company must be agreeable to sane and respectable persons. Thus reasoned Horsingham, at all events.

To the second count—that of “oddness” in his household—I believe grandfather would have had to plead guilty. The inmates of his house consisted, besides himself, of two female servants, and a person whom he always addressed as “Judith,” but who was known to the rest of the world as Mrs. Abram. She was the widow of a long-deceased younger brother of my grandfather; and her proper style and title was, therefore, Mrs. Abram Hewson. But no one ever called her so. She was utterly dependent on grandfather. Her husband had ill-treated her during his life, and—having wasted her little fortune—left her destitute at his death. Grandfather gave her a home in his house. It was an act of disinterested benevolence, for Mrs. Abram could not be called an agreeable inmate. She was subject to fits of gloomy depression on account of her religious views; and I believe that she had at one time been so terrified by a zealous preacher that her mind became disordered. I remember, as a child, hearing from some of the servants at home that Mrs. Abram had been “in an asylum.” And although the phrase conveyed no very definite idea to my mind at the time, it served to invest her with a weird interest.

She was of so singular an aspect as made it difficult to guess at her age. Her face was of a dull brick-red color all over. Her skin was singularly coarse. Once, when I was little, some one showed me the palm of my own hand through a microscope, and I have ever since associated Mrs. Abram’s complexion with that scientific experiment.

She had a high Roman nose with a hump on the bridge of it, a high narrow forehead, very scanty eyebrows and eyelashes, and brown eyes, with queer yellow specks in them, which always reminded me of the coat of a tortoise-shell cat. Her hair had been cut short, she said, and was entirely concealed by a black net cap lined with brown silk, save two loops on the temples—flat festoons of hay-colored hair, whereof no man saw either the beginning or the end. She always was dressed in black, and I never saw any point of brightness about her person, but the casual glitter of her worn wedding ring.

Perhaps the strangest peculiarity about Mrs. Abram was her voice. It was a muffled, inward voice, whose tone I vaguely connected in my mind with the lump on the bridge of her nose. When she spoke she dropped her lower jaw and kept her mouth half open, moving the lips very little, so that her articulation was indistinct. Also, one effect which her conversation had on my nervous system was an overpowering desire to make her clear her throat,

and in default of daring to suggest such an operation to her, I was driven to clear my own, convulsively.

Poor Mrs. Abram! She was always very kind to me, and I believe she was sincerely grateful and attached to grandfather, and had a high respect for him; but that did not prevent her from being very despondent about his spiritual condition.

Then there was Keturah, grandfather’s cook, housekeeper, and factotum. She was a woman of remarkably low stature, with a large dwarfish head, and short arms like the flappers of a seal. Her face was very pale, almost livid, with bright dark eyes, deeply sunken, and strong black eyebrows, and black hair. Her features, though disproportionately massive for her height, were not ugly. And when she smiled her face became transfigured into something that, if it were not beauty, affected me with a charm like that of beauty. But then Keturah very rarely smiled.

The other servant, Eliza, was a staid young woman, who belonged to an obscure sect of dissenters, and employed her leisure in reading tracts and hymns. But, unlike Mrs. Abram, she was very cheerful and equable in a mild, soft way. She had pale reddish hair, and a freckled face, and was slightly deaf. My interest in her was strongly aroused by being told that she had been cruelly treated by a step-mother, and that her deafness was the consequence of neglect and ill-usage in childhood.

Such was the household at Mortlands; for Havilah, the man who groomed grandfather’s horse, and did whatever was done in the way of cultivating the garden, did not live in the house.

No doubt they were a singular set of people; and no doubt it was not unreasonable that my father’s servants should wonder what amusement Miss Anne derived from staying among them.

I loved my grandfather dearly; but that did not altogether explain my delight in Mortlands; for I also loved my parents—especially my mother—very thoroughly, and I was treated at home with the fondest indulgence.

I believe the truth to be that Mortlands afforded a freer scope than Water-Eardley (my father’s house) for the exercise of a faculty that is active in most children, and was peculiarly so in me—I mean imagination.

For example, the garden at home was trim, bright, and well cultivated, yet I cared nothing for it in comparison with Mortlands. I knew the former by heart; its red, yellow, or blue beds disposed in geometrical patterns, its clipped box borders, and smooth gravel paths. Nothing was left to the imagination. There were no nooks and hiding-places, no moss-grown walks, no mouldering walls and pleached bowers, no tangled thickets of heterogeneous growth to be peopled by childish fancies. At Mortlands the very air was thick with dreams. They swam in the noted sunbeam, and flut-

tered about the ivy, and brooded under the soft shadow of the sycamore.

My own home was a comfortable, modern country house. My father was a "gentleman farmer." His was chiefly grazing land, and he prided himself on his breed of cattle. He was fond of horses, too, and he always had a couple of hunters in his stable. Some of his friends considered this an unwarranted extravagance, and were kind enough to suggest (*to each other*, which was scarcely quite practical, but much safer than suggesting it to my father) that the money spent on the hunters had been better employed in buying a neat little carriage for Mrs. Bell—say one of those new park phaetons—and keeping a pair of ponies for her to drive. But I believe mother, gentle as she was, would have flamed out very angrily at any one who should have said such a thing to her.

My father and mother made a love-match. But it was also a quite "proper" match in the eyes of the world. In station and fortune they were quite suited to each other. He had inherited a flourishing and unencumbered little estate; she was the daughter of a country doctor, and brought her husband a good dowry. She very much desired, I have learned from my grandfather, to bestow her little fortune, as she bestowed her hand, on her bridegroom unconditionally. But grandfather would not hear of this; neither would my father. Her money was settled on herself, and the arrangements of her marriage were utterly devoid of the least spice of romance.

Nevertheless, it was, as I have said, a love-match. They must have been a very handsome couple. I have heard people say that when they paid and received their bridal visits, George Furness and his wife looked for all the world like a prince and princess in a fairy picture-book.

They had passed out of the picture-book stage by the time I can first remember them distinctly. Father rode nearly a stone heavier than in his fairy prince days, and mother's cheek had less rose-bloom on it; but they were still most delightful to look upon. Indeed, I think that my mother must have been more really beautiful than at the time of her marriage; but perhaps most people would not agree with me.

Grandfather Hewson had handsome, boldly cut features—a little stern, perhaps—and mother's face was a softened copy of his. It was to his as a cameo is to a marble bust. She had beautiful dark eyes, and penciled eyebrows, and a quantity of bright chestnut hair that fell in tendrilly ringlets on her neck.

When I was a little child mother and father saw a good deal of company, and visited much among their country neighbors. I was an only child. Two boys had been born after my birth, but they both died when infants. Thus, when my parents were absent, I had no society at home save that of the servants, and to their society I had an intense repugnance.

I was a dainty child ("more nice than wise," as my nurse-maid contemptuously expressed it),

and I shrank from our coarse, country-bred servants. Their boisterous movements, loud voices, and rough hands were disagreeable to me. The mingling of shyness and pride with which I regarded the inmates of our kitchen would, had I had no refuge from their company, have grown into positive hatred. But this tendency to a morbid tone of mind was greatly counteracted by my visits to Mortlands. At home the servants alternately scolded and spoiled me. They were, I believe, amused with my little disdainful airs, as they might have been amused at the shrinking of some delicate little animal from their rough but not unkindly touch. I had not the resource of solitude at will (which would have been far less injurious to a character like mine), for it would not have been safe to let a child of my years wander alone about the farm. There were perils by flood and field—the river, in which it was possible for me to drown myself, and the meadows full of cattle, into which it was not always safe to venture. Then, too, our house fronted the great high-road, and was separated from it only by a narrow sweep of gravel and a hedge. This dusty highway wound along, over hill and dale, from Horsingham all the way to London, and at certain seasons of the year it was thronged with a miscellaneous crowd, including tramps, gipsies, and generally disreputable characters, in whose too close neighborhood my parents would have trembled to trust their little girl. My nurse-maid, therefore, had orders never to let me out of her sight when father and mother were away from home.

Horsingham possesses a fine race-course, and was, and is, renowned for a great annual race, to which people flock from all parts of England. There is a spring meeting, too, but the great race is in the autumn. I remember Horsingham before there was a railway station there, and I consequently also remember seeing from my nursery window, which looked on to the road, the smart mail-coaches, laden with passengers, that dashed, with their four horses, toward the town at a certain hour every day. And then at "race time" the number and variety of vehicles that passed were endless. Water-Eardley was situated about five miles from Horsingham, and four from the race-course, which lay between us and the town. Mortlands was nearly opposite to the race-course. Only from grandfather's house all signs and symptoms of "The Great Autumn Meeting" were jealously excluded. Grandfather hated the very name of horse-racing, and all connected with it; and the earliest occasion when I remember, as a child, to have heard sharp words pass between him and my father was during a discussion on that subject.

However, Dr. Hewson and his son-in-law were very good friends in general, and father was never unwilling to allow me to go to Mortlands, although he might be puzzled by the oddity of my taste in wishing to do so. He had great faith in grandfather's medical skill, and believed that my health (which was rather

delicate when I was a little child) was benefited by Dr. Hewson's supervision. I doubt not he was right in so believing; but I am sure that the health of my mind benefited even more than that of my body by being subject to grandfather's influence. But I do not suppose it ever occurred to father to conceive that my mental condition needed any more subtle treatment than unlimited indulgence, so long as I did not make myself actively troublesome, and an occasional whipping (performed in a rather perfunctory manner) when I became a nuisance to my elders.

In endeavoring to describe the course of my uneventful childhood I shall present as faithfully as I can those things which are most strongly impressed on my memory, without much regard to the relative importance I should now attach to them. To revert to my former simile, I shall take at random those pictures which remain the most vivid in certain long-lived chambers of my brain.

For, although I be not skilled to analyze them, I doubt not that the causes which keep some memories fresh, while others fade and perish, are interwoven with the whole fabric of my nature.

CHAPTER II.

I HAD passed my seventh birthday at home. Mother had asked some children to spend the evening with me, and we had had cake and fruit and blind-man's-buff and magic-lantern. All this I know, because it is so set down in the chronicles of the family; but real remembrance of these festivities I have none—or a very slight one.

I remember the morning better; when I awoke to find a bright red doll's house, with green balconies, and a story-book by my bedside. The doll's house was from father; the story-book was mother's gift. I can see the book now, guiltless of illuminated borders or chromo-lithographs, but a treasure to me beyond all price. I could read it fluently. Mother had taught me to read when I was little more than a baby, by throwing bone counters on the floor for me to scramble for, on one side of which counters were two black, portly letters of the alphabet (a capital and a small letter), and on the other a colored picture of some bird, beast, or flower, whose name began with the same letter. This, too, is matter of faith with me, and not of knowledge; for although I distinctly remember the look of the bone counters—one especially, bearing the image of a prancing horse, with a coat of the color called by artists burnt sienna—that is because some remnants of this notable company of worthies lingered on in my nursery until I was at least nine or ten years old. I know not how they finally disappeared. Who *does* know how such things finally disappear?

At all events I was quite able to read my

birthday book, and I so enjoyed reading it that I insisted on carrying it to grandfather's when I went to Mortlands on the day after it was given to me.

Father and mother were going to spend a week with an aunt of the former who lived in the country, some miles from us, and I was to stay at Mortlands during their absence. This prospect was the only thing that could have consoled me for mother's going away. But no prospect could make me part from her unmoved. Dear mother! how pretty and graceful she looked as she stood at the door to watch me depart! I can see her now, with her delicate muslin dress, and a crimson ribbon at her throat, and her bright curls falling lightly from a high comb that gathered them together at the back of her head. But my last glimpse of her, as the dog-cart whisked round the corner of the drive, was dimmed by tears.

"Don't ye take on, Miss Anne!" said Dodd, the groom, who was driving, and beside whom I was perched on some cushions.

I did not wish my tears to be observed, and I turned my head aside, as if to contemplate the landscape, while I took out my little pocket-handkerchief to wipe my eyes. This, however, was an operation I could not perform unobserved, for my handkerchief was attached by a loop to a ribbon round my waist, and I well remember the difficulties connected with the using of that square of cambric.

Selina, my nurse-maid, perceived that I was bending myself double, and was twisted all on one side; and, leaning over from the back seat where she sat, exclaimed, "What's she doing? Why, Anne! if she ain't crying! Well, I wouldn't be such a baby!"

The effect of which sympathizing speech was to make my tears flow the faster.

Dodd was gruff but good-natured, and, despite his rough exterior, had more delicate tact than buxom, bright-eyed Selina.

"Come," said Dodd, "I don't know what you may think of it, S'lina, but it seems to me as a young lady of seven—*turned* seven year old—ain't exactly a baby! That's a funny idea, ain't it, Miss Anne? Turned seven—rising eight, as one may say! Lord, S'lina, I should have thought as you'd have knowed better than that!"

I glanced up at Dodd half distrustfully, but he kept his eyes steadily turned away, and flicked Ruby (father's fast-trotting mare) thoughtfully with his whip. This sagacious behavior had its due effect. I hastily wiped off the last tear with the extreme corner of my pocket-handkerchief, and prepared to comport myself with the self-command which the world evidently expected from a person of seven years old.

But Selina, with characteristic obtuseness, disturbed my returning composure.

"Ah!" said she; "the idea of crying when she's a-going to her grandfather's! Such a nice place to be at!"

I perfectly well knew that Selina by no

means considered it a nice place. I detected (or fancied I detected) a tone of ridicule in her voice; and ridicule directed against the inmates of Mortlands always stung me sorely. I said nothing, but I felt my cheeks burn, and my childish heart beat fast.

I know not whether it were mere stupid love of teasing, or whether Selina really fancied I was deceived by her clumsy acting; but at all events she continued to speak of Mortlands in the same sneering tone.

"Oh my, Miss Anne, how pleasant it must be there, to be sure! You always enjoy yourself at Mortlands, don't you?"

"Yes," I answered, sharply; "I do enjoy myself there; but I sha'n't talk to you about it."

"Hoighty, toighty! Why not, pray?"

"Because you can't understand things. You're stupid, and I don't like you."

Selina burst into a fit of laughter, which irritated me the more because I felt it to be genuine.

"Now she's on the high ropes!" she exclaimed. "There never was such a faddy little monkey!"

"Leave her alone," said Dodd; "what's the good of bothering the child? It's nat'ral she should love them as loves her. Every body ain't so hard-hearted as *you* be."

Selina had the good-humor of utter insensibility. She was not in the least put out by this speech. It sank into my heart though, and from that day forth commenced a new feeling in me for Dodd. I was grateful to him with a gratitude which those alone can understand who, in childhood, have needed and received a refreshing word of timely sympathy. It fell on my angry spirit like dew on a parched soil.

I was silent for a while. But the brightness of the day, the exhilarating movement of the vehicle through the fresh air, and the still more exhilarating sense of kindness at hand, soon restored my cheerfulness.

During the remainder of the drive I ignored Selina as far as possible (I had by no means forgiven her), and chatted away with Dodd. I had already read one or two of the stories in my new book, and I talked instructively, as I flattered myself, retailing much newly acquired information. One of the stories was laid in India; and I gave Dodd a glowing account of a country far away, where it was very, very hot always—far hotter than the hottest summer in England—but where there were strange animals and splendid plants, and where the people wore gold and diamonds on their clothes, and rode about on elephants.

To this Dodd replied that he didn't believe as he should think much of that country; give *him* horse-flesh! Which a little disappointed me.

When we arrived at the dear old garden gate at Mortlands, Selina got down to ring the bell, for Ruby did not like standing, and Dodd thought it unsafe to relinquish the reins.

Selina rang a peel at the rusty bell that made me quiver sympathetically as the clanging noise broke the peaceful stillness of the place, for I knew how it would jar against the calm that reigned there. At home I should not have cared had she made twice as much noise.

After a little pause the gate was opened, and Eliza appeared at it. She was no more flurried than if Selina's alarm had been the tinkling of a musical box. I reflected that, under certain circumstances, it was not wholly a misfortune to be somewhat deaf.

A little black trunk, containing some clothes for me, was lifted down and placed inside the gate. Selina gave me a sounding kiss on the cheeks, which I received with passive coldness, and mounted to her place again. Dodd touched his hat as I called out, "Good-by, Dodd; please tell mother that I am very well, and that I had a nice drive." And then Ruby, who had been fidgeting and chafing during the few minutes of her enforced stay, set off along the avenue of branching elms that bordered the road from Horsingham nearly all the way to Water-Eardley, at a pace that soon carried the dog-cart out of sight.

Eliza shut and locked the gate, and I stood in the garden, a little dizzy with my rapid drive.

From subsequent and repeated experience of similar days, I do not doubt that as soon as I had seen Mrs. Abram I was sent into the garden to amuse myself until the dinner hour, at which time grandfather would join Mrs. Abram and me. All the morning he was either seeing patients abroad (although he had voluntarily, and by degrees, already relinquished a great part of his practice), or was shut up in his study, where none of us would have dared to disturb him save on the very gravest emergency.

I say that, from subsequent experience, I do not doubt that I was welcomed by Mrs. Abram in her own mournful and husky manner, and was then sent out to amuse myself; but I do not remember that such was the fact.

The next picture that memory preserves of that day shows me myself nestling on the rustic, moss-grown seat I have once before alluded to, with the new story-book in my hand, and a heap of flame-colored nasturtiums on my lap. How well I recall the hot, pungent taste of their seed-vessels that I loved to bite at, although they burned my mouth! I was reading a story whose heroine was called Helen; and I have ever since connected that name with the color of yellow—an association due, of course, to the nasturtiums.

Presently, as it draws near two o'clock—grandfather's dinner hour—Eliza comes to call me into the house, and takes me to the little bedroom I always occupy at Mortlands, there to wash my face and hands, and brush my hair. And while this operation is being performed she reveals to me that she has got leave to go out to tea some evening toward the end of the

week, and to take me with her, if I am willing to go. This is great news. I am very willing to go, and begin to inquire about Eliza's friends with much interest.

"Are they nice people, Eliza?"

"Why, Miss Anne, they are humble, but godly. They have got religion, the whole family."

"Like Mrs. Abram?" I ask, doubtfully, for the phrase to my ears is not suggestive of festivity.

"Oh, Miss Anne, it is not for me to judge. They don't belong to the same Church, you know. They go to our chapel."

"Do they—do they have nice things when they ask people to tea, Eliza?"

The answer to this question was highly reassuring; it included hot butter-cakes and other dainties, so that I descended to dinner in very good spirits. I was not, in truth, a specially greedy child. But the only very "religious" person I knew at that time was Mrs. Abram; and her ascetism was such that I was prepared to find people renowned for piety indifferent to hot tea-cakes, if not absolutely disapproving of them. An enlarged experience has since entirely disabused my mind of that notion.

Grandfather was as kind and dear as ever, and even Mrs. Abram only gave a smothered sigh as she wished me many happy returns of my birthday. Grandfather gave me a beautiful toy dog, snowy white, with a red morocco collar round its neck, and standing on a green platform. Mrs. Abram presented me with a woolen jacket of her own knitting, and would have added a packet of penny books, but that grandfather peremptorily interposed to prevent her.

"Don't you think you shall be accountable for keeping the bread of life from her, Dr. Hewson?" remonstrated Mrs. Abram. She spoke so slowly and huskily, with such a far-off muffled tone (as of one discoursing inside an empty hogshead), that I was impelled to clear my throat with a shrill sound that was almost a scream.

"No doubt I shall be accountable for that, if I am accountable for any of my actions, Judith. Come, come, eat your dinner."

Grandfather tapped sharply once or twice with his open palm on the table-cloth, and poor Mrs. Abram started from a melancholy drooping attitude she had assumed, and proceeded to obey him.

All through dinner-time he watched her closely, and, if he saw any symptoms of moodiness in her, proceeded to rouse her with a peremptory sharpness, which I did not then fully understand, but which I now know to have been dictated by kindness and wisdom.

I was radiant, and talked about my various birthday gifts with the genuine self-engrossment of a child. The toy dog's name was a matter for great debate and deliberation. When at length that was settled (I called it Jessie: I have totally forgotten for what reason) din-

ner was over, and I climbed on to grandfather's knee and petitioned to have a story told me. A story! That was my great delight. Any one who would tell me a story was sure of winning favor in my eyes.

Grandfather had a quantity of iron-gray hair tossed about in confusion over his head. Occasionally the whim would seize me to arrange this thick mane in what I considered a becoming manner, and I made loud lament that grandfather's hair *would* not "stay parted." It would no more "stay parted" than water will. And yet no lady's hair is softer and silkier than were those willful locks.

On this special day I claimed a sort of birthday privilege to combine the two enjoyments of combing grandfather's hair and listening to grandfather's story.

"What shall I tell thee, little Nancy?" asked grandfather, submitting with sweet patience to the ruthless operations of my seven-year-old fingers as they plunged into his hair.

"Oh, a story, please, grandfather: *any* story!"

"Once upon a time there was a man who was very poor, and got his living by cutting wood in a forest—"

"Oh, I know that one! That's the Forty Thieves!"

"Well, you didn't bargain for a *new* story, little Nancy!"

"No; but—please—would—you—because—yesterday—was—my—birthday?" said I, breathlessly, in one polysyllabic utterance.

"But I don't know any new stories."

"Then tell *about* something. Tell about savages."

"Oh, you little barbarian! I suppose you would like to hear about cannibals best?"

"Poor creatures!" murmured Mrs. Abram, shaking her head over her work. "How awful to think of the heathen!"

She raised her eyes as she spoke with such a strange look of terror that I clung closer to grandfather, under the influence of a nameless alarm. I was always very accessible to emotions of fear—a peculiar, formless fear, compounded of vague possibilities. In the presence of physical pain, or tangible danger, I was not a coward.

Grandfather stroked my head softly, and made answer, "No, no, little Nancy; we will have nothing savage in our birthday story. We will speak of something pleasanter. I have a true story that I can tell you; a story about a boy."

"What boy?"

"An Anglo-Scottish boy."

"What for?"

My question was merely intended to demand, in a compendious manner, all the information that could be given me respecting the boy. But Mrs. Abram interpreted it literally, and replied, as through a blanket, "Will of God, love."

"There were, once upon a time, two boys," began grandfather.

"Two boys—?"

He held up a warning finger to prevent further interruptions; and I nestled my head down against his breast so that I might *feel* as well as hear the vibrations of his deep voice, and prepared to listen quietly.

"These two boys were at school together. One was six years the elder of the other, so that he was quite an old boy in comparison to the little fellow."

"May I just ask this: what were they called?"

Grandfather paused a moment, and then said, "The big boy was called Abel, and the other Stephen. Stephen was a bright-faced, affectionate boy—very bold and generous by nature. About Abel I can not say very much, except that he was not mean or cruel, and did not like to see the small boys put upon by the elders. Steenie—that was Stephen's nickname—was another boy's fag." Here I again interrupted to have the meaning of that word explained to me; which being done, grandfather resumed:

"Steenie's master was a very brutal boy. He liked to tease and hurt animals, and to inflict pain on any helpless thing that could not resist him. Nobody liked him, but many feared him; for he was tall and strong, and ready to fight always. One day poor little Steenie had offended this ruffianly boy; and after school-hours, when we were all in a big playground together, he set upon the little fellow, and began to beat him so cruelly that several of the boys cried shame!"

"Why didn't they save Steenie? I would have *killed* that bad boy! I would have got a gun and shot him!"

I clenched my little fists, and sat uprightly on grandfather's knee, with cheeks on fire with indignation. He looked at me curiously, but not angrily. Mrs. Abram, on the contrary, raised her hands in reprobation of my evil passions.

"We didn't shoot each other, little Nancy," said grandfather. "The masters would have objected to the practice, and it might, if carried to any length, have brought discredit on the school. But Abel was very grieved and angry to see the poor little fellow so badly used; so he went up to the bully, whose name was Jackson, and told him either to leave off beating Steenie, or to fight him (Abel)."

"I hope he hurt Jackson ten times worse than Jackson hurt Steenie!"

"Well, he had all the will to do so, but Jackson happened to be twice as big and strong as Abel, and Abel got licked. But he had given Jackson enough for one while, and he never afterward was so cruel to little Steenie as he had been. And not long after the fight, Jackson left the school, and then Steenie became Abel's fag, and they grew very fond of one another."

"I should have loved Abel—oh, ever so! if I had been Steenie."

"Steenie was a very grateful-hearted little

fellow, and he did love Abel 'ever so,' although what Abel had done for him was a small thing, after all. One day Steenie jumped into the river, with his clothes on, to save a little dog from being drowned, just because he knew Abel was fond of the creature."

"I like Steenie."

"Yes; most people did like Steenie."

"Did he die?"

"No; he grew up to be a man, and became a soldier, and went away to India."

"Oh, I know all about India!"

"Do you, indeed, little Nancy? That is rather valuable knowledge in these days."

"Yes; it's awfully hot there."

"True. Well, that is nearly as much as some government officials have known about India within—the last cycle or so! You open big eyes, and don't understand a word I'm saying, little Nancy. Well, Steenie went to India, and married a pretty young lady, whom he was very fond of, there; and they lived very happily until the young lady died."

"What became of Abel, grandfather?"

"Oh, you want to know what became of Abel? Why, he didn't turn soldier. He took to killing folk in another fashion."

"Why did he kill them?" said I, a good deal startled.

"For the same reason as the soldier—to earn his living."

"Is Steenie the—the—Anglo-Saxon boy you were going to tell me of, grandfather?"

"Anglo-Scottish, little Nancy. No; the boy I had chiefly to speak about is Steenie's son, Donald Ayrle."

"Oh! then it's ever so long ago the fight, and—why, grandfather, *your* name is Abel!"

"And *your* real name is Anne, if you come to that, little Nancy."

"No, but do tell me! Was it you that saved the boy and fought the other boy? But, grandfather, I'm sure you never killed any body? So you just told a story—there now!"

"You asked for a story, didn't you? But I must finish, because I want to go away, and there is an interesting part to come. Steenie's son, Donald, was sent home from India when he was a very small child. India—which you know all about—does not do for little white boys and girls to live in. They wither up like flowers that get no shelter from the sun. So Donald Ayrle was sent to his mother's relations in England to be taken care of. But the relations are going to leave England; and Donald is now a good big boy at school. And his father wrote to me to ask if I would let him, for the sake of auld lang syne—"

"What's that?"

"I can not stay to explain it fully now. In short, Captain Ayrle asked if I would let his boy spend his holidays here, now and then; and if I would look after him sometimes. And he is coming very soon;—*there now!* as you say, little Nancy."

Grandfather set me down on the floor, kissed

me, and bade me be good and not tease Mrs. Abram. And then he went away to his study.

I would fain have asked a hundred questions about this Donald, and about grandfather's school life, and many other things. But I knew that it was vain to beg grandfather to stay when he had once said he must go. I never knew him go back from his word in the most trifling things.

So I was driven to calm my excitement as best I could; and being in want of something to do, I accepted Mrs. Abram's offer of teaching me to do a sample, and sat down with a box full of scraps of colored wool and a square of canvas, to mark my name on it. Mrs. Abram took advantage of grandfather's absence to read aloud from one of the little penny books she had by her. My head was so full of other matters that I did not attend very much to what she was reading. I have a dim notion that it was the life (after his reformation) of a penitent "navvy," who had been a hideous reprobate, and who was quite sure that his own sins had been washed white as snow, but suffered a good deal from despondency about the sins of his neighbors.

But I was so engrossed with speculations as to what "Donald" would be like, that not only did he stand between me and the "navvy" (which perhaps was as well), but he absolutely obliterated the promised tea-drinking for a while. By-and-by Mrs. Abram went away to her own room. I think she usually took a nap after dinner, but I am not sure.

I was not sorry to be alone. There I sat before the red, glowing fire, dreaming delightfully. It was in the autumn. I am sure of the date by my birthday, which falls on the 17th of September, and this was the following day.

There is a fibre in my composition which always responds to the influence of a pensive melancholy. I suppose it is the same strain in my nature that, for as long as I can recollect, has made me prefer to spring and morning the evening of the day and the autumn of the year.

I have said that I was alone, but in fact there was another occupant of the room (I speak not of visionary creatures of the fancy, for they were thick as motes in a sunbeam, and made a society that I loved better than that of most beings in the flesh), namely, Tib, my grandfather's tailless Manx cat, whom I looked on as a rare and valuable phenomenon in natural history. Tib crouched on the hearth-rug beside me, purring drowsily, and blinking his green eyes at the fire. Perhaps he, too, was dreaming. The twilight grew deeper. The air was so still that not a twig stirred of the garden shrubs outside the long French window, and all the house was hushed in silence, save only the chirp of crickets on the kitchen hearth. I could hear their elfin voices across the broad stone passage that divided it from the dining-room, and Tib's purring droned out a dreamy bass to the shrill cricket chorus.

Suddenly, but softly, Eliza opened the door

and said to some unseen person, "Master is in his study. He can't be disturbed just now. Will you please stay here a bit until I can tell Dr. Hewson as you're come?"

The unseen person entered the room. Eliza left it and closed the door. I was much startled. The apparition of a stranger at Mortlands was an unprecedented phenomenon within my remembrance. I remained sitting on my little stool, with my scraps of wool and the square of canvas crumpled up on my lap, and it was a second or so before I ventured to raise my eyes. When at length I did so, they encountered nothing very terrible—merely a roundish head, dimly seen in the dusk, and by no means so high above my own as I had anticipated. My eyes fell again immediately, and lighted on a pair of clumsy high-lows, whereof the toe of one was uneasily hiding against the heel of the other.

CHAPTER III.

THE owner of the high-lows stood for half a minute without moving, further than to kick one foot against the other, as I have said. Then he advanced from the door toward the fire and sat down. But he took a chair that was out of the range of the fire-light, and was, besides, so far from the window as to receive no glimmer from thence, so that he was immediately swallowed up in a black gulf of shadow.

I observed Tib blink greenly toward the corner where he of the high-lows sat, and I envied Tib's power of vision, for I firmly believed that cats could see even in the most palpable darkness, and I took it for granted that the black shadow was to Tib transparent as a crystal screen.

I did not know what to do. I felt that I was not behaving with the ease and *à plomb* which, according to Dodd, might be expected from my years, and yet an invincible shyness bound me.

At length, after a silence which seemed to last an hour, I muttered, stammeringly, "Would you like to come nearer the fire, please?"

"Yes, I should," was the immediate response, delivered in a clear voice, and with an accent that was strange to my ears.

Encouraged by this prompt acquiescence, I ventured further:

"Would you like to have the other stool and sit in front of the fire?" As I spoke the stranger emerged from his obscurity, and I saw by the fitful light from the hearth—it was now almost dark outside—a little boy with light auburn hair and blue eyes, and a singularly grave and candid expression of face. When I observed his gloveless hands, red and purple with the cold, I did not wonder that he should be willing to approach the fire.

He drew up the stool I had pointed out beside mine, and sat down, stretching his legs out straight before him. They were not very long legs, and did not stretch far; but they

were stout and sturdy, as was the boy's whole build.

"How cold you are, ain't you?" I said, emboldened by finding a person apparently still more silent and awkward than myself.

He nodded, and answered briefly, "Pretty well." Something in the look that accompanied the words—a half smile, a little frank lifting of the brows—made me all at once sure that this could be no other than "Steenie's" son.

"You're Donald, ain't you?" I said, forgetting to be shy in my eagerness, and looking straight at him with all my eyes.

"Yes; I'm Donald Ayrle."

He kept rubbing his hands, or clapping them together, and tapped with one thick boot against the floor, as though he were keeping time to a tune.

"I know about your father, and Abel, and the fight with Jackson. Grandfather told me. Grandfather was Abel. Did you know?"

"Who is your grandfather?" demanded Donald, looking at me very solemnly.

"Why, Dr. Hewson! He was very fond of Steenie. So am I. I like Steenie for saving the dog, don't you?"

It appeared on investigation that Donald was unacquainted with the story of the great fight between Hewson and Jackson, and the cause of that terrific combat. He merely knew in a general way that his father and my grandfather had been school-fellows. But he had not seen his father for a long time ("Not since I was quite a little fellow, several years ago," he observed, with gravity), and he was of opinion that when he left India he was too much of a baby to be talked to on such important topics.

"I'm seven years old," said I. "*Turned* seven!"

"Oh," answered Donald, "I was seven almost four years ago!"

While I was taxing my powers of calculation to ascertain the present age of this enviable person, who had been seven almost four years ago, he added, "I shall be eleven in two months."

We both sat silent for a time after this, looking into the fire. At length I resumed the conversation in the form of a catechism; which, indeed, was the form my conversation was apt to take.

"Did grandfather know that you were coming to-night?"

"I suppose not. The maid said I wasn't expected yet. Old Crowe said he should write in time, but I suppose he didn't."

"Who is old Crowe?"

"Our writing-master."

"Do you like him?"

"No; I should think not!" The answer was given in such a tone as made me feel that my question had involved an absurdity. Still I could not refrain asking, timidly, "Doesn't any body like him?"

"Oh, I don't know," replied Donald, musingly. It was evidently a new idea to him that any body should be expected to like old Crowe.

"Don't his relations like him?"

"Perhaps they may. I shouldn't like him if he was my relation, that's all!"

I meditated on these words for some time, and at last resolved to pursue the matter further. I wished Donald to like me, and I thought that if he could be got to state his grounds of objection to old Crowe, I might obtain a criterion whereby to judge what was likely to win his (Donald's) approbation; so I put yet another question: "*Why* shouldn't you like him if he was your relation?"

"Old Crowe! Why he drops his h's! And he's so beastly greedy! Why he has turtle-soup every day at the pastry-cook's; and his wife and all of them have to eat scrag of mutton! I shouldn't think you'd like that yourself!" exclaimed Donald, in a tone of indignant remonstrance.

I hastened to assure him that I should *not* like that myself; and that I considered it very naughty and shocking to be greedy. I further reflected with secret satisfaction that I had been taught to pronounce my h's. But I did not mention this fact.

Presently I resumed my catechism.

"Who brought you here?"

"Nobody. I came by myself."

"Did—you—walk?" I demanded, hesitatingly.

"Walk!" echoed Donald. And the scorn in his voice made the hot blood suffuse my face until my very ears tingled. "Why, what a little silly you must be to suppose I could walk from one end of England to the other!"

"Oh! I didn't know."

"Did you never learn geography?"

I was forced, with unspeakable humiliation, to confess that I had not yet tackled that science. But I asserted (I fear quite groundlessly) that I was going to begin immediately.

"Well, *I* don't know much geography," was Donald's utterly unexpected reply. "We do Latin mostly. And a jolly lot of it too, I can tell you! You wouldn't be able to do a quarter of it."

I suggested that I thought I could learn Latin if I tried.

"Oh no, you couldn't," returned Donald, decisively. "Girls never learn Latin. Besides, you're too small. Hullo! What a queer-looking cat! Why, he hasn't got a tail! What a lark!"

Donald leaned across me to stroke Tib, who had arisen, and was stretching himself on the hearth-rug, thereby conspicuously exhibiting his lack of tail.

My self-consequence had been a good deal ruffled by Donald's cavalier speech about the Latin. The accusation of smallness, too, seemed to me injurious. I therefore seized on the present opportunity to retort; and answered, with dignity, "Why, he's a Manx cat. Manx is in the Isle of Man. And Manx cats never have tails. I *wonder* you didn't know that!"

"No! Haven't they, though? None of 'em got any tails? Are you sure? Have you ever been at Manx, in the Isle of Man?"

Donald was so simply good-humored, so willing to be as surprised as I would have had him, so far from resenting, or even perceiving, my little bit of a sneer, that I instantly put myself at the bar of conscience (to me, that has never been an indulgent tribunal. I have usually found my judgment of myself far sterner than the judgment of others upon me; but, alas, I believe, far juster also!), and became quite penitent. I hoisted up Tib in my arms, and set him on Donald's knees, as a peace-offering, advising him, at the same time, to stroke Tib, and feel how soft his coat was; and declaring that I dared to say Tib would make great friends with him very soon.

At this moment grandfather opened the door, and stood there for a second, looking at our two childish heads bending down close together in the shine of the fire.

Donald scrambled to his feet as soon as he became aware of grandfather's presence in the room, and the latter advanced and took the boy's hand kindly in his. His other hand he laid on Donald's head, and turned his face so as to see it as well as the gloom would allow.

"Hullo, Master Donald!" said grandfather, smiling with his mouth, but fixing grave, searching eyes on the blue eyes raised to meet his. "So you've stolen a march upon us! I did not expect you until Wednesday."

"I hope it ain't inconvenient, Sir," began Donald, blushing.

"Not a bit, boy; not a bit! Glad to see you. H'm! you're like your father. You couldn't be like a better man. Poor little Steenie! How the old times come back! But you're a giant to what he was when I first knew him. You're older, eh? Almost eleven? Aha! The years spin along 'swifter than a weaver's shuttle.' Men found *that* out in the ancientest days. *Good face!*"

Grandfather uttered the last words half aloud, in a fashion he had sometimes of soliloquizing audibly. And as he spoke them, he relinquished his hold of Donald, and pushed him gently from him.

Then, as one who reads aloud closes a chapter with lowered voice, and begins a fresh one in a correspondingly fresh key, grandfather resumed in a quite different, and much louder tone, "Now, before I ask you a word about your journey, or any thing else, go up stairs and wash your hands and face, and brush your hair, for tea. You must be hungry. They're getting something ready for you. Here's Eliza. Show Master Ayrlic to his room, Eliza. Give him some soap and water. Eliza will look after you. She's a very good, kind young woman; a trifle deaf; so that if she don't answer you directly, you mustn't think her sulky. Be off!"

The instant Donald had disappeared I sprung upon grandfather's knee, and plunged into a

recital of all that I had said to Donald, and all that Donald had said to me, which lasted until Mrs. Abram came in, simultaneously with the tea-tray.

I did not then notice it as any thing remarkable; but I observe retrospectively that Mrs. Abram was never intrusted with any household duties; that she was never expected to take any share in the domestic administration; and that she never seemed to wish to do so. She, indeed, demanded little personal attention; but she contributed nothing in the way of labor or arrangement to the government of the house. In this department Keturah held undivided sway.

I gathered a general notion from what grandfather and Mrs. Abram said to each other that Donald had come a long way by the coach, and that he was at a great public school in a southern county. I remember Mrs. Abram murmuring, in her huskiest tones, "Did the poor child come by himself all that way, Dr. Hewson?" and grandfather's replying, "By himself? Of course he did! He didn't require a nurse-maid to take care of him, Judith."

Then Donald came down, with his face shining very much, and his hair all sprinkled with drops of water. Cold meat and some beer were brought up for him, and Keturah sent in a dish of mashed potatoes deliciously crisped and brown on the top, and afterward several relays of hot tea-cakes, for which she was famous.

Donald ate and drank with true, healthy, school-boy appetite. Mrs. Abram was aghast at the quantity of food that disappeared within his unwearied young jaws. But grandfather looked on with glistening eyes. I had my little cup of tea—a pale brown liquid, more than three parts milk—and some of the nice hot cake. But I looked longingly at the mashed potatoes, and was only restrained from asking for some of them by the fear lest Donald should think me greedy, like old Crowe.

After tea grandfather took his usual place at the fireside; Mrs. Abram sat opposite to him, on a specially uncomfortable chair she had selected for her own use, and began to knit something made of fleecy wool. I climbed on grandfather's knee, and Donald was bidden to draw his chair up before the fire.

"Now, Donald Ayrlic," said grandfather, "have you been duly presented and introduced to this young person? Miss Anne Furness, of Water-Eardly Manor, commonly called little Nancy—"

"Not commonly, grandfather," I whispered. "Only by you."

"Uncommonly called little Nancy," pursued grandfather; whereat I felt abashed.

"Have you made friends with each other, you two?"

"Yes, Sir," said Donald.

"That's right. I want you to be good friends. You are the only two young things in the house. All the rest of us are very, very ancient."

"Is Tib old, Sir?" asked Donald, simply.

"Tib is fallen into the sere and yellow leaf," replied grandfather.

"What is that, grandfather?" I asked.

"That is a way of saying that he is getting old; just as the leaves turn dry and yellow when they are near dropping from the tree."

"But the leaves grow again, don't they?"

"Ay, ay, little Nancy. The leaves grow again. But when poor Tib disappears from among us his place will know him no more. There will be other Tibs, perhaps; Tib's kittens."

"That's not the same! I like *this* Tib. I don't care for the other Tibs."

"Little Nancy!" muttered grandfather, musingly, while he laid a soft, lingering touch on my head. "Little, tender-hearted Nancy! Why, the tears are in her eyes! Oh, cheer up, little Nancy! What are you crying for?"

"I don't want Tib to die."

"Now look here, little Nancy; you are crying a little bit because you are fond of Tib, and a great bit because you have been excited and tired, and because it's getting near bedtime."

"No, I don't!" sobbed I, replying to an accusation understood, though not expressed; "I don't feel a bit sleepy, indeed, grandfather."

"You don't know that you do. But grandfather is wiser than little Nancy—which isn't saying much; is it, Donald?"

Donald had been looking on at this scene in mute surprise, I doubt not. He was sorry to see me shed tears, but could scarcely be called sympathetic, inasmuch as he was totally unable to imagine my state of high-strung nervousness. When grandfather appealed to him he got up, and lifting the cat very gently in his arms, brought it to me and made me stroke it. "Look here," he said. "Tib's all right. He's quite jolly, you see, isn't he? And he doesn't know he must die some day, so it don't matter to him."

"Well said, Donald," cried grandfather, clapping him on the shoulder. "You're not morbid, at all events."

"What's morbid?" I asked, trying to wipe off my tears with a corner of the inaccessible pocket-handkerchief.

"I think little Nancy must wait to have that explained until she is big Nancy. Meanwhile Nancy is not too little to attend to this: it is very nice to love Tib, and be kind to him; but it is still nicer to understand that crying because he must die does him no good, and annoys people who have more sense than poor Tib, and whom you ought to love a little too."

Among my other deep debts to my grandfather, I believe that it is to him I owe that I have not grown up a prey to an exaggerated sensibility. At home this trait was either laughed at or praised to the skies. Only at Mortlands was I taught, by precept and example, how much nobler is self-command than the weak indulgence of every passing emotion. We all easily grow proud of our faults; and I fear

I was peculiarly liable to have done so. But grandfather never shrank from telling me plain truths, and inflexibly enforcing his own will whenever it chanced to come into collision with mine.

I sat in silence, broken only by an occasional sniff, stroking Tib, and nestling against grandfather's breast, as he talked to Donald about his school life, and made many inquiries as to his lessons.

I did not understand a great deal that they were saying, but I perceived that grandfather was satisfied with Donald's answers. Gradually the sound of their voices sank into a confused buzz, and anon they became preternaturally loud and distinct, and Donald's barley-sugar-colored hair glittered and expanded into a kind of *aurole* of undefined outline. In a word, I was growing desperately sleepy; but the last thing I remember saying, while I was in the dining-room, was, "Oh no, indeed, I don't want to go to bed one bit, grandfather!"

Then I was dimly conscious of being carried up stairs, and of the ticking of a watch close at my ear—which proves that it must have been grandfather who carried me—and of being laid gently on my little white bed, where Eliza undressed me. The rest is silence.

CHAPTER IV.

THAT week at Mortlands passed away very quickly. I did the honors of the garden to Donald, and showed him all my favorite nooks, and timidly revealed to him a few of the legends my fancy had attached to them. But I did not find him so much interested in these latter as I could have wished. He rather hurt my feelings at first, by observing that the story of the White Cat was nonsense, and couldn't be true; and further, that for his part he was rather glad it wasn't true—for what a bother it would be for a fellow to have a lot of hands messing about him like that prince had in the white cat's palace, and to be dressed and undressed like a baby! And as for the rabbit-hunt they went to, why what was it to tiger-hunting in India? or buffalo-hunting on the prairies of America? That was the kind of sport for him! And when he grew up he intended to travel and see countries and wonderful things—*real* wonderful things, not make-believe nonsense like fairy stories.

But Donald also was able to make-believe on occasion. He turned the old rustic garden-seat into the deck of the *Erebus*, and, enveloped in one of Keturah's ironing-blankets, and accompanied by one faithful follower (myself, with my knitted woolen jacket tied round my neck by the sleeves, and with Mrs. Abram's muff on my head), we sallied forth across the trackless wastes of snow and blocks of ice—represented by a lettuce-bed and a so-called "grotto," meaning merely a heap of stones and shells overgrown with moss—to discover the North

Pole. We did discover it, as far as I remember; and if I am not mistaken, we stuck a twig into the ground to mark the spot, so that we might find the North Pole again without difficulty, and then hastened back to the ship to inform our brave mess-mates of the triumphant success of our expedition.

Another time Tib was made to do duty for a tiger of the jungle (I recollect that his peculiar conformation was accounted for by his having lost his tail in a trap set by the native hunters!), while Donald took aim at him with grandfather's walking-stick from an ambush of gooseberry bushes.

To me the North Pole and a jungle full of tigers were as replete with elements of the marvelous as the "Arabian Nights" or the "Child's Own Book;" and when I found that Donald's realism merely meant substituting one wonder for another, I was perfectly content, and entered into it all with the happy versatility of childhood.

But our great play was *Robinson Crusoe*. Donald implicitly believed in the truth of every detail of that immortal fiction. And as, moreover, it presented the almost unique advantage of a *dramatis personæ* (at least throughout the only part of the story that we concerned ourselves with) which numerically fitted our corps, there was an additional reason for performing it frequently.

Many an hour have we spent strengthening the fortifications around the cave, digging intrenchments, and "getting things neat and handsome about us" in the interior of the dwelling. Many a time, in my character of man Friday, have I spluttered and made faces over food cooked with salt, and smiled and nodded energetically to express approval of victuals dressed without that condiment. (Our fare, when it left Keturah's hands, was mostly bread and treacle, or it might be a slice of seed-cake; but by the time it reached our desolate island, behind the big elder bushes at the bottom of the garden, it was sure to have turned into goat's flesh, turtles' eggs, or wood-pigeon.) Many a time has Havilah, grandfather's "odd man," whom I have before alluded to, been assailed with a brisk volley of musketry from a rolling-fire and the walking-stick, which had already done execution on the tiger of the jungle, and compelled, blood-thirsty cannibal that he was, to take to his canoe, and disappear across the ocean into the distant brew-house.

"Many a time," I have said, and yet all these things happened within a week! But days were long then, and full of incidents. Tedium was unknown, as was that mournful kind of experience which teaches that to-morrow must be sad because it will be analogous to to-day.

It may be remembered that Eliza had spoken to me before Donald's arrival of a contemplated tea-drinking. She obtained leave for "Master Ayrle" to join the party, and we all three went to her friend's house one afternoon.

Eliza's friend was called Kitchen. We children thought this a very odd name, but we refrained from saying so, for fear of hurting Eliza's feelings.

Mr. Kitchen lived in a tiny house in a remote, silent street called Burton's Gardens. All streets in Horsingham were more or less silent, except at "race time," when the whole town moved and babbled like a stream suddenly set free from frost; but Burton's Gardens was perhaps the dullest and least-frequented spot in Horsingham. On our way thither Eliza gave us a long account of the Kitchens, from which it appeared that Mr. Kitchen was a widower, with one son and one daughter; that he was by trade a coach-maker, and had been foreman many years in his father-in-law's shop; that his father-in-law, Mr. Green, had saved a great deal of money; that the said Mr. Green was rather "near," but very strict in his moral views; that Mr. Kitchen's son was apprenticed to his father's and grandfather's business, while his daughter kept house; and that Mr. Green was confidently expected to bequeath his wealth to his grandchildren, Matthew and Alice Kitchen.

"So you see, Miss Anne," said Eliza, following out a sequence of ideas with which I was not then so familiar as I have since become, "the Kitchens are *most* respectable."

I should not deem it necessary to commemorate this tea-drinking but for the fact of its being the occasion of introducing me to people who were afterward closely connected with some of the chief incidents of my life. My remembrance of the evening has doubtless been greatly assisted by my subsequent knowledge of the people at whose house I passed it.

There was a strip of garden inclosed within green palings in front of the house—a garden so small as only to contain one flower-bed, of about the size and shape of the apple-pies Keturah gave us at dinner. A white chrysanthemum occupied this bed, which was bordered with London pride, and surrounded by a path not much broader than my sash, strewn in a geometrical pattern with various colored gravel. I remember that Donald and I admired this vastly.

We were received very kindly. The Kitchens were not at all gloomy, as I had expected. They laughed and talked and ate with great apparent enjoyment. I thought this rather strange, for the two or three books on a side-table that I peeped into (I could never see a book without longing to open it) appeared to contain matter of a very depressing and awful description; and I had heard Eliza say that the preacher at the chapel they attended was "enough to make your blood run cold" sometimes.

The whole was, as I have said, tiny; and the parlor we took tea in seemed scarcely big enough at first sight to hold us all; but we found room enough after a while. There was a great old-fashioned escritoire opposite to the window, made of shining black wood. In the centre of

it was a flap covered with green baize, that turned down so as to form a writing-desk; and on this flap were disposed a huge Bible, an illustrated edition of the "Pilgrim's Progress," and a white china elephant with a gilt trunk, and a gilt turret on his back, which turret was an ingenious contrivance for holding ink; and there was a steel pen stuck into a hole in the turret, and I noticed that the steel pen appeared to be the only article in the room that did not look bright and clean. It was very rusty and dirty, and the wooden holder was thick with old ink-stains. I supposed that when Mr. Kitchen wanted to write a letter he took a better pen from some one of the many drawers in the *escritoire*; but on confiding this supposition to Donald, he answered that very likely Mr. Kitchen never did write letters.

Alice Kitchen, Donald and I decided, was a very pretty girl. She had row upon row of stiff light brown curls all round her head, and a fair skin, and she wore a blue bead necklace. Mr. Kitchen was an elderly man, who did not impress me particularly. He seemed rather fond of making jokes, most of which I did not understand, and he ate an enormous quantity of butter-cakes, saying, every now and then, "Alice, my daughter, go and see if the little maiden can not find yet another batch of butter-cakes in the oven. Let us enjoy the merciful gifts of the Lord. Let us not receive them with a thankless heart."

Donald and I very much approved of this doctrine, and devoured so much pastry as makes me bilious even to think of nowadays, though I do not remember that any evil consequences followed it then.

Both Mr. Kitchen and Alice appeared delighted at the quantity we ate, and kept hospitably pressing us to take more. This, I reflected, was very different from Mrs. Abram, who had a fixed idea that we should infallibly overeat ourselves at every meal. I have thought since that she possibly attributed this to the innate depravity of our unregenerate natures. I suppose that she herself must have suffered frequently from indigestion, for I remember that she used to "quack" herself, as grandfather called it, in secret. And I have seen him ruthlessly confiscate many a little round pasteboard box, wherever he laid hands on it. As for myself, I believe no child of the contemporary generation was physicked less. Grandfather had as mortal an aversion to dosing folks "as though medicine were poison," as Mrs. Abram plaintively observed; "and he's a doctor too!"

We had half done tea before Matthew Kitchen came in. He had been detained at the shop by stress of work.

"That is," explained Mr. Kitchen, "he hadn't ought to have been expected to stay over-hours, but his grandfather thinks no end of Mat, and has a fancy that so long as he's there things goes right. And Mat nat'rally don't like to put his grandfather out."

I took a strong and instant dislike to this

young man. He was clumsily and awkwardly made, and moved in a loose-jointed fashion. He had red cheeks and black eyes, a shapeless snub nose, and coarse, pouting lips of unspeakable sullenness, surmounted by a black down of incipient mustache.

His father and sister seemed anxious to propitiate him, I thought; for they made room for him eagerly, and Alice put fresh tea into the pot, and sent into the kitchen for hot cakes, earnestly assuring Matthew that they had been put aside specially for him. He said grace in a growling bass voice, and afterward a hush seemed to fall upon us all. Even the butter-cakes seemed to have lost their savor; but that may have been because we had already eaten so many.

The only incident of that evening worth recording is a sudden blaze of defiance elicited from Donald by Mat Kitchen. The word "blaze," perhaps, is too unsteady and fleeting to describe Donald's condition. It was rather a glow. It happened thus: Mr. Kitchen had been telling me (in an elaborately easy style, as of one painfully stooping to my childish level) how Dr. Hewson, my grandfather, had attended his (Kitchen's) late wife in her last illness; and how, although it was impossible to save her life, grandfather's care and skill alleviated her sufferings. I listened with much interest, and thought it kind and pleasant of Mr. Kitchen to speak so well of grandfather, when Mat (whom, in my subsequent knowledge of him, I discovered to be constitutionally averse to hear other people praised) interposed gruffly with the remark that the skill of the godless profiteth nothing.

"Grandfather isn't godless!" cried I, flushed and trembling in a moment.

"No, deary, no," said Alice, soothingly. "Don't ye mind. Matthew is very zealous in testifying. But he don't mean it, deary."

But this equivocal praise did not suit Matthew's temper.

"Yes, I do mean it!" he said, apparently beginning to enjoy himself more than he had hitherto done throughout the evening, and letting his pouting mouth relax into something like a smile. "I ain't a-going to be a respecter of persons. It won't pay to fly in the face of Providence for the sake of worldly men or worldly matters."

"Well, well, my lad," said Mr. Kitchen, rather uneasily. "Thou'st testified; now hold thy peace. We all think well of Dr. Hewson's skill in the healing art, and of his kindness in a carnal and unregenerate sense. That's enough."

"Nay, father," persisted Matthew, doggedly, shaking his head and shooting a vicious side-glance from his bright black eyes, like a horse that has got the bit between his teeth, and fully understands all that that implies; "nay, that is *not* enough. When is Dr. Hewson seen among the congregations of the godly? What is his religion?"

"That's no business of yours!" cried Donald, stoutly. He rose to his feet and faced Matthew, who, however, feigned not to notice him.

"Is he not as one of the vain physicians—as those who hold by worldly science, which is foolishness, and neglect heavenly things, which only are wisdom?"

"You come along, Anne!" said Donald, seizing his cap and taking me by the hand. "I sha'n't stop here to hear your grandfather abused. Come along out this minute!"

He had got hold of my little cloak by this time, and was trying to huddle me into it, with the hood trailing on the ground, and the hem round my shoulders. I was crying. Eliza, confused by her deafness, looked thoroughly bewildered; and Alice was vainly trying to make peace, but only succeeding in adding to the tumult.

No persuasion could move Donald to remain. He was quite inflexible, and insisted so masterfully on Eliza's dressing me and bringing me away, that we were absolutely on the point of leaving the house, when Mr. Kitchen said:

"Young Sir, you are under my roof, and have partaken of my humble hospitality. I do not think this a becoming manner of taking your leave."

Donald faced round in a moment.

"I don't mean to behave badly to you, Sir," he said; "but what does your son pitch into Dr. Hewson for? Dr. Hewson is a gentleman; and I think your son is very ignorant when he talks about science being 'foolishness,' and things like that. I'm very much obliged to you and Alice for the butter-cakes," added poor Donald, with a touch of bathos, "but I sha'n't stay here to hear things said against Dr. Hewson all the same. And *you* wouldn't like to hear your friends spoken ill of yourself!" he exclaimed, turning full upon Matthew with a strength of earnest indignation in his childish face that I shall never forget. "And I call it mean and cowardly to speak ill of people behind their backs; especially people that have never done you any harm, but have been kind to you; and really good people wouldn't do it. So all your talk is just cant, Mr. Matthew; and if I was big enough I'd thrash you."

With this final burst he marched out of the place, holding me by the hand, and followed by Eliza, who was a mere image of confusion and dismay.

I do not remember that much was said to us afterward on the subject of our stormy exit from Mr. Kitchen's house. Grandfather, I think, held a theory akin to that of the old lady who laid it down as a rule that children should be treated with a little *wholesome neglect*. At all events, he always avoided "making a fuss" about any of our sayings and doings, either to praise or to blame.

But I have a distinct recollection of hearing the matter debated by the female members of the household. Each took a different view. Eliza—who had the gentlest temper in the

world—mildly said that she thought Master Ayrle had been a bit too hot; Matthew Kitchen *would* testify, in season or out of season; and, of course, it wasn't like as if he'd said any thing against Dr. Hewson in a worldly spirit.

"I suppose you call it showing a heavenly spirit, for a young bellowing calf like Mat Kitchen to set himself up in judgment on a gentleman like master! And one as smoothed his own mother's last moments, and attended her as though she'd ha' been the foremost lady in the land, and took no fee because they was poor and in trouble at the time. I've no patience!" exclaimed Keturah, indignantly. And when Eliza meekly replied that no doubt Matthew had been moved by a sense of duty, and that it must have been a painful trial to the natural man to speak as he had spoken, Keturah rejoined with withering contempt: "Don't you believe a word on it! *His* nat'ral man's the kind o' creetur as hates to be grateful; that's what it amounts to. It ain't hard for fellows like Mat Kitchen to do their duty so long as they can make out as their duty is to pick all the hard words from the Bible and pitch 'em at folks' heads! To see them kind o' people ready to burst wi' overbearingness, and calling it religion! Ugh! it fairly turns my stummick!"

Mrs. Abram, as far as I was able to understand her utterances, attributed Matthew's want of charity to the fact of his being a dissenter. She moaned a good deal, I remember, and seemed to think we were all—including grandfather—in a bad way.

Soon after our visit to the Kitchens the time of my parents' absence from home came to an end, and I had to return to Water-Eardley. I left Mortlands with the hope of soon seeing some of its inmates again; for grandfather promised to bring Donald to see us, and he kept his word.

I had a great deal to say to mother when I reached home. I found that she was aware of Donald's arrival, and that she remembered having seen his father, Captain Ayrle, when she was a little girl, and before he went to India.

"I think," said I, one day, very gravely, "that when I grow up I shall marry Donald."

"Oh, indeed!" said mother, laughing, and stroking my hair with both her hands. "You have settled that, have you?"

"Well, I told Donald that I thought I should marry him."

"And what did he say?"

"He said he thought he shouldn't mind."

This speech was repeated that same afternoon to my father at dinner. He was immensely amused, and threw himself back in his chair to laugh—a good deal to my confusion and perplexity.

Of Donald's visit to Water-Eardley I have retained no special remembrance. But I do recollect that my father asked grandfather's leave to take him (Donald) to the races, whither I also was to go for the first time, and that

grandfather peremptorily refused, and there was sharp discussion—almost a quarrel—about it. Also I remember that, before going back to Mortlands, Donald confided to me that if my father would let that young black bull be turned into the river-side meadow by himself, he thought he could lasso him as they do in South America.

“For,” said he, argumentatively, “you know it’s more skill than strength that does it.”

But my father’s objections to the experiment proved insuperable, and Donald went away without having lassoed the black bull.

CHAPTER V.

WE went to the races—father, mother, and I—on the day on which the great cup was run for. That was a race famous throughout the length and breadth of the land; and the beautiful Horsingham course was crowded with people from far and near.

I scarcely recognized it under its changed aspect. The bright green turf, where I and Selina had gathered mushrooms many a morning, was trampled and strewn with a squalid litter of orange-peel, and nut-shells, and fluttering, crumpled papers. Merciless feet—brute and human—crushed the light elastic harebell and the short-stemmed daisy. There was a roar of voices in the air that ebbed and flowed like a tide—now louder, now lower. We were in an open carriage, in a good position to see every thing that passed. Strange, grotesque figures came and went in motley garb. I was amused and excited, and at the same time a little frightened by the unwonted throng. I remember once that vague feeling of terror to which I was subject took possession of me as the panting horses dashed past us, followed by the terrible roar of voices that seemed to rush along in their wake, as flame rushes through stubble.

I pressed up close to mother in silence, and turned my face away from the surging, shouting crowd. Then there was a pause, and another rush and roar as the horses came back to the winning-post. And then they said that the race was over, and that the favorite had been beaten.

Father had gone away before the great race began, and at its close he came back to the carriage, laughing and talking very excitedly. And he made Dodd pour out some Champagne, and told mother she ought to drink a glass to celebrate the occasion. And then he made me taste the foaming wine also, and said that he had been in luck.

I remember—how well I remember!—that mother shook her head and told him that he had been naughty, and that he had promised not to bet. And father turned quite red and angry in a moment, and asked how could she talk such nonsense? It could not be called betting; merely a few shillings. But it had

been a mere chance, the favorite not winning; and so he had won ten times what he had risked. And why hadn’t she the good-nature to be pleased at seeing him in good spirits, instead of croaking and preaching?

This impressed me as much with surprise as pain. For I was happily unaccustomed to hear harsh words pass between my parents. The crowd began to move away from the course. Our horses were put to, and we drove slowly away amidst the press of other vehicles. As we were departing, father said to me, giving me a kiss, “Well, Anne, and how did *you* like the races?”

I answered that I liked it all very much, especially the little boy with the blue frock on, and the long white stockings that had sparkling silver things all over them, and the dog who danced on his hind-legs when the organ played. But that I wished those men that rode on the pretty horses would not whip them so, for I was sure the poor horses ran as fast as ever they could; and, for my part, I thought it was cruel.

But to this father made answer impatiently that I was a little goose, and that the horses liked the excitement of racing very much—which, however, I secretly doubted.

The air and the wine, which I was quite unused to, made me drowsy, and I fell fast asleep. I did not awake until we were driving in at the gate of Water-Eardley. I found myself tenderly covered with a warm shawl and with a cushion under my head. As I opened my eyes, I saw father holding mother’s hand in his, and heard him say, “My darling Lucy, what is the use of making promises? Can’t you trust me?”

Donald’s arrival at Horsingham had been a great event in my life, and his departure left a blank for a long time. The prospect of his going away drove the races out of my mind. He was to return to Mortlands, but not until the midsummer holidays. Next summer! It seemed worlds away. You might almost as well have talked to me of next century.

I well remember a parting scene that took place the night before Donald returned to school. I had been spending the day at Mortlands. We children had revisited our favorite spots in the garden, and I had received injunctions from Donald as to the administration of a good deal of his property in Robinson Crusoe’s Island during his absence. Also I had promised to look after some guinea-pigs he had purchased. He had at first had some intention of carrying them to school in his pocket, but grandfather dissuaded him. So the guinea-pigs were left under Havilah’s charge, subject to my occasional supervision. I was not fond of the guinea-pigs. They had a peculiar mobility of nose which distressed me. And my private opinion was that they were not really affectionate. But I promised to be kind to them for Donald’s sake. It had been a busy morning, and after dinner we all sat round the fire, gathered together for the first time that day. Grandfather and Mrs. Abram were in their usual places. I was seat-

ed on my little stool with Tib on my knee; and Donald stood by grandfather's chair. Grandfather had one hand on the boy's head, and was talking to him kindly and earnestly. As I looked up at the two it suddenly struck me that Donald, who seemed so tall and strong and wise to me, was but a little fellow beside grandfather after all. I began to cry at the image I had conjured up of Donald, friendless and unprotected, all those many miles away, among big, rough boys, who, perhaps, might even beat and ill-use him, as Jackson had beaten Steenie.

Grandfather lifted me up from my stool on to his knee, and soothed and comforted me with great gentleness and patience; but my tears continued to flow, and my sobs went on crescendo. I was vexed at Donald's apparent indifference, and I had a vague notion that if I cried very much it would pain Donald, and punish him for not being so sorry to go as I was at his going. I was perfectly aware that this feeling was evil, and I afterward suffered severely from remorse, for my conscience, as I have said, was as inevitable and implacable as fate; nevertheless, I yielded to it, and continued to utter ever-increasing sounds of lamentation.

"Come, Anne," said Donald at length, much disconcerted by my convulsive grief. "I say, Anne, don't cry any more. What's the good? Come! Have a snap."

With that he drew forth and presented to me a species of confection popular in Horsingham. It was a treacly kind of cake, full of holes, like a very thin section of petrified sponge, and it was known as "gingerbread snap," or, more briefly, as "snap."

Donald, in all good faith, held out a sticky snap, which had grown flaccid from a prolonged residence in his pocket. But far from accepting this singular panacea for woe, I clenched my little fist and struck him as hard a blow as I could with it—to his profound astonishment.

"Little Nancy!" said grandfather, in a deep, concentrated voice, which had the instant effect of making me try to check my sobs—still them at once I could not. They had got beyond my control. "Little Nancy!" I trembled, conscience-stricken.

"See now what all your affection is worth! You are sorry that Donald is going away, and that is natural. But you are also *angry*—angry that he too does not scream and sob and distress every one around him. And so, in your selfish desire to vex him, because you are vexed, you let yourself be ungrateful and violent and foolishly ill-tempered. I could not have believed this of my little Nancy."

I was so overwhelmed by the essential truth of this reproof, so confused at my childish mind being thus plainly read, so stricken to the heart by the thought that now Donald, seeing what manner of little girl I really was, would love me no longer, that I slid down from grandfather's knee on to the hearth-rug, burying my face in an agony of sorrow and mortification,

the bitterness of which, while it lasted, I am inclined to believe has never been surpassed throughout my subsequent life.

There was a silent pause that seemed to last for an hour, and that was only broken by Mrs. Abram inarticulately murmuring something about the Evil One—she habitually attributed all troubles to his direct and personal interference in the affairs of mankind—and by my stifled sobs.

Then I felt Donald kneel down close by my side, and he whispered in my ear, "Come, Anne, I say, don't cry any more; I shall come back at midsummer, you know. And I don't mind your hitting me; it didn't hurt me a bit. Come!"

"I d—didn't wa—a—ant the snap. But I—I—I've been *so* naughty. You'll n—never, n—never love me any mo—o—ore!"

"Oh yes I shall; all right. Come, don't cry. Here, Anne, I say, do have a snap."

I accepted the snap on purely sentimental grounds, for I did not in the least want to eat it, and clasped it convulsively in one hand, while I tried to wipe my eyes on the inaccessible pocket-handkerchief with the other. Heaven knows my grief was genuine enough, and yet at that very moment I began to lick off a few tears that had trickled down at the corners of my mouth, and to speculate wonderingly on the phenomenon of their saltness.

Of course I was finally kissed and forgiven; and I sat close beside Donald all the rest of the evening, holding his hand in mine. Once, in the fullness of my gratitude for reinstatement into his affections, I raised his broad sturdy little fingers to my lips, and kissed them humbly. And I recollect observing, as I did so, that they smelled of slate-pencil.

He went away the next day on the top of the mail-coach, looking very small up there, I thought, beside the burly men in great-coats. And for a long time, or for a time that seemed long to me then, I missed him sorely. When the spring began to clothe the trees with green again, I began to talk of Donald's return, and to look forward to it eagerly. Grandfather did not say much on the subject, but I knew very well that he, too, would be glad to see the boy again. He was a favorite with the whole household at Mortlands. Keturah had treated him with unexampled indulgence. I remember that my sense of justice had many a time been outraged by the difference made between him and me in sundry matters of tearing and spoiling clothes, etc. I could see no such fundamental diversity between a rent in Donald's trowsers, and a splotch of ink or garden-mould on my pinafore, as made the one a pardonable peccadillo, and the other a serious lapse from virtue. But, although my reason rebelled against accepting the statement frequently made by Mrs. Abram—"Donald is a boy, love; boys always tear their clothes; it's in the nature of them"—as any satisfactory excuse for condoning his destructiveness (since it was clear that

it was equally in the nature of *me* to dirty my pinafore and crush my straw bonnet out of shape), I bore Donald no grudge for the preference shown to him. I loved him too well to be jealous of the love that was given to him; though I think it likely that I might have been jealous of the love that he gave, had any competitor in his affections come in my way in those days.

Be that as it may, every one liked Donald at Mortlands, and looked forward to his return. But there came a sad disappointment. Grandfather read us a letter one morning from a certain Colonel Fisher, who was a distant relative of Captain Ayrle, saying that he had obtained leave from the boy's father to take him to Scotland for the holidays, and that he thought it might be advantageous to the boy to make friends among his own people. A week or two afterward came a letter from Captain Ayrle himself, written a long time previously, to the effect that his comrade and third cousin was returning home from India with his family, and would look after Donald, and receive him during the holidays. And Captain Ayrle added that he hoped Colonel Fisher would reach England in time to save grandfather the bore of having the boy in his house at all, as it must necessarily be a nuisance to so quiet a household as Mortlands to have a noisy school-boy suddenly brought into their midst. And it was only his (Captain Ayrle's) reliance on grandfather's old friendship that had ever emboldened him to ask such a thing, in the difficulty of knowing to whom to intrust the boy. Great was the outcry when these disappointing missives arrived. As for me, although in honest truth I believe that time had already begun to make Donald's image fainter in my mind, I was in despair. It was my first great disappointment. I wanted grandfather to write and *demand* Donald without delay.

"Tut, little Nancy," said grandfather, slowly. "It will be better for the boy to live a healthy boy life among his own kith and kin in Scotland than to come here. Yes; he would have found it drearier and duller as time went on. Unless, indeed—Dry your eyes, little Nancy; I am sorry, too."

Two events soon happened to occupy my attention. The first event was the birth of a little brother; the second, my consequent going to school. The simple lessons that mother was used to give me were all interrupted by baby's arrival. Mother was not strong for a long time after his birth, and I was banished to my nursery during the greater part of the day. All the happiness that home had ever afforded me was gained in my parents' society. Debarred from that, Water-Eardley Manor was but an uncongenial place to me. I could not be always at Mortlands; and, if I could have been, there were no means there of prosecuting my education; so it was settled that I should go to school.

There was a lady who kept a boarding-school

in a fine old-fashioned house in Horsingham, on the outskirts of the town, and not very far from the race-course. I was to be what was called a weekly boarder, going home—or to my grandfather's house, which was nearer—every Saturday, and returning to school on Monday morning. I looked forward to this change (as well as I can recall my feeling on the subject) with, on the whole, more pleasure than pain. But it was not without a sinking at the heart, and some bitter tears, that I said "good-by" to mother, and gave a farewell kiss to my little baby-brother sleeping on her breast.

CHAPTER VI.

THERE is no need, for the clear understanding of the rest of these pages, that I should describe my school life at length. It was calm and monotonous. I can compare it to the course of the little streamlets that intersected some of the grass-lands on my father's farm. The natural channel was banked up, and guided without being distorted altogether from its original direction. Little ripples sometimes ruffled it; deeper pools lay brown and silent beneath its banks; blue forget-me-nots made the eye glad with their beauty here and there; there were reaches of weedless grass, green and smooth; and again there were tangles of hemlock, and spear-like clusters of pithy rushes. Slowly the little streamlet slid onward with a steady, secure current, until it joined the wider river, and must thenceforth flow through calm and storm unguided to the sea.

The greater part of my life during eight years was spent at school. Our governess, Mrs. Lane, was a widowed gentlewoman; tall, slender; stately, with a soft voice and a stern eye. To her the school was the world. Had she been the matron of a jail, or head-nurse in a hospital, I am inclined to believe that the universe would speedily have presented itself to her mind as all jail or all hospital. She had a passion for systematizing such as I have met with in no other Englishwoman. Her rules were inflexible, because they were the strictly logical result of her principles. Given the premise, Mrs. Lane's deductions must infallibly follow. Her intellect, though shallow, was very clear. She always reminded me of a fine frosty day: cloudless, pale sky, bright sunshine (delightful to look upon, impossible to bask in), and a little sharp *nip* pervading the serene atmosphere. Fortunately it was among Mrs. Lane's principles that ample and generous nourishment was necessary for young growing creatures. We were well fed and well lodged.

How well I remember Mrs. Abram (who, poor soul! had once been nearly starved to death at school herself) expressing the greatest solicitude about my diet, and making a suggestion, unknown to grandfather, that I should be provided with a tin case of captain's biscuits to stave off the pangs of hunger, should I find

myself reduced to a low ebb. I very much approved this scheme, and was eager to adopt it, with one trifling alteration, namely, that the tin case should contain, not captain's biscuits, but "snaps" and macaroons. But Mrs. Abram would not hear of either; partly because macaroons and snaps were bilious, as she said; but also, as I was secretly convinced, because they were nice! However, I had not been many weeks at school before it became obvious to all who looked on me that no such provision as Mrs. Abram had contemplated could be needful. I have mentioned that my health was delicate when I was a young child. But I grew stronger year by year, and I have been throughout my adult life a singularly healthy woman.

The few events that marked the course of those eight years which I have said I spent chiefly at school may be briefly presented before the little banked-in rivulet leaves its straight, safe channels for the wider flood.

Selina, my nurse-maid, got married, and who should her bridegroom be but Donald's old enemy, Mat Kitchen! I felt there was somehow a suitability in the match, although I was vaguely sorry for Selina, too. It had been brought about in this wise: My father had bought a pretty little pony-phaeton as a present for mother, out of his winnings on the day of the great race which I was taken to see. Some accidental injury having been done to this vehicle, Mat Kitchen was sent out to Water-Eardley by his grandfather, Mr. Green, the coach-builder, to see what repairs were necessary to it. On this occasion, and on several subsequent occasions, he saw Selina, and was attracted by her. Mat was by this time receiving good wages, being, I believe, skilled in his trade. Then, too, he had the prospect of an inheritance from his grandfather, and was considered altogether an eligible match.

"I was vexed with your father for buying me that phaeton," said mother once, thoughtfully. "I said I was sure that money got by betting would bring no blessing with it. But it has brought good luck to Selina, at all events. It has got her a husband."

Such amount of good luck as was involved in marrying Mat Kitchen certainly did fall to Selina's share. My parents helped to furnish her little house for her. I was taken to see it before the wedding; and there I saw the bridegroom-elect, looking, as I thought, more sullen than ever. He had shaved his dark upper lip, and wore a fringe of black whiskers. He eyed the furniture in a glum manner, and let fall no syllable of gratitude or gratification for the presents Selina had received. I could not help fancying—probably erroneously—that he kept remembering the evening when Donald and I had taken tea at his father's house, and secretly enjoying the recollection of having made himself so unpleasant. But he called me "little miss," and was not uncivil. Alice Kitchen was there too. She begged me to go and see her and her father some day, when Mat should be

married. I did go one afternoon on my way from school to Mortlands, accompanied by Eliza. I had discovered—I can not now tell exactly by what means—with the intuitive quickness of a child's observation, that Eliza was afflicted at Matthew Kitchen's marriage, and would have liked to marry him herself. Also I noticed that Mr. Kitchen and Alice seemed sorry for her, and made much of her, and I drew the conclusion that they would have preferred to have her for a daughter and sister rather than Selina. Mr. Kitchen's little parlor looked exactly the same as of yore, even to the white and gold elephant, with the rusty steel pen in his castle. I had some delicious butter-cakes, baked expressly for me. And they talked of Donald. Mr. Kitchen observed that he (Donald) was "a high-mettled young youth;" and seemed to think the phrase a happy one, repeating it more than once.

And now, as I look back, I perceive that during my school life the image of Donald had been fading, fading, until it had become the mistiest outline of a memory. Were it not for hearing him spoken of, I should, I feel sure, have forgotten him at this time altogether. Should the reader ask, "How, then, is it that you have been able to give so many minute details of your first acquaintance with the boy?" I shall reply by another question. Do you not now, O reader, if your years number more than some twoscore or so, recall the events of your childhood more clearly than you could have done at eighteen?

In the leafy summer-time we see only the screen of foliage that borders our pathway. Every hedgerow is full of life. Every branch bears its bloom. But when autumn, like some grave and wise enchanter of old time, touches the world with his golden wand, and the transmuted leaves fall yellow from the bough, we look back through the open tracery, and the landscape we have traversed lies softly clear beneath our gaze.

The seasons succeeded each other, and my life continued to be monotonous and tranquil outwardly. Within there was growth and struggle and change; as, I suppose, there must be in all young souls. Those by whom I was surrounded remained unaltered; or they altered so gradually that I scarcely as yet perceived any change in them. Only one thing I observed in my visits home; namely, that father had quite fallen into the practice of going to the races every spring and autumn. Sometimes he even went away to our county town to attend a great race there. Also I noticed that grandfather, who used to inveigh so heartily against horse-racing, had now become gravely silent on the subject at Water-Eardley; or, at all events, he was so whenever I was present. Once, however, on going into our dining-room, after dinner, with a message from mother to my grandfather, who had been spending the day with us, I found the two men in a vehement dispute over their wine. Father was hot and flushed and angry.

Grandfather's face was as stern and set as stone, only his gray eyes sparkled. As I entered I heard father say, sneeringly, "I wonder, Dr. Hewson, that you, who have such very *liberal* views on most subjects, should be so prejudiced on this point!" Whereto grandfather made answer, "I do not think, George, that you in the least degree apprehend what my views *are* on any important subject. At least, let me assure you that my views do not include proclaiming full liberty of blackguardism to blackguards."

Then they both saw me standing scared in the doorway, and ceased speaking. My message put an end to the discussion, for it was to beg grandfather to come and look at my little brother Harold. The child had been ailing for some days; and mother said he seemed fevered and uneasy in his sleep; and she was anxious about him.

Ah! I am coming to a dark place in my young life; to a valley of shadow, watered by a fountain of tears. My little baby-brother! How we watch the sweet round cheeks growing hot and crimson, and listen to the piteous little cry, "Oh, mamma; oh, mamma; Harry *so* *sirsy*!"

Almost more piteous is it, when he is for a time free from suffering, to see the little creature laugh and try to play his old romping games with me, and open wide appealing eyes when he finds that his baby strength no longer suffices to do as he has been used to do. For he grows weaker and weaker, and wastes and fades day by day. And at length the end comes. Care and skill, and the mother's sleepless devotion, can not save him. He falls softly into a slumber, with one little wasted hand clasping my finger, and the other laid upon his innocent lips, like a symbolic statue of silence. And the silence comes down solemnly—solemnly and sweetly. The waxen face changes to marble, and the tiny hand grows chill. I am brought face to face with an awful, irrevocable fact, that is blind and deaf to my sorrow.

After her baby's death, mother was ill for some time; ailing for some time longer. She and father went away to a sea-side place: very far away it seemed to my imagination. In my parents' absence I spent every Saturday and Sunday at Mortlands. I went with Mrs. Abram to a musty-smelling church, with damp, stuffy pews, and a black, shining wooden gallery. And there a clergyman preached long sermons, "full of sound and fury, signifying"—many things which I am averse to contemplate, even at this present period of my life; but which seemed to afford Mrs. Abram a gloomy and ghoulish satisfaction. Hideous images of the charnel-house, from which my soul revolted! How he harped on despair and dread, as if they made sweet music! No word of human love and charity can I recall that issued from his lips in the pulpit. "Good-will toward men," had been omitted from his gospel. That is not what the angel voices sang in *his* ears. Glad

tidings of good things were revealed to no mortal by his clerical voice. Dressed in a little brief authority, he dealt out death and damnation to all and sundry. But when he descended to the vestry, he grew milder; and by the time he had donned his coat, and reached the church-door, he became human, and held his little children gently by the hand. I even heard that in sickness and poverty no one was more benevolent than he; that he gave liberally out of his slender means, and grudged neither time nor trouble to his needy parishioners. All which things, as I grew older, I kept in my heart, and pondered them.

Mother came back from the sea-side with restored health. All fell into its usual track at Water-Eardley, as it used to be before our pretty blossom came and peeped upon the earth, and then folded his soft leaves again forever. At Mrs. Lane's I did not form any of the romantic friendships which are popularly supposed to make a necessary part of a school-girl's experience. I was not very gregarious by nature. I was fastidious in my choice of companionship. And then, doubtless, I was devoid of many qualities which insure popularity. I had very few acquaintances in Horsingham. Grandfather, as I have said, had lived in almost total seclusion from society for as long as I can remember. And the years, as they advanced, rather confirmed than diminished his dislike to mix with the world. My father's friends and relations lived chiefly in the country. Still there were one or two houses in Horsingham which I occasionally visited. Sir Peter Bunny's was one of these houses. Sir Peter had once been mayor, and was knighted on the occasion of heading some deputation during his mayoralty. He was a thin, handsome old gentleman, with dark eyebrows and white hair and small features. His portrait was exhibited one year at the Royal Academy; and the legend ran in Horsingham that enthusiastic visitors would point it out to each other as the very type and ideal of an aristocratic gentleman of ancient lineage, and would turn to their catalogues and say, "Bunny! Sir Peter Bunny! Of the Shropshire Bunnys, I wonder?" in a very genteel and knowing manner. But we Horsingham folks knew that Sir Peter made his money as a maltster, and that Lady Bunny's mother kept a boarding-house at Scarborough; and that despite the big coat of arms on their carriage, and the crest blazoned on every possible and impossible article of furniture in the house, the Bunnys are, in the pure eyes of *county* society, "nobody"—mere impalpable figments of the vulgar brain. They, and their man-servant, and their maid-servant, their cattle—and, in short, every thing save the stranger within their gates (who is usually, in his own opinion, somebody, and eats Sir Peter's dinners in a manner calculated to prove it!), being in any polite sense the mere baseless fabric of a vision.

Despite this Berkeleian theory of the Bunnys'

existence, they were greatly liked and respected. Their youngest daughter was a school-fellow of mine, and I sometimes took tea at her father's house, and spent a quiet evening there. Also, I had made the acquaintance of Mr. Arkwright, the curate of Mrs. Abram's favorite clergyman, whose direful ministrations I have spoken of; and of Mrs. Arkwright and the little Arkwrights—and the name of these latter is Legion. I never met Mr. Arkwright without being possessed by a yearning pity for him. The phrase sounds absurd, in our relative positions; nevertheless, it is strictly true. My more mature judgment leads me to doubt whether the case were one calling for all the compassion I lavished on it. But as a very young girl—little more than a child when I first knew him—I was unfeignedly sorry for the Reverend Edwin Arkwright in my heart. He was so very poor, and he had so many young children, and his wife, though doubtless the partner of his cares, appeared to me so little calculated to be the soother of his sorrows. He was known by all Horsingham to be in debt; and yet no one could blame him for extravagance. I once said to Mrs. Lane (I scarcely know how my speech was brought about, for my communications with her were rarely impulsive or confidential), "How dreadful it must be to be in debt! To feel that you have had people's goods, and have not paid for them!" And Mrs. Lane looked at me very strangely, and said, Yes; she supposed it must be dreadful; and hoped I should always continue to think in the same way.

A day or two afterward I was passing Mrs. Lane's sitting-room, the door of which was ajar, and I was surprised and startled to hear grandfather's voice within.

"We will settle the whole account now, if you please, Mrs. Lane," he said. "Three-quarters' schooling are due, are they not?"

Before I could gather presence of mind to move away, the door of the sitting-room was fully opened, and grandfather and Mrs. Lane came out into the hall.

"Anne, how pale you are!" exclaimed my governess. She looked quite alarmed, and made a movement forward to take hold of me. Grandfather gave me a searching glance, and said, "May Anne come home with me to Mortlands now, Mrs. Lane? I know that it is out of the regular course of things; but it will only anticipate the half holiday by one day, and I shall feel obliged to you if you will permit it."

Mrs. Lane at once assented. I think she fancied that my grandfather's medical eye detected some incipient illness in me. But there was none; I had merely been startled and seized upon by a vague feeling of uneasiness, which had immediately translated itself in my countenance.

Grandfather took me home to his house; and as soon as we arrived at Mortlands he bade me follow him into his study. I obeyed with a beating heart. I could recall no such

summons having happened previously. He kissed me and placed me in a chair, and then sat down opposite to me.

"Anne," said he, "what did you hear me say to Mrs. Lane? I saw in your face that you had been shocked and startled."

I told him what I had heard; adding, "How could it be, dear grandfather, that so much should be owing to Mrs. Lane? I had no idea—I thought—"

I stopped with twitching lips. An attempt to utter another syllable would have resulted in a burst of tears, and I was resolved not to give way to that weakness without a struggle to retain my self-command.

"Little Nancy, I did not know that the money was owing until yesterday. When I did know it, I got your mother to let me pay it—for her."

There was an almost imperceptible pause before the two last syllables, but my ear detected, my mind marked it. However, I did not press grandfather with any further questions at that time. He told me that all was well at Water-Eardley, and reassured me on the whole.

"By-the-way, little Nancy," he said, just before dismissing me from the study, "when you go home you will miss the hunters. That is to say, you might miss them if you chanced to go near the stable; or the servants might speak to you of them. In any case, do not say any thing to your father about them. It is a sore subject."

"What has happened to the hunters?" I asked, wonderingly. "Are they dead?"

"No; they are sold."

CHAPTER VII.

FROM that time forth began a new era for me. Very shortly after the incident I have spoken of in the last chapter I was removed from Mrs. Lane's and returned to Water-Eardley. I was then between eighteen and nineteen. I am inclined to believe that I was more childish in some respects, and much less so in others, than most girls of my age. The sort of foretaste of the world—the preliminary experience of its buffets and struggles, its victories and defeats, which is supplied to a child by the competition of brothers and sisters, I had never had. Even my school life had not altogether stood in the stead of it. But, on the other hand, I had escaped the most imminent danger that usually threatens an only child: I had never been "spoiled." But for this blessing I have to thank my grandfather's firmness and wisdom. I had been accustomed to appeal to him and to lean on him with absolute trust throughout my young life; and he now stood by me with counsel and help when I had to face a new aspect of things, and to learn some lessons which only a practical contact with the difficulties of existence can teach.

My father was sorely pressed for money. I

had known that it must be so, when I heard that he had sold his hunters: the beautiful, docile creatures in whom he had taken such pride. And this, too, painfully explained why there were such long arrears of payment to be made for my schooling. But of what had caused my father's need I had no conception. Grandfather forbore to tell me. But poor mother, in her distress and her yearning to confide in a loving heart, soon revealed to me that my father had of late been involving himself deeply in what are called "turf speculations." In plain terms, he had been betting and gambling and losing, not recklessly—he was but too deeply plunged in anxiety as to the result of the risk he was running—but infatuatedly. It would be more correct to say that mother's face and voice infected me with apprehension and grief, than that my intelligence fully realized all that was implied in the word "gambler."

"Then, mother dear," said I, attempting to apply what little lore of life I had gleaned from story-books to the present case, "I suppose we are ruined?"

It appeared, however, that we were by no means ruined. Mother even smiled at my solemn face as I said the word; but her smile was like a pale sunbeam struggling through rain clouds. No; we were not ruined. Father might even have avoided the sale of his hunters by raising money in another way; but he had resolved, mother said, to make a sacrifice which should fall on him personally, and on no one else. And was not that noble and generous? Mother bade me note what liberal atonement he had made. And, after all, father had not been so much to blame; he had been led on and on by a run of good luck. And he had been persuaded and tempted by others: wicked men who had neither pity nor principle. But perhaps this taste of misfortune was a blessing in disguise: it would show father, before it was too late, what gulfs of ruin lay hidden beneath that smiling surface of good-fellowship. He had promised, he had given his word to bet no more. He was so good, so affectionate, so frank in acknowledging his error.

I watched mother's face thoughtfully while she spoke. When she had finished, finding that her countenance revealed something not altogether in harmony with her words, I said, "Then why should you be so sorry and so anxious, mother darling? If father has given his word, that is enough. You need not be afraid any more; need you, mother?"

"No, my dearest. You are right. I ought to have faith in my own darling; and I have, Anne. You must not fancy that I doubt father."

But her speech was closed by a sigh that seemed to come from the depths of her heart.

However, it seemed as if her apprehensions had in truth been excessive, for the storm cleared away, and left, as far as I could tell, no permanent disaster behind it. No comfort that

we had been accustomed to enjoy in our home was absent from it. The empty stalls in the stable, and the dismissal of one of the grooms, alone reminded us that we had narrowly escaped a far greater misfortune. My old friend Dodd, for whom I had always retained a kindly feeling, left us about a year after my return home. He married, and set up in a little roadside inn about seven miles from Horsingham, which inn, from its situation in close proximity to the main highway, did a thriving business with carters and carriers, at all seasons of the year, and with stray travelers during the race-time.

Dodd was replaced at Water-Eardley by a smart, sly, undersized creature, who had been for some time employed about Lord B——'s training stable. I remember father mentioning this fact as being a great recommendation when the man was first engaged, and grandfather making him very angry by replying, "Mercy on us! The fellow comes armed with a regular diploma from the school of perdition, does he?"

But grandfather seldom permitted himself such utterances as this. He had the talent of holding his tongue. (How rare and how precious a power!) He had a sincere desire to make peace. He knew that nothing is more likely to check the struggling growth of amendment than the cold breath of distrust. He encouraged my mother—he was cordial and pleasant as ever with my father. It seemed as if all were still as it had been. But it was only seeming.

Among other changes which I observed in my father, now that I lived constantly at home, was a listless indifference to the pursuits he had formerly been interested in; his farm and his stock were merely a care and a trouble. He sold off all the beasts he had of a famous breed of cattle (more than one silver prize-cup won from county competitions glittered on the sideboard in our dining-room), and replaced them with common animals.

I could not for the life of me have told why, but even to my inexperienced eyes the whole aspect of the farm was changed. The Germans have a homely proverb of rural life: "The master's footstep manures the field best." On our fields the master's footstep rarely fell. By degrees father entirely relinquished one farm, consisting of arable land, which he had rented, and retained only the grazing meadows. Father always had some excellent reason to give for every change that he made. He really was an enlightened farmer, and understood his business very thoroughly. This made it almost impossible for any one to remonstrate with him as to what he was doing, and what he was leaving undone. "You will allow, I suppose," father would say, sharply, "that I know something about land, and something about stock!" This being indisputable, he would add, "And I presume you will give me credit for using my knowledge to my own interest. A man will

care for *that*, at all events, whatever else he cares for."

Interest! His own interest? How strange it is that men should go on repeating the parrot-like formula, whose truth is contradicted by every day's experience! There is no petty passion in the human breast but will override "interest," in the sense generally attached to that word.

Father was constantly saying that farming was such a *slow* way of making money; that what you gained one year you lost the next; and making other grumbling speeches, which—I confess it—irritated me terribly. Once my mother exclaimed, very innocently, "But, George dear, what need is there for us to 'make money' at all? Have we not enough? Heaven knows I don't long for riches?" And father was out of humor the whole day afterward. Alas! that was coming to be a frequent occurrence. Father never had sweetness of temper comparable to mother's. He was what people call "hasty." But then whosoever made that remark almost invariably added, "It was over in a minute." For my part, when I hear such a characteristic mentioned in the way of praise, I am inclined to ask, "With whom is it over in a minute? With the hasty man himself, or the object of his sudden wrath?" Wounds given in haste will often take long to heal. But, at least, in former times when father was angry, those around him usually comprehended wherefore he was so. He had been frank-natured too, and disdainful of equivocation; but he was changing, changing, changing, day by day.

I am dwelling chiefly on the internal phases through which our home life passed, so to speak. These were mostly hidden from all who were not dwellers at Water-Eardley. The superficial part of our existence was, I imagine, much the same as ever in the eyes of strangers.

My parents, perhaps, did not go from home as much as they had been used to do when I was a child. But my father had a large circle of relatives in the neighborhood, and we visited a good deal; much more, indeed, than was agreeable to me. For, to say truth, I did not find all these tribes of second and third cousins by any means congenial to me. I had, to say the least, a distaste for their society, and I have reason to believe that the distaste was heartily reciprocated.

The few acquaintances I had made during my school-days in Horsingham I retained. Lady Bunny called upon my mother, and my mother returned her visit; and there ensued dinners at Sir Peter's house and at my father's; and a dance at the former place, on which occasion both Barbara Bunny, my late school-fellow, and I were introduced to the fashionable world of Horsingham. But this was a rare dissipation, and did not lead to much further gayety. It had the effect, however, of distracting my mind from other things for some time afterward. I found, to my surprise, that my studies

were flat and savorless; that I was haunted during the writing out of an exercise by the echoes of a tuneful waltz; that my thoughts were rather frequently busied with devising imaginary costumes for myself, and fancying how I should look in a lemon-colored crape dress, such as the eldest Miss Bunny had worn, and other similar speculations. In a word, I discovered in myself a hitherto unsuspected taste for excitement, not to mention a considerable development of the organ which I believe phrenologists have designated love of approbation.

Since I had left school, I had, by grandfather's advice, and partly in consequence of a suggestion that he had made to my parents, continued certain of my studies under the auspices of the Reverend Edwin Arkwright. He was an excellent German scholar, and he gave me lessons in that language. Also he read history with me, and even imparted to me a slight smattering of Latin. Father had objected at first rather strongly to this latter study. He did not want his girl to be a blue-stocking. He hated learned women; they notoriously made bad wives and mothers. Home was a woman's sphere, and domestic duties were her proper employment. I remember in my inexperience earnestly endeavoring to discover father's reasons for thinking that the declension of *hic, hæc, hoc*, would undermine my principles, and harden my manners, and utterly failing to get any enlightenment as to his views on the subject. When I had recourse to grandfather, he merely said that every one had some prejudices, and that it could not be expected that my father should be totally exempt from them; but that he (grandfather) had persuaded father to let me learn from Mr. Arkwright, assuring him that there was no apparent danger of my becoming a portent of erudition. And indeed the discerning reader, who shall peruse these pages to the end, will scarcely require me to assert that whatever evils have happened to me in the course of my life have most undoubtedly been due in no wise to excess of learning: Heaven save the mark!

"But then, grandfather," said I, earnestly, "how is it? Does father want me not to learn well from Mr. Arkwright? Does he think it won't be a bad thing if I only *pretend* to learn German and Latin, but that it will hurt me if I really do study industriously?"

Whereto grandfather only replied, dryly, that I had better not make such speeches as that to my father, as he would probably consider them unfeminine. And then he added, more seriously, "Do not question your parent's conduct in a caviling spirit, little Nancy. No Latin in the world was ever worth a loving heart and a docile temper."

I went once a week to Mr. Arkwright's house to take my lesson; and I usually spent the evening of those days at Mortlands, especially during the winter and autumn when the daylight set early. To me my lesson-days were

times of almost unmixed enjoyment. At least they had been so up to the time of the dance at Sir Peter Bunny's. After that occasion, I found that the concentration of my mind upon my books was much more difficult than it had been: still I continued to go to the curate's house on the appointed days. I knew beyond the possibility of doubt that the sum paid for my lessons was an important object to the Arkwrights. It never occurred to me to question my parent's power of affording it. The exam-

ple of Mrs. Lane's over-due school bill might, it may be thought, have awakened some misgivings; but I believed that the causes which had led to that circumstance had ceased forever; and that the sun was not surer to rise each morning than was the price of my lessons to be duly and regularly paid to Mr. Arkwright. I may here record that it was so paid. But not until many years later did I learn from mother's confession, that the person who paid it was my grandfather.

FEMALE SUFFRAGE.

A LETTER TO THE CHRISTIAN WOMEN OF AMERICA.

Part II.

LET us now look for a moment at the actual condition of women in America, in connection with the predicted elevation. We are told they are to be elevated by the suffrage—and that by hanging on to the election tickets in the hands of their wives, the men are to be elevated with them. What, therefore, is the ground women now occupy, and from whence they are to soar upward on the paper wings of the ballot? The principal facts connected with that position are self-evident; there is nothing vague or uncertain here; we have but to look about us and the question is answered. We already know, for instance, from daily observation and actual experience, that, as a general rule, the kindness and consideration of American men have been great, both in public and in private life. We know that in American society women have been respected, they have been favored, they have been protected, they have been beloved. There has been a readiness to listen to their requests, to redress grievances, to make changes whenever these have become necessary or advisable. Such, until very recently, has been the general current of public feeling, the general tendency of public action, in America. If there appear to-day occasional symptoms of a change in the tone of men on this point, it is to be attributed to the agitation of the very question we are now discussing. Whenever women make ill-judged, unnatural, extravagant demands, they must prepare to lose ground. Yes, even where the particular points in dispute are conceded to their reiterated importunity, they must still eventually lower their general standing and consideration by every false step. There are occasions where victory is more really perilous than a timely defeat; a temporary triumph may lead to ground which the victors can not permanently hold to their own true and lasting advantage. On the other hand, every just and judicious demand women may now make with the certainty of successful results. This is, indeed, the great fact which especially contributes to render the birth-right of American women a favorable one. If the men of the country are already disposed to

redress existing grievances, where women are concerned; as we know them to be, and if they are also ready, as we know them to be, to forward all needful future development of true womanly action, what more, pray, can we reasonably ask of them? Where lies this dire necessity of thrusting upon women the burdens of the suffrage? And why should the entire nation be thrown into the perilous convulsions of a revolution more truly formidable than any yet attempted on earth? Bear in mind that this is a revolution which, if successful in all its aims, can scarcely fail to sunder the family roof-tree, and to uproot the family hearth-stone. It is the avowed determination of many of its champions that it shall do so; while with another class of its leaders, to weaken and undermine the authority of the Christian faith in the household is an object if not frankly avowed yet scarcely concealed. The great majority of the women enlisted in this movement—many of them, it is needless to say, very worthy persons as individuals—are little aware of all the perils into which some of their most zealous male allies would lead them. Degradation for the sex, and not true and lasting elevation, appear to most of us likely to be the end to which this movement must necessarily tend, unless it be checked by the latent good sense, the true wisdom, and the religious principle of women themselves, aroused, at length, to protest, to resist. If we are called upon for proof of the assertion, that American men are already prepared to redress actual grievances, we find that proof in their course at the present moment. Observe the patience with which our legislative bodies are now considering the petitions of a clamorous minority demanding the redress of a fictitious grievance—a minority demanding a political position which the majority of their sex still utterly reject—a position repugnant to the habits, the feelings, the tastes, and the principles of that majority. If men are willing to give their attention to these querulous demands of a small minority of our sex, how much more surely may we rely on their sympathy, and their efficient support, when

some measure in which the interests of the whole sex are clearly involved shall be brought before them by all their wives and mothers?

And again: they are not only already prepared to redress grievances, but also to forward all needed development of true womanly action. Take, in proof of this assertion, the subject of education. This is, beyond all doubt, the vital question of the age, embracing within its limits all others. Education is of far more importance than the suffrage, which is eventually subject to it, controlled by it. This is, indeed, a question altogether too grave, too comprehensive, and too complicated in some of its bearings to be more than briefly alluded to here. But let us consider education for a moment as the mere acquirement of intellectual knowledge. This is but one of its phases, and that one not the most important; but such is the popular, though very inadequate, idea of the subject in America. Observe how much has already been done in this sense for the instruction of the women of our country. In the common district schools, and even in the high schools of the larger towns, the same facilities are generally offered to both sexes; in the public schools brother and sister have, as a rule, the same books and the same teachers. And we may go much farther and say that every woman in the country may already—*if she is determined to do so*—obtain very much the same intellectual instruction which her own brother receives. If that education is a highly advanced one she will, no doubt, have some especial difficulties to contend against; but those difficulties are not insurmountable. The doors of most colleges and universities are closed, it is true, against women, and we can not doubt that this course is taken for sound reasons, pointed out by good sense and true sagacity. It is impossible not to believe that between the ages of fifteen and five-and-twenty young men and young women will carry on their intellectual training far more thoroughly and successfully apart than thrown into the same classes. At that age of vivid impressions and awakening passions, the two sexes are sufficiently thrown together in family life and in general society for all purposes of mutual influence and improvement. Let them chat, walk, sing, dance together, at that period of their lives; but if you wish to make them good scholars, let them study apart. Let their loves and jealousies be carried on elsewhere than in the college halls. But already female colleges, exclusively adapted to young women, are talked of—nay, here and there one or two such colleges now exist. There is nothing in which American men more delight, nothing more congenial to their usual modes of thought and action, than to advance the intellectual instruction of the whole nation, daughters as well as sons. We may rest assured that they will not fail to grant all needed development in this direction. One female college, of the very highest intellectual standard, would probably be found sufficient for a

population of some millions. The number of women desiring a full college education will always, for many different reasons, be much smaller than the number of male students. But there is no good reason why such colleges, when found desirable, should not enter into our future American civilization. Individual American women may yet, by these means, make high progress in science, and render good service to the country and the race. Every branch of study which may be carried on thoroughly and successfully, without impairing womanly modesty of mind and manner, should be so far opened to the sex as to allow those individuals to whom Providence has given the ability for deep research to carry them to the farthest point needed. But as regards those studies which are intended to open the way to professions essentially bold and masculine in character, we do not see how it is within the bounds of possibility for young women to move onward in that direction without losing some of their most precious womanly prerogatives—without, in short, unsexing themselves.

The really critical point with regard to the present position of women in America is the question of work and wages. Here the pocket of man is touched. And the pocket is the most sensitive point with many men, not only in America, but all the world over. There can be no doubt whatever that women are now driven away from certain occupations, to which they are well adapted, by the selfishness of some men. And in many departments where they are day-laborers for commercial firms they are inadequately paid, and compelled to provide food, lodging, fuel, and light out of scanty wages. Yes, we have here one of the few real grievances of which American women have a just right to complain. But even here—even where the pocket is directly touched, we still believe that women may obtain full justice in the end, by pursuing the right course. Only let the reality of the grievance be clearly proved, and redress will follow, ere long. Providence has the power of bringing good out of evil; and therefore we believe that the movement now going on will here, at least, show some lasting results for good. The "Song of the Shirt" shall, we trust, ere long become an obsolete lay in our country. Our women, twenty years hence, shall be better paid in some of their old fields of labor; and new openings, appropriate to their abilities, mental and physical, shall also be made for them. And here they are much more likely to succeed without the suffrage than with it. It is not by general law-making that they can better themselves in these particulars. Individual fitness for this or that branch of work is what is required for success. And if, by thorough preparation, women can discharge this or that task, not essentially masculine in its requirements, as well as men, they may rest assured that in the end their wages will be the same as those of their fathers and brothers in the same field of work.

And how is it with our homes—how fares it with American women in the family circle? To all right-minded women the duties connected with home are most imperative, most precious, most blessed of all, partaking as they do of the spirit of religious duty. To women this class of duties is by choice, and by necessity, much more absorbing than it is to men. It is the especial field of activity to which Providence has called them; for which their Maker has qualified them by peculiar adaptation of body and mind. To the great majority of American women these duties are especially absorbing, owing to the difficulty of procuring paid subordinates, well qualified for the tasks they undertake. The task of positive labor, and the task of close supervision, are both particularly burdensome to American wives and mothers. Thus far, or at least until very recently, those duties of wife and mother have been generally performed conscientiously. The heart of every worthy American woman is in her home. That home, with its manifold interests, is especially under her government. The good order, the convenience, the comfort, the pleasantness, the whole economy of the house, in short, depend in a very great measure on her. The food of the family is prepared by her, either directly or by close supervision. The clothing of the family passes through her hands or under her eye. The health of the family is included within the same tender, watchful, loving oversight. The education of the children is chiefly directed by her—in many families almost exclusively so. Whether for evil or for good, by careless neglect or by patient, thoughtful, prayerful guidance, she marks out their future course. This is even too much the case. American fathers love their children fondly; no fathers more affectionate than they are; they pet their children; they toil ceaselessly for them; but their education they leave almost entirely to the mother. It may be said, with perfect truth, that in the great majority of American families the educational influences come chiefly from the mother; they are tacitly made over to her as a matter of course. The father has too often very little to do with them. His work lies abroad, in the world of business or politics, where all his time and attention are fully absorbed. In this way the American mother rules the very heart of her family. If at all worthy she has great influence with her husband; she has great influence over her daughters; and as regards her sons, there are too many cases in which hers is the only influence for good to which they yield. Is there so little of true elevation and dignity in this position that American women should be in such hot haste to abandon it for a position as yet wholly untried, entirely theoretical and visionary?

It will be said that all women are not married, that all wives are not mothers, that there are childless widows and many single women in the country. Quite true, but in a rapid sketch one looks at the chief features only; and home

life, with its varied duties, is, of course, the principal point in every Christian country. The picture is essentially correct, without touching on lesser details. We pause here to observe also that almost every single woman has a home somewhere. She makes a home for herself, or she is ingrafted on the home of others, and wherever she may be—even in that wretched kind of existence, boarding-house life—she may, if she choose, carry something of the home spirit with her. In fact, every true woman instinctively does so, whatever be the roof that covers her head. She thinks for others, she plans for others, she serves others, she loves and cherishes others, she unconsciously throws something of the web of home feeling and home action over those near her, and over the dwelling she inhabits. She carries the spirit of home and its duties into the niche allotted to her—a niche with which she is generally far more contented than the world at large believes—a niche which is never so narrow but that it provides abundant material for varied work—often very pleasant work too. Let it be understood, once for all, that the champions of widows and single women are very much given to talking and writing absurdly on this point. Their premises are often wholly false. They often fancy discontent and disappointment and inaction where those elements have no existence. Certainly it is not in the least worth while to risk a tremendous social revolution in behalf of this minority of the sex. Every widow and single woman can, if she choose, already find abundance of the most noble occupation for heart, mind, body, and soul. Carry the vote into her niche, she certainly will be none the happier or more truly respectable for that bit of paper. It is also an error to suppose that among the claimants for suffrage single women are the most numerous or the most clamorous. The great majority of the leaders in this movement appear to be married women.

A word more on the subject of home life, as one in which the interests of the whole sex are most closely involved. It is clear that those interests are manifold, highly important to the welfare of the race, unceasing in their recurrence, urgent and imperative in their nature, requiring for their successful development such devotion of time, labor, strength, thought, feeling, that they must necessarily leave but little leisure to the person who faithfully discharges them. The comfort, health, peace, temper, recreation, general welfare, intellectual, moral, and religious training of a family make up, indeed, a charge of the very highest dignity, and one which must tax to the utmost every faculty of the individual to whom it is intrusted. The commander of a regiment at the head of his men, the member of Congress in his seat, the judge on his bench, scarcely holds a position so important, so truly honorable, as that of the intelligent, devoted, faithful American wife and mother, wisely governing her household. And what are the interests of the merchant,

the manufacturer, the banker, the broker, the speculator, the selfish politician, when compared with those confided to the Christian wife and mother? They are too often simply contemptible—a wretched, feverish, maddening struggle to pile up lucre, which is any thing but clean. Where is the superior merit of such a life, that we should hanker after it, when placed beside that of the loving, unselfish, Christian wife and mother—the wife, standing at her husband's side, to cheer, to aid, to strengthen, to console, to counsel, amidst the trials of life; the mother, patiently, painfully, and prayerfully cultivating every higher faculty of her children for worthy action through time and eternity? Which of these positions has the most of true elevation connected with it?

And then, again, let us look at the present position of American women in society. In its best aspects social life may be said to be the natural outgrowth of the Christian home. It is something far better than the world, than Vanity Fair, than the Court of Mammon, where all selfish passions meet and parade in deceptive masquerade. It is the selfish element in human nature which pervades what we call the world; self-indulgence, enjoyment, the lust of the flesh, the lust of the eye, the pride of life, receive, in that arena, their full development. Society, on the contrary, in its highest meaning, becomes the practical development of the second great commandment, loving and serving our neighbor. In every Christian country there are many individuals, especially among women, to whom social life practically bears that meaning. Public worship itself is a social act, the highest of all, blending in one the spirit of the two great commandments—the love of God and the love of man. And whatever of social action or social enjoyment is not inconsistent with those two great commandments becomes the Christian's heritage, makes a part, more or less important, of his education, enters into the great stream of the better civilization. And it is here that we reach what may be called the more public duties of woman. From all duties entirely public she is now, or she may be if she choose, relieved by man. These more public duties of hers are still but the outgrowth of her home life, and more or less closely interwoven with it. They are very important, never to be neglected with impunity. The really unsocial woman is in great danger of becoming also unchristian. Every friend crossing the threshold brings social life into the home. The genial smile, the kindly greeting, the cheering word, all these and a thousand other gracious impulses, are, of course, but the first instinctive movements of the social feeling. And from these we move onward over a vast field of action, to the very farthest point reached by the higher charities of Christianity. There can be no doubt that the charm, the grace, and the happy cheerfulness of society are chiefly due to women; and it is also true that the whole un-

written common-law of society is, in a great measure, under their control. The world is constantly encroaching here, enervating and corrupting social life. To oppose wisely, skillfully, and effectually these treacherous encroachments, these alluring temptations, is one of the most difficult tasks possible. To contribute her full share toward purifying and brightening the social atmosphere about her, in accordance with the spirit of true Christian civilization, such is one great and essential part of woman's work in life. It is a work more especially her own. Man, without his helpmeet, can do but little here. His faculties are absorbed by other tasks, not more important, but more engrossing and essentially different. The finer tact, the more graceful manner, the quicker wit, the more tender conscience, are all needed here. Every woman in the country has her own share of this work to do. Each individual woman is responsible for the right use of all her own social influences, whether for good or for evil.

To keep up the standard of female purity becomes emphatically one of the most stringent duties of every Christian woman. For her own sake, for the sake of all she loves, for the sake of her country, for the service of Christ and His Church, she is bound to uphold this standard at a high point—a point entirely above suspicion. This task is of importance incalculable. But, owing to the frivolity of some women, and the very loose ideas of many men, it is no easy task. Undoubtedly, the very great majority of women are born modest at heart. Their nature is by many degrees less coarse than that of man. And their conscience is more tender. But there is one temptation to which they too often yield. With them the great dangers are vanity and the thirst for admiration, which often become a sort of diseased excitement—what drinking or gambling is to men. Here is the weak point. Yielding chiefly to this temptation, scores of women are falling every day. Vanity leads them to wear the extravagant, the flashy, the immodest, the unhealthy dress, to dance the immodest dance, to adopt the alluring manner, to carry flirting to extremes. Vanity leads them, in short, to forget true self-respect, to enjoy the very doubtful compliment of a miserably cheap admiration. They become impatient of the least appearance of neglect or indifference, they become eager in pursuit of attention, while men always attribute that pursuit to motives of the coarsest kind. It is generally vanity alone which leads a married woman to receive the first disgraceful flattery of dissolute men. Probably nine out of ten of those American women who have trifled with honor and reputation, whose names are spoken with the sneer of contempt, have been led on, step by step, in the path of sin by vanity as the chief motive. Where one woman falls from low and coarse passions, a hundred fall from sheer levity and the love of admiration.

To counteract this fatal influence young women must be taught to respect themselves, to be on their guard against vanity and its enticements, to cherish personal modesty in every way. The married woman who is quietly working by example or by precept among the young girls nearest to her, seeking to cherish and foster among them this vital principle of pure personal modesty in dress, in language, in reading, in tone of voice, in countenance, in manner—the natural outward expression of true modesty of heart—is doing far more for her country than if she were to mount the rostrum to-morrow and make a political speech eloquent as any of Webster's.

Sensible women may always have a good measure of political influence of the right sort, if they choose. And it is in one sense a duty on their part to claim this influence, and to exert it, but always in the true womanly way. The influence of good sense, of a sound judgment, of good feeling may always be theirs. Let us see that we preserve this influence, and that we use it wisely. But let us cherish our happy immunities as women by keeping aloof from all public personal action in the political field. There is much higher work for us to do. Our time, our thoughts, our efforts may be given to labors far more important than any mere temporary electing, or law-making, passed to-day, annulled to-morrow, in obedience to the fickle spirit of party politics.

THAT WORK IS TO PROMOTE BY ALL WORTHY MEANS THE MORAL CIVILIZATION OF THE COUNTRY.

Toward this work legislation, the mere enacting of laws, can do but little. We have all heard of the shrewd mind who considered the songs of a people as more important than their laws. The moral condition of a nation is subject to many different influences—of these the statute book is but one, and that not the most important. No mere skeleton of political constitution can, of itself, produce moral health and strength. It is the living heart within which does the work. And over that heart women have very great influence. The home is the cradle of the nation. A sound home education is the most important of all moral influences. In the very powerful influences which affection gives them over the home, by teaching childhood, by guiding youth, over the men of their family, women have noble means for working good, not only to their own households, not only to the social circle about them, but to the nation at large. All these influences they can bring into action far more effectually by adhering closely to that position which is not only natural to them, but also plainly allotted to them by the revealed Word of God. In no position of their own devising can they do that work half so well.

Political and social corruption are clearly the great evils to be dreaded for our country. We have already gone far enough in the path of universal manhood suffrage to feel convinced

that no mere enlargement of the suffrage has power to save us from those evils. During half a century we have been moving nearer and nearer to a suffrage all but universal, and we have, during the same period, been growing more corrupt. The undisguised frauds at elections, the open accusations of bribery in legislative assemblies, the accusations of corruption connected with still higher offices—of these we read daily in the public prints. And these accusations are not disproved. They are generally believed. It is clear, therefore, that something more effectual than universal manhood suffrage is needed to stem the torrent. And it is simply ridiculous to suppose that womanhood suffrage can effect the same task. Who can believe that where men, in their own natural field, have partially failed to preserve a healthful political atmosphere, an honest political practice, that women, so much less experienced, physically so much more feeble, so excitable, so liable to be misled by fancy, by feeling, are likely, in a position foreign to their nature, not only to stand upright themselves, but, like Atlas of old, to bear the weight of the whole political world on their shoulders—like Hercules, to cleanse the Augean stables of the political coursers—to do, in short, all that man has failed to do? No; it is, alas! only too clear that something more than the ballot-box, whether in male or female hands, is needed here. And it is the same in social life. The public prints, under a free press, must always hold up a tolerably faithful mirror to the society about them. The picture it displays is no better in social life than in political life. We say the mirror is tolerably faithful, since there are heights of virtue and depths of sin alike unreflected by the daily press. The very purest and the very foulest elements of earthly existence are left out of the picture. But the general view can scarcely fail to be tolerably correct. Take, then, the sketch of social life as it appears in some half dozen of the most popular prints from week to week. You will be sure to find the better features grievously blended with others fearfully distorted by evil. There are blots black as pitch in that picture. There are forms, more fiend-like than human, photographed on those sheets of paper. Crimes of worse than brutal violence, savage cruelty, crimes of treachery and cowardly cunning and conspiracy, breach of trust, tyrannical extortion, groveling intemperance, sensuality gross and shameless—the heart sickens at the record of a week's crime! It is a record from which the Christian woman often turns aside appalled. Human nature can read no lessons of humility more powerful than those contained in the newspapers of the day. They preach what may be called home truths with most tremendous force. From this record of daily crime it is only too clear that universal suffrage has had no power to purify the society in which we live. If no worse, we can not claim to be better than other nations, under a different political rule.

This admission becomes the more painful when we reflect that in America this full freedom of fundamental institutions, this relief from all needless shackles, is combined with a well-developed system of intellectual education. We are an absolutely free nation. We are, on the whole, and to a certain point, intellectually, an educated nation. Yet vice and crime exist among us to an extent that is utterly disgraceful. It is evident, therefore, that universal manhood suffrage, even when combined with general education, is still insufficient for the task of purifying either social or political life. The theoretical infidel philosopher may wonder at this fact. Not so the Christian. Great intellectual activity, and the abuse of that power for evil purposes, are a spectacle only too common in this world. Look at the present condition of the most civilized nations. Of all generations that have lived on earth, our own is assuredly the most enlightened, in an intellectual sense; mental culture has never been so generally diffused as it is to-day, nor has it ever achieved so many conquests as within the last half century; and yet mark how comparatively little has this wonderful intellectual progress accomplished in the noble work of improving the moral condition of the most enlightened countries. To the mind humbled by Christian doctrine, living in the light of a holy faith, these facts, though unspeakably painful, can not cause surprise. We are prepared for them. We have already learned that no mere legislative enactment and no mere intellectual training can suffice to purify the human heart thoroughly. An element much more powerful than mental culture is needed for that great work. For this work light from on high is sent. A thorough *moral education* is required, and the highest form of that education can be reached in one way only—by walking in the plain path of obedience to the will of the Creator, as revealed in Holy Scripture. We must turn, not to Plato and Aristotle, but to inspired Prophet and Apostle. We must open our hearts to the spirit of the Decalogue and the Sermon on the Mount. We must go to Sinai and to Calvary, and humbly, on bended knee, receive the sublime lessons to be learned there.

We should never have expected moral progress as an inevitable consequence of free institutions and mere intellectual education, had it not been that, like other nations, we indulge in idolatries, and among our "gods many" are the suffrage and mental activity. We are gravely told by philosophers that, with the vote in the hands of woman, the moral elevation of the race is secured forever! "Great is Diana of the Ephesians!" The feeling is common in America that to doubt the omnipotence of universal suffrage in its extreme development is not only treason, but a sort of blasphemy. And this feeling is now leading many minds, unconsciously, perhaps, to shrink from opposing the present movement in favor of womanhood suffrage. They bow the knee to the common

idol. They dare not believe it possible for the suffrage to be carried too far. For ourselves we have no sympathies whatever with idolatry. We fearlessly declare our opinion, therefore, that no political institutions whatever, neither despotic, nor monarchical, nor aristocratic, nor yet the most free, are capable, in themselves, of achieving moral education for a people. Neither do we believe it more possible for abstract intellectual culture to gain this most important of all ends. Institutions wisely free are a very great blessing. Let us be fervently thankful for them. Intellectual education is equally important and desirable. These are both noble and admirable means to work with, provided we still look above and beyond them for a farther development of the race—for fullness of *moral civilization*. In fact, if we wish for a vigorous, healthful, lasting development of republican institutions, we must necessarily unite with these not only intellectual teaching, but also a sound *moral education*. This is a fact to which men, in the whirl of their political or commercial struggles, too often willfully shut their eyes. They are quite ready to acknowledge the truth of the assertion in a general way, but they choose to forget its vast importance in political or commercial practice. They recklessly lower the moral standard themselves, whenever that standard is at a height inconvenient for the attaining of some particular object toward which they are aiming. They are lacking in faith. Unlike women, who carry faith with them in private life, men act as if faith were not needed in everyday public life. At least the great majority of men, nominal Christians, fail to carry Christian principle with them into common business or politics. Faith, in the heart of women, is connected with love; consequently it is less easily stifled. They more frequently carry this principle with them in daily practice—not to the extent that they should do, but far more so than most men do. And here, Christian women, is your great advantage. It is the Lord's work to which we would urge you. The work of true faith, however lowly, is sure of a blessing. With faith unfeigned in your hearts, giving purity to your lives, you have it in your power to render most effectual service to the nation in your own natural sphere, far beyond what you could possibly accomplish by the path of common politics. You have never, as yet, done full justice to the advantages of your own actual position in this respect. You have overlooked the great work immediately before you. We have no magic talisman to offer you in carrying out that work. We shall not flatter you with the promise of unlimited success; we shall not attempt to gratify any personal ambition of public honors. We have no novel theories or brilliant illusions with which to dazzle your imagination.

Fidelity to plain moral duties—this is the one great principle to which we would most earnestly call your attention. There is absolutely no principle so sorely needed in the civilized world

to-day as this. We live in an age of false and inflated ambitions. Simple moral truths fare badly in our time. Imposing theories, brilliant novelties, subtle sophistries, exaggerated development, arrogant pretensions—these too often crowd simple moral truths out of sight, out of mind. And yet, without that class of duties in healthful action, corruption more or less general is inevitable.

Truth of word, honesty of action, integrity of character, temperance, chastity, moderation, sincerity, subordination to just authority, conjugal fidelity, filial love and honor—these duties, and others closely connected with them, bear old and homely names. But, Christian women, you can not ask for a task more noble, more truly elevating, for yourselves and your country, than to uphold these plain moral principles, first by your own personal example, and then by all pure influences in your homes and in the society to which you belong. In no other mode can you so well forward the great work of Christian civilization as by devoting yourselves to the daily personal practice, and to the social cultivation, by example and influence, of these plain moral duties. Your present domestic position is especially favorable to this task. You have more time for thought on these subjects; you have more frequent opportunities for influence over the young nearest to you; you have more leisure for prayer, for invoking a blessing on your efforts, however humble they may be. It is not enough to set a decent example yourselves. You must go to the very root of the matter. You must carry about with you hearts and minds very deeply impressed with the incalculable importance of a sound morality; you must be clearly convinced of the misery, the shame, the perils of all immorality.

In this nineteenth century the civilization of a country must necessarily prove either heathen or Christian in its spirit. There is no neutral ground lying between these boundaries. Faith or infidelity, such is the choice we must all make, whether as individuals or as nations. Thanks be to God we are not only in name, but also partially in character, a Christian nation. Faith is not entirely wanting. We all in a measure feel its good effects. Even the avowed infidel living in our midst is far more under its influences, though indirectly so, than he is aware of. And where there is life, there we have hope of growth, of higher development. To cherish that growth, to further that higher development by all gracious and loving and generous influences, is a work for which women are especially adapted. They work from within outwardly. Men work chiefly by mental and physical pressure from without. Men work by external authority; women work by influences. Men seek to control the head. Women always aim at touching the heart. And we have the highest of all authority for believing that this last is the most efficient mode of working.

"Out of the heart are the issues of life." This, therefore, Christian women, is your especial task. Use all the happy womanly influences in your power to forward the moral education, the Christian civilization, of the country to which you belong. Be watchful, with the unfeigned humility of the Christian, over your own personal course, and the example connected with it. Aim at keeping up, on all occasions, a high practical standard of sound morality at all points. Cultivate every germ of true moral principle in your own homes, and in the social circle about you. Let the holy light of truth, honor, fidelity, honesty, purity, piety, and love brighten the atmosphere of your homes.

What heathen civilization means we know from many sources, more especially from the records of Rome under the empire, in the days of St. Paul, when it had reached its highest development.

What Christian civilization means we learn from the Apostle: "Let him that nameth the name of Christ depart from iniquity." "Whatsoever things are true, whatsoever things are honest, whatsoever things are just, whatsoever things are pure, whatsoever things are lovely, whatsoever things are of good report—think on these things."

A DREAM OF A DEAD FACE.

Dizzy with ocean's roar
I wandered by the shore
Where sullen heaving waters rose and fell;
When on the wave's green edge,
Swift o'er the sandy ledge,
Up to my feet there rolled a delicate shell—
A pale pink shell, dashed with the ocean's dews,
And painted fair with morn's divinest hues.
So beautiful it lay
In the last light of day,
Close to its pinky cells I held my ear.
Its hollow murmur stole
Into my troubled soul.
"Tell me," I cried, with rivaling hope and fear,
"O shell! that moanest by the lonely shore,
Where are the friends that come to us no more?"
The passionate question died
Along the ocean side,
Spurned by disdainful waves to quick disgrace;
When, lo! a stream of light
Dazzled my mortal sight;
The pale pink shell became a pale pink face;
And eyes I fondly knew, with light divine,
Smiled gentle memories as they looked in mine.
The murmur now which came
My restless soul to tame
Was music sweet of softly whispering lips:
"O friend, complain no more!
Safe on a happy shore
Rests the dear freight of all thy sunken ships.
Whether these fretful waves recede or swell,
To us who dwell beyond them all is well!"
A glow of rosy flame
Over the ocean came,
Trembling a moment on its blue expanse;
And in the fleeting ray
Floated too soon away
That sudden vision from my pleading glance.
The soul I loved escaped my beckoning hand;
The shell to which I clung dropped, broken, on the sand.

ANTEROS.

BY THE AUTHOR OF "GUY LIVINGSTONE," "SWORD AND GOWN," "SANS MERCI,"
"BREAKING A BUTTERFLY," ETC.

CHAPTER XVIII.

LOAMSHIRE, though a tolerably extensive county, was not large enough to contain several satraps of independent power. In the course of generations ancient families had died out or fallen into obscurity, and fresh ones had been founded; but neither from the old blood nor the new had any one arisen rash enough to challenge the supremacy of the Dukes of Devorgoil. Other great nobles, perhaps, might own estates as vast, but these were probably scattered here and there throughout the breadth of England; whereas the territory owned by this family, if not literally in a ring-fence, lay either within or immediately around the Loamshire borders. It was centralization not less than hereditary prestige that made their influence overweening. Occasionally, of late years, a radical candidate, smarting under defeat, has dared to speak evil of the august name; but such a diatribe, unless non-electors formed the bulk of the audience, was seldom favorably received. The Loamshire democrats evidently thought that the line of desecration and demolition should be drawn somewhere; much on the principle of their more advanced brothers, who, furthering all imaginable changes in Church and State, are not prepared to sweep away the crown.

The present head of the great house was not, and never could have been, personally popular; but this signified very little. People seemed to think that if such a magnate was decently affable in his public capacity, he might almost dispense with private courtesy; not that there was any thing rude or repulsive about the eighth Duke of Devorgoil—his self-assertion seldom verged on insolence, or his arrogance on oppression; he was only a frigid formalist, narrow of mind, and shallow of brain; more alive to the importance than to the duties of his station, yet willing to acquit himself of these decorously. His subscriptions to charities were munificent; but he had never been known to bestow the smallest mite on a beggar. He was regular in his religious observances, and every morning, in the castle-chapel at Grandmanoir, his pompous "Amen!" drowned the voice of his domestic chaplain at family prayers; but his creed was well-nigh as short and simple as Voltaire's, and the Bible in his chamber had never been opened since it was placed there with the rest of the furniture. His temper was neither violent nor particularly irritable. He was slow to take offense, simply because he found it hard to believe that any creature could intentionally thwart or beard him; but when he had once taken umbrage his wrath would rankle on for years, nor would atonement, ever so ample, abate its venom.

There were excuses to be made for him, certainly. Even at his baptism a heavy load was laid upon his infant shoulders: Lupus Fitzrol-land—these were only two out of many names bestowed upon him then; and how could any man be expected to walk through life, so decorated, without either staggering or stiffening himself under the weight of ornament? From the time that he could stand alone he was never natural or childlike. At Eton some few attempts were made "to knock the starch out of him;" but as he resided there with a private tutor he could always take refuge from persecution under the wing of that complacent and compassionate bear-leader. At Oxford the college authorities, from the dean to the cook, made obeisance to him; and fellow-commoners of as ancient if not as lofty blood as his own were not ashamed to be reckoned among his henchmen. He took the seat that had been kept warm for him in a family borough a month after he came of age; and before the house had decided whether his obstinate silence proceeded from choice or from incapacity, the death of his father invested him with the full imperial purple.

There was a striking contrast between sire and son. The first—free and debonair to a fault—seemed ever equally at ease, whether the blackened rafters of a farm-kitchen or the gilded damask of a boudoir sheltered his handsome head. In both, if all tales were true, he had a habit of making himself rather too thoroughly at home; and some of these tales were told with such a circumstance that even Loamshire loyalty could not entirely close its ears against them, and was fain to confess that "his Grace might be a little—just a little—gay." That same gayety of his caused some bright eyes to wax dim from remorse and shame, and some honest men to curse the hour when they first made him welcome under their roof; nevertheless, when he went to his account, there was a mighty flourish of funeral trumpets in the county journals; and it would have been treason to question aloud whether a heavy loss had befallen Loamshire. The eighth duke was a very different personage; from his youth upward until now, there could not have been imputed to him the faintest lapse in morals or derogation of dignity. He walked through life with the rigid uprightness of one who has never been strongly tempted to sin. He married early, and had issue—two daughters and a son; but the last died in childhood. This was the single blot on his prosperity; and he brooded over it, always with a bitter sense of personal injury. Though he treated her with due observance both in public and private, he never forgave his wife for not replacing the dead heir; and,

though he omitted no outward religious duty, he never forgave Providence for having visited him thus. Had his chaplain ventured—the good man never did so, be sure—to preach submission to the common lot, he would have answered that the common lot was not meant to apply to ducal houses in general, much less to that of Devorgoil. And for the unlucky accident of their sex he never forgave his daughters. Rachel Fontenaye was very hard, but Ursula very homely, of feature; and it was no wonder if neither had been sought for by an eligible wooer, for the chance of any much below their own degree would have been hopeless; and it had somehow got noised abroad that, despite their father's princely revenues, these august damsels would not be superbly dowered.

A small spare man—with a narrow sour face, and a sharp up-turned nose, changing color like a chameleon, under extremes of heat and cold—gifted with a slow, steady flow of speech, that, aided by a pompous clearing of the throat whenever he was at a loss for a word, carried him fairly through his frequent orations. This about expresses the Duke of Devorgoil at the age of twoscore years and ten.

He was any thing but a sportsman at heart; nevertheless, even here, he contrived to play his part creditably. The Grandmanoir preserves had been famous for generations; but the head of game had been rather augmented than decreased under his rule, and on the bench he was a turn more severe on poachers than on sheep-stealers. To his great *battus* there were invited, almost exclusively, chiefs of his own order—a belted earl counted rather low in the scale—and on these occasions it pleased him to walk about, followed by two giants in laced velveteen, each bearing a gun, which his Grace never discharged, save at a corner so hot that his misses were bound to pass unnoticed. The partridge-shooting he meted out to the squirearchy and certain of the clergy in just proportion to their political influence and electioneering zeal. In early life he was occasionally to be seen at the covert-side, mounted on the gravest and gentlest of cattle; but his ideas of the pursuit probably much resembled those of a conscientious legislator, still to the fore.

Representing a constituency of which a good half are born centaurs, Mr. Talboys considered hunting a senatorial duty; and so maintained a costly stud, the which—being a welter weight with impossible hands—he generally managed to use up before the season was through. He never by any chance saw any thing of a run, but rode the line doggedly from end to end, of course with countless falls; and his rueful countenance never was known to light up save when fate favored him with a blank day. On a certain March morning he came to real grief over stiff timber, and lay stunned for a while. When his senses returned they heard him murmur softly—he was a pious person of Low-Church

tendencies—"Only a fortnight more of this, thank God!"—referring, you must understand, to the opening of the session, when the labors of others, and his rest, would begin.

If, in those by-gone times, the Duke of Devorgoil sacrificed his inclinations to public opinion, he took special care to sacrifice nothing more, and was never known to risk his serene neck over any thing larger than a water-furrow; a crowd at a gate he eschewed as if there had been pestilence in the midst thereof. The distaste for the saddle grew on him with advancing years, and now, when a meet was honored by his presence, he always came in state and comfort on the easiest of wheels. Despite of this, throughout his vast territory, the coverts were not often drawn blank; though, by some curious fatality, a straight-goer rarely was found close to Grandmanoir. They were too highly fed there, the keepers said, mournfully, and keepers always know best; albeit, why a hen-pheasant should be more harmful than a rabbit to vulpine training is a problem only to be solved by those faithful guardians of the game.

There were fixtures not a few on the Devorgoil domains; but, unless some royal personage or foreign potentate chanced to be his guest, the Duke never offered a lawn-meet, for this would have involved a breakfast; and any thing in the shape of chance entertainment was entirely out of his line. To stately set dinners he was fully equal, and dispensed such formal hospitality pretty liberally; but the idea of rustics, whom he scarcely knew by name, clanking in under his portals without special invitation, cutting and coming again under the scutcheoned roof of his banqueting-hall, and so snatching refreshment on his sacred threshold, was quite too much for his nerves and sense of propriety. Absolutely discountenancing vulpicide, and subscribing largely to the hounds, he held himself *functum officio*, and to spare. But the L. H., as a rule, were honest folk, caring little for the coffee-house: so long as the Duke found them foxes they were content to trust to their modest sandwich-cases, and find their own jumping powder.

Hazlemere Cross was rather a favorite meet. Within half a league of the park fence, it was so far removed from the inner Capua of Grandmanoir as to make a ring not quite a certainty. If the fox sunk the hill, as generally happened when the wind lay right, he was bound to take a good line—a line, indeed, entirely after the heart of a Loamshire "hard," with lightish plows, and grass enough to satisfy any but a captious stranger; and, best of all, big fair jumping, from end to end.

Thitherward, on a murky morning that, if a breeze sprung up, looked as if it might lift toward noon, drove Lord Atherstone with his bride. With the exception of an occasional visit to Heslingford, it was the first time the pair had appeared in public since their marriage. Said Ralph at length:

"And the nerves, Lena—are they as steady as when we started? The farm where our horses are waiting is just over yonder rise, and the meet's a short mile farther on."

She smiled a little haughtily. "The nerves are as well as can be expected. It is rather a trial to be presented to a county and a fox on the same day; but there are only two things which I am really afraid of, monseigneur. The first is, that I shall commit some *gaucherie*, of which you will be thoroughly ashamed; the second is, I shall be terribly an encumbrance, if the hounds are running."

"I'll risk the *gaucherie*," he said, quietly; but one of those rapid changes came over his face as he turned it toward her. "And I can't fancy you as an encumbrance yet. I am more doubtful of how I shall acquit myself. I've never played pilot before, you know, and it's a stiff country, if we go over the vale. To be sure, I know every inch of it, and I've an idea there's a line of gates most of the way, though I never paid much attention to them; still I'm half sorry that I promised you should follow. You will remember *your* promise, though, that you would pull up the instant you felt nervous, whether it was before or after a fence. Perhaps we shall have no jumping to speak of, after all, but shall be ringing round the park all day. It wouldn't break my heart if that were to happen."

"I ought to take that as a compliment," Lena answered, "but I'd rather have gone on flattering myself that I was no great clog upon you. Could you have been so patient two months ago?"

"Certainly not. Many things are altered within the last two months; and all for the better, I believe. I shall care for hunting some time longer, I dare say; but never again as I used to care when my life was quite lonely. I never pay compliments, as I told you once before. But this seems to me quite natural."

"We won't argue the question, at all events," she returned; "and perhaps even a 'clog' might be useful, if it cured you of rash riding. I wonder if there will be a great crowd to-day, and whether the Grandmanoir people will be out! It's rather strange that none of them have called yet. Is it their way?"

Lord Atherstone knit his brows. Plainly his wife had touched the chord of thought that had already vibrated not harmoniously.

"I know very little of their ways," he said, curtly. "The Duke bears me no good-will, I fancy; but we've never come into collision, and he's always been formally civil when we chanced to meet; it's impossible that he can mean to be otherwise now. It's a long, heavy drive, remember, in such weather as we've had lately, from Grandmanoir to Templestowe. He rarely misses this meet; so he will probably speak for himself before long."

There was no time for more, for just then they were turning into the little elm avenue

that led up to the cozy farmstead where their horses had found shelter. The owner stood at the door, booted, spurred, and bareheaded, anxious to do honor to the new Baroness. Unpopular to a degree among the gentry and peasantry of his county, Ralph was not ill liked by the better class of yeomanry. He was a liberal, though a somewhat careless landlord; and, out hunting, often had a familiar word for a farmer, when he could scarcely spare a nod to a squire; besides, there were not a few admirers of his "bruising" style, and among these was John Langlands.

So Lena met with hearty welcome, and there were pressed upon her such varied refreshments that she was fain to compromise with a sip of home-made cherry brandy; and then she was mounted comfortably. At this ceremony the buxom hostess assisted with intense admiration. She had hitherto not conceived it possible that any who had come to matronly estate could get to saddle without the assistance of horse-block, or some substitute; and when Lena seemed to spring from, rather than be lifted by her husband's palm, Mrs. Langlands opened wide eyes, as though she witnessed a rare *tour de gymnase*.

"My lady went up as light as a soap-bubble, I do declare," she said afterward; "and yet as fine a figure of a woman as you'd wish to see."

So, the groom and John Langlands following, Lord Atherstone and his wife paced slowly up the long, gentle ascent, on the brow of which scattered brutes, growing denser fast, showed that the L. H. were like to muster strong to-day.

Will you prick forward and see who are the earlier comers?

CHAPTER XIX.

A PLOT of open ground, somewhat larger than an ordinary village green, the converging point of several roads and bridle-paths, crowning a low hill, from whence the view, on one side, though not very extensive, lies open over a vale, but is hemmed in on the other three by tall plantations close by, and by the towering woods of Grandmanoir farther afield. Such is Hazlemere Common.

Near the centre of it stands the cross—not a graceful spire, such as those that mark Queen Eleanor's resting-places on her long journey tombward, but a mighty monolith, roughly hewn, doubtless even at first, and now so maimed and worn by rough usage and weather that, passing it carelessly, you might hardly recognize the symbol of our faith. The date thereof and whether it was set up in thanksgiving or in penance, or to mark the place of blood-shedding, or to commemorate some pre-historic victory over the heathen, are not certainly known, albeit learned persons, coming from afar, had wrangled over it in language scarcely parliamentary; and on this stone many local antiquaries have whetted their maiden blade. There it has stood from immemorial time, keeping its

own secret, if secret there be to tell. And so it will be, perchance, after the men and manners of this our nineteenth century have become matter for archæologists.

Within a few rods of this same cross most of the personages worth your notice are grouped already. On principle, if not by choice, you will, of course, first inspect the hounds.

A level, compact lot, certainly; a little low, if any thing, and rather neat than airy-looking; indeed, you might pick out several necks and shoulders too heavily loaded for elegance, and one or two clear cases of throatiness. But there are some rare legs and feet, and, as a rule, no deficiency of bone. Such as they are, they thoroughly satisfy Loamshire critics, and almost satisfy their fastidious master, who, for years past, has given his whole mind to their improvement, and is pitiless in his "drafts."

That is he—the silent, sedate man, sitting betwixt his hounds and the gathering crowd on an equally sedate, though cleverly shaped bay. There is rather a workman-like look about him, despite a provoking preciseness of exterior, which even hunting-costume can not disguise. When he took the Loamshire country, purposing to be his own huntsman, his friends said it was a rash step in many ways; but Jasper Knowsley did not often err on the side of rashness, nor does he appear to have done so now. He brought to his task great patience, a perseverance akin to obstinacy, and no mean knowledge of the noble science, acquired by long, sedulous study in more or less famous schools. He never tried to make profit out of his office, and was liberal enough about earth-stopping, keepers' fees, and damages; nevertheless, he has contrived to show sport enough to satisfy all but inveterate grumblers, without seriously impairing his own modest revenue. His trim chop-whiskers are thickly sprinkled with gray; and even in his youth he was rather a neat than a determined horseman. So when they are running hard over a stiff country he can not be expected to ride right up to his hounds; but, knowing every gate, gap, and bridle-road, he generally contrives to be with them before they want lifting; and, should he fail, there is always Jem Spurrell—nominally first whip, though he never waits for the lagers in covert—to the fore, who, for the strange tricks he plays with his neck, might have been bred an acrobat, and would ride at a bull-finch on fire if it came in his line. Very mild, if not meek, of speech is our master, never rating even a hound violently; and when forced to chide human ignorance or impetuosity, prone rather to remonstrance than abuse; on extreme provocation he is capable of a certain acid sarcasm, of the which one instance may suffice:

It was late in the afternoon; and after a series of disappointments the hounds had got settled to a fox, and pushed him steadily through a chain of small coverts till he was bound to break over a fair stretch of open country, when

a youthful plunger (a squadron was always quartered at Heslingford), determined at all hazards to get a start, rode right down on the critical corner, so that a chop followed as a matter of course. There were murmurs, as you may imagine; but all held their peace to listen as Jasper Knowsley approached the offender, smiling sourly. "You're nearly a stranger in this country, Sir, and probably suppose that we met this morning expressly for your amusement. If it has given you any pleasure to spoil the sport of a hundred or so of your fellow-creatures, I'm sure nobody will complain; but now, if you're *quite* satisfied, and you don't want the hounds to run adrag, or any thing of that sort, I think, with your permission, I'll take them home." So, lifting his cap courteously, he turned away.

They say that the cornet wept. Certainly there are men who would liefer have taken their "month at the mill" than have sat then in his glistening boots; and most of those present held the punishment equal to the misdeed.

Perhaps our master would be old-fashioned enough to allow that a certain amount of loud and strong language is necessary to keep a field—particularly a provincial field—in order. But this part of his duty he shifted from his own shoulders long ago. And yonder sits his deputy—the huge, hairy man with a face like a full moon looming through mist on the big bony brown; you must have heard his hoarse voice before you rose the crest of the hill. This is Swinton Swarbrick's thirtieth season with this same pack; and though it has changed hands five times at least since he first was "blooded," he has never wavered in his allegiance, nor strayed far from those russet tilths that he still swears "carry a better scent than all your grazing-grounds." If his means had permitted it he would have tried his hand at the mastership ere now; but being free-handed to a fault, his estate, when stable expenses and his subscription are paid, scarcely suffices his needs. Nevertheless he is a man of great mark in the hunt, so much so that, when he curses a culprit, the anathema is supposed to descend with a semi-official weight. Years ago he talked himself into the idea that he was a bruising though unlucky rider; and though Loamshire has got his measure pretty accurately, strangers often find it hard to realize that all that laying down the law about "lines" and "points" does not entail jumping one blind or big place in a week. In spite of his swagger, Swinton Swarbrick is a sportsman to the marrow of his massive bones, and a prime favorite throughout his county with high and low. Even those who have been lashed by his unsparing tongue bear no malice. "He may bluster," they say, "but he's never nasty." And, to speak truth, one of Jasper Knowsley's slow, stinging sentences is more dreaded than a string of the other's voluble blasphemies.

Look a little to the left, to the rearward of

the cross, and your glance will be apt to linger longer than it has hitherto done on the centre figure of the group. Did you ever see a daintier Amazon, or one more happily at home in her saddle, though it is clear that the dark chestnut wants some riding?

That is no other than winsome Cissy Devereux, the pride, if you believe her friends—the pest, if you believe her foes—of Loamshire. Polling the county through, the votes of the former would probably prevail; for even women find it hard to hate her, or, at all events, to sustain the feud. Whether her life's sky be bright or lowering, her clear laugh still keeps its ring—the laugh that, to some who hear it, is a better tonic than ever has been devised by mediciner: thoroughly sincere for the moment, if not always stable in her friendships, and frank even in her small treacheries; through good or evil report bearing herself always dauntlessly—it is no wonder if many prefer shutting their eyes and believing in her, to sifting her demerits. Her face is so provokingly pretty, too; and, though she is out in all weathers, the peach-bloom has not fled from her cheek, nor the sheen from her bonny brown hair; and as for her figure—is it not known how shapely women, envying her habit, have sought the studio of Herr Veltermann, and abased themselves before that artist, to secure an exact fac-simile, and how, having donned the master-piece and compared it with the original, they have returned home despondent, and ready to writher the innocent garment to shreds? That she will go great, very great length in coquetry, her hottest partisans will allow; and whether there are any limits to her imprudence is a question that has been discussed without, as well as within, the Loamshire borders, and never, so far as society knows, been fully solved. She must assuredly more than once have strayed very near the verge of the crater, but the lurid sulphur fumes have never wrapped her round as yet, and she changes her light loves so often that the scandal-mongers get flurried, and, like a nervous shooter when the covey rises all round him, sometimes fail to pick their bird; moreover, however pleasant, it is not always a safe pastime to cast stones at your neighbor's wife, when the said neighbor is ready to catch them in the skirt of his mantle and send them back with a will. Now, foremost among the willful beauty's blind adherents above mentioned is her husband, Dick Devereux, still known among his intimates by his old regimental soubriquet of The Driver. "There's not a woman alive fit to hold a candle to Cissy; and if she *has* a bit of a temper, there's not an ounce of vice about her." So Dick believed when they were first engaged, and seven years of matrimony have not altered his creed. He takes his wife's bullying like a lamb; but toward the rest of the world carries a somewhat taurine temper, and, when fairly roused, is apt to run a rude tilt without distinction of persons or even of sexes. The fractiousness of the savage

brute he is riding obliges him to keep without the circle; but you may see his heavy, handsome face light up, as one of Cissy's gay impertinences requites a point-blank compliment from Sir Manners Mannering—always pompous, when not coarse, in his gallantries—who looks as if he had been born in those high collars and stiff throat-gear.

Besides this somewhat bloated aristocrat the group is made up of Arthur Corbett, radiant in smiles and in attire; grave Malise Walwyn, heir to an ancient Catholic house, who, despite his fair prospects, is said to have a vocation for the priesthood; cheery Peter Assheton, the sporting parson, who, were he as powerful in the pulpit as in the pigskin, would count fewer dissenters in his parish; and a strong cavalry contingent from Heslingford, headed by Godfrey Colville, the keen-visaged man, with eyes and hair black and shining as jet; he is Cissy's "latest love," and will have the perilous honor of leading her to-day. Be it noted in passing, that, though her caprices take the widest range, she has rather a leaning toward military devotion. "Dick likes them best," she says, considerately, "and they're quite clever enough for me." Indeed, it must be owned that intellectual jewels, clumsily set, do not sparkle temptingly for the wayward lady.

And now—

There is only one poor hunting-horn available, and such pomps are not in fashion here; but, if we met on foreign ground, there would be a *fanfare* of bugles, for the gorgeous barouche, drawn by four grays, with outriders to match, sweeping down the road and drawing up with a jerk, brings the Duke of Devorgoil and his daughters twain.

His Mightiness does not seem in a specially gracious humor this morning. The sharp wind may, perhaps, account for the vicious flush at the tip of his nose; but the fidgety working of his thin lips, and the frequent contraction of his brow, bode no good; nevertheless, he condescends to answer the greetings of the master and the privileged few who venture to accost him, and acknowledges with sufficient affability the doffing of hats and caps, till Lord and Lady Atherstone appear on the further verge of the little common; then the signs of discontent on the ducal visage are no longer dissembled, and they darken as the pair draws near.

Hard-featured Lady Rachel—though one would think it difficult—waxes stiffer and stonier than her wont; and homely Lady Ursula looks half apprehensive, half amused; and certain of the by-standers, more curious than their fellows, edge nearer to the saluting-point, as if they expected something like a scene.

And as Ralph makes his way slowly through the throng, nodding a return to divers greetings, but never halting, or turning a hair's breadth aside, till he comes within speaking distance of the carriage, there is a quiet resolute look on his face, like that of one who—fully

aware of a danger—goes, not reluctantly, to meet it.

And a danger it is, of such a sort, moreover, as he has never yet confronted; for, though stout heart may help somewhat, strong hand may nothing avail.

We needs must drop the historic present here, for the root of these matters strikes deep into the past.

A MODERN BILL OF FARE.

THE conjunction of American ingenuity and administrative ability has nowhere displayed itself more eminently than in the management of hotels. At the time we were almost literally possessed of "a hundred religions and one gravy," and were in the very infancy of the secrets and value of the *cuisine*, we had daring spirits who conceived and carried into successful execution establishments for the boarding and lodging of large numbers of first-class people which had no example in any foreign country. The first step toward national distinction in this direction was made by the Tremont of Boston. Then followed the Astor, of New York, both destined to be eclipsed by the St. Charles, of New Orleans, which for long years was the grandest building and most lordly hotel in the world.

From the time of the success of these establishments every American city and every large town, sooner or later, has become possessed of buildings of striking architecture, grand gathering points of our local and traveling population; and the spirit of all this in our national and most irreverent humor has been concentrated in the apothegm that a very successful man in everyday business "can keep an hotel."

Some twenty-five years ago an English nobleman,* who had been for nearly half a century a European soldier and diplomat, made New Orleans for two seasons a winter residence. He was very fond, when with a few select acquaintances whom he accepted of as friends, of talking in a modest way of the varied experiences of his eventful life. We remember on one occasion, after being more than usually communicative and instructive, he ended off with a description of a military review he witnessed in Russia, when the Czar Alexander reviewed what was then almost the concentrated military force of his empire. Occupying by courtesy a prominent position on the imperial staff, our narrator had every possible opportunity of witnessing the imposing pageant; and he possessed the intellectual ability of bringing the scene vividly before his auditors. Suddenly stopping short, and possibly somewhat disconcerted at his own earnestness, and the deep impression he had made upon his friends, he paused a moment, and resumed:

"This review only struck me, after all, as

grand because of the immense physical resources it displayed of a rising nation; but, as strange as it may seem to you, I honestly say that I witness every day in this stately hotel what, more than all else I have witnessed, fills me with admiration, and it is this: I live under a single roof that affords constant shelter for over one thousand persons. This, gentlemen, affords a number of men about equal to two full regiments in the field. At three o'clock six hundred of these people at one time sit down to dinner. Every course (occupying in the routine about three hours) is brought to the table at the proper time, and, without the slightest confusion or mistake, is excellently served. There is an administrative power displayed in this work that would make these hotel-keepers better colonels of regiments than any I have met with in my military life; and it is this order and discipline that constantly commands my unbounded admiration—more than did the military review of the concentrated armies of Russia."

A few weeks ago we were talking on this subject of hotel-keeping with Mr. Warren Leland, who is among the few who have become representative men in this great department of our social economy, and on this occasion, as on many others, we were deeply impressed with the large mental resources, vast capital, and varied knowledge of human nature that were necessary to be combined to command success in hotel-keeping; and while thus impressed, and in the midst of our conversation, a number of letters were brought in by a servant, from one of which Mr. Leland drew a portly roll of MS., glanced his eye over its surface a moment, and, throwing it toward us, carelessly remarked:

"There is the entire bill of fare of the Union Hotel of Saratoga for the last summer campaign of a hundred days."

We looked over the long list of details, made out in the neatest possible manner by an expert clerk, and were inspired with the idea that, at an unexpected moment, we had gotten hold of a key to the inner life of a first-class American hotel. Here was a carefully written commercial statement of what our most opulent citizens, with every facility afforded by nature and money, consume as food. With the specification of each article and the relative quantities used, furnished by the careful book-keeper, we conceived the idea of adding the associated history, and thus making the interesting and useful record complete.

Beef, the great staple of all substantial food, as might have been expected, headed the list. From the States of Ohio, Kentucky, Illinois, and New York are procured the best qualities. Of three hundred and thirty fattened bullocks there were only taken for hotel consumption the "seven ribs" and the "short loins;" the remainder of the carcass, the "inferior meat," being readily disposed of to the multitude of consumers residing in the city. The aggregate

* Sir William Drummond Stuart, afterward the Earl of Lorn, etc., etc.

of loins and ribs was forty thousand pounds. This meat, "killed and dressed" in the evening, packed in ice, is forwarded by express to Saratoga, so that it is in the hotel for the morning meal.

Of mutton there were consumed twenty-one hundred "racks" consisting of seven ribs each, ready at a moment's notice to be divided into chops. The gross weight of these "racks" was nine thousand five hundred pounds, including the choice parts of the carcasses of one thousand sheep gathered up from different parts of the Union. The average weight of a "dressed" sheep is sixty pounds; of this quantity only nine pounds are selected, the remainder is sold from the stalls. It is apparent from this exhibit that sheep-raising in the United States has not reached much perfection! We see in this statement the justice of Hawthorne's testimony, who somewhere writes that all America could not supply the President's table with such mutton-chops as were served up to him at Uttoxeter, England, in a dinner costing eighteen pence.

There were two hundred and twenty-five lambs consumed, amounting to two thousand pounds—the entire carcass of a lamb being considered "choice." These lambs are purchased from persons living in the Adirondacks and Green Mountains of Vermont, and are admitted to be superior to any similar food raised elsewhere in the country, and are probably not surpassed in delicacy and nutritiousness by any in the world. This superiority comes from the excellent character of the grasses, and the purity of the air found in the localities where these lambs are produced. The whole of the "Northern Wilderness" of New York, including "John Brown's tract," must at some future day become famous for sheep farms, and then the President's table will be supplied with a chop noway inferior to Albion's best.

Of veal, the shoulders of which are rejected, there were seven thousand pounds consumed, furnished by three hundred and fifty hind-quarters. These "creatures" were obtained from the farmers living in the immediate vicinity of the Springs. Three hundred and eighty-nine calves' livers, only served up by broiling; and two hundred and sixty beeves' kidneys, supplied from New York, made exclusively into stews. Both breakfast dishes.

"Sweet-breads," the choicest part of the calf, two thousand three hundred. This delicacy is universally popular, and difficult to obtain. A small number are supplied from the neighborhood of the Springs, but to procure any quantity they must be gathered up from different places. They are expensive, and always considered a luxury.

Thirty-seven thousand spring chickens were consumed in this hotel campaign of a hundred days, affording the gross weight of thirty-six thousand eighty-nine pounds. These chickens were obtained from regular traders residing in Saratoga, in the vicinity of Syracuse, in Bos-

ton, and in Canada. They are gathered up by peddlers, who do no other business, and who have their established districts and head-quarters. The country people raise this poultry as part of their farm crop, and depend upon its proceeds as their active capital for the purchase of articles not produced by home industry. The first ventures in business of thousands of farmers' children are connected with the sale of their broods of spring chickens. Tame ducks, one thousand six hundred and twenty. Young geese, three hundred and eleven.

One hundred and seventy-two thousand nine hundred and forty-four eggs, or one thousand seven hundred and twenty-nine eggs a day used for the table at breakfast, and for culinary purposes. These eggs are obtained principally from the neighborhood of Syracuse and from the regular dealers in New York.

Seven hundred and fifty-three fresh salmon, weighing nine thousand four hundred pounds, caught by professional fishermen in the Kennebec and other rivers of Maine, and sent to Boston, the head-quarters of this favorite food, and from this last-named point, after being packed in ice, forwarded to Saratoga. Bluefish and bass, two thousand eight hundred pounds. Salt fish—including smoked salmon, codfish, and mackerel—two thousand seventy-five pounds. Sheep's-head and black bass from Boston. Lake trout, muscallonge, and white-fish from Lake Erie. Pickerel from Saratoga Lake.

Lobsters, eighteen thousand and seventy-nine pounds; caught off the coast of New England, and immediately boiled, after being taken from the trap, in salt-water, then packed in ice, and sent to consumers from Boston. Green turtle, one thousand three hundred pounds,* and forwarded by established fish-dealers from Fulton Market. Pickled oysters, four hundred and forty-four jars, put up in Baltimore; very choice, and, when in perfection—contrary to popular tradition—as wholesome in midsummer as in the winter months.

Extraordinary as the statement may appear, the hotel in a hundred days furnished its guests with two thousand and sixteen pounds of brook trout. This enormous quantity is obtained by the enterprise of a Mr. Hoxie, formerly a bank clerk in the city of New York, who, perceiving that his health was declining under the pernicious influences of a confined city atmosphere, ten or fifteen years ago moved to a home in the Adirondack Mountains. He at first occasionally offered small quantities of trout for sale, but upon receiving the encouragement of a named and liberal price for all he could obtain, he very

* Turtle is obtained from dealers in Fulton Market. The best specimens of this species are caught off the Florida coast and the island of Nassau. They average fifty pounds, but patriarchs have been caught that weighed nearly half a ton. Turtles caught in American waters are admitted by our custom-houses free of duty, but if they get within the marine jurisdiction of England or Spain they are named by our revenue collectors a foreign product, and have to pay an impost of twenty per cent. on their commercial value.

shrewdly organized a large and profitable business. His knowledge of the trout streams was taken advantage of to erect at proper places in the winter time a number of commodious ice-houses. He then engaged, by liberal payment, a number of men to fish the mountain streams for trout, the product of each day being deposited at nightfall in one or more of the ice-houses. The next morning the trout are packed in ice and moss, and, in a frozen state, carried to market. Mr. Hoxie, at the proper season of the year, has a dozen men employed in this business. The price paid is sixty cents per pound. We would add, for the comfort of all true disciples of Izaak Walton, that the fish, which average about four ounces each, are caught with a rod and fly.

The arrival of the trout is a marked event among certain good people of the hotel. They are on hand in force to admire the beautiful gem-speckled creatures, to select the largest for especial commendation, and they seem never to be wearied with asking the fish-monger innumerable questions about the streams and lakes where the fish are caught. An unusually large trout will afford material for exciting conversation among these professed idlers for a whole day. There is a tradition that there was a trout brought from the Adirondacks to the hotel that weighed three pounds and a half! Honest, truth-loving gentlemen saw it, and innumerable good and true men will swear to it; but old trout fishermen still doubtfully shake their heads; and well they may, for, with much experience in such matters, a brook trout, born of the mountain torrent, of a pound weight, is a thing to admire, for even such a one is seldom seen.

At the close of the revolutionary war an old Hessian soldier settled upon a small farm situated about two miles south from the centre of the village of Saratoga. It was a most picturesque place, and the "clearing" at the time was hidden from the public road by a dense pine forest. Just north of the farm-house is a little lake, which, in its primitive state, was so deeply overshadowed by tall trees that the sun never fairly illumed its mirrored surface. The consequence was, its waters, in the sultriest heats of summer, were of an almost icy coldness. It was, and is indeed, a natural paradise for trout. To this romantic place the earlier visitors of Saratoga who were luxuriously inclined used to carry their choice wines, and indulged in their nectar while eating trout caught from "Barhyte's Pond."

The owner was considered an eccentric man, for when he established himself on the farm he stated that the possession of that "pond" more than compensated for an inhospitable winter climate and a sterile soil. As time wore on, however, his taste was vindicated, for this same "crystal well" became a source of profit, and brought to his humble dwelling the best people of the land.

Among the visitors to Barhyte's, on one of

these memorable occasions, was Joseph Bonaparte. He had but recently arrived in this country, and was quietly looking about for some eligible spot whereon he could build himself, most literally, a "princely home." He was of France, and had been king of Sicily and Spain, and all that was favored by nature in soil, climate, and scenery was to him familiar. In pursuit of his purpose of founding a home in America, he had visited some of the most celebrated localities of the Northern and Middle States, but wavered in making a selection. The moment, however, he saw the little trout lake and examined its surroundings he seemed inspired. He threw aside all ceremony when conversing with its owner, he gratified the old German by indulging in familiar conversation and in smoking one of his "corn-cob pipes," and at last his ex-majesty announced his desire to purchase the farm.

Contrary to all expectation, Barhyte refused to sell. The real value of the property at the time might have been two or three thousand dollars, and Joseph Bonaparte increased his offer from the sum named to the enormous one, as then considered, of thirty thousand dollars; but the queer old proprietor refused to part with his domain—his trout pond, he said, should never be other than his while he lived. Thus escaped Saratoga the fashionable prestige of having a palace and a park, which were subsequently created at Bordentown, New Jersey; and such was the estimate that the eldest brother of Napoleon placed upon the trout ponds and scenery in the vicinity of the world-renowned Saratoga Springs.

Ohio contributed six thousand five hundred pounds of ham, two thousand thirty-three pounds of bacon, and one thousand two hundred pounds of mess pork.

Beef-tongues, five hundred and eighty-seven, from the "smoke-houses" of the New York meat-curing establishments.

Seventeen thousand three hundred and nineteen pounds of "extra choice butter," made by the farmers in the vicinity of Saratoga. The pastures in Northern New York and the Green Mountains are the best in the world for the production of pure, rich milk. All the butter purchased is received in June, and packed in a dark, cool cellar. The farmers rely upon this market, and the hotel is equally dependent on them. As all butter of a good quality is purchased, a dozen wagons a day often deliver their freight.

Flour—Rochester brand—one hundred and eighty-five barrels. Indian meal, one thousand one hundred pounds.

Thirty-four thousand eight hundred quarts of milk, or three hundred and forty-eight quarts per day. Four thousand seventy-six quarts of cream. These articles are procured from especial farmers in the neighborhood of Saratoga. Milk is obtained from one set of producers, and cream from another set; so that there will be no inducement to furnish an inferior article of either kind.

Certain named vegetables are obtained in the neighborhood—viz.: four hundred and sixty barrels of turnips; four hundred and thirty bunches of rhubarb, or pie-plant; four thousand one hundred beets; eleven thousand carrots; seven hundred and forty-three bushels of potatoes, which are pronounced to be superior in quality to any others raised in the United States; eleven hundred and fifty-two bunches of asparagus. From the South came thirteen hundred and twenty-two heads of lettuce; two thousand eight hundred cucumbers; three hundred and fifty crates of tomatoes, of two bushels each; seven hundred and fifty squashes. These vegetables are brought first from Charleston, South Carolina; then, as the season advances, from Norfolk, Virginia; then from Delaware. They are brought to New York city in the regular line of steamers, and represent a vast and growing business.

Of fruits, we have one thousand five hundred and ninety-five water-melons from Charleston and Savannah, the cost averaging over one dollar each; sixty barrels of apples, selected with care from orchards in the neighborhood of the hotel, and only fit for the table toward the close of the season.

Of green corn, fifty-two thousand ears, grown in the neighborhood. This delicious food is raised by gardeners who make it a specialty. The planting is so arranged as to produce a succession of crops; so that the corn is in its perfection each day, from the beginning to the very close of the season.

A limited amount of strawberries are obtained from the South; but as the season advances, Saratoga County, and its surrounding country, produce abundant crops of strawberries and blackberries, reaching a total of six thousand six hundred quarts.

One thousand five hundred and fifty-six cans of different kinds of preserved fruits, packed in the western part of the State of New York; Rochester being a prominent point. Three hundred and fifteen bushels of mint, obtained in great perfection in the neighborhood, and not used exclusively for sauces. One hundred and fifty-four bunches of water-cresses, grown in the neighborhood.

The game laws prohibit shooting woodcock before the 4th of July. After that time, one thousand four hundred and sixty-eight were furnished the larder of the hotel, at the contract price of seventy-five cents each. Northward and within a circle of ten miles, Saratoga being the centre, is one of the best woodcock regions in the Northern States. Four hunters are in the employ of the hotel, who make it their exclusive business to kill the game, and bring it in fresh from the woods. When this bird should be cooked, after it is caught, is a subject of grave discussion among the lovers of good eating. One school insists as soon as possible after they are killed; another, with truer taste, we think, would wait a while, at least, before consigning the precious morsel

to the spit. The chemist of the kitchen has, therefore, a difficult task to perform to meet the requirements of such opposite tastes. To one class, a bird just killed and immediately cooked would be more offensive than would be a bird cooked after its "gamy flavor" was widely pronounced.

Three hundred and sixty-one "quail," and two hundred and thirty dozen reed-birds, conclude the list of game, which is not large, owing to the time of year it is in hotel demand at Saratoga.

From abroad, among other things, came 134 boxes of sardines; 914 pounds of almonds; 38 boxes of raisins, 9 boxes of oranges; 33 boxes of lemons; 80 gallons of olives; 7 boxes of capers; 25 dozen cans of green pease, and 42 dozen cans of mushrooms, put up in France; 339 pounds of tea, the greatest part "black;" 2689 pounds of coffee; 427 pounds of chocolate, manufactured in New York, and superior to any that can be imported from abroad; 14,380 pounds of sugar; 160 pounds of farina; 427 pounds of rice; 115 pounds of samp; 200 pounds of hominy, and 600 pounds of wheaten grits. Italian macaroni, 450 pounds. Gelatine, New York manufacture, 348 pounds. Pickles, 11,300, sold by count, raised and prepared for market at White Plains. Vinegar, 333 gallons. Of spices—ginger, 46 pounds; nutmegs, 3 pounds; black pepper, 34 pounds; cinnamon, 10 pounds; cloves, 18 pounds; cassia, 13 pounds; mustard, 72 pounds. Miscellaneous—molasses, 32 gallons; cream of tartar, 125 pounds; olive oil, 60 cases. One thousand three hundred and sixty-eight baskets of assorted wines, principally claret and Champagne, an average of only 164 bottles per day.

In reviewing this list, it must strike the most superficial observer that, as a people, the Americans are dainty in matters of food, and that only the best and most nutritious things of nature's vast and varied storehouse are appropriated as articles of daily consumption, wherewith to obtain the physical and brain power of our active population. How much this fact of daintiness in food has affected, and will affect, our national character in the formation of a distinctive physical man and woman, to be known as the American race, is a subject of interesting consideration.

Of the nations mentioned in ancient history, the Romans, in our opinion, most resembled the people of the United States. There is a positive sameness in the spirit of conquest, in the absorption of surrounding countries, in colonizing, and then ingrafting all acquisitions on the national stock as one people. It is, therefore, worth a moment's examination to see what the masters of the Old World served upon their tables for daily food. In the palmy days of imperial Rome its wealthy citizens had their Saratoga Springs at Baden-Baden; and at that still-fashionable locality were hotel-keepers and learned gastronomic professors of whom we have no superior examples. The bill of fare of the

best class of people two thousand years ago is preserved to us with great minuteness; and upon examining it we are entitled to the unctious that the Romans, in their best estate, were a ruder people than our own. They were mighty in arms and in physical progress, but their bloody combats in the arena were consonant, as might be expected, with the grossness of their appetites.

The Romans considered beef the most substantial food, and it constituted the chief nourishment of the athletes; but they did not confine themselves to the bovines, for they considered donkey-flesh a luxury, and esteemed the flesh of the wild ass better than venison. They entertained the American estimate of the value of pork, but they knew nothing, apparently, of our many excellent ways of preserving the meat with salt. Plutarch, refined as he undoubtedly was, speaks of the gravid sow (after being trampled to death and the mass then cooked) as a dish fit for the gods! Pigs stuffed with asafœtida were esteemed a luxury. These Romans also ate dogs and foxes with a gusto that would do credit to our Apache Indians. Of wild fowl they preferred one of the coarsest that lives. The flamingo to them was a *bonne bouche*, and was most appreciated after the consumption of a hearty dinner. And yet, incredible as it would seem, cooks catering for such coarse appetites invented the inestimable *fois gras*, which has preserved its place as one of the daintiest dishes of modern cookery. The Romans were also strangely barbarous in the selection of fish, the lamprey eel being a great favorite, and, if fed upon human flesh,

it had a conventional quality of superior excellence. Among their eccentricities, they roasted snails on silver gridirons, while at table, and ate them hot, to give a more pronounced flavor to their splendid wines. Such were some of the favorite dishes of the Romans, composed of materials naturally repugnant to the human taste; and yet it is certain that these people, in their mild Italian climate and nearness to semi-tropical countries, possessed a larger amount of what are now at Saratoga considered luxuries (the wild turkey excepted) than we can command; and yet the Romans, as will be seen by examining our modern bill of fare, were, by comparison, so far as food is concerned, a coarse and rude people.

From these records of the magnates of the past we turn to the appetites of a people possessed of the largest pecuniary resources, and able to gather by the aid of steam any imaginable edible from the four quarters of the earth. With the same unlimited power to gratify the palate which in their day was at the command of the masters of the Old World, we find no abuse of God's evidently designed laws regarding things to be appropriated for food. The very creatures above all others suggested by nature as the proper and best nourishment of man have been carefully selected. And herein are the evidences of the refining influences of modern, we should say Christian, civilization, and a promise, possibly, of an eventual progress toward perfection in human development that moralists and statesmen, through intellectual influences, have already fancied they saw foreshadowed in the continent of the New World.

FOOTPRINTS OF CHARLES DICKENS.

CHARLES DICKENS was dead. It was hard to realize, but realized it was at last; and then there was no look or voice in London but repeated it over and over—Charles Dickens is dead! I remember but one other occasion when the death of a man could be read with equal plainness on every face one met, and that was when news of a great tragedy at Washington burdened and blighted the air like a sirocco. When Dickens died the crowds seemed to walk the streets with muffled feet, and if one encountered merry parties it was plain they must be foreigners who had not known the breadth and depth of the nation's bereavement. To them we might say, as Dante mourning for Beatrice to the pilgrims:

"Come ye from wandering in such distant land
(As by your looks and garb we must infer),
That you our city traverse in her woe,
And mingle with her crowds, yet tears withhold,
Like persons quite unconscious of her state,
Who ne'er have heard the heavy loss she mourns?"

Silently and quietly his body was borne to rest in Westminster Abbey, among the good and great who were his brothers. There old Chaucer was buried, because his official duties

were there brought to an end by death. He was, in one sense, the father of English literature, and they are his children whose dust reposes, or whose memories are honored, beside him—and none more than he who was last laid there, in whose genius, as in that of Chaucer, an era of English life is preserved. No sadder sight was ever witnessed in that old abbey than on the day when the grave was left open that the people might look down on his coffin. It was the people who were his mourners—the people who had found their lives touched into romance and pathos by his magical pen. The grave was almost filled with flowers—each flower the symbol of a heart. The grave was finally closed, but the tearful crowd could not leave it. They came day after day, and still heaped flowers upon the stone slab over him. There were long lines of children who came, each bearing a rose or a twig of evergreen, and the tears they shed were from the same fountains that had been touched by the woes of Oliver or Little Nell.

The death of Dickens did not, indeed, take his personal friends by surprise. For some time he had not walked the streets with the

old elasticity, and he had shown an increasing disposition to linger in his country home. An indication of the extent to which his more intimate friends had for some time been anxious about him may be found in a singular statement which I hear on good authority—namely, that the artist Frith, on the morning of June 9, said, “I dreamed that Charles Dickens was dead.” A few moments afterward he found that his dream was true. It may have been, indeed, that the anxieties, of which Mr. Frith’s dream was one expression, were partly caused by a somewhat mournful tone which the author himself had recently held—a tone which some of his friends have thought they could detect in his voice ever since the terrible Staplehurst railway accident, which he witnessed, and on the anniversary of which he died. “I begin to feel,” he said, when Maclise died, “like the Spanish monk of whom Wilkie tells, who had grown to believe that the only realities around him were the pictures which he loved, and that all the moving life he saw, or ever had seen, was a shadow and a dream.” They were words that might have seen the shadows of the brothers whose names and forms now encircle his in the abbey beckoning to him.

When a beloved one is dead it is a sad but a real satisfaction to trace over each step he has gone by our side, to touch the empty chair, to sit in the empty room, to read the volume he used to love. On the morning when I left the grave of Charles Dickens all London seemed to be his vacant room, and chair, and volume; and there seemed to be nothing left but to walk the streets and by-ways he had woven into the tissue of his work, to gaze on the houses that were his homes and the scenes he had interpreted. The three or four houses in which he resided—beginning with that in Furnival’s Inn, where he began to work for a lawyer at thirteen and sixpence a week, and afterward wrote his “Sketches” and “Pickwick”—are all common London houses, nowise distinguishable from those in which other young men are writing to-day for London journals, with hopes and aims as high as his were. One can observe with each change of residence another rung in the upward ladder gained. Forty-eight Doughty Street, where he lived from 1837 to 1840, is a plain brick house, such as one may see miles off in London; number One, Devonshire Terrace, where he lived from 1840 to 1850, is much more elegant, the home of a middle-class English gentleman; and still more elegant, with pleasant court-yards about it, is Tavistock House, Tavistock Square, where he resided from 1850 to 1860. But, after all, these houses do not represent the vestiges of Charles Dickens in London. For these one must walk the streets of which he was the poet, and of these the lowliest. Let us go to Covent Garden Market, the spot around which English genius has always hovered. In that house Johnson used to eat his chop, and there he first met Boswell; not a hundred yards distant the wits of the old *Spec-*

tator were wont to gather—Will’s coffee-house; and across the way, close together, are now Evans’s and the Savage Club, where the writers and actors may still be seen on almost any evening. Nay, the artist more like Dickens than any other found in Covent Garden the sources of his inspiration. Here in Maiden Lane, in an old house yet standing, but soon to fall, the barber’s boy, afterward to be known as Turner, was born. He covered the walls of England with gorgeous colors and scenes, yet Ruskin declares he can trace the dust, stones, baskets, cabbage leaves, oranges, and stall-women of Covent Garden in the finest pictures Turner ever painted. One of the first sketches that ever induced London publishers to ferret out the young writer of certain papers in the *Morning Chronicle* was about Covent Garden. It is not very far to go to Goswell Street, where any coffee-house may have been the original of Goswell Hall, where Pickwick nourished his comfortable frame. But most of all the genius of Dickens is associated with Field Lane, where Fagin had his den. Let one pass by Smithfield, where Sikes dragged little Oliver—wondering at the swarms of the market (it is covered now by a magnificent edifice which is still a market)—poor little Oliver, at the moment suffering as sad a martyrdom as Smithfield ever saw, and on to Field Lane. On the day after Dickens’s funeral I still saw the street signs, “Little Saffron Hill,” and “Field Lane;” but what a change has come over the place since the author made it the scene of his thrilling story! The alterations made by the new Holborn Viaduct have almost completed the work begun by the Underground Railway, and Field Lane is now one dismal row of houses, from whose front the opposite row has been swept clean away, leaving all its wretchedness and filth exposed to view, and calling loudly to be swept into the biggest dust-hole that can be discovered. Eight years ago the wretched place was still what it had been when Dickens fixed it as the spot for Fagin’s den. A large ragged school had appeared at one end of it, and a sturdy siege against the fortress of its furies had been begun; but the missionaries seemed to have no effect whatever. The chief commerce of the place was in old clothes, most of which were stolen. A gentleman with whom I walked the lane at that time related to me an incident which shows how felicitous the novelist was in apprehending the utmost details of what he wrote about: “In walking this lane with a friend when Dickens had made it much talked about I missed my handkerchief. It was plain that the Artful Dodger still lived thereabout. Some weeks later, passing through the lane, I saw in one of the windows my handkerchief exposed for sale, with my name still legible on it. I had the curiosity to enter the house and ask about the article, but two or three others were called in, and there began to be certain menaces, so that I was quite willing to depart, leaving the handkerchief in their hands.”

The old house which was pointed out to me as one which had been really a den resembling that of Fagin has disappeared, and on the spot there is to-day a very handsome Gothic church. In a year's time, probably, the Board of Public Works will have succeeded where the Board of City Missions failed, and every house that originally went to make up the terrors of Field Lane will have disappeared. The wretched inhabitants can not at all understand why they should be occasionally subjects of curious inspection. They are clearly unconscious of their fame, and have never heard of "Oliver Twist." Bloated, diseased, filthy men, women, and children still swarm at the doors like rats; and even now no respectably dressed person can walk past without being angrily chaffed. It were well if we could hope that the work-house system, whose horrible workings were exposed, along with Fagin's den, in "Oliver Twist," was as likely to be cleared away as the latter, and as soon. But, despite the sensation produced when the portrait of Mr. Bumble was brought to light, the London work-house system is to-day as bad as it was then—probably worse.

If from Field Lane one passes by Holborn Hill to Drury Lane, he will find there, at every turn, exactly the pawnbroker's shop which is described in the "Sketches;" but the same may be said of every spot invested by his genius. At Yarmouth one may see along the shore just such houses—half house, half vessel—as the Pegottys lived in; and at Canterbury I have seen the very tombs amidst which the poor out-cast of that story might have crouched, listening to the hymn of the cathedral choir. At Ramsgate one can not remain through a summer's day without perceiving that the place has been photographed—body and soul—in "The Tuggs's at Ramsgate." All these are the works of one who knew the inmost nature of every Englishman, all its deeps and by-ways, and who has turned his bull's-eye upon all hidden spots, not with the spirit of a detective, but with that of a preserver. Some time ago, when it was proposed to return Dickens to Parliament for Newcastle, and he declined, some one said: "He is right. Why should he go into the House of Commons? He is a House of Commons in himself." And when we consider the new interest in the poor he has awakened, the wrongs he has brought to light, the measures which would never have been passed had he not written, we can not help feeling that he really represented this whole people before that highest legislature—Public Opinion.

The debt which America owed to this man was hardly less than that which England owed him. The insane fury with which his "American Notes" was received in our country was simply an outburst of the same rage that afterward was visited on Mrs. Stowe for her "Uncle Tom's Cabin." The outcries about "exaggerated and distorted statements" heard in England from poor-house authorities, when "Oliver Twist" was published, were counterparts

of the angry denunciations of slavery when Dickens published the advertisements about negroes which he read daily. I remember that the Southerners were also furious at his description of the roads and the driver in Northern Virginia, declaring it all a caricature. But I happened to have been born and reared close to that old Acquia road, and have often seen the stage and the driver which figure in the "American Notes;" and it was known to me, as to others dwelling in the same region, that the descriptions were all not only graphic, but photographic in their accuracy. John Randolph once described that same road as a "Serbonian bog," and Dickens illustrated the fact. The old negro driver's call to his laboring horses, "Pill, Giddy, Pill," was long proverbial in the neighborhood of Fredericksburg. It is probable that Dickens's sketch was the first thing that led to the improvements of a region which had become almost impassable—which have ended in the railway. And as his local descriptions of Northern Virginia were accurate, so were his reports of Southern institutions; and his brave exposures of slavery must also be counted among the agencies which swelled that shame and wrath which seized on the American people when they began to see themselves as others saw them, the sum and result of which is now a matter of history. The same must more and more be said by intelligent Americans concerning the other blots in their country upon which he laid his finger—as the system of solitary confinement, and the savage manners of some sections. "Charles Dickens," says Emerson, "self-sacrificingly undertook the reformation of our American manners in unspeakable particulars. I think the lesson was not quite lost; that it held bad manners up so that the churls could see the deformity." This is a judgment that Lord Jeffrey prophesied would come from the best Americans in the end. "The slavers," he wrote to Dickens, "of course, will give you no quarter, and, of course, you did not expect they would;" but the slavers were not to rule America forever; and it is not the least happy circumstance in the career of Dickens that he was able to visit America when her sons had left off the habit of seeing every thing through Southern eyes, and was able to let them feel the substantial and hearty love for them which beat in his breast. His first wounds given us were the faithful wounds of a friend; and in every English company his language concerning America has been for many years rather that of an enthusiast than of a critic.

The feeling in London concerning the People's Author seems to me to have increased with every day since his death. The paper that has a new paragraph about him is still sure of the largest sale for that day. As a scene of enthusiasm among ordinarily cool intellects, the sale of his effects was quite unparalleled.

After the sale of Dickens's pictures, which took place July 9, I repaired with a dear friend to the Charing Cross station, and took a ticket for the little village of Higham, in Kent. I held a little invitation to visit the home of Charles Dickens before it, too, should cease to be identified with him. It is not near; one must travel an hour and a half by rail to the village that is nearest Gadshill Place, and then go a mile and a half before reaching the house. For the first half hour we found ourselves soaring on our steam-wings over the red-tiled tops of London houses. It seems as if one would never get beyond these thick chimney-tops. How many times had the genius of London passed over these crowded homes, and how many dreams had he dreamed of the struggle with grim Fate going on beneath each of these roofs! We glide into the fields at length—on by pleasant parks, where the wealthy dwell; by the hovels of agricultural laborers, deforming the adjacent mansions; by spreading meadows and farms, where male and female tramps are making the most of the days of sunshine preceding their long hibernation; by wigwams of gipsies; by cricket-grounds, where youths in flesh are winning their innings or loafing about their tents; by the huge paper-mills of Dartford; by Gravesend, where the Indian princess Pocahontas died just as she was starting again for the dear wilds of Virginia, for which, amidst the court splendors of England, she still sadly pined; until at last we come to one of the wretchedest little groups of houses discoverable in this country. This is Higham, the nearest station to the spot which Shakespeare and Dickens have made classic. When we inquire for a conveyance the station folk eye us smilingly. A conveyance in Higham! We must walk. It is nearly four o'clock; exciting auctions are hungry affairs; we will find a luncheon at yonder public house. But the only room we find there is full of roughs and their smoke. We ask at the bar for a bottle of Bass's ale. The publican looks at us with amazement, as if we had asked for *Veuve Clicquot*. "You will not find Bass's ale in 'Igham, Sir. People in gen'l 'ereabouts won't pay so much for ale as that comes to" (pints 6d.). "I've some hale werry good, Sir." This "werry good" ale was replaced on the counter after the first sup, the two-pence paid, and we started for Gadshill. It is a narrow, unpicturesque road, up hill all the way, and—it being in the time of the drought—dry and dusty. It lies through a country which supplies Covent Garden with fruit, and we experienced the probable emotions of Tantalus as we passed by laden cherry-trees and strawberry-gardens, from which no cherry or berry could be obtained, except by the bushel. We begin to feel weary and irritable, and doubt if we shall be in a fit frame of mind to enjoy the visit to Gadshill. At this moment we encounter two English gentlemen. "Are we right for Gadshill?" "Yes; but

are you not too late?" "Too late!" I look at my invitation and find that it is essential that we shall be there between ten and four, and it is now twenty minutes past four. This comes of the gigless unrespectability of Higham. "Don't you think they'll let us in? Surely they'll not let us, after coming so far, go away without seeing the house and grounds!" "I fear you'll be mistaken in your hopes; they didn't seem to be very accommodating." We trudge on. The next moment we see crowning this undelectable hill a grove of beautiful large firs, and in the midst the charming little summer-house of oak and green colors, which some Swiss admirers presented to Dickens, and in which he passed the last morning of his life. Passing this, which is on the front division of the Gadshill grounds—reached from the house by a tunnel running beneath a public road—we see a pleasant, unostentatious brick mansion, with flowers and vines climbing on its walls. This, one would say, at first glance, is an ordinary country gentleman's home; the home, it might be, of the squire. But this is the house which seemed to fill the longings of Charles Dickens, when he felt that he had passed through the noise and storm of the great city, had heard the full music and learned all the rhythm of its myriad footsteps, and would fain find a quiet bower of literary leisure in which to pass his declining years. Visitors to Gadshill Place have often wondered that the author should have sought his seclusion so far away from the friends who were always so necessary to his social temperament; but, since his death, one of his personal friends has related the very touching story of its connection with the early associations of his boyhood. It was not alone, as he told us himself long ago, that it was in this neighborhood that he used to stroll when a school-boy—that it was these very trees that used to twine into frames about Roderick Random and shape themselves to the visions of Don Quixote. The "not very robust child, sitting in by-places, near Rochester Castle, with a head full of Partridge, Strap, Tom Pipes, and Sancho Panza," must have found this old hill peopled with a queerer company than Falstaff ever met here. But it now turns out that once, when rambling with his father, he admired this house, and the father said, "If you work and mind your book, you will, perhaps, one day live in a house like that." The words sank into his mind, and from that day the house became, as it were, a beacon to his life. He never lost sight of it, and on the day when he called it his own it meant more than success—it meant the fulfillment of a faithful father's hope.

Gadshill is not so dreary now as it is pictured in Knight's Shakespeare, but it requires all of its classical associations to make it picturesque. A dusty macadamized road, a public house, and one or two small tenements, go to make all of its human pretensions beyond

the one considerable residence we have come to visit. What few people walk the road or loiter at the door of the public house have that dull, seedy look which marks the country people of England, so many of whom are serfs of the soil in all except the freedom to drink as much bad beer as they please, and keep their children in ignorance—this last being a liberty before which the House of Commons itself lately faltered and sank. Here, where society is ever on the defensive, the gardens of the wealthy add no beauty to the road, unless to those who ride by in carriages, and can peep over their high brick walls; and Gadshill Place is only partially an exception to the rule. On the occasion of our visit its walls seemed particularly obdurate—written all over with the words, “No admission after four.” Nevertheless, I did not despair. An old farmer, on a wagon, said, “He was a good neighbor, Sir; there be many hereabouts that will miss him.” The walls that have inclosed a heart that has earned the love of poor and ignorant neighbors, as well as of the distinguished, must have a soft place about them somewhere. Yet there was certainly no appearance of any sentimental weaknesses about them. The huge oaken gates were shut fast and barred for the day, and, instead of pleasant grounds haunted with memories fragrant as their flowers, we found ourselves in front of a fortress, pondering how to enter it. The bell is pulled, and a handsome lad appears. He tells us that entrance after four o’clock is impossible. Various arguments—even the suggestion of sops—are tried on this smiling little Cerberus in brass buttons; but his heart is apparently hard as the nether millstone. At last I said, “Will you please tell Miss Hogarth that there are two Americans—” “Americans!” exclaimed the boy. In a moment he had vanished; in another the great gates were rolling back on their wheels; it was not to be that either in life or death the door of Charles Dickens was ever closed to an American. How the Englishmen whom we had met on the way could have said that those having charge of the house were unaccommodating I know not; I fear they must have allowed the Paul Pry element to preponderate during their visit; we were conducted kindly into every room in the house—even the bedrooms, wherein the most sacred family pictures and souvenirs were now kept, and at whose doors we hesitated—and found only affability and attention.

On entering, the first thing we behold is a frame containing an inscription to the effect that the house stands upon the Gadshill of Shakspeare. Beneath is the quotation from 1 Henry IV., act I., sc. 2: “But, my lads, my lads, to-morrow morning, by four o’clock, early at Gadshill: There are pilgrims going to Canterbury with rich offerings, and traders riding to London with fat purses: I have visitors for you all, you have horses for yourselves.” There was something strange in the fact that

this old hill, so famous before Shakspeare’s time for robbers, should have been, as it were, tilled by his genius into the floral spot which now crowns it.

The library of Dickens was in the front of the house. The desk at which he wrote, the chair in which he sat, were there as we entered, close to the bay-window, through which he would see the road where the Canterbury pilgrims passed—the road where Falstaff and his fellow-robbers scampered away before Prince Hal and Poins, the eleven men in buckram. Here passed Chaucer, listening to the Canterbury tales; here followed Shakspeare, shaping the ancient ballad of “The Robbery at Gadshill” into one of those jewels, as Tennyson defines them, “which sparkle on the forefinger of Time.” And here at last came to live and die the one man alone among Englishmen worthy to be named with the others as a third among the representative writers of England.

There was something almost fearful in the vacancy of this library when the pen had fallen from the hand of the author. The vacant chair; the desk, on which were neither pen, ink, nor paper; the studious nicety of the little furniture remaining—all these had the horrible effect of a clean, varnished, and silver-mounted coffin. The book-shelves remained fastened to the walls on every side of the room from floor to ceiling, but not one single book was left. Every book had, however, left its mark upon the wall. Every thing spoke of the vanishing of the spirit that had here sat at its task. I knew the feeling of the superstitious who tread tremblingly at midnight in haunted houses. As in a dream, there arose before me all the faces and scenes which, in one among the millions of lives that have been somehow influenced by this master, had become intertwined with his memory.

Far away in a little town in Virginia it was, when, as a wondering child, I heard the elders tell of our wealthy neighbor who had broken a blood-vessel, and required the utmost care of the physician. It was related that he had been reading “Pickwick,” his laughter over which had brought about the casualty. The doctor prescribed “strict abstinence from Dickens.” Who is Dickens, I ask; and who or what may be “Pickwick?” But my father is a stern man, who doubts about novel-reading. Nevertheless, he relaxes a little for the novels of this one man; and I find myself entering a new heaven and a new earth through the pages of “Oliver Twist” and “The Old Curiosity Shop.” To this day I can not help suspecting the sanity of any one who does not concede that those are the two best novels ever written.

The writer of those books seemed to me to be so far removed beyond all other mortals that, when I was one day told that he was actually, and in the flesh, to pass through our little Virginian town, I should have been less amazed to hear that the man in the moon was to do that same. I remember the day on which he came—and went—for I marked it

around with charcoal, as that on which I first knew the iron touch of 'Tragedy. To have set eyes on the man who wrote "Oliver Twist" would for me have enriched life immeasurably. The thought of seeing him alight from the stage-coach at the hotel was a possible joy so great that it winged my feet as I went up that day to the schoolmaster, and asked release for one small half hour for that purpose. But the old teacher had never heard of Dickens, and he said, "No." Alas! old master, you have long ago passed into the grave, and I can not even remember other blows you may have inflicted; but this one which the boy of ten received it is still hard for the man to forgive—impossible to forget! The word "No" filled up the place of the sun that day. Under a mad impulse I leaped from the window of the school-room and ran toward the hotel where the author was to appear; but with each step the struggle between Ahriman and Ormuzd in my breast grew fiercer, until at last the latter prevailed and carried me back a penitent to the school. The old teacher was moved as I entered. "You can go, Sir, and see the man," says he. I ran like lightning; but it was too late; I heard only the hurrah of a group of people—only saw a carriage wheeling swiftly away with the one man on earth in it whom I wished to see.

When twenty years afterward I grasped the hand of that man, and listened often to the magic of his voice, there seemed a heavy injustice wiped out of my life.

I remember Dickens at the grave of Thackeray. An unhappy difference had for some years clouded the friendship between Thackeray and Dickens, but one day, encountering each other by merest chance, their hearts and hands rushed together as by some secret force of nature; and their relations were more cordial than ever—they were almost affectionate—up to the day when Thackeray died. On the day when that great and true man was laid in his grave in Kensal Green—close to the dust of others whom both had known and loved, Jerrold and Leigh Hunt—Dickens had a look of bereavement in his face which was indescribable. When all others had turned aside from the grave he still stood there, as if rooted to the spot, and watching with almost haggard eyes every spadeful of dust that was thrown upon it. Walking away with some friends he began to talk, but presently, in some sentence, his voice quivered a little, and shaking hands all around rapidly he went off alone.

Most precious, since his death, to those who heard and saw them are those wonderful impersonations of his which were called "readings." Readings indeed! A few years ago, when Mr. Carlyle was somewhat dejected, and, as his friends thought, confining himself too much at home, he was persuaded to go and hear Dickens read, and I heard him relate his experience thereof. "It didn't have a very attractive look at first," he said, "this of hearing a man read

his works; but I pretty soon found that 'reading' was a very insufficient description of the thing provided for us. The man's face and voice were made into a kind of stage, and he called up his people upon it so that we might see them act their parts. His characters seemed, indeed, to be related to his physiognomy, the further projections of him, to be mastered at will like his tongue and eyes. Such alternations of drollery and pathos, such ingenious grotesque sidelings into all the corners and crannies of human eccentricity and sentiment, one would have imagined quite impossible to any one man." The relation of Charles Dickens to the people was never more displayed than at these assemblies to listen to him. When he took his stand and glanced around it was with a certain look of love on his face, as if he felt that he had in the crowd around him the material out of which he had drawn his characters, and perceived that they had come to see themselves as they really were, and know how they were really performing their part. He received them imperially too, sometimes, as if they were all Rose Maylies, Nicholas Nicklebys, or Dr. Marigolds. And the occasions for the manifestation of this feeling were not infrequent in London. St. James's Hall is pleasant, but it was hardly large enough for the average audience that came to hear him, and there was often a difficulty in getting seats even for those who had paid for them. "I am sorry to interrupt, Sir," a man exclaimed, just as the author was about to begin one of his last readings; "but some of us who have secured seats can not get them." "Order—silence," cried the multitude of the seated; but Dickens said: "The gentleman is quite right, and I shall not begin until every one present who has paid for a seat has it." At another time when a lady in the body of the hall fainted the reader hastened to send her his glass of water before the audience knew any thing of what had happened. I do not know how it was in America, but here in London there was rarely an assembly which Dickens met which was not made to feel that they were all in some sort his guests. When he was leaving a room in which he had made any public appearance a crowd always waited at the door, as other crowds wait for the appearance of the Prince; but I have seen on such occasions manifestations of popular reverence such as never yet greeted any prince. I particularly remember when he was leaving the door of the Freemasons' Tavern, after the banquet at which he had bidden adieu to his friends, an aged and poor woman rushed from the pavement, caught his hand between both of hers, and looked with her withered face bent upon his. Dickens stood still, his face flushing, and returned her look with a sad smile. No word was said by either. The author entered his carriage and drove away; the people fell back to let the old woman hobble away into the Inane; and it seemed to me as if Charles Dickens had been met and blessed

on his departure by one of the Parcæ or one of the Incarnations of these London streets.

Alas, alas: memories, visions, scenes, all sink and fade: there remains this empty chair!

Gadshill Place is completely invested with flowers. There are roses climbing on the house, and blooming to-day with an almost mocking luxuriance; there are conservatories opening from the drawing-room and the dining-room, and on every side of the house. Along

the edge of the sward behind the house are large stone urns, or rather basins, of bright red flowers, and the front garden is also glowing with parterres. There are some graceful trees also, laurel and ivy and holly among them; and from these, with the permission of the kindly woman who conducts us, I gather a handful of leaves—green and yellow, in which I shall not be at a loss to find some symbolism in the years to come.

Editor's Easy Chair.

"I KILLED the old hen the day before Independence," said the farmer's wife; and her phrase restored all the old flavor to the festival. It suggested a calendar which dates from American Independence, preserving the exact historical significance of the day, and recalling John Adams's jubilant prophecy. The more modern phrase is "the Fourth," which has no uncertain meaning, but yet does not so directly remind us of the occasion. And how fast we are coming to the centennial anniversaries! This is the hundredth year since James Otis retired from active life. The 5th of last March was the hundredth anniversary of the Boston massacre. In December, 1773, the tea was thrown overboard in Boston Harbor. In the spring of 1774 the Committee of Correspondence was formed in New York, which proposed the "Congress of Deputies from the Colonies in General." In 1775 came Lexington and Bunker Hill. In 1776 the Declaration of Independence. Already Philadelphia has begun to reflect upon its immense responsibility, and will devise some vast and adequate ceremonial. But every where the day will be the highest festival ever known in the country.

This year the day was in itself so cool and delightful as to be memorable. Usually it is intensely hot, and the heat is aggravated by the incessant and universal tumult and exasperating crack of gunpowder. The city of New York is always given up upon the occasion to squibs, fire-crackers, pistols, and rockets; and an unhappy gentleman, lying seriously ill in a hospital, wrote to the papers a pitiful tale of his sufferings and those of others from this senseless noise—a tale which was undoubtedly as accurate as it was dismal. It is long since there has been a city oration on Independence-day; but the Tammany Society holds an annual meeting on that day, at which there is an immense effervescence of rhetoric, and prophecies pop as glibly as Roman candles. It is perhaps too exclusively a partisan festival to satisfy the requirements of the Revolutionary patriot. But he would find the same difficulty probably every where, and in the words of men of all parties.

And who shall satisfactorily interpret the Revolution? The Easy Chair was once beguiled into delivering a Fourth of July oration, in which it expounded what it believed to be the very doctrines of the fathers. During the discourse it observed a grave, white-headed gentleman cherishing a dignified gold-headed cane, and intently

listening. When it was ended the listener waited, and as the orator approached the old gentleman remarked, "Sir, excuse me! But if those were the opinions of the Revolutionary fathers, I know nothing about them." He then began to talk with the Easy Chair, and to endeavor to persuade it that it had entirely misconceived the men and the times of the Revolution. The truth is, that the better men of each party believe themselves to be the heirs of Revolutionary principles, forgetting, perhaps, that the men of the Revolution were almost as warmly divided as we. There is nothing ferocious in our party disputes that can not be paralleled among our fathers; and there is no partisan rivalry of the best men of the opposition for which there is not the most painful and startling precedent in our history. If any body is disposed to give up the ship because of the difficulties and perils that surround it, let him take heart as he recalls the awful typhoons which it has survived. It is not worth while, indeed, to be enervated by optimism, but it is not therefore desirable to be paralyzed by despair. The old faith that the burden is proportioned to the strength is justified in nations as in individuals.

But, although there is no city oration, there are, and there always will be, orations under some auspices upon the great day, as there will always be the private if not the public pyrotechnics, to relieve the swelling emotion of the occasion. Indeed, the curious observer has sometimes supposed that he detected a close resemblance between the two, and has even, in moments either of too utter forgetfulness or of too shrewd perception, imagined that he was hearing the rush of rockets and the jubilant *feu de joie*s at the wrong end of the day. As a penalty for political offenses, how would it do to sentence culprits to six months of Sing Sing and a reading course of all the Fourth of July orations of the last quarter of a century, with discretion reserved to the Executive to commute the punishment, upon proof of good behavior, into two years of Sing Sing without the literature? But why should the explosive rhetoric surprise us? The Fourth of July orator has a painful consciousness that he is to compete with ginger-pop, gunpowder, and the circus, and that he must somehow produce the impression of remarkable "somersets," or the clown over the way will bear the bell. The orator is at a lamentable disadvantage. The day is pitched in a key of high and rollicking excitement. He must be in tune

with it, and, to do him justice, he usually tries to be. But the clown has more practice.

Yet there would seem to be a better way. Instead of spreading his sheeny vans to soar in the empyrean of hifalutin, why should he not leave the lovers of the noble spectacle of jumping at flying speed through beribboned hoops to their own refreshment, and address himself to another taste? Considering how constantly and copiously we have talked for nearly a hundred years about the Revolution, the general knowledge of the subject is a little ludicrous and shameful in its small extent. Governor Seymour, in his address at the Cornell University, said that it was the part of our history with which we are most familiar. But that was only a polite way of saying that we don't know much of any part of it. If you look into any of the anniversary orations, what strikes you most is their avoidance of the text. There is very little information in them about the Revolutionary men or events, and yet what exhaustless themes they are!

If all the orators next year should agree to select some hero or conspicuous Revolutionary man, each a different one, and tell his story, what immense freshness and charm the day would have, and how we should all rise from our seats wiser men! Each of the old thirteen States would furnish every orator in it with some son whose life would be well worth the telling. Here in New York there would be Hamilton and Jay and King and Morris and Clinton and the Livingstons, to begin with. And the old thirteen could furnish all their younger sisters with subjects, so that on Independence-day, from the Atlantic to the Pacific, the air would be loud not only with the general sound of rejoicing, but with the words of special and individual remembrance that would make the old men and the old time live again. The whole land would be an Old Mortality giving that day to the graves of the honored dead, and scraping away the moss from every headstone. We are evidently to have a memorial day of the later war; let us not less reverently decorate the graves of the Revolution by refreshing the memories of its heroes in our hearts.

It was a little odd that some of the more conspicuous orations of this year dealt with a question of population, and from a new point of view. Hitherto the Independence orator, with exhaustless national hospitality, has held wide open the gates of the land, and cried aloud to "the oppressed of all nationalities" to enter. "America," he has exclaimed, as if through a tremendous speaking-trumpet, whose notes were to reverberate through the vast whispering-gallery of the world—"America is the final refuge of the wanderer. The toiling millions crushed beneath the EFFETE DESPOTISMS of other lands are welcome here. The bird of American freedom, spreading wide its sheltering wings, and holding the Star-spangled Banner in its mighty talons, would fain gather beneath its brooding bosom all who would fly to its protection." This has been our gushing Independence strain. But on this anniversary the chief orator of both the great parties in the country filed a bill of exceptions, while the Senate of the United States, sitting upon the national Sabbath itself, was stormily debating a proposition which forbade all persons born in China to become citizens.

It was a little comic when it was remembered

that two years ago we were all complacently rubbing our hands because, under American auspices, the Chinese wall was about to be broken down, and an American had been selected to announce to the rest of the world that China wished now to be admitted *ad eundem*. "The most hoary and ancient of nations," we said, "joins hands with the youngest. The most venerable of civilizations blends with the most juvenile. Day-before-yesterday hobnobs with Day-after-to-morrow." There was immense feasting. Delmonico gave the dishes of an entire dinner complimentary Chinese names. The deftest orators said delightful things about China. We do not recall a single allusion to paganism. Not one of the eloquent gentlemen suggested that the "Mongolian race" should give us pause. The inability of Asiatics who are addicted to joss-sticks to bind themselves by Christian oaths was not even mentioned in the flow of festive speech. Somebody in Congress, indeed, carried an appendix to the treaty to the effect that it was not to naturalize any body; but the fact was not remarked in the general hilarity. We were all to go and make our fortunes by building railroads and telegraphs in China, and all to wear cheap grass-cloth jackets in summer, and pack our winter woollens in camphor trunks.

This pretty dream was painfully brief. Day-before-yesterday began to hobnob with Day-after-to-morrow in a pleasant rural town in Massachusetts. But Day-after-to-morrow was for handcuffs and tomahawks rather than hobnobbing; and the sitting down of seventy-five Chinese on the shoemakers' benches of North Adams shook the whole country. It was a very small detachment of the oppressed of other lands—a mere squad of the victims of the effetest despotism of all; but many of the orators hastened to shut the gates in their faces, and to declare that we didn't mean those particular victims, nor the oppressed of that especial despotism. The protest was limited, indeed. It did not declare that no Chinese should come, but that they should not be brought over as virtual slaves by contract. Yet it was said with such an air of alarm, and with such a denunciation of a degraded race, that the argument seemed to apply to the permitted as well as to the proscribed.

It is all right, and every thoughtful American will agree; but he will still smile at the contrast between the exuberant festive eloquence that saluted the treaty, and the kicks and cuffs that greeted the arrival of "the most ancient of peoples and civilizations." Indeed, our rhetoric is a frisky nag, and on great occasions he runs away with us. On Independence-day, especially, there is such a blazing and popping that he is quite unmanageable, and we go like John Gilpin—we ride as we were mad. John did not mean to run toll, and we don't mean to transcend common-sense. But we get going, and clear all bounds. Then, again, on Independence-day, or indeed on any other, an "effete despotism" affects us as a head was to affect the well-advised Irishman in the shindy. Wherever he saw it he was to hit it. So we have struck out at the "Old World," and we have stimulated the excellent bird of our country to cluck all people under her wing; but we now discover that we don't wish all to come.

The truth is, as we were saying, that if the

orators would not undertake to rival the circus, but would reflect that nations, like persons, have their laws of health, which can not be safely outraged, obedience to which is neither pusillanimity nor treachery, and illustrate this great truth by the Revolutionary example, when the Colonies, although fighting for liberty and independence, did not hesitate to deal with the disaffected who gave aid and comfort to the enemy, then the orators would do us a service for which a resolution of thanks would be carried unanimously and with enthusiasm.

ANGELICA writes to the Easy Chair that she had set her heart upon voting in Vermont at the next election, and that the wickedness of the present voters in forbidding her affects her so deeply that she feels that the cause is henceforth hopeless. Indeed, she seems to take it so much to heart as to imply that if another State should decide otherwise it would not satisfy her. Apparently the change must begin in Vermont or nowhere.

The argument of the young gentleman with his schoolmate, that if he couldn't have it his way he wouldn't have it at all, is one of the most familiar of arguments. And it results from this disposition that the failure of our own method seems to us to involve the failure of the whole cause in which we are interested. Thus, in Congress, a warm partisan, who has set his heart upon a railroad to the moon from the top of the Andes instead of the Himalaya—for what patriotic American would ever concede that an Asian point of departure could be superior to any upon our own majestic continent?—the Congressional advocate of the Andes route, we say, in the ardors of his eloquent appeal, exclaims: "Mr. President, the eyes of the country, of the world, are upon us. Our duty is plain. I have shown the merits of the case, and it remains for the Senate [or the House] to decide. But, Sir, I warn those honorable gentlemen with whom I am politically connected that if they turn a deaf ear to the appeal of reason and common-sense—if, dazzled by any illusion or seduced by any sophistry, they consent to sacrifice their own continent to another, and to prefer the cloudy peaks of Asia to the heavenly heights of America, they will assume the dreadful responsibility of destroying the party; and so total will be its annihilation that at the next election there will be no sign to show that such a party ever existed."

This gentleman thinks so. The meaning of his speech is, that if his advice is not followed universal night is at hand. And it is a very common belief. In a late religious convention one reverend gentleman urged with great earnestness the imperative, the vital necessity of building a neat little denominational wall. "I appeal to the good sense of my brethren. How shall we ever know where we end and our neighbors begin if we do not invoke the favor of the tutelary Terminus? If any inquiring friend demands how far we go or where we stop, shall we refuse to enable ourselves to answer him? If any ill-disposed traveler sneers that apparently we run over all creation and have no bounds whatever, shall we lie naked to his merciless gibes, or shall we not rather throw up a neat and elegant hedge or a decisive stone wall or a simple wire fence upon which we can lean triumph-

antly, and tell him that if he has eyes he can see, and that if he has not 'tis a pity, but can not be helped, forasmuch as it is the business of a sect to build walls, which we have done, but not to furnish eyes, which we shall not undertake to do? And, brethren, one thing is evident. The time has come for a wall. It is a crisis. All the signs in heaven and upon the earth cry aloud for a wall. In the still watches of the night I hear a voice which says, Build a wall! Posterity pleads with us for some little structure of that kind. As Peter the Hermit, preaching the Crusade, cried, God wills it! God wills it! even so I feel constrained to shout, God walls it! God walls it! Our Zion must no longer be left unwallled. If we would sit under our own vine and fig-tree unmolested, we must fence them in. If we do not—if our hearts are hardened, and we abandon them to the chances of a garden without hedges or ditches—for even a ditch will answer—a ditch in which the unwary or the designing, poaching upon our limits, may be mired—then, brethren, the end is sure. I give you two years, and when they are passed this fair and fruitful denomination will have utterly vanished from the face of the earth—and all for the want of a wall."

This gentleman also thinks so. Like the honorable member of Congress, he feels that, if he can not have his way, not only will he be disappointed, but in the one case a party, in the other a sect, will have been willfully destroyed. And this conviction is a beautiful provision of nature, because it inspires such zeal and tenacity. The men who achieve great results are those who are persuaded that every thing depends upon the success of their particular plan. The work must not only be done, but it must be done so, and not otherwise. But when two of these positive currents meet—when, after A has shown that if you do not make the Andes the starting point chaos will immediately follow, B arises, and with equal conviction and eloquence proves that the same chaos is sure to overwhelm us unless we start from the Himalaya, we are naturally inclined to listen with a great deal of attention to C, the honorable member from the Atlantic Ocean, who says: "Mr. President, this is at least the tenth time this session that the party has been at the last gasp. If the Senate refused to order a quart bottle of mucilage for each Senator, we were solemnly told that the party was going into liquidation. If this body was unwilling to adjourn at the first dinner bell, we were warned that we were wantonly hostile to the deepest instincts of the party, and that the party of our faith was doomed. Sir, the party is not—I say it with profound respect for all my honorable friends in this chamber—it is not a bob to the tail of any man's kite."

And so in the religious convention, when the friend with the wall eye, so to speak, had seated himself, after his very sincere declaration that without a wall the denomination would be gone in two years, another friend, with equal conviction, arose—the other positive current—and said: "Ever since I have known any thing about the denomination it has been expiring and expiring, always upon its death-bed, always surrounded by a weeping company, and always as alive and alert as it is to-day. It is evident that it does it no harm to die. If the want of a wall is

to be fatal, why, the denomination is used to fatalities; and it can do no more, as Brother Walrus says, than die of that want, as it is perpetually dying of all its other wants. Dying doesn't hurt it, but a wall would. In the Christian sense—and, of course, Brother Walrus has no other—to die is to grow. But to be walled in is to be imprisoned and dwarfed. The truth is, that we are always pushing out our boundaries. Terminus is to us the chief of false gods. If we should build a wall, we should only break our heads against it. Our Zion is not a yard, but the world." It was very clear that the want of a wall would not be so fatal as the first orator had represented, and unquestionably believed; and the brethren resolved to take the risks.

In one of Browning's most subtle poems, "A Soul's Tragedy," he describes a revolution in an Italian town. The provost is to be overthrown. If he is not, say the revolutionists, tyranny and anarchy will reign supreme. Well, he isn't, and tyranny and anarchy do not reign; and the provost, as he sends the ringleader into a little exile, wholesome for reflection and improvement, remarks, sententiously, "I have known *four-and-twenty* leaders of revolts."

The truth is, that great systems and parties and sects and causes of every kind do not die so easily as gentlemen with theories suppose. They are, in a certain sense, independent of their supporters, as principles are independent of human volition. The mistake of the Commonwealth men in England, as of the Terrorists in France, was in supposing that to cut off the king's head was to destroy kingship. It is easy enough to kill a monarch, but not a monarchy. So it is easy to defeat any particular method or measure, without harming the principle from which it springs. It is certainly a good thing, for instance, to establish still further intercourse between the moon and the earth. To that end a railroad is very desirable. But even if A's route from the summit of the Andes, and B's from the Himalaya, should both be defeated, the resolution to have further communication with the moon will certainly remain. The honorable A and B, like the young gentleman at school, may decline to take any further interest if their plans are not adopted. But they speak for themselves only. The great cause of lunar communication is not a bob to the tail of their kites.

The Easy Chair observes that in some quarters the conduct of the Senate Committee in asking to be excused from further consideration of the petitions of certain women for fair play, and the extremely attenuated minority which supported the same proposition in the Vermont Convention, are good-humoredly regarded by others than his correspondent, Angelica, as what the same young gentleman at school would call "settlers" or "sockdologers." They certainly do not indicate an immediate or easy success. But the Easy Chair trusts that the petitioners will not lose heart. The victorious provost may chuckle that he has known *four-and-twenty* leaders of revolts, meaning that so many efforts have failed. It is not surprising. The huge intrenched political system of the city of Faenza could no more be overthrown by a riot than its palace walls could be pushed down by enthusiastic hands. But the *fifth-and-twenty* leader of revolts may do the business. And if not the

fifth-and-twenty, then the *fifth-and-twenty* hundredth.

The petitioners should remember that they really ask for thought rather than for action. Of course the demand for action is the best way to stimulate thought, and thought once aroused will bring down both the provost and the palace. But the substance of their petition is so new that it has approached public consideration very much as Wolfe's advance crept to Montcalm's lines upon the Heights of Abraham. The camp was in peril of being carried almost before it knew it. So society has been smiling and dozing along its lines, not believing a serious assault possible upon that side, and lo! here it is. Here is Birnam wood coming up the hill to the castle! It is incredible, but it is a fact. And now the cry to arms resounds every where.

Still, gentle enemy, the castle is yours, although you must fight for it. You will not carry it by a *coup de main*, and so much the better. You will prove your endurance, your resources, your valor, as well as your skill. The particular point at which you aimed is for the present lost. But the success every where else makes that point finally surer. On every hand the gates of opportunity are opening. Colleges, special schools, special training of all kinds invite you, more and more. Fiction, the most powerful of modern advocates, pleads in Wilkie Collins's "Man and Wife" for fairer laws, and fairer laws thunder at the doors of the House of Lords, and demand to enter into the British code. The outworks of mere tradition are giving way. Here and there your far-reaching batteries are planting thoughts in the very citadels of prejudice. Your cannonade has set the world thinking, and therefore your victory has begun. If the minority in the Vermont Convention is one only—"how far that little candle throws his beams!" If the Committee of the Senate ask to be relieved from considering your petition, it is because it has been taken up by society in Committee of the Whole.

"THE victors of Jena survive." These are the last words of the French declaration of war against Prussia. It is the war proclamation of a Bonaparte; and before such words and the associations they awaken more than a half century disappears. When these words are printed the war will be far advanced. The two most military nations in Europe, whose adjoining frontiers are a constant irritation, whose mutual jealousy and hostility are profound, whose armies are in perfect condition, suddenly spring into fierce collision, and the concussion shakes the world. Yet to every contemplative Easy Chair how humiliating as well as exciting the spectacle is! For how many of the people of those countries really wish the war? We read with incredulity the stories of kings plunging countries into war for their private quarrels, and we think with relief that such days are passed. The splendid but terrible campaigns of Marlborough, the days of Blenheim and Ramillies, of my Uncle Toby and the profane army in Flanders, how cruel and causeless they seem now! The most peaceful districts ravaged, the most harmless people slaughtered, universal interruption of industry, universal desolation, the most hopeless oppression—these are what we read between the lines that record the famous

battles which made a few men rich and renowned.

"But what good came of it at last?"

Quoth little Peterkin.

"Why, that I can not tell," said he;

"But 'twas a famous victory."

Little Peterkin may well ask now what good can come of the new war, and whether our times are much more civilized than those of Marlborough and the Prince Eugene. Let us see how the story of the present war could be truly told to little grandson Peterkin. My dear boy, the people of Spain wanted a king. So the officers whom they had appointed to govern until a king was found asked Prince Leopold, a relation of the King of Prussia, to allow the representatives of the Spanish people to vote for him, and to become King of Spain if he received votes enough. But when the Emperor of France heard this he said that he would not permit any relation of the King of Prussia to become King of Spain, and he began to march troops and to get ready for war. Then Prince Leopold said that he did not wish to make trouble, and his father told the people of Spain that the Prince would not be a candidate for king.

But the Emperor of France was not satisfied, and he declared that the King of Prussia must promise not to allow any of his relations to become King of Spain; and he continued to march troops, and to make ready for war. One day the messenger of the Emperor of France met the King of Prussia walking in the street, and he said to him: "I wish you to tell me at once whether you will promise that none of your relations shall ever be King of Spain." But the King of Prussia did not answer, and told the messenger to go home. Then the Emperor of France said that he was insulted, because his agent was sent home; and because of that insult, and because the King of Prussia had not himself ordered his relation, Prince Leopold, not to be King of Spain, and because he permitted him to decide for himself, the Emperor of France declared war against the King of Prussia.

This is the simple and true story. Now, dear little Peterkin, war is always terrible, but it is sometimes justifiable and necessary. Sometimes it is the duty of brave and good men to fight for their own liberty, and that of those who are dear to them. Sometimes governments are so wicked and oppressive that, in order to end their cruelty, they must be overthrown. But it is wrong to take arms to overthrow them until it is evident that no arguments nor appeals will change their conduct. And when it is plain that there must be war it is the most dreadful necessity. For however just and defensible and unavoidable a war may be, it is full of horror and suffering. When, therefore, the Emperor of France declared war against the King of Prussia, he ordered that thousands and thousands of men should be killed and wounded; that they should be tortured by shot and shell; that they should waste away by the most painful diseases; that countless homes, as pleasant and peaceful when this summer began as ours, little Peterkin, should be desolated; that houses and barns should be burned and sacked; fields trampled down and ravaged; mothers and wives and sisters left weeping and broken-hearted; and towns and cities ruined. And ships from other

countries, quietly sailing upon the sea, are to be chased and seized and carried into strange ports, and their cargoes stolen and their passengers annoyed; and for many and many a year afterward the taxes will be so enormous that the price of bread will be very high, and thus the poor will feel the oppression of the war long after the last gun has been fired.

Do you ask, little Peterkin, whether there was such intolerable suffering upon the part of the Emperor of France, which he had tried in vain to remove by arguments and appeals, that he was forced to declare war against the King of Prussia, and to cause all the lamentable consequences that we have been describing? You must judge for yourself, little boy. The Emperor says that the King was impolite to his messenger, and that he ought to have promised that he would not permit any of his relations to become King of Spain. Now if these are good reasons for all the killing and wounding, and burning and stealing, and suffering and heart-break, then the Emperor has done right. But if they are not, what will you call the Emperor? If you ask why he was unwilling that the Prince Leopold should become King of Spain, the answer is that the Emperor and the King have never been friends. The King owns some land upon the banks of the river Rhine which the Emperor wants. This has always been a difficulty between them. And lately, while the King of Prussia was becoming more famous and powerful, the Emperor of France has been acting foolishly in Mexico, and his pride has been hurt because he knew that he was becoming of less consideration in the world.

So, when the people of Spain asked Prince Leopold to be their king, the Emperor, knowing that the Prince was a relation of the King of Prussia, thought that the King would be a more powerful and dangerous neighbor than ever, and that that fear would be a good excuse to make war upon him, and try to get possession of the land upon the Rhine that he has so long wanted. But when Prince Leopold said that he would not be King of Spain, the Emperor had that excuse no longer; and as he did not like to lose the opportunity of taking the land, he said that the withdrawal of Prince Leopold would make no difference unless his relation, the King of Prussia, would promise to do hereafter what the Emperor wished. As the Easy Chair has already told you, Peterkin, the King would not promise; and so there is war, with all its woeful consequences. The Emperor says that he accepts the war which the King of Prussia imposes upon him. But the little Peterkin has read the fable of the wolf who stood up the stream and said that the lamb muddled it, and must therefore be eaten; and Peterkin will probably think of that fable now. But the Emperor of France will not find the King of Prussia a lamb.

If little Peterkin does not think it a wanton and wicked war, he will differ from most of his elders. For you can see, little boy, as well as Mr. Gladstone or Mr. Disraeli, that the demand of the Emperor upon the King was an insulting defiance. No king or government, that has not been forced to it by war, ever makes such a promise as the Emperor demanded. And no ambassador who understood diplomatic etiquette, as the Emperor's messen-

ger did, ever made such a demand as he did, and in such a way, without expecting and intending that it should be resented by his dismissal, in order that his dismissal might be called an insult, and invoked to justify a war. Peterkin, the Emperor of France is like the Irishman at the fair who carried a chip upon his shoulder and jostled his neighbor, then accused him of knocking the chip off, and proceeded to fight him.

When the Emperor declared that he would not permit a relation of the King to sit upon the Spanish throne, he made the old plea of the balance of power. This was a theory that certain great nations in Europe must be content with certain limits, and that none of them must become so disproportionately powerful as to threaten the others. But when the Prince withdrew, the balance of power was no longer threatened. To plead an apprehension of a possible wrong as a justification for actual wrong is criminal. But this is what the Emperor of France has done. Suppose that he is victorious, what wrong will have been righted? What will Europe or mankind have gained? France may push her frontier to the Rhine. Does such an end justify the means?

There is now an imposing and intelligent public opinion of the world which should hold imperial and royal offenders accountable. There should be—little Peterkin, let us at least hope there will be—a powerful protest from the press of civilized countries in the interests of public morality and international amity against this monstrous war. The Peterkin and Wilhelmine

of Southey's poem have grown to full manhood and womanhood now; and the soft satire of the familiar verses should have become a general cry of shame and indignation:

" 'It was the English,' Kaspar cried,
'Who put the French to rout;
But what they fought each other for
I could not well make out.
But every body said,' quoth he,
'That 'twas a famous victory.

" 'My father lived at Blenheim then—
Yon little stream hard by;
They burnt his dwelling to the ground,
And he was forced to fly.
So with his wife and child he fled,
Nor had he where to rest his head.

" 'With fire and sword the country round
Was wasted far and wide,
And many a childing mother then
And new-born baby died:
But things like that, you know, must be
At every famous victory.

" 'They saw it was a shocking sight
After the field was won,
For many thousand bodies here
Lay rotting in the sun:
But things like that, you know, must be
After a famous victory.

" 'Great praise the Duke of Marlboro' won,
And our good Prince Eugene.'
'Why, 'twas a very wicked thing!'
Said little Wilhelmine.
'Nay, nay, my little girl!' quoth he;
'It was a famous victory.

" 'And every body praised the Duke
Who this great fight did win.'
'But what good came of it at last?'
Quoth little Peterkin.
'Why, that I can not tell,' said he;
'But 'twas a famous victory.'

Editor's Literary Record.

NOVELS.

MR. WILKIE COLLINS, in the preface to the English edition of his new novel, *Man and Wife* (Harper and Brothers), advises us of a difference between this book and those which have preceded it. "The story here offered to the reader," says he, "differs in one respect from the stories which have preceded it by the same hand. This time the fiction is founded on facts, and aspires to afford what help it may toward hastening the reform of certain abuses which have been too long suffered to exist among us unchecked." The novel is, in short, an indictment of the marriage laws of England, Ireland, and Scotland—in the matter of marriage very far from a United Kingdom—and would be very effective if Mr. Collins had only taken the trouble to ascertain what those laws are. His general charges are, indeed, scarcely too sweeping. The confession of Hester Dethridge represents a state of bondage from which, happily, American legislation has, in most of the States of the Union, emancipated the outraged wife. The scene in which Geoffrey Delamayn carries off the wife he hates to her prison-house, and Sir Patrick Lundie is powerless to interfere because there is no other proof of the brutal husband's murderous intent than his ugly face, will prove, perhaps, quite as effective an indictment as John Stuart Mill's statement of the law under which such an outrage is possible:

"If she leaves her husband she can take nothing with her, neither her children, nor any thing which is rightfully her own. If he chooses, he can compel her to return, by law, or by physical force."* But the plot turns on the supposed state of law in Scotland—law which is so loose, in fact, that it did not need exaggeration to turn public sentiment against it. In the alleged marriage between Arnold Brinkworth and Anne Silvester Mr. Collins builds up a man of straw to knock it down again with a club of the same material, in the equally supposititious marriage between Geoffrey Delamayn and Anne. Even under Scottish law proof of an actual agreement is indispensable to marriage; and that Arnold should, in a piece of good-natured thoughtlessness, pass for a single night for poor Anne's husband as little constitutes him hers, without such an agreement, as his passing for Geoffrey Delamayn changes his identity. Mr. Collins himself points out this fatal weakness in his plot when, at the close of the story, he represents Delamayn's lawyer as advising his client that Anne's unfortunate night at Craig Fernie Inn is not even ground for a divorce. But Anne is as little Delamayn's wife as Brinkworth's. His promise to the girl he had ruined—"Upon my soul, I'll keep my promise"—his signature—"Your loving husband *that is to be*"—is

* This, however, is not true in any of the States of the Union.

not marriage, but only a promise to marry. In the case of Dalrymple *vs.* Dalrymple, to which Sir Patrick Lundie appeals so confidently, and before which Mr. Moy bows so submissively, there was an agreement in writing, signed by both parties, acknowledging each other husband and wife; and the Scottish court, in that case, marked the distinction, which Mr. Collins's lawyers so curiously overlook, between a promise to marry in the future, and a marriage accomplished as a fact in the past. In short, Delamayn was as free to marry Mrs. Glenarm as Arnold was to claim Blanche. Mr. Collins has built an admirable superstructure, but on a foundation of sand.

As an indictment a failure, as a romance "Man and Wife" is pre-eminently superior to any fiction of the year. Grant the man of straw to be a real man, and the club of straw to be a real club, and the battle becomes intensely exciting. Nor is its only or even its chief merit the ingenious structure and working up of the plot. In incident, in characterization, in description, and in honest, earnest, moral purpose animating all, it is entitled to high, if not the very highest, praise. We have met Lady Lundie before, both in novels and in real life; and Blanche, though a very sweet character, is not a remarkable one. But Anne Silvester and Hester Dethridge are unmistakable originals. Sir Patrick Lundie, the Scotch lawyer, with his provokingly cool head and his tenderly warm heart, would alone entitle the man who drew him to high rank as an artist. Arnold Brinkworth's sailor-like frankness and thoughtlessness in getting into the tangle whose unraveling constitutes the story, and his mistaken sense of honor which keeps him from getting out, is very true to a nature which the reader loves, and is out of all patience with. And Geoffrey Delamayn, the "villain," is characteristically unlike the conventional villain of the novel and the stage in that he is an animal—merely an animal—though a somewhat cultivated and a very admirably trained one, and his villainy is the natural product of a training which spends all its energies on sinew and muscle, and leaves the mind and moral powers untaught. Some of the descriptions in the book are fine; that of the foot-race at Fulham, for example—an admirable and courageous reply, as is the whole life and character of Geoffrey, to the glorification so common of the muscular sports of modern muscular Christianity. Despite its one radical and inherent defect, "Man and Wife" is intensely interesting, and is entitled to, and will take, a high rank in English romantic literature.

Stern Necessity, by F. W. ROBINSON (Harper and Brothers), barely falls short of being a great novel, and does not fall short at all of being a very good one. Whether the author's carelessness is an ingrained trait of character, such as no education can overcome, or whether it is the result of a want of that patient application without which no work of art can be more than second-rate, whatever he writes leaves on our mind the impression that he might have written better. The story is certainly original; the plot ingenious; some of the descriptive passages—that of the Spitalfields emporium, for example—admirable; and some of the characters, as that of its proprietor, Marmaduke Spanswick, good enough to remind us of Dickens, and yet original enough

to be no imitation. But the book opens better than it closes, and is a capital novel for the season, without being likely to survive it.—*Kilmeny*, by WILLIAM BLACK (Harper and Brothers), a story cast in autobiographical form, is readable and pleasant; what the English critics call a "clever novel"—just that, and nothing more. The fact that the reader is carried by it into the Tyrol is no excuse for the plentiful interlarding of German jargon—a sorry piece of affectation, and the book's worst blemish.—In Harper and Brothers' complete edition of *Miss Thackeray's Works* we renew our acquaintance with some good friends in the five stories founded on the old fairy tales; and very charming variations on the old themes they are. It is not infrequently said that genius exhausts itself, and leaves no inheritance for its children. The history of England's two great novelists does not justify this remark. Charles Dickens's son, who has inherited from his father the editorship of *All the Year Round*, has also inherited from him a very graceful pen; and Miss Thackeray has, though a very different genius from that of her father, one equally unmistakable. Without his force and spirit, never employing that sarcasm which was so favorite a weapon with him, like him only in her quaint but quiet humor, she is a graceful and charming writer, a graphic photographer, and writes with a geniality and sympathy which win our affections, rather than enforce our conscious admiration.—The heroine of *Gwendoline's Harvest* (Harper and Brothers)—the author himself so designates her—is an English Lucretia Borgia. She falls madly in love with a hero who begins as a fool and ends as a roué. She is not so madly in love as to believe in love in a cottage; and as to her intended husband's ever doing any thing to earn a competence for them both, a plan so commonplace does not enter the mind of either. She attaches herself to a wealthy old man; helps worry his invalid wife into the grave; carries off the husband, and marries him as the "vidder" married Tony Weller; finds he is not to be worried into the grave, and takes a shorter mode of disposing of him—prussic acid—which an easily cajoled doctor prescribes on her demand; sends for her former lover, who has been awaiting on the Continent what should turn up; marries him; finds her step-daughter in the way; and, having grown probably somewhat audacious, is detected carrying a vial of prussic acid No. 2 into the step-daughter's room, to send her after her father. Whereupon, self-exiled, she retreats to the island of Calypsa, there to live with her husband, who has learned to hate her, and whom she has learned to hate, and so to reap her harvest. *Moral*.—It is never safe to commit more than one murder in a lifetime. The plot is sufficiently absurd, the characters sufficiently unnatural, the scenes sufficiently highly wrought, the whole story, in plot, incident, and characters, sufficiently vivid and dramatic to make the book a sensational novel of the very first water.—Of *The Lady of the Ice* (D. Appleton and Co.) it is only necessary to say that it is by the author of the "Dodge Club," and has the rollicking humor and uproarious fun of that most absurd of writers, yet entertaining withal, JAMES DE MILLE, an author who gives you a double laugh—one at the folly of the book, another at your own folly in being interested in it.—*Summer Drift-wood for Winter*

Fire, by ROSE PORTER, and *White as Snow*, by EDWARD GARRETT and RUTH GARRETT, his sister, are of a class of books which it is hard to designate. Both are published by A. D. F. Randolph; both are, in form, stories; in fact, embodiments of certain types of Christian truth or Christian experience. The first purports to be the diary of a young lady who, going away for the season, gathers in the pages of her journal some drift-wood for the winter evenings. The love-story, which is sad in its ending, is subordinate to the religious teaching, which is cheerful and attractive. The second is a series of short and simple stories, full of charming tropes and figures and quaint conceits and truths compressed into happily turned sentences, which render it a delightful companion for a quiet Sunday afternoon.—A somewhat similar book is *Lifting the Veil* (Charles Scribner and Co.), a pleasant and helpful tract, much after the order of "Gates Ajar." Its theology is of the evangelical school, but is embodied in real or imaginary experiences that carry it to the heart, and make it a consolation to those whose Christ is veiled from them by some bitter and inexplicable sorrow.

POETRY.

SELDOM has there been left unfinished by the death of an author solely adequate to the completion of his difficult task a work more tantalizing in its incompleteness than WARTON'S *History of English Poetry* (G. P. Putnam and Son). Neither Macaulay nor Buckle was more exceptionally fitted for the accomplishment of the histories of politics and morals they left forever fragmentary than was Thomas Warton for the kind of literary history in which there has been no nearer successor than the quite dissimilar work of Hallam. The most highly gifted of a family distinguished for its poetical talent, the son of an Oxford professor of poetry, to whose chair he himself succeeded, brought up among the precise surroundings needed to develop his strongly marked taste for the studies of his life, with full command of the accumulated stores of the libraries of either university, and with access to many private collections, there was wanting no condition for success in the career in which Thomas Warton, and in a less degree his brother Joseph, became eminent. But, though the verses of them all were smooth, scholarly, pleasing, with much elegance of fancy and refinement of feeling, neither father nor sons possessed that genius which alone insures poetical immortality; and, although Thomas enjoyed the distinction of being the one poet-laureate, during a long period, who was neither obscure nor ludicrously conspicuous, the preservation of his family from oblivion is due solely to the merit of his critical writings, and especially of his "History of English Poetry." Dr. Johnson, in one of the numerous letters to Warton which find place in Boswell's "Life," pays his friend a very honest acknowledgment for the advancement of the literature of their native country. "You have shown to all," he says, "who shall hereafter attempt the study of our ancient authors the way to success, by directing them to the perusal of the books which those authors had read." The compliment is in allusion to Warton's edition of Spenser's "Faëry Queen;" but the method adopted in it was also that of his annotations

upon other poems, and of his "History." The research exhibited in this volume is immense; and the author's industry and learning, his familiarity with out-of-the-way nooks of poetical antiquarianism, his command of bibliographical and biographical details, and the range of reading displayed in his collatings of the development of English literature with that of contemporary continental Europe, are equaled by the just taste and true judgment which he applies to the examination of the writings passed under review. The book amply redeems its author's promise "to develop the dawns of genius, and to pursue the progress of our national poetry from a rude origin and obscure beginnings to its perfection in a polished age." From the Norman-Saxon period of the century succeeding the Conquest, to the eve of the reign of Elizabeth, the survey of the growth of English poetry is faithful and minute without ever becoming tedious. Several of those digressions, in which the completing of the topic in hand led him to disregard the considerations of chronological uniformity, show our author's thorough familiarity with the Elizabethan writers, and his strong appreciation for what he has termed "the most poetical age of our annals." The loss is irreparable; yet we have reason to be thankful that our guide only fails us when we have been conducted to a comparatively familiar region, and when we have already received instruction which is of immense assistance to the literary student, and gives to the ordinary reader, within the compass of a single work, the essence of libraries enormously voluminous, and largely inaccessible.

BIOGRAPHY.

A REALLY good biography of Charles Dickens, a book which should tell us something of his personal life and habits, and which, more than that, should disclose to us his real character, which should make us acquainted not with the author whom we know already so well and love so dearly, but with the man whose abhorrence of interviewers found such an expression in "Martin Chuzzlewit," and who is so curiously unknown to his myriad readers, such a book would be more than useful—it would be endeared to us all. That both the secular and the religious press should have engaged in such prolonged and imbittered discussions of the great novelist's religious character is, after all, the greatest compliment that could have been paid to him. The religious character of a stranger is no concern of ours, and to inquire too curiously into it is a piece of sorry impertinence. But what can concern us more than the religious character of our friend?—and it was the peculiar character of Charles Dickens's pen that it made every reader of his pages a personal friend. It need hardly be said that F. B. PERKINS'S *Life of Charles Dickens* (G. P. Putnam and Son) is not a work of this description, and will not satisfy the public appetite for a more personal acquaintance with the man who so nobly fulfilled his own avowed life purpose, "to contribute to the common stock of healthful cheerfulness and enjoyment." Mr. Perkins does not pretend to have enjoyed any personal acquaintance with Mr. Dickens, or to have had any access to his private papers, or any peculiar facilities for becoming acquainted with his per-

sonal life and character. Except, perhaps, the mere date of his birth, Mr. Perkins's book tells us nothing that we did not know before; but it conveniently comprises, in the compass of a few pages, all that an assiduous study of contemporary criticism could afford. As a résumé of what the newspapers have said for the last few weeks, and of what English, and, considering Mr. Taine's elaborate *critique*, French criticisms have said for the last score of years, it is a very readable and entertaining substitute for something better; something better, too, which is happily promised. For it appears that Mr. Dickens was not infrequently pestered while he lived by applications for material by would-be biographers. He sheltered himself from these applications by alleging a purpose to relieve them from all such labor by writing, at some future time, his own life—a task which he did nothing more toward fulfilling than by the preparation of some tolerably full autobiographical notes. These, it is said, have already been handed over to his friend, Mr. John Forster, Landor's biographer; and until the production of his pen appears we must fain content ourselves with such glimpses as are afforded by less elaborate attempts. Among those which have been hastily put forth to catch the tide of popular interest, the most satisfactory as a biographical and critical sketch is a volume entitled, *Charles Dickens: the Story of his Life* (Harper and Brothers). In spite of hasty composition it is both interesting and valuable. Without any pretense to fine writing, it sets forth the main facts in the life of the great novelist in a pleasant and attractive manner; and those who are interested in knowing when his stories appeared, and under what circumstances each was written, will find the desired information in these pages. Sprinkled through the volume are many pleasant anecdotes illustrative of Dickens's character and way of life, most of which are now printed for the first time. The account of the origin of the "Pickwick Papers," and the dispute as to whether Dickens was indebted to the artist Seymour, or Seymour to Dickens, for the figure and character of the immortal Chairman of the Club, is fuller and more satisfactory than any we have met with elsewhere. The volume is adorned with numerous illustrations, including several portraits of Dickens, taken at different periods of his life, and views of the residences he has occupied. It is altogether a very interesting and attractive work.

On the whole, however, Harper's publication of an edition of the *Speeches, Letters, and Sayings of Charles Dickens* gives a better insight into the character of the man than any thing short of a confidential and semi-autobiographical life could do. This volume gathers into 150 pages the public addresses of Mr. Dickens, ranging through a period of nearly thirty years. Of their earnestness, of their genuine benevolence, of their cheery humor, of their occasional sarcasm, and of their honest, downright, plain Anglo-Saxon calling of abuses by their right names, it is not needful to speak, since these characteristics are well known to all who read what Dickens wrote. But they are full, also, of hints and suggestions that tell us some things of his character and life which his books do not. We note that of the fifty-six speeches reported here, though

nearly all are after-dinner speeches, made in the hour when men mostly give themselves up to pleasant but meaningless civilities and small talk, there is hardly one to be found which has not an earnest purpose animating it. Most of them are pleas for benevolent institutions. It is quite clear—we need go no further than this volume for the evidence—that Dickens did not use the poor to ornament his stories, but employed his stories to cheer and elevate the poor. The same voice that pleads so eloquently for "Joe," pleads for the Hospital for Sick Children in accents not less pathetic. The voice which tells with such inimitable humor the story of Mr. Vincent Crummes, manifests sympathy for the distressed actor in more than one speech for the Theatrical Fund. The heart which beat with such honest indignation at the Yorkshire schools, and scourged them so terribly in the person of Mr. Squeers, in soberer tones, scarcely less effective, pleads for popular education. The man who dared arouse all the indignation of the Circumlocution Office by giving it a name it will carry with it to its grave, dares—a more difficult deed—to face the managers of what he accounts a mismanaged charity with such words as these: "The question raised by the resolution is, whether this is a public corporation for the relief of men of genius and learning, or whether it is a snug traditional and conventional party, bent upon maintaining its own usages with a vast amount of pride, upon its own annual puffery at costly dinner-tables, and upon a course of expensive toadying to a number of distinguished individuals." And, finally, the man who seemed to leap at once to his position as the foremost novelist of the age explains in two sentences the secret of his success: "When I first took literature as my profession in England, I calmly resolved within myself that, whether I succeeded or whether I failed, literature should be my sole profession"—a sentence which gives a new significance to Richard Carstone's unsettled and disastrous life; a purpose which, nevertheless, might have led to failure but for the spirit with which it was prosecuted. "My own imagination or invention, such as it is, I can most truthfully assure you, would never have served me as it has but for the habit of commonplace, humble, patient, toiling, drudging attention."

No man's character has been a greater riddle than that of Frederick W. Robertson. He belonged to no school, yielded allegiance to no creed, owned no man master. It is simply impossible to comprehend his utterances without studying the man. In his *Life and Letters* (Harper and Brothers) is to be found the key to his otherwise enigmatical sermons. STOPFORD A. BROOKE's memoir we have come to regard as an almost ideal book of its kind—a book which does much to redeem religious memoirs from the charge of stupidity not unjustly brought against them as a class. It is a book we love to recur to again and again, as to a friend, a book one no more gets weary of than he would of Robertson himself.

G. P. Putnam and Son republish the *Life and Times of John Evelyn, Esq.*, long known in England as a classic, and to the student of history an indispensable companion to Hume, Hallam, and Macaulay. Indeed, from such a diary one may get a far more accurate picture of the interior life of Great Britain, in the days of Crom-

well and the Stuarts, than from the more labored and pretentious histories. Minute and photographic, it ranks second only to the famous "Diary and Correspondence of Samuel Pepys."

THEOLOGICAL AND RELIGIOUS.

DR. JOHN HENRY NEWMAN'S *Grammar of Assent* (Catholic Publication Society) is one of those rare books which add something to the store of theological thought. It is well-nigh impossible for a Protestant to comprehend the mind of a devout Roman Catholic. The Protestant demands that the Romanist prove to him the truth of his irrational creed—transubstantiation, infallibility, the immaculate conception. The Romanist can not prove them—hardly essays to do so. Yet he is not dismayed, nor his faith shaken, by his inability. He believes them none the less because they are incapable of proof. Dr. Newman explains this singular characteristic of the Roman Catholic mind. Conviction and assent, he says, are two different intellectual acts. We are convinced of some truths by arguments. We yield our assent to others upon the mere statement and showing of them. Religious truths are not to be proved; they are to be assented to. "Of the two, I would rather have to maintain that we ought to begin with believing every thing that is offered to our acceptance than that it is our duty to doubt of every thing." That is the Roman Catholic theory of faith in a nutshell. The Œcumenical Council proclaims the infallibility of the Pope. The Protestant mind, listening to the dogma, at once asks, Why? But this is to doubt; this is to demand conviction. "There is no why," replies the Romanist. "The creed is not a conviction. Just believe; believe without questioning, without a reason." This is faith. What the mother declares for truth the child assents to. He does not doubt, investigate, become convinced. He assents without conviction. So the race, children in knowledge, are to receive what the Holy Mother Church tells them, assenting without investigation, receiving without questioning, convinced of nothing, trusting all things. This is the basis of the Roman Catholic theology. It has never received a clearer or more admirable statement than in the "Grammar of Assent." Let us add that in this psychology of faith there is so much of truth that the book is really a valuable contribution to theology, not merely a curiosity of literature. In clearness of thought and perspicuity of expression it is admirable, as is every thing from the pen of Dr. Newman.

The value of an illustration in bringing home a thought to the popular mind is realized by many clergymen and other public teachers, who are at a loss to find what they want in the hour of their need. Rev. ELON FOSTER'S *New Cyclopaedia of Illustrations* (W. C. Palmer, Jun., and Co.) is designed to meet the want of such persons. The true way for every man is to make his own cyclopaedia. Spurgeon abounds with anecdote and illustration. "How fertile a mind," cries Rev. Dr. Dullard; "he never forgets any thing." Ah! my dear doctor, he keeps, and has kept for years, a note-book, in which goes down every thought, trope, figure, illustration which observation, experience, or reading suggests. Out of this well-stocked granary he draws his stores. "Go to the ant, thou sluggard; consider her ways

and be wise." The mere jotting down impresses on the memory, and the figure, forgotten for a while, returns when it is needed. But many men are too lazy, and many too busy, and many more not forehanded enough for this; and for all such Elon Foster's dictionary will prove a very useful book. It is based, we judge, though not avowedly, on one or two similar English compends; but for the American reader it is certainly a great improvement on them. If your minister is a little dry, and you a little inclined to nod during the long exposition of doctrine, we commend you to give him a hint by presenting him a copy of Elon Foster's dictionary. If you are called on to make occasional addresses at school celebrations or temperance lodges, and are at a loss for a story, which always helps to enliven an otherwise dull speech, this book will serve you a very useful purpose. Apart from this, its more legitimate use, it is not dull reading for the half hour when your mind is too wearied to read any thing connectedly, but is in just the mood to glance down a page, catching now a story, now a figure, now a moral sentiment; getting a taste from all, making a meal of none.

How to break up a family, on how small or great provocation husband and wife may separate, this is the great topic of discussion in American circles. It is refreshing to turn from these disputes about divorce to such a book as *Life at Home*, by Dr. WILLIAM AIKMAN (S. R. Wells), the object of which is to tell how the family may be preserved and the husband and wife live happily and cheerily together. Without any pretense to being a great book, it is, what is better, a very useful one. Dr. Aikman, very unministerially, spends no time in discussing theories of marriage; but, assuming the fact, drives straight to the practical question, how it shall be made pure and happy. It is a book of eminent good sense and of still more eminent good feeling; and a practical regard to its precepts—rather a practical acceptance of its kind and loving spirit—would make life at home what it always should be, an earnest of the home toward which we all are traveling, and where our eternal life of love shall be.

MISCELLANEOUS.

To the young man entering upon the study of the law, bewildered and almost lost in the extent and complexity of the labyrinth before him, WARREN'S *Law Studies* (John D. Parsons, Jun.) is much more than a mere map or guide-book in his explorations. It gives him rather the sense of the living presence of a genial companion, familiar with the devious turnings and returnings of the catacombs filled with the dry bones of arbitrary rules and principles which constitute our jurisprudence. So far as any book can, it is well adapted to supply the lack of the living teacher; and law generally is, and of necessity must be, studied under that disadvantage. The author has succeeded to a great degree in infusing his own personality into his work, and this, with its earnestness and good sense, and the frankness with which the results of his own experience and observation are set forth, has given it, in spite of manifest defects of arrangement and an uneven and sometimes faulty style, a deserved success. The later English editions have been greatly enlarged, the modifications and ad-

ditions by the American editor seem judicious, and the book in its present form—though much reduced in size, and perhaps in value, by omissions—will probably be more widely useful on that account. Many of the chapters would be as valuable to other students as to the class to whom they are addressed; and general readers will find the work, largely illustrated as it is with anecdotes and extracts from the sayings and writings of the great lawyers, superior to the gossip in the ordinary books about the profession. To the general public Mr. Warren has long been well known as an essayist, and as the author of "Ten Thousand a Year" and "The Diary of a Physician."—The very existence of such an organ of engineering, manufacturing, and building as *The Technologist* (which has now passed, in its improved form, its eighth number) is one of the most striking evidences of the development of those arts from a merely mechanical to a scientific level. We know not how any engineer or builder who means to achieve progress in his profession can do without it, and it is not without value to any one interested in the mechanical progress and developments of the age.—We want space to commend as highly as it deserves Professor M'ILVAINE's treatise on *Elocution* (Charles Scribner and Co.). It is, indeed, the only treatise strictly confined to elocution that we ever remember to have met with—and our search has not been limited—which raises the subject above an imitative art to the grade of a true science. Professor M'Ilvaine has, with success,

traced the hidden power of oratory to its source, the securing and maintaining of true vital relations with the audience by the direct action of mind on mind; and though he has by no means developed the full meaning of this law, nor stated all the conditions necessary to its application, nor measured its relation to some indubitable and very perplexing phenomena, which, because science can not explain, it leaves in the hands of the quacks, nevertheless, in dwelling upon it and demanding its recognition, he has given to his book a dignity which few treatises on elocution possess.—*The Gentleman's Stable Guide*, by ROBERT M'CLURE (Porter and Coates), is a capital treatise on the stabling, feeding, grooming, and general management of horses. No man can afford to leave a horse wholly to the care of a groom, since professional groomsmen are rare, and conscientious groomsmen are still rarer; and we know of no other treatise on this subject in which may be found so much of practical information condensed into so small a number of pages.—We are not a connoisseur in pigs. We have no penchant for them, dead or alive. Of *Harris on the Pig* (Orange Judd and Co.) we can say, for the benefit of our agricultural readers, that it covers the whole ground of the breeding, feeding, housing, and rearing of that unpleasant animal, and that an agricultural friend, who has familiar acquaintance with piggy's ways and wants, assures us, after a careful examination, that we can cordially recommend it as an admirable practical treatise.

Editor's Scientific Record.

OCCURRENCE OF MARINE FORMS OF ANIMALS IN THE GREAT LAKES.

MUCH interest was excited some years ago by the discovery, in the deep waters of Lake Ontario, of a new genus of cottoid fishes (*Trigloopsis*) of a purely marine type, and only known from being found in the stomachs of the lake trout and ling. Within a very recent period some dredgings prosecuted in the deep waters of Lake Michigan, off Racine, by Drs. Stimpson and Hoy, have resulted in the discovery of a new crustacean allied to Arctic marine forms, and furnishing a parallel to the similar occurrence of a marine type (*Mysis*) in the depths of Lakes Wenner and Wetter, of Sweden. These lakes are believed to have been formerly arms of the sea, but cut off by the gradual upheaval of the coast, since which the water has been changed from salt to fresh, but still retaining some of its original inhabitants, as the *Mysis* in question. How far the same change is to be inferred for our own lakes, and whether, as in the Swedish lakes mentioned, the deepest water is still salt, remains to be decided; but there is no question that a thorough exploration of the deepest parts in the entire chain will result in discoveries of the greatest interest.

GERMINATION OF SEEDS.

Some curious statements have recently been published in regard to the extent to which the germination of seeds can be facilitated by chemical agencies, especially by ammonia and oxalic

acid. By placing them in a solution of the latter substance, they will begin to germinate within one or two days, even after having been kept for forty years, and are then to be planted out in the usual way. Coffee seeds, which are proverbially hard to start, are best forwarded by placing in a covered vessel, containing equal parts of water and of spirits of sal ammoniac, at the ordinary temperature. At the end of twelve hours the roots will be found to have started, and even the young leaves can be discovered by careful inspection. In 1834 wheat was exhibited to the German Scientific Association, raised from seed found in an Egyptian tomb, 2000 to 2500 years old. This had been soaked for a considerable time in fatty oil before planting.

CLEANING KID GLOVES.

However well adapted benzine is to the cleaning of kid gloves, certain precautions are necessary to insure entire success. These consist mainly in not rubbing the gloves with the benzine, but immersing them in a glass vessel, so that the benzine stands above them. The gloves are then to be removed; and, after being well squeezed, hung over a line to dry in a strong current of air; and when the smell of the benzine is removed as much as possible, the gloves are laid upon a glass plate, placed over a vessel filled with boiling water, and another plate laid over this, but so as not to touch the gloves. The heat of the boiling water drives out the remainder of the benzine, and removes all the smell

of it from the gloves. These are then to be stretched and shaped by means of the ordinary glove-stretchers. It will be understood that great care must be taken not to bring any fire or lighted lamp too near the scene of operations.

HORSE-TOOTH CORN.

A variety of Indian corn called the carragua, or horse-tooth corn, has been lately introduced into France from Nicaragua, which is asserted to be superior in many respects to those already known to agriculturists. The point of excellence in this corn consists in its availability as a fodder plant—the yield per acre being nearly four times as great as that of the ordinary varieties—and its cultivation for this purpose alone is highly recommended. It attains a height of from twelve to eighteen feet, and, when fully grown, the stalks are so stout that they require to be divided longitudinally before they can be fed to cattle. The yield of grain is said to be from one-fourth to one-half greater than that of common corn; but it produces more bran in proportion, and less starchy matter, which, however, is of unusual whiteness. The principal objections to this corn are the length of time required for it to reach maturity, and the necessity of a very rich, fertile soil, with plenty of moisture, for its successful cultivation. Where these conditions can be combined, and the season is long enough to permit the crop to mature, as in the Southern and Western States, it is probable that its cultivation might be profitably introduced into the United States.

EXHALATION OF AMMONIA BY MUSHROOMS.

It has recently been ascertained that growing mushrooms of various kinds give off a measurable quantity of ammoniacal gas in a normal condition. This exhalation seems to be a continued function, acting in all stages of growth, and depending simply upon the chemical action of the elementary organs, and not proportional to the weight of the plant.

SELENIUM IN COMMERCIAL COPPER.

The occurrence of selenium in various forms of the copper of commerce is a fact not without its interest to the chemist. It may be shown by oxydizing the metal in a muffle-furnace, and bringing the oxide thus formed, after placing it in a glass retort, to a red heat in a current of dry and pure air. After a time, if selenium be present, there will be seen near the end of the tube a white volatile crystalline ring of selenic acid, forming a mass of transparent, elongated, and homogeneous crystals. With reducing agents, such as hot hydrogen, or moist sulphuric acid at the ordinary temperature, the white ring is transformed into a red ring, possessing all the characteristics of selenium.

CANINE MADNESS.

An elaborate memoir has recently been presented to the Academy of Sciences in Paris by M. Bouley upon the statistics and method of cure of canine rabies; and its general conclusions may be summed up in the following propositions: First, that by having resort to cauterization by fire, with the least possible delay after the bite occurs, injurious or fatal results may be

almost entirely obviated; and in default of the immediate application by fire, certain other preventive applications will also have a beneficial effect. Second, that it is possible to diminish, in a very great degree, the disasters caused by the bite of a mad dog by applying with great strictness against dogs known to be, or suspected of being, infected, the sanitary measure of seclusion, prolonged for at least eight months, in preference to killing them at once.

COMMENSALISM.

It is very easy to show that life on the surface of our globe does not consist of an accumulation of isolated objects, but that there is a definite relationship between one form and another of the plant or animal; so that the existence of the one is involved in that of the other. We are all familiar with the fact that the occurrence, in a given region, of certain insects can always be predicated on the existence of certain plants, and *vice versa*; the insect feeding on the plant, or the plant depending on the insect for the proper fertilization of its flowers. A similar relationship exists between certain animals, the one being dependent on the other for food, or for some equally necessary assistance.

A still different kind of association between animals is that which has lately been described by Professor Van Beneden as *commensalism*, or that of being fellow-boarders at a common table, the one not interfering with or injuring the other in the slightest degree. This able naturalist has lately published a memoir on this subject, in which he classifies the different kinds of associates: first, as "Free Fellow-Boarders," and second, as "Fixed Fellow-Boarders." Illustrations of the free fellow-boarders are found in the case of a fish which makes its abode in the body of the holothuria, a radiated animal, looking not unlike a prickly cucumber. This fish often has as fellow-inhabitants of its house different kinds of crabs, which seem to thrive upon the same kind of food which is taken into the body of its host. In another instance a certain fish lives in association with the star-fish; while in Brazil a fish of the siluroid family furnishes a lodgment in its mouth for certain small fishes, formerly supposed to be its young, but now known to be entirely distinct. The occurrence of little fish in the body of the sea-anemone has lately been brought to notice by Dr. Collingwood; and the interior of certain jelly-fish is similarly inhabited by small fish of another species.

Another instance of a like character, with which we are all familiar, is that of the small crab found in the oyster, and which is not met with under any other circumstances. On the coast of Peru there is a small crab found in the anus of the sea-urchin, while still another species inhabits the thick branches of the coral, and is sometimes completely inclosed in them, so as to be unable to escape. The hermit crab, which, as most of us know, depends entirely for the protection of its soft body upon the shelter of a dead shell, has with it very frequently a small worm, the two living together in perfect harmony. Many other instances of a similar sort are mentioned in the memoir of Professor Van Beneden, and they may be increased almost indefinitely, the current researches on the part of naturalists continually bringing to light additional cases.

Among the fixed fellow-boarders may be mentioned the barnacles, a form of crustacea inhabiting the bodies of whales of different species, and each species of the latter having generally its characteristic form. Sharks, tortoises, and various forms of invertebrates are also similarly favored. The *Remora*, or sucking-fish, also belongs in this category, being usually found attached to the body of some larger animal, and is not unfrequently made use of on the coast of Mozambique for the capture of sea-turtles, a string being fastened around its tail, and the animal directed toward the turtle; when the remora has fastened upon it, the two are drawn in together.

PETRIFICATION OF TISSUES.

Many of our readers have heard of the remarkable process of petrification discovered by Signor Segato of Florence, by which a stony hardness was imparted to the muscles and viscera and other parts of the body without apparently altering the shape and color of the original. These specimens, as ground down and made into Mosaic tables, and other objects, have long been the wonder of visitors to that city. The process was kept a secret by its inventor, and its details died with him. Many attempts have since then been made to accomplish a similar object, but entirely in vain; until lately, Messrs. Tarchiani and Billi, of Florence, have succeeded in discovering, if not the same process over again, at least one equally efficient. By it they now prepare entire animals, such as cats, dogs, and birds, with the hair, feathers, and all parts kept in their natural condition, and perfectly indestructible.

The objects to be preserved are placed in a bath containing the necessary ingredients, which are said to be moderate in price and simple in application; and the same solution may be used over and over again for a number of different operations. The details of the preparation are still kept a secret, although it is probable that it will not be long before they are revealed. An analogous process has been applied by the same gentlemen for the preservation of meat and poultry for exportation as food, and which, after being treated, were found, after a lapse of six months, to be perfectly sound, exhibiting the same appearance as if kept in pickle, with a natural color and an entire absence of odor.

DETECTION OF BRAIN DISEASES.

In a recent communication to the Academy of Science, M. Lieuvre endeavors to show that the pathological modifications in the vessels of the brain—aneurisms, for instance—may be detected by the observation of corresponding changes in the retina. These latter are observed by means of the ophthalmoscope, an instrument consisting of a concave mirror, which reflects light through the pupil into the cavity of the eye, and is perforated by a central aperture, through which the observer makes his examination, either with or without the aid of a lens interposed. This instrument, it will be remembered, has attained considerable prominence during the present year, in consequence of its use by Dr. Hammond and other experienced physiologists of New York in preparing evidence to be used in the trial of several persons for murder,

in which the defense consisted in the plea of insanity.

According to the statements made as the result of ophthalmoscopic observations of the retina, they can be used advantageously in determining many conditions of the brain—such as congestion, softening, tumors, etc.

TRANSMISSION OF NERVE FORCE.

According to Dr. Place, of Leyden, the rate of transmission of nerve force along the motor nerves in man may be estimated at about 180 feet per second.

CHEMICAL INTENSITY OF TOTAL DAYLIGHT.

According to Professor Roscoe, the mean chemical intensity of total daylight for the hours equidistant from noon is constant; and although the chemical intensity for the same latitude, at different places, and at different times in the year, varies according to the difference in the transparency, yet the relation at the same place between the altitude and intensity is always represented by a straight line.

NEW LINK BETWEEN REPTILES AND BIRDS.

The gap existing between the reptiles and the birds of modern times, as already remarked in these columns, is being rapidly bridged over by the discovery of fossil forms that serve as intermediate links. The latest announcement of this kind relates to a skull obtained in a coal mine in Germany, of the upper cretaceous period. While possessing reptilian characters, it is said that the convexity of the occiput and its gentle passage into the roof of the skull, together with the presence of a transverse ridge in the occipital region, the absence of sutures, the globular form of the condyle, and some other peculiarities, show a very intimate approach to the birds. The new genus, which may indeed become the type of an order, has been named *Struthiosaurus*.

INFLUENCE OF CEREBRAL AND MUSCULAR ACTION ON THE URINE.

Some curious experiments have lately been made by Dr. Byasson in regard to the relationship between cerebral action and muscular movement and the composition of the urine. An experiment, prosecuted for many days, during which the amount and character of the food was carefully regulated, and all extraneous influences held in abeyance, showed that during the time when the brain was exercised in study, the body being kept quiet, the principal constituents of the urine were urea, phosphates, and alkaline sulphates; and, on the other hand, when the muscles were kept in constant action, the brain being quiet, the products were urea, uric acid, and the chloride of sodium. From these facts our author concludes that the occupation of an individual, whether mental or physical, during a given period, can be determined by an examination of the urine, and the relative percentage of the two modes of exercise ascertained by a similar test.

The experiments in question are still in progress, and the final conclusions to be arrived at will be looked for with much interest. The physiological deductions to be made from them may also be of the highest importance in furnishing hints as to the supply of material to compensate for the waste of the animal economy.

BLUE COLOR OF THE SKY.

According to a recent writer, the color of blue in the sky and in the landscape is simply the result, in the former, of the darkness of space as seen through the white light contained in the atmosphere; and, in the latter, of the dark and distant portions of the landscape as seen through the interposed medium of the air filled with white light. The color of aerial blue is thus due in both cases to the same cause, namely, a dark body neutralized, as to its darkness, by being seen through a white and transparent medium.

METHOD OF COVERING A BANK OF EARTH WITH GRASS.

To cover a steep bank quickly with grass the following method is recommended by a German horticultural association. For each square rod to be planted take half a pound of lawn grass seed, and mix it intimately and thoroughly with about six square feet of good dry garden earth and loam. This is placed in a tub, and to it liquid manure, diluted with about two-thirds of water, is added, and well stirred in, so as to bring the whole to the consistency of mortar. The slope is to be cleaned off and made perfectly smooth, and then well watered, after which the paste just mentioned is to be applied with a trowel, and made as even and thin as possible. Should it crack by exposure to the air, it is to be again watered and smoothed up day by day, until the grass makes its appearance, which will be in eight or fourteen days, and the whole declivity will soon be covered by a close carpet of green.

COLOR OF LARVAL SALAMANDERS.

Much interest was excited some years since by the result of certain experiments instituted in Paris upon the larva of a Mexican salamander, which laid eggs while still in the immature condition, these eggs hatching out in the water, and ultimately developing into the perfect salamander form. The progeny of this salamander tadpole has been distributed since that time over Europe, and there are few collections of any importance without specimens, either in alcohol or living. In experiments upon breeding these salamanders it was found that when reared under orange-colored glass they were bleached exactly as if they had been kept in the dark—this appearance (due to the absence of pigment in the cellules of the skin) contrasting very remarkably with the dark gray tint of those reared in vessels of transparent glass. The bleaching in question is supposed to be due to the absence of blue, violet, and ultra violet rays of the spectrum, which are absorbed in passing through the glass.

EXTRACTION OF SUGAR FROM MOLASSES.

The attention of a French chemist was drawn to the fact that, after extracting all the sugar easily obtainable from beet juice, there was still left in the molasses 50 per cent. of its weight of sugar that could not readily be secured. He has now published as the result of careful experiment, and applicable to any kind of molasses, the simple process by which 70 per cent. of the remaining sugar can be obtained in a perfectly pure state. Alcohol of 85 per cent., mixed with 5 per cent. of monohydrated sulphuric acid, is to be added to the molasses, and all shaken well together. The liquid is then to be filtered, and

additional alcohol of 95 per cent. is to be added. The sugar is now taken up by the stronger alcohol and retained in a state of so-called supersaturation, and would remain so for a long time, with but a slight deposit in a crystalline form. By adding a small quantity of powdered sugar, however, to the mass, the other sugar will be rapidly deposited with the new, and in a perfectly pure state, to be washed and freed from the alcohol in the ordinary way.

The advantages claimed for this process are: first, the extraction of 35 per cent. of the weight of the molasses in sugar; second, the obtaining of the pure sugar directly, without the necessity of various complicated processes; and third, the almost total suppression of the use of animal black in sugar refineries. The scientific theory of the process need not be given here, the statement of the facts and results being sufficient for our present purpose.

DEVELOPMENT OF HEAT BY NERVE ACTION.

According to Professor Schiff, the excitation of one of the higher senses under favorable conditions—that is, if it reaches the cerebrum—produces an elevation of the temperature in the latter region, the facts being determined by the arrangement of properly constructed thermoelectric needles. It is also stated that when the nerves of animals, after being at rest or narcotized, are suddenly roused and put into activity, they produce a very sensible effect upon the galvanometer. Another conclusion from the experiments of this author is that the life of the brain does not cease immediately after the cessation of the circulation, since, when in animals poisoned with the woorara the sensory nerves were irritated after the movement of the heart had stopped, the temperature of one of the hemispheres of the brain still continued to rise as before, though unquestionably to a less extent. The elevation was observed to occur for as many as twelve minutes after the entire cessation of the beating of the heart.

IDENTITY OF BETAIN AND OXYNEURIN.

According to a German physiologist, a substance found in the sap of the beet, called betain, is identical with the oxyneurin, a product of the excitation of the neurin of the brain. It is also said that in plants of the turnip tribe a substance occurs of the same complicated composition as the protogen of the brain, and that these elements split up naturally, in the same manner as they do when decomposed artificially, and in both cases phosphoric acid, sugar, and nitrogenous substances like neurin and oxyneurin, result from the process.

DECORATIVE PAINTING.

A new method of applying paint in houses has recently been introduced into Paris, by which the disagreeable smell attendant upon freshly painted surfaces may be entirely escaped. This consists in applying the paint in the shop first upon tin-foil, which is spread upon damp glass and treated exactly as if it were a surface to be coated. As many coats are given of such tints as may be desired, and when perfectly dry the foil with its paint is removed from the glass, rolled up upon a roller, and carried to the building where it is to be used. A water-proof mixture is first ap-

plied to the wall or surface to be coated, and then the painted foil is put on as if it were wall-paper. The flexibility of the foil permits its application, even to surfaces of an irregular character; and it may be so skillfully done that it is difficult to realize that the paint was not put on coat by coat, as in common painting. Gilding may be effected in the same manner by first applying the gilt leaf to the tin-foil, and then fastening this to the surface desired. The advantage of this method of tin gilding consists in the fact that it does not so easily become tarnished as the ordinary gilding.

COMPOUNDS OF GELATINE AND GLYCERINE.

An English journal mentions certain properties of the compound of these substances as of much importance in the arts. It solidifies on cooling, and then forms a tough, elastic substance, having much the appearance and characteristics of India rubber. If a corked bottle have its upper end dipped into the melted composition several times, allowing each new coating to dry before repeating the operation, the stopper will be sealed almost hermetically. It may be further stated that the two substances united form a mixture entirely and absolutely insoluble in petroleum or benzine, and that the great problem of making casks impervious to these fluids is at once solved by brushing or painting them on the inside with the compound. This is also used for printers' rollers and for buffers of stamps, as benzine or petroleum will clean them when dirty in the most perfect manner and in an incredibly short space of time. All these applications have, we believe, been made the subject of patents. Water must not be used with the compound, except as a passing application.

CAUSE OF VARIEGATION OF LEAVES.

According to Mr. Morren the difference in the color of the leaves of the variegated plants, which form so ornamental a feature of our green-houses, is due to a disease which is at once contagious and capable of being transmitted from one species of plants to another, by a kind of inoculation. He considers that the alteration of the chlorophyl (which he compares to the red globules of the blood), or green coloring matter, gives rise to variegated leaves, which consist of a mixture of green parts with others more or less yellow. If the discoloration is general it produces death. Among the higher orders of plants only those which are parasitic can exist when entirely deprived of chlorophyl. Variegation is a sign of organic disease; the discolored or variegated portions of the leaf have lost their power of reducing the carbonic acid of the atmosphere; the plants are generally weaker, smaller, their flowers and fruit much poorer, and their power of resisting cold diminished. Variegation can be propagated by means of layers, buds, or grafts, showing that the buds themselves are infected. The seeds, however, from variegated individuals usually produce normal and healthy plants.

TIN CANS.

Every one knows the difficulty experienced in ordinary domestic economy of opening or unsealing the soldered tin vessels containing canned or preserved fruits, meats, etc. The suggestion has been made of using fusible cement, instead

of the ordinary solder, which, while sufficiently tenacious at ordinary temperatures, will readily yield to the heat of boiling water poured upon it. An additional advantage of this method would be that any one could fasten up a can filled with the substance to be preserved without the aid of a tinner or his soldering irons.

SPECTROSCOPIC EXAMINATION OF CANDLE-FLAME.

Mr. Lockyer has lately shown that phenomena observed by his new method of spectroscopic observation in the sun may be produced in the common candle-flame, care being taken to examine the flame, as Mr. Lockyer examines the sun itself, namely, by means of its image thrown on the slit of the spectroscope. In this way the existence of an outer layer of sodium vapor, often invisible to the unassisted eye, is shown, which gives a bright line outside of the spectrum of the candle, in the same way that the red flames give a spectrum of bright lines outside that of the sun's photosphere. Inside of this sodium layer is another layer of carbon vapor; and by imitating a storm in the sun by means of a blowpipe, mixing the white-light-giving substance of the candle with the outer layers, the phenomena of a solar storm were almost absolutely reproduced, sodium being substituted for hydrogen of the red flame, and the carbon vapor for the lower lying sodium and magnesium vapors in the sun's atmosphere. Mr. Lockyer has also shown that the phenomena have a distinct bearing on those of the sun's atmosphere.

HEAD LETTUCE.

It is said that heads of lettuce can be produced in winter in from twenty-four to forty-eight hours by taking a box filled with rich earth, in which one-third part of slacked lime has been mixed, and watering the earth with lukewarm water; then taking seed which has been previously softened by soaking in strong brandy twenty-four hours, and sowing in the usual way. We are assured, but will not vouch for the fact, that a good-sized head of lettuce may be obtained in the time mentioned.

COUNTER-PRESSURE STEAM-BRAKE FOR LOCOMOTIVES.

The engineering journals of America and Europe are filled with commendatory notices of a new attachment to locomotive engines, by means of which counter-pressure steam can be made to serve as an elastic brake, enabling the driver to manage his engine and the train with a degree of certainty and efficiency far exceeding that obtained by any arrangements which have hitherto been in use. It consists simply of a pipe, which carries water from the boiler into the branches of the exhaust-tube, to be converted into a fine spray by contact with the heated metallic surfaces of cylinders and piston. While carrying this and absorbing the heat produced in the motion of the parts, the steam acts not only as a brake, but can be made to produce a discharge from the blast-pipe sufficient to keep any gases from the smoke-box.

The system in question places the control of speed directly in the hands of the engineer, enabling him to use the whole load on the driving-wheels as a brake, with little physical effort, and

no danger to himself; and thus enables him to dispense, in a great measure, with the use of brakes on the tender and cars. The apparatus can be applied to any locomotive at a small cost, and has already been used in thousands of engines in Europe. We presume that it will not be long before the experiment is tried in this country; and if its results are as important as they have been represented to be, much good will ensue from the ability of the engineer to arrest the speed of the train in a much shorter time than has heretofore been possible, thus enabling him to control its motion to any desired degree.

DISEASES OF THE SILK-WORM.

Few persons have turned the use of the microscope, in the study of the cryptogamic vegetation, to better account than M. Pasteur, of France, since it is to his researches that we owe most important announcements in regard to the nature and cure of diseases of the silk-worm, the preparation and preservation of wines, and other subjects of economic importance. This gentleman has recently published, in two volumes, a final report, or résumé, of his researches upon the silk-worm and the various affections to which it is liable, supplying an encyclopedia of reference of the utmost value.

The principal diseases attacking the worm he finds to be three in number, namely, the muscardine, the pebrine, and the flacherie. The muscardine is produced by a cryptogamous plant of the genus *Botrytis*, allied to the mould and mildew, which attacks the worm, and, gradually penetrating all its tissues, finally destroys it. This pest is abated and extirpated by washing the silk-worm houses and their furniture with a solution of sulphate of copper, by which means it can be readily kept under proper subjection. The same, unfortunately, can not be said in regard to the pebrine, which, for twenty years past, has been the cause of immense injury to the silk-worm establishments of Europe, and even of the East. The disease itself consists in the development of corpuscles which invade all the tissues of the worms, the chrysalids, butterflies, and the eggs; and it is often transmitted by contact, by the rubbing of the worms against each other or against infected objects. M. Pasteur shows, however, that the disease can not pass from one generation to another, excepting through the agency of the eggs; since the corpuscles which permeate the silk-worm houses at a certain epoch, and which are not removed in the cleaning up of the houses, do not survive over the season, and can not reproduce themselves in the following year. This circumstance furnishes the means of counteracting the evil. If females exempt from the disease are preserved for the propagation of the race, the transmission of the malady can be arrested.

Flacherie may be spontaneous, hereditary, or transmitted from one generation to another. It is due to a ferment which multiplies with infinite rapidity in the tissues of the animal, and causes its destruction. The starting point appears to be in the fermentation of the mulberry leaves upon which the animal is fed. But once developed, the germ of the evil can pass also to the egg, to be preserved there and to be transmitted from it. The hereditary transmission may be

avoided by selecting females exempt from the disease; and the development of the evil can be guarded against by caution in selecting the leaves to serve as food, and in keeping them from fermentation. The small size of the silk-worm apartments used in Europe is given as the principal source of these diseases. By having them much larger, such as are used in Japan, it is said that the trouble may be much more readily avoided.

ECLIPSE OF THE SUN IN DECEMBER, 1870.

Astronomers in all parts of the world are now busy in making their preparations for observing the eclipse of the sun in December 21-22, 1870. Although it will not be visible in the United States, it has been suggested that some of the American observers of the last eclipse be sent abroad for the purpose of taking part in the observations of the one in question, and Congress has already appropriated \$29,000 to the Coast Survey for the purpose. Great praise was awarded by foreign physicists to the American astronomers for the excellence of their work, and especially for the remarkable photographic pictures that were taken, and at so many points; and it is urged that these same gentlemen, or a selection from them, would be admirably fitted for a renewed investigation of the kind, since their experience of the first phenomenon would enable them to utilize their time to better advantage during the second. According to a recent writer this eclipse will begin in the North Atlantic Ocean, the line of central and total eclipse, moving in a southeasterly direction, crosses Portugal a little to the south of Lisbon; passing over part of Spain and the Mediterranean Sea, it enters Africa near Oran, and soon afterward attains its extreme southern limit; the shadow of the moon, now moving in a northeasterly direction, leaves Africa, and, crossing the island of Sicily, the south of Turkey, the Black Sea, and the Sea of Azof, disappears; the penumbra of the moon, decreasing rapidly, leaves the earth with the setting sun in Arabia. The sun will be centrally and totally eclipsed at noon in lat. $36^{\circ} 38' N.$, long. $5^{\circ} 1' W.$, a little to the northeast of Gibraltar.

NEW SILK-WORM PARASITE.

The long list of difficulties attendant upon the cultivation of the silk-worm has been lately increased by the appearance, in Japan, of a parasite insect belonging to the order of diptera, and recently described as the *Tachina Andji*. This, it is said, attacks indifferently the worms, the chrysalis, and the perfect insect.

ADULTERATION OF VINEGAR BY SULPHURIC ACID.

A method of testing vinegar, for the purpose of ascertaining whether it has been adulterated with sulphuric acid—a trick which is said to be not uncommon—consists in covering a vessel of boiling water with a wide saucer, placing a layer of a solution of sugar upon this, and after this has evaporated to dryness, and is still hot, laying upon the sugar a drop of the vinegar to be tested. Pure vinegar does not produce any blackening of the sugar after a considerable time of trial; but this result takes place if it has been falsified with sulphuric acid. In case it is desired to determ-

ine the presence of a very trifling percentage of sulphuric acid in any liquid, a similar experiment may be employed. A drop of water hanging to a glass tube, which contains not over an eighty-thousandth part of sulphuric acid, will produce action upon the heated layer of sugar. In this case there is no blackening, but the change is into green. Other acids, such as phosphoric acid, hydrochloric acid, nitric acid, etc., do not produce this alteration of the sugar.

MICA SPECTACLES.

The use of mica in spectacles, for protecting the eyes of workmen from the heat and glare of the fire, is rapidly coming into general favor; and complete masks, and even cylinders entirely encircling the head, are sometimes used for a similar purpose when a greater safeguard is required. Experiments have been lately made in regard to the manufacture of blue spectacles from this material. The best method of accomplishing this has been found to consist in the use of plates of transparent blue gelatine fixed between two layers of mica, thus protected from the action of the heat. The experiment of applying the blue coloring matter directly to the surface of the mica itself failed in consequence of the impossibility of forming a suitable combination; but the gelatine layer, as indicated, answers all the purposes desired.

WAXED PAPER.

An article known as waxed paper is in very extensive use in Europe, especially on the Continent, for tying up the necks of bottles, covering preserve jars, and for enveloping tobacco and other substances that require to be kept from the air, replacing generally tin-foil and similar substances. It is generally prepared there on a large scale by taking a quire of paper and opening it flat upon a table, and then going over it quickly with a very hot smoothing-iron, against which is held a piece of wax, which, melting, runs down upon the paper and is absorbed by it. A little practice will soon determine the amount of wax that should be melted off from time to time. When the upper sheet is saturated it is taken off, and the one below is treated in a similar manner. Any excess of wax applied in the first instance readily penetrates through to the lower layers.

IGNORANCE OF BLUE AMONG THE ANCIENTS.

Dr. Geiger, of Frankfort, calls attention to the curious fact that in all the most ancient writings there is no term used to indicate the color blue, notwithstanding the inducement to this in the description of natural phenomena, such as the cloudless sky, etc. Neither in the Rig Veda nor in the Bible, the writings of Hesiod, the Zendavesta, nor in the Koran, is there any reference to the blue color of the heavens. Theocritus and Virgil speak of a sun-burnt countenance, and compare it with the black of the violet and the hyacinth. Cassiodorus confounds blue with gray. References to green even do not occur in the highest antiquity, although it is mentioned earlier than blue. In the Rig Veda and Zendavesta, in speaking of trees and plants, golden fruits are described, but no mention is made of the green color of the leaves; and among the Greeks green was frequently confounded with yellow. Xenophon, Aristotle, and

the Edda, recognize only three colors in the rainbow; the Pythagoreans, four; while the Chinese and Arabians are the first to add green to the list. We find that in the very earliest periods the colors black and red are very sharply and accurately defined. From this, and many other facts adduced by Dr. Geiger, he concludes that the most refrangible rays of the spectrum were last of all appreciated by the human eye, while previously only the most brilliant portions around the red were noticed. He infers, therefore, a successive improvement in this important sense. The speculations in question are highly curious and interesting, and deserve to be followed up, although it seems hardly possible that entire nations should be insensible to the existence of certain colors in early times, or should be, in a measure, color-blind. If, however, the deductions referred to are legitimate, such a conclusion would seem to be a natural consequence.

TREATMENT OF ZINC WHITE.

The practice of mixing zinc white with any preparation of lead as a paint is condemned by a recent author as unadvisable. He recommends the preparation of zinc-white paint with an oil treated in the following manner: Instead of mixing it with the ordinary boiled linseed-oil, two hundred pounds of linseed-oil are to be boiled moderately, first for five or six hours alone, and then for at least twelve hours with twenty-four pounds of coarsely broken peroxide of manganese. By this method an oil is obtained which dries very quickly, and is especially adapted to mixing with zinc colors. This oil is to be kept excluded from the air, to prevent its becoming too thick. When used, from three to five per cent. of it is to be added to paint prepared in the ordinary manner with raw linseed-oil.

TEMPERATURE OF NEW-BORN INFANTS.

Since the experiments of Edwards and Despretz it has been the general assumption, although controverted by eminent authority, that for a short time after birth the temperature of a new-born infant is considerably less than that of an adult. Recent investigations by M. Andral, however, seem to show that this is not the case, and that for the first half hour of extra-uterine life the temperature is the same as that of the adult. It is true, indeed, that a reduction of temperature has frequently been observed; but this is said to be the result of evaporation from the surface of the skin of the amniotic liquid in which the infant had been bathed, the resulting cooling being sometimes so excessive as to produce injury, if not death. A natural inference may readily be drawn as to the necessity of applying to the new-born infant such covering as shall prevent this evil.

BITE OF VAMPIRE BATS.

According to Hensel, the bite of the vampire bat is not injurious so much in consequence of the amount of blood which it extracts by the bite as because the wounds attract flies, which leave their eggs in them, thus producing running ulcers in a short time. It is stated that it is horses and asses particularly, rather than cattle, that are bitten by the bats.

NEW GLAZING PUTTY.

A new glazing putty, known as thermo-plastic putty, has been recently introduced into England, and applied to fasten glass into the roofs of railway stations, green-houses, and other structures where iron sashes are employed. This article hardens in a few hours after being used; but when exposed to solar heat sufficient to cause an expansion of the glass and metal becomes plastic, and on cooling again hardens to its original firmness, thus obviating the danger of breakage, which is so frequent when ordinary glazier's putty is employed.

BROMIDE OF POTASSIUM.

M. Namias, in prosecuting certain experiments upon bromide of potassium, finds that this salt is eliminated not only by the urine, but also by the saliva; and, in fact, a post-

mortem examination of an individual who had taken large quantities of this salt revealed its presence not in the blood merely, but in the other liquids of the system, as well as in the liver, lungs, brain, the spinal marrow, etc. He also found that bromide of iron might replace advantageously, in certain cases, the bromide of potassium; since, while an appreciable quantity of bromine was found in the urine, but little of the iron was detected, this having probably been retained by the blood. In discussing the preceding communication, as presented to the Academy of Sciences of Paris, M. Balard urged the propriety of the use of the bromide of sodium in preference to that of potassium. He stated that soda is the alkali which is usually present in the animal juices, potassa occurring to a much less degree.

Editor's Historical Record.

UNITED STATES.

OUR Record closes on the 30th of July.—The following is a brief summary of the proceedings of Congress previous to adjournment *sine die* on the 15th:

The Senate, on the 1st, passed a bill for the continuance of the income tax at the rate of $2\frac{1}{2}$ per cent. for two years, \$2000 being exempted. The bill was passed by the House on the 9th, the provision continuing the tax for two years being rejected.—On the 6th, in the Senate, the Conference Committee on the Currency bill reported in favor of the adoption of the bill as passed by the Senate, with a modification fixing the amount of additional currency to be issued at \$54,000,000. The bill, which, in accordance with this report, was adopted, provides for the immediate distribution of this additional issue of currency among the several States, and for a redistribution after the census of 1870 shall have been taken. This bill was on the 7th passed by the House.—In the Senate, on the 7th, the Naval and Fortification bills were passed. Also, on the same day, the Congressional Apportionment bill, fixing the number of Representatives at 300, with an amendment providing that States having a fraction exceeding one-half over the amount of population required for one Representative shall be entitled to an additional member.—A bill was passed by the House, on the 7th, to regulate the mode of ratifying constitutional amendments, 128 to 54. This bill makes it unlawful for any state officer to certify a repeal of a ratification once made, and affixes a penalty of fine and imprisonment for an attempt to repeal a ratification after it has been once consummated.—The Senate, on the 9th, passed the Army bill nearly as reported by the Conference Committee. This bill reduces the army to 30,000 men. Officers who have served during thirty years may, if they desire, be placed on the retired list, the number on which may be increased to 300. Officers on the active list are forbidden to hold civil offices on pain of vacating their commissions. The payment of the General of the army is fixed at \$13,500 per year; that of the Lieutenant-General at \$11,000; that of a major-general at

\$7500; that of a brigadier-general at \$5500; that of a colonel at \$3500. Officers on the retired list are to receive 75 per cent. of the pay due their rank.—The appropriation for the Polar Expedition was reduced by the Senate on the 9th to \$50,000. C. F. Hall is to have command of the expedition.—On the 13th the Senate adopted the reports of Conference Committees on the Tax and Tariff and on the Funding bills. In respect to the Funding bill Mr. Sherman explained that the Committee had provided for three classes of bonds—two hundred millions of five per cents; three hundred millions of four and a half per cents; and one thousand millions of four per cents. The expenses of negotiation had been fixed at one-half of one per cent., under the control of the Secretary of the Treasury. The seventh section, relating to the national banks, has been stricken out, leaving the bill merely a voluntary bill. The House adopted the report of the Conference Committees on the Tax and Tariff and on the Funding bills on the 13th.—On the 14th the Senate passed a bill allowing Mrs. Lincoln a pension of \$3000 a year.—In the House, on the 14th, a bill was passed appropriating \$5,000,000 for the carrying out of Indian treaties. This action was sustained by the Senate on the 15th. As finally passed the bill contains a proviso that nothing in it shall be so construed as to ratify, approve, or disaffirm any treaty made with any tribes, bands, or parties of Indians since July 20, 1867; or to either affirm or disaffirm any of the powers of the Executive and the Senate on the subject. The President is to control the disbursement of the appropriation. The bill continues the Board of Peace Commissioners for another year.—On the last day of the session (July 15) a special message was communicated to both Houses by the President, calling attention to the breaking out of the war in Europe and the necessity for the increase of our commercial marine by the purchase of ships. In the Senate this message received little attention, and was finally laid aside without action. In the House it was referred to the Committee on Ways and Means, with instructions to report forthwith. Two reports were received, the majority postponing ac-

tion and the minority reporting a bill favoring for a certain time the registration of foreign-built iron vessels. A long debate ensued on the subject of free ships. No action, however, was taken.

John Lothrop Motley has been removed from the post of Minister to the Court of St. James. On the 14th the President sent to the Senate a nomination of Frederick T. Frelinghuysen as his successor. This nomination was confirmed on the 15th.

EUROPE.

It was announced on the 6th of July that Prince Leopold of Hohenzollern had formally accepted the Spanish crown. This fact was known to the French government on the 5th, and "a firm and energetic note" was addressed to Baron Werther, the Prussian ambassador, upon the receipt of which the Baron departed for Ems to meet the King of Prussia. What the tenor of this note was may be inferred from the statement made the next day in the Corps Législatif by the Duke de Grammont, Minister of Foreign Affairs, namely, that "it was true that General Prim had offered the throne of Spain to the Prince of Hohenzollern, who had accepted it; but the people of Spain had not pronounced on the transaction, and France had to know the details of an affair which had been conducted in secrecy. The French government would persist in its policy of neutrality, but under no pretext would it permit a German power to place one of its princes on the throne of Charles V. He hoped, however, that prudence in Germany and wisdom in Spain would avert extremities." The *Moniteur*, on the evening of the 9th, said: "The abandonment of the Hohenzollern project on the part of Prussia is not enough now. France must prevent the recommencement of similar projects, and on the part of Prussia demand an entire fulfillment of the Treaty of Prague—namely, the liberty of South Germany, the evacuation of the fortress of Mayence, the renunciation of military influence beyond the Main, and the settlement of the Schleswig-Holstein question with Denmark." The position assumed by the *Moniteur* was that maintained by the French government. For, notwithstanding the withdrawal of Prince Leopold, the French government insisted upon the official renunciation now and forever of all pretensions to the throne of Spain on the part of any member of the Hohenzollern family. The Prussian king refused to receive Count Benedetti, the French ambassador, bringing the above demand from the French court. On the 15th the French government, sustained by the Corps Législatif, declared war against Prussia. This declaration asserts that the Emperor of the French was obliged to consider the proposal to elevate a Prussian prince to the throne of Spain as an attack on the security of France; that he desired that Prussia should disavow the scheme, which Prussia refused to do, reserving her right to be governed by circumstances; and that the Emperor was forced to consider this determination as equally menacing to France and the European equilibrium, and, particularly, as it was rendered the more significant by the communication made by Prussia to the cabinets of Europe, giving an account of the refusal to receive the French ambassador. The declaration

concludes: "The French government, therefore, is taking steps for the defense of its honor and injured interests, and having adopted all measures which the circumstances render necessary, considers itself at war with Prussia."

The London *Times*, of July 25, published a projected treaty submitted by France to the Prussian government, guaranteeing its authenticity. The following are the points of this document: The preamble sets forth that the King of Prussia and the Emperor of the French, in order to strengthen the ties of friendship between the two governments and peoples, etc., hereby conclude the subjoined treaty: In the first article, Napoleon admits and recognizes the late acquisitions of Prussia from Austria; in the second, the Prussian king engages to facilitate the French acquisition of Luxembourg; in the third, the Emperor acquiesces in the union of the North and South German States, Austria excepted; in the fourth, France finding it necessary to absorb Belgium, Prussia lends her assistance to that measure; the fifth article is the usual one of offensive and defensive alliance between the two nations.

Count Von Bismarck pronounces the copy of the treaty as published by the London *Times* to be authentic, and says it was the same as proposed to him by the French Minister in 1866. The publication of this secret treaty created intense excitement in England.

Up to the time of closing this Record the other European governments have maintained a position of neutrality. England insists that the territory of Belgium must not be invaded.

Thus far no engagement of importance has been reported. On the 25th the French fleet was to have sailed for the Baltic.

The French Emperor left St. Cloud for the field on the 28th, taking with him the Prince Imperial, and leaving the Empress as Regent of France during his absence. At that date the Prussian army was concentrating between Treves and Merzig on the River Saar.

In the British House of Commons, July 1, an amendment to the Education bill, providing for free education, was defeated, the majority against it being 225.—In the House of Lords on the 8th the Irish Land bill was read for the third time, and passed.

In the Œcumenical Council, July 13, the dogma of Papal Infallibility was adopted by a vote of 450 to 88. The dogma was, on the 18th, proclaimed by the Pope with imposing ceremonies.

OBITUARY RECORD FOR JULY.

Rear-Admiral John A. Dahlgren, of the United States navy, died at Washington July 12, aged sixty years.

Hon. Daniel S. Norton, United States Senator from Minnesota, died in Washington on the 14th, aged forty-one years.

M. Prévost-Paradol, who arrived in this country on the 13th as Minister from France, committed suicide in Washington on the 20th. He was forty-one years old.

Chevalier Charles F. De Loosey, for the past twenty years Austrian Consul-General at New York, died suddenly on the night of the 21st, aged sixty years.

Madame Marie Ratazzi died at Florence July 27, aged forty years.

Editor's Drawer.

A WESTERN NEW YORK friend furnishes the following hitherto unpublished reminiscences of James T. Brady:

In the summer of 1867 the writer met the gifted and lamented Brady in a company of gentlemen of the bar, and remembers now, with great pleasure, the genial, kindly address, and rare faculty of entertaining, shown by the great advocate. The anecdotes that fell from his lips derived peculiar humor from his way of telling them, which could neither be imitated nor described. There was nothing of the actor about it. He entered heartily into the fun of what he was relating, and laughed as loud as the loudest.

"There is Counselor M——," he said, referring good-humoredly to an advocate of considerable distinction—"quite a brilliant jury-lawyer, and a pretty strong man, but with some peculiarities. Did any of you ever notice his queer parentheses in his summing up? For instance: If he desires to allude to any one connected with the case in terms of condemnation, you'll always hear him begin in this fashion:

"Then, gentlemen of the jury, there is the defendant (God help him!)," or, "Observe, gentlemen, the character of the witnesses marshaled here to crush us; and, first and foremost, we have John Smith (God help him!)," etc., etc.

"Now, I think," pursued Mr. Brady, with a mirthful twinkle, "that if Mr. M—— would only direct his appeals to tribunals where he has some weight and influence, he might always have a reasonable expectation of success."

Some one speaking of the great public interest manifested in a successful lawyer, Mr. Brady jocosely said: "I really think that has been all the other way with me. Some of my most flattering victories at the bar have passed almost unheeded by my personal friends and acquaintances; but once let a jury find a verdict against me, and I would be certain to be stopped by half a dozen men between Chambers Street and the Astor, each with the same question—"I say, Brady, how did that suit go?"

On another occasion, desiring to make an assurance that he gave to a lawyer present particularly emphatic, Mr. Brady said: "You may depend upon it; I give you my word—the word, in fact, of a brother-in-law."

A NATTY little book has just come over from London, entitled "Reminiscences of America; by Two Englishmen," which describes the manner in which the twain rippled through the country, what they saw in the country, and what they heard in the streets. As instances of the "hyperbole" of the country they record the following:

In describing the large trees of the Yosemite Valley one said that "it took two men and a boy to see the top of them." One being asked by a friend if he saw a certain mosquito on the weather-vane of the State House (!) at St. Louis, answered, "Yes, I see it winking." A third, in describing the prices of carriages at Niagara, asserted that the "hack fares are so high that the Falls are insignificant by comparison." Another story is related, with the appearance of

truth, of a boy who was watching his school-fellows as they snow-balled an old gentleman's windows. The old gentleman rushed out of his house, determined, if possible, to inflict some severe corporal punishment on the offender, saying, when he caught the boy, "Now, you rascal, I'll thrash you within an inch of your life!" Accordingly he began to beat him, when the boy immediately commenced laughing, and continued until the old gentleman stopped beating him, with the exclamation, "Boy, what are you laughing at?" "Well," said the boy, "I'm laughing because *you* are awfully sold: *I ain't the boy!*"

JUDGE DOWLING has many a queer and ingenious rascal before him, but seldom one with more delicious coolness than was possessed by a young fellow, decently dressed, who was arraigned for having stolen a watch. It was his first error, and he was ready to plead guilty. The Judge addressed him in very gentle tones, and asked him what had led him to commit the theft. The young man replied that, having been unwell for some time, the doctor advised him to *take something*, which he had accordingly done. The Judge was rather pleased with the humor of the thing, and asked what had led him to select a watch. "Why," said the prisoner, "I thought if I only had the *time* that nature would work a cure!"

At one of our "Institutes" the following was sent in among the "compositions:"

ON INDUSTRY.—It is bad for a man to be *idol*. Industry is the best thing a man can have, and a wife is the next. Prophets and kings desired it long, and died without the *site*. The End.

APROPOS of the anecdote of Governor Butler, in the July number of the Drawer, a correspondent at Omaha, Nebraska, sends the following from that young State:

The science of legislation out here is rather crude. Our "assembled wisdom" have a hearty contempt for the verbose law-makers of the East, and, as the result, the simplicity of our "acts" is only equaled by the strange fix in which they sometimes put things. A few years ago a statute was passed to regulate the sale of liquors. One of its provisions, after imposing a fine of \$25 for sales of liquor to minors, and that complaints for the offense should be made before a justice of the peace, wound up thus: "And on proof of the violation of said section, or any part thereof, the justice shall render judgment for the whole amount of fine and costs, and be committed to the common jail until the sum is paid!"

At an early day Judge Wakeley, now a leading practitioner of the Omaha bar, presided in our highest Territorial court. This was in '55, when such a thing as a "Form Book" was a scarce article, as the sequel will show. At one of the first terms in an interior county his Honor took his seat on the bench—and this is how court got opened:

"Mr. Sheriff, open court."

A long pause ensued, the sheriff staring with a bothered and inquiring look around the room and at the judge, as though "he couldn't see any thing about that ere court" that particularly needed "opening."

"Come, Mr. Sheriff," the judge repeated, "open court, if you please."

Here the bewildered sheriff, resolved not to seem quite so ignorant of his official duties, laid aside the old prairie hat, and giving a rake through his thatchy locks, tangled by the winds, proclaimed: "*By request of Mr. Wakeley, this court is now open!*"

OMAHA is the metropolis of Nebraska, and Judge Lake, who at present holds the office of Justice of the Supreme Court, is universally esteemed as an able and upright jurist, and somewhat noted for administering *plenty* of impartial justice to criminals. Toward the close of the term of the District Court held by him last January, a number of prisoners were brought up from the jail to have their bail fixed. Among them was a negro boy named "Sam," charged with chicken-stealing. The grand jury had been discharged for the term just prior to Sam's arrest. His bail was fixed at \$50. Sam couldn't muster that much, and, addressing the Court, said, "Yer Honor, 'tain't no use tryin' to gib dat. I 'pose jus' to plead guilty, and *hurry along wid dis ting, somehow!*"

Of course the proceedings lacked the important step of an indictment, and the judge therefore enlightened Sam's mind as follows:

"You mustn't steal chickens *just after* the grand jury have been discharged. Hereafter, be careful to do it *just before* they adjourn. Then your case will be quite likely to receive their early attention."

Sam's square proposition to plead guilty, and "hurry dat ting along, *somehow*," cost him the three months' additional detention that intervened before the next empanneling of a grand jury. He simply remarked, "Golly!" and hied him to his cell.

A CORRESPONDENT at Vincennes, Indiana, has been among the Quakers, and picked up the following:

In — County a Quaker maiden, who had reached the age of sixty, accepted a matrimonial offer from a man who belonged to the "world's people" and the Presbyterian Church, and began to prepare for her wedding. As usual, a delegation of Friends from her meeting waited on her, and remonstrated with her for marrying out of meeting. The bride-elect heard the visitors patiently, and said:

"Look here! I've been waiting just sixty years for the meeting to marry me, and if the meeting don't like me to marry out of it, *why don't the meeting bring along its boys?*"

That seemed to settle the matter. The delegation "farewell'd," and evaded the premises.

THE high courts of Colorado have become the arena of poetical merriment, as we are informed by a correspondent dating from the "Sherman House, Trinidad, Colorado, June 30, 1870:"

At the June term, just closed, one of the causes tried was that of Father Munnicom, a

priest, against one Skelly, for sundry expenses incurred in the burial of a child. Boyles and Baird were for the plaintiff, and E. J. Hubbard, an ex-judge of New Mexico, for the defendant. As is quite often the case in serious matters, the lawyers became jocose over it.

Judge B——, of New Mexico, led off thus:

"The doughty Hubbard and the sapient Boyles,
In strife forensic, spread their cunning toils;
While those who listen to the wordy 'sum'
Wonder which side will make the Munni-com."

This being passed to the presiding judge, Hallett, that dignitary wrote under it the following:

"If plaintiff fails his suit to gain,
The end is clearly this:
That Munni-com is money gone,
And Hubbard's crowned with bliss."

This was sent down to District-Attorney Stone, who ended the matter:

"The fee-hungry Hubbard,
At a suit-able cupboard,
Picks the *Skelly*-ton of the dead;
While the soup-erior pot Boyles
Over ecclesiastical spoils,
And makes Munni-com down with the red."

Declining to express any opinion as to the legal right to sepulture, or to enter upon the theological argument, we may venture to intimate that the doggerel may be regarded as "A 1, Colorado."

A FASHIONABLE New York Church, worshipping in an unfashionable part of the city, a short time since sold its edifice and moved further up town. The purchaser chanced to be a livery-stable keeper, who thought he needn't be more particular than the original Christian owners, and turned the building to the most ignoble uses of his business. Whereupon the pastor, in the spirit of old Matthew Byles, composed a gently satirical hymn, supposed to be sung by the congregation on meeting for the last time in the church, of which we rescue the concluding stanza from oblivion. It ran on this wise:

"And for the last time here to-day
We marshal Zion's forces;
No more we'll meet to praise and pray,
For we give place to horses."

SOME years since, when there was no usury law in Iowa, a lawyer of the name of Jenks brought suit on a note held by his client, which drew thirty per cent. interest, and recovered judgment. It was supposed that the maker of the note was insolvent, but it afterward transpired that such was not the case. The note had been running three or four years, and the judgment would only draw six per cent. interest, while, if that could be set aside, the note would draw the thirty per cent. The opposite party took the case to the Supreme Court, to reverse the judgment, which Jenks was willing should be done. Jenks was a fine scholar, but would at times imbibe too much. On this occasion he came into court quite "tight." After his opponent had finished an elaborate argument, Jenks, after one or two attempts, succeeded in getting on his feet, and, remembering only the point of the case, *i. e.*, the thirty per cent., said:

"Mer brother 'turney 'nis argumen' has mos' sassfied me ther judgt [hic] orter be sesside. I'm sassfied this judgt orter be 'versed [hic]; antershow ther Court I'm 'nernest, I'll tell yer

whatel do. If yerl 'verse that judgt I'll give yer fivedolls!"

One of the judges, a punctilious man, indignantly asked him if he meant to insult the Court.

This seemed to take Jenks by surprise. Straightening himself up, and thinking a moment, a new light seemed to dawn on his mind, and he said, with an air of putting the thing right at last:

"Nosr! I don't meanter 'sult the Court—the Court m'sunderstoo' me—I mean *five dolls piece!*"

WITH the thermometer at 90° in the shade, let our writers of editorials bear in mind that it is a good thing to be brief. Column editorials do try the patience. The compound, double-back-action, reversible, self-adjusting, patent cut-off and condenser, is what should be introduced into every newspaper office during the dog-days. What is now needed is a summer editor—a shrinker; some such sort of man as the late Colonel Samuel L. Knapp once encountered in a printing-office—a dapper little man, who had started a magazine, which he was puffing at a great rate, and in the most "highfalutin" style, in all the journals in the country. To this periodical Colonel Knapp was invited to contribute. He consequently sent in an article, which overran, by half a page or more, a "form" of eight pages. Unwilling to extend the number of pages, because of the cost, the proprietor changed a comma into a period at the end of the closing line of the page, leaving the *gist* of the article, the very *dénouement* of the story, undeveloped!

The author, as may readily be supposed, was "a little riled."

"Print the article as it was *written*, Sir, or leave it out altogether!"

"My *dear* Sir," responded the dapper little proprietor, "what's the *use*? It 'stops' very handsomely as it is. Just let it go in! It makes another half form if it runs over, and that I can't afford!"

Reasonable as this request was considered, the author of the article peremptorily declined. The discomfited proprietor now took *another* tack, interposing what he thought would prove "a clencher," and remove all objections:

"Let it stand, Colonel Knapp—let it stand. It is very good as it is. I like it just as well as if that last part were tacked on to it; and if it *ain't* quite so nice it don't make no difference—*nobody will read it!*—so what's the use?"

Bear it in mind, ye brethren who write "leaders," and such! When the thermometer is only 10° below "par" "it don't make no difference; *nobody reads 'em!*"

ABOUT these days expect Agricultural Fairs and Plowing Matches. And remember the good advice once given by the President of a State Agricultural Society, on presenting a silver cup to a young man who had won the first prize at a plowing match: "Take this cup, my young friend, and remember always to plow *deep* and drink *shallow*."

THE recent session of the *one* General Assembly of the Presbyterian Church in the United States, at Philadelphia, and the clever things said, as well as the good things done there, re-

calls a little anecdote of two notable men in their day, Krebs and Breckinridge, in an ecclesiastical battle that occurred many years ago in one of the General Assemblies held in Philadelphia.

Dr. Krebs was pressing his antagonist, Dr. B., hard with his authorities, and at last came down on him with this: "And now I will proceed to quote Breckinridge against Breckinridge."

Instantly, without rising from his seat, Dr. B. exclaimed, "And you could not possibly cite an authority that would have less weight with me!"

LAST winter the Rev. W. E. S——, of Lowell, Massachusetts, was spending a few months in Jacksonville, Florida, for his health, and while there manifested great interest in all things pertaining to the welfare of the freedmen. On one occasion, while attending the Sabbath-school of the Colored Baptist Church, a class of boys was turned over to him as instructor. The lesson of the day was the 5th chapter of St. Mark, relating to the manner in which the Saviour cast devils out of the demoniac and into the swine. After the chapter had been read, Mr. S—— turned to the class and asked:

"Now, boys, do you think that those were real devils that possessed this poor man?"

The boys looked at each other hesitatingly, but no one ventured a reply. He finally spoke to one of the boys on the front seat, who was black as Erebus, and evidently the "logy" one of the class, and asked:

"Do *you* believe that men in those days had devils in them—real devils?"

The young "amendment," solemnly rolling up the whites of his eyes, replied:

"Yas, I dus; and *dar's* heaps on 'em wot's got de debble in 'em now!"

Whatever might have been the moral status of those Gadarene people who became so troublesome to the swine, there is no doubt whatever that the Floridian freedboy was quite exact in saying that "dar's heaps wot's got de debble in 'em" at the present writing.

WE were not aware, until informed by a correspondent at Lyons, Iowa, that the eminent geologist, Dr. Mantell, was a man of unusually gigantic stature. The fact is sufficiently authenticated in Dana's "Text-Book of Geology," page 181, where this statement occurs:

"To the group of Dinosaurs belongs the *Iguanodon*, of the Wealden beds, first made known by Dr. Mantell, *whose body was twenty-eight to thirty feet long*, and which stood high above the ground, *quadruped-like*, the *femur*, or *thigh-bone*, *alone being nearly three feet long*."

What a long man—on the whole!

THE following little incident occurred recently in the Sunday-school of the Greene Street M. E. Church in Piqua, Ohio, which exhibits the brightness of the "coming boy" of that State:

Professor Ingles, of Illinois, was addressing the school, telling them what his State was doing in the Sabbath-school work, and reverting to the great work in progress among the convicts in the Illinois Penitentiary. He asked if any one of the children present could tell him how many convicts there were in the prison of his State. No response.

"Well," continued the Professor, "can any one tell me how many there *ought* to be?"

"A million!" was the instant response of a bright-eyed urchin.

According to the census of 1865, the population of Illinois was 2,145,000. To say, therefore, that a million ought to be in the penitentiary would seem to be out of proportion. The boy, however, may have understood the matter better than we do.

IN the course of a description of Brigham Young's city and dominion, the following is given as an encouragement for the "Saints" to make prompt payment of their tithes:

TITHING SONG.

[AIR—"The King of the Cannibal Islands."]

Now, male and female, rich and poor,
Who wish to keep your standing sure,
That your salvation may secure,
Come forward and pay up your tithing.
A tenth, that is, and nothing less,
Of all you do or may possess
In flocks and herds and their increase,
With pigs and poultry, ducks and geese—
A tenth, indeed, of all your toil,
Likewise the produce of the soil,
And if you've any wine or oil,
Come forward and pay up your tithing.

Chorus.

Then if to prosper you desire,
And wish to keep out of the fire,
Nay, if you to be saints aspire,
Come forward and pay up your tithing.

A HYMN of about the same "grade" is one that can occasionally be heard at the cathedral of the Shakers, at New Lebanon, said to have been dictated by the spirits:

SONG OF THE ANGELS.

[To those who are bound Heavenward.]

The fare is cheap, and food is plain,
For you can eat as you ride along,
For there is no grease to soil your clothes,
No bones to pick, or scales of fish to interfere.

SOME five-and-twenty years ago, when Buffalo and Rochester were smaller, but not less enterprising cities than they are now, there was not a little rivalry and "pride of place" between them. Sometimes it led to droll talks. At the time we speak of our friend Lawrence Jerome was a newspaper man, and kept the *American* (not a hotel, but a newspaper thus entitled). Talking one day with a gentleman who had been on a pleasure tour through the western portion of the State, the latter said:

"You have a fine, growing city, though probably Buffalo goes ahead of you."

"Not a bit of it," replied Mr. Jerome. "In five years we can beat her, and give her six."

"But Buffalo is a very flourishing town."

"It is," replied the estimable Lawrence—"it's all flourish!"

SOMETHING of the same sort is this: A gentleman wearing a peculiar hat entered one of the news-dealers shops in this city, and asked:

"Do you have the Philadelphia papers?"

"No."

"Do you keep the Boston papers?"

"No, Sir; we don't keep any village papers."

WE are indebted to a government official in North Carolina for the following narrative, set-

ting forth the manifold troubles occasioned in a single family by the late war, and the solicitude felt on the part of the patriotic survivor to rehabilitate himself by a zealous devotion to "the whisky business," about the manufacture of which he laudably desires instruction. We copy verbatim:

—ARK, March 25, 1870.

DEAR SIR—I ask a favor of you. I want you to give me sum instructions. I live near a flearishing little town Greenville in Hempstead County. I am a maccanic. A pore man. I wor pore before the wor, and in time of the wor the rebs cleand me out becaus thay compeld me to leave my home. I made my wa to fayette ville. thay shot at me like a woolf and wonded me. I suferd much in gitten to Fayette ville. I got thare on the 7 of Feb 63 and joind the first Ark infantry. thay tuck two of my Suns oft in the servis. one of them dide the other like to hav dide. he has marred sence the wor. he lives with me & has fits. the way thay trated him is the caus of it. he disearted them three tims. the last tim thay tuck him to little Rock, Hineman had percession of that place. he had him cort marcheld and condemn to be shot but the day before the lord delivrd him out of his hands. he fled to the moun tains and when the feds tuck that place he got to them joind the service and stade with them and fit the rebs until peace was made.

the other one of my suns a younger one wos with me when thay wos after me & got cut oft from me. and frozed to death that night.

thar is lots of the boys living about fayette ville you can ask for information.

several of them lives thare yit that wor in the first rigment.

If you pleas giv me a full hystory of what it will cost me to meck whiskey and sell it by the hole sale or retale

we lov whiskey

it sells high

it sells hear now in Greenville at 150 per quart.

pork is high hear. I want to raze hogs.

I have got the best Spring cold good water and in about one hundred yards falls 20 feet. wood plenty

I can doo my own grinding and in about one mile and one half from Greeneville.

pleas wright to me. wright to Mineral Springs Hempstead County Ark.—yours Truly

JEROTHUEL LUMMIS.

SOME few years since, when the oil fever was at its height, a very good man, who officiated as a sort of surveyor and prospector in the oleaginous region, furnished to a party desiring it the following document:

"A Discription of Mr. Shattick's Lot of Land, this Land is partly Upland intersperst with Rills and Ravines also with Hillocks and hollars every Holar is an oil site every Ravine is intersperst with oil Sites, for i have Surveyed this Land Sistematically and Theologically, and it is Rich with Oil in my Jedediah Kissam opinion."

SPEAKING of the American's devotion to business, we have this:

A New York merchant who for six years had left his home at 6 A.M., not returning until 8 P.M., after his children were in bed, was aroused on a Sunday afternoon from a nap on the sofa by the voice of a child crying out, "Ma, ma! quick! there's a man in the dining-room!"

Didn't know its own dad!

IN —, Ohio, reside two or three families who have grown so as to form quite a "settlement" of their own. They were never a people of high aspirations, and their descendants have followed the paternal example. They never went to "meetin'." Not long since one of the S— family died, leaving a large family, as well as a brother near his own age. The Methodist minister of the town was called upon to go

to the settlement and conduct the funeral services. After doing this he accompanied the funeral procession to the country grave-yard. Upon arriving there the various teams composing the cortège were "hitched," and all proceeded to the grave. After the ceremonies there were ended, and as the assembly were dispersing, the clergyman, who was walking with the surviving brother, being anxious to know what impression had been made upon his mind, addressed him thus: "Well, Father S—, you will soon be going home too." To which the bereaved old gent responded: "Yes, yes, pretty soon; the boys have gone now to unhitch the critters!"

Further consolation was not tendered.

It is no sin not to be well up in the classics. 'Liakim Dutton was not. But he loved the American fair. In fact he loved two of them. Those two felt emotions of love toward 'Liakim. And they quarreled about him like two Kilkenny pussies. Consequence was, all three were brought into court. 'Liakim, being the cause of the struggle, was thus addressed by his Honor:

"And so those women were fighting about you?"

"I believe so, Sir."

"You are a sort of Adonis, then?"

"Sir?" inquired 'Liakim, his eyes protruding, and a shade of pallor creeping into his face.

"You are an Adonis," the Court repeated.

"Oh no, Sir—never as bad as that; *but I've been in the penitentiary for stealing horses.*"

THE recent decease of Mr. William Gilmore Simms—a name well known to the readers of this Magazine—recalls a little thing of his, written many years ago, the beauty of which will be especially appreciated by every one who is so fortunate as to be blessed with a young daughter:

"My little girl sleeps on my arm all night,
And seldom stirs, save when, with playful wile,
I bid her rise and press her lips to mine,
Which in her sleep she does. And sometimes then,
Half muttered in her slumbers, she affirms
Her love for me is boundless. And I take
The little bud, and close her in my arms;
Assure her by my action—for my lips
Yield me no utterance then—that in my heart
She is the treasured jewel. Tenderly,
Hour after hour, without desire of sleep,
I watch above that large amount of hope,
Until the stars wane, and the yellow moon
Walks forth into the night."

A DIRECTOR in one of our orphan asylums mentions the following:

Last Christmas the directors assembled at the asylum to witness the effect upon the little people of old Santa Claus's visit. Among them was a bright-eyed boy, whose present was a pair of copper-toed boots—a long-desired present, truly; yet a shade of further longing hung upon his face. Finally, with some hesitancy, he approached the matron and asked,

"Mayn't I kick Joe *just once*?"

Alas, that that final joy should have been denied the youngster!

A CLERGYMAN, in a certain town in Massachusetts, having occasion to call in the services of a brother minister, tendered to him at the close of the day the usual fee for preaching, which, in those days (it was before the war), was ten dol-

lars. Such a sum for such work was then thought good pay. But on this occasion the man seemed slow to take it, and finally said, while putting it in his pocket-book:

"I talked to the Sunday-school nearly half an hour; and, besides, I had some conversation with an impenitent sinner on the steps of the church, and I thought *fifty cents more would be about right.*"

The extra charge seemed reasonable, even before the war, when \$0 $\frac{50}{100}$ had some "purchase" to it, and was readily paid.

IN the office of our clever young friend Surrogate Hutchings many curious documents come to light in connection with the disposition of property. Not long since an old lady, being in infirm health, and wishing to make a will, sent for an Irish friend to put it in proper form. After receiving the lady's instructions he commenced to write, beginning with a phrase he had heard was used in such documents, viz., "In the name of the benevolent Father of all," etc. But after he had written *Fa*—he stopped, recollecting it was a *woman's* will, and made what he thought to be the necessary change. Fortunately the old lady recovered from that illness, but subsequently went the way of all old ladies, and her will went the way of all old wills—to the surrogate, who, on opening it, read what was to him a novel commencement: "In the name of the benevolent Mother of all, I, Ellen M'Tavish," etc., etc. Nevertheless the rest of the document seemed to meet the legal requirements, and was admitted to probate.

WE all know the man who sells his things for less than cost. He is to be found in every village. He of whom we write lived in one of the numerous "cities" of Michigan. In addition to farming he made a little (some said much) money by selling beef. But, according to his own statement, he always lost money by it. While serving his customers with tender steaks he would speak feelingly of how much was lost on that "critter."

"Well, Uncle Johnny," said a customer, "if you lose so much money, why don't you quit the business?"

Uncle Johnny was equal to the occasion, when he replied, in slow and thoughtful manner, "Well, the fact is, I've just bought the farm next south of mine, *and it's got to be paid for!*"

Exactly. So much that "must be paid for," and so we sell for "less than cost." At least it is so stated in the placards.

THERE lived in the northern part of Vermont Judge Turner, who in his day (he has been many years dead) was very famous for his wit. A few of his repartees are furnished to the Drawer by Mr. John G. Saxe:

When a practicing attorney, many years ago, he happened, while arguing a question of some difficulty, to illustrate a point in his case by a pretty free use of the vocabulary of the card-table. The presiding judge abruptly inquired what he meant by addressing such language to the court.

"I meant, your Honor, to be *understood*," was the reply.

On another occasion a judge, vexed with the

difficulty, or irritated by the insignificance, of a cause which Turner was conducting, cried out:

"Sir, why do you bring such a case as this into court? Why not leave it out to some of your honest neighbors?"

"Because, your Honor," replied the barrister, "we don't choose that *honest* men should have any thing to do with it."

In the early days of Vermont jurisprudence the strict decorum which now very generally distinguishes the New England bar was comparatively unknown. Nothing was more common than sharp altercations between the bench and the bar; such wranglings, indeed, as would now be deemed "contempt of court" were they to occur only between the lawyers themselves. On one occasion Judge Turner, who was then plain "Esquire," had addressed a sound argument to the court and sat down. The judge, who chose to argue the question rather than decide it at once, replied in a feeble argument, which the lawyer in his turn demolished. The judge rejoined by repeating, without any material variation, his first reply, and then "closed the pleadings" by an adverse decision.

"Your Honor's two arguments," said Turner, addressing himself partly to the court and partly to the bar, "remind me of a story. A foolish old woman in Connecticut, being one evening at a party, was greatly at a loss for something to say. At length she ventured to inquire of a gentleman who sat next her whether his mother had any children. The gentleman politely pointed out the absurdity of her inquiry. 'I beg pardon,' exclaimed the old lady, perceiving her mistake; 'you don't understand me; I meant to inquire whether your *grandmother* had any children.'"

HERE is an old story done into doggerel, and very well done at that:

A country curate, visiting his flock,
At old Rebecca's cottage gave a knock;
"Good morrow, dame! I mean not any libel,
But in your dwelling have you got a Bible?"
"A Bible, Sir!" exclaimed she, in a rage;
"D'ye think I've turned a pagan in my age?
Here, Janey, haste, and run up stairs, my dear,
'Tis in the drawer; be quick, and bring it here!"
The girl returned with Bible in a minute,
Not dreaming for a moment what was in it;
When, lo! on opening it at parlor-door,
A pair of spectacles fell upon the floor.
Amazed, the dame was for a moment dumb,
And then exclaimed, "Oh, Sir! I'm glad you've come,
'Tis six months since these spectacles were lost,
And I have missed them to my poor eyes' cost."
Then, as the glasses to her nose she raised,
She closed the Bible, saying, "God be praised!"

A MASSACHUSETTS gentleman writes to the Drawer: We have a "popular preacher" in our town. He draws; and here is a literal copy of a passage in his last sermon. Speaking of the wisdom of all Nature's works:

"The bird was made to live in the air, the fish in the water, the mole in the ground. Put the first in the element of the second, it struggles and is strangled; the second into the element of the third, it flounders and gasps and dies; and should the mole attempt, like the eagle, to soar above the mountain crags, 'twould make him dizzy!"

THE proceeding known to lawyers as "polling the jury," is the calling over the list after

the verdict has been rendered, with the question to each juror, separately, "Is this your verdict?" Thereanent a story is told of two lawyers, both standing very high in the profession to-day, who, years ago, met as opponents in the arena of a certain court, composed of a presiding judge and two associate justices, for the trial of an important case. During the trial a point was raised by lawyer No. 1 which the presiding judge instantly decided in his favor. Lawyer No. 2 was taken by surprise at the ruling, and thinking that he discovered signs of dissent in the faces of the associate justices, he blandly inquired,

"Are we to understand that such is the decision of the Court?"

The judges laid their heads together, and briskly discussed the question in low tones, while lawyer No. 1, alarmed at the turn the affair seemed to be taking, began to argue earnestly for the point. He was presently interrupted by the presiding judge, who said:

"I decided in your favor, Mr. Blank, as I was convinced was right, and I still think so. Much to my surprise, I find my brethren are both against me. It is therefore the decision of the Court—not mine—that the evidence which you offer must be rejected."

Lawyer No. 1 (*sotto voce*): "Well, I declare! I've often heard of polling a jury, but this is the first I ever knew of *polling a court*!"

FROM the correspondent who sent the foregoing we have the following account of a scene which recently amused a crowded court:

By the District-Attorney: "You are well acquainted with the prisoner?"

"Yes, Sir; know him well."

"What is his disposition as regards being quarrelsome, or otherwise?"

"Pretty ugly, I should say; that is, when he's drunk."

The District-Attorney, having "interviewed" the witness beforehand, and knowing what his answer to the question would be, judiciously concluded to allow the defendant's counsel to ask that question. The defendant's counsel plunged into the trap, in this wise:

"You say you know defendant well?"

"Yes."

"How long have you known him?"

"A matter of five years."

"How often have you seen him in that time?"

"From four to five times a week."

"Every week?"

"Just about every week."

"And you say he is ugly when he is drunk?"

"Yes; wants to fight, and such."

"Well, Sir—now tell this jury what the prisoner's disposition is when he is sober."

"That I can't do; *I never saw him sober*!"

"You can go down, Sir."

WHEN Dr. Gross was at the zenith of his fame in Philadelphia he was taken dangerously ill. Shortly after his recovery he met one of his lady patients, who remarked to him:

"Oh, Doctor, I rejoice to see that you are out again; had we lost you, our good people would have died by the dozen!"

"Thank you, madam," replied the Doctor; "but now, I fear, they will die by the *Gross*!"

HARPER'S NEW MONTHLY MAGAZINE.

No. CCXLV.—OCTOBER, 1870.—VOL. XLI.

THE YOUNG MEN'S CHRISTIAN ASSOCIATION.

EMPLOYMENT COMMITTEE.

IT is now about a quarter of a century since a dozen clerks in the heart of London met in the upper story of one of its great commercial houses for the purpose of spending an hour in religious and devotional exercises. A few of the more sanguine among them entertained the hope that some of their fellows might perhaps be induced to join them. The first thought of the founders of this meeting did not involve the idea that their field was any larger than the house to which they belonged. But,

by one of those sudden and unexpected movements by which the Great Father seems to delight sometimes to surprise His children, who receive the more because they expect so little, the influence of this little meeting spread with wonderful rapidity to other houses. Even those clerks who had the least inclination for devotional exercises found a social gathering of this description an agreeable relaxation from the worry and wear of business. Daily prayer-meetings were multiplied. Finally, a conference between

Entered according to Act of Congress, in the year 1870, by Harper and Brothers, in the Clerk's Office of the District Court of the United States, for the Southern District of New York.

VOL. XLI.—No. 245—41

those who had become interested in this movement was held; and on the 6th of June, 1844, a society was formed for "Improving the Spiritual Condition of Young Men in the Drapery and other Trades." This was the foundation of the Young Men's Christian Associations, which, extending first upon the Continent and then to this country, now embrace between twelve and fifteen hundred local organizations, and from one to two hundred thousand members.

From London the movement, which was so little organic that we may designate it as spontaneous, crossed the Channel. In Paris it met with some obstacles which were unknown to Englishmen—impossible, indeed, under English law. By the French Code, no public meeting can be held without authority from the police.

This new movement the police were unable to comprehend. They feared that it was a blind to conceal ulterior political purposes. Assured that it was purely religious in its character, they asked, with naïve simplicity, if there were not already churches enough in Paris. They watched with suspicious eyes the first sessions, when permission to assemble had been reluctantly granted. Placards posted on the walls forbade all political discussions. These were, perhaps, not unnecessary in Paris, where the temptation to make the most casual meeting an occasion for a political debate is very great. However, the suspicions of the police were at last allayed. The new organization secured the confidence of the prefect. It grew rapidly, and multiplied itself by establishing local associations in connection with the various Protestant churches of the city. Seventy or eighty of these associations have been since formed in France.

Fortune, or, should we not rather say, Providence, placed it in the power of these young men to render to the cause of Christian truth an essential service, and, at the same time, to secure the increased confidence of the government.

Monsieur Rénan issued his "Life of Christ." All Paris rushed after it with an enthusiasm equal to that with which the earlier romances of Sue, Sand, and Dumas were greeted. The French government suspended the learned but unbelieving lecturer from his post. All literary Paris was thrown into a fever heat by the deposition. The "Life of Christ" was made more popular by the martyrdom of its author. The Paris that had rarely spoken the name of Jesus except in jest or in derision read with avidity the romance of Monsieur Rénan, and studied the character of the Nazarene with seriousness; at least, with as much seriousness as may reasonably be expected of the modern Vanity Fair. The Paris that knew of Jesus only as an ecclesiastical ornament—one whose reflected glory made Mary mother of God and an object of holy adoration—was made, for the first time, to realize that He was indeed a man, who lived, ate, drank, slept,

sorrowed, suffered, died. The Young Men's Christian Association availed itself of the excitement of the hour. Under its auspices Protestant lectures were delivered in reply to the curiously inconsistent but fervidly imaginative pictorial representations of the French romancer.

These lectures were thronged. Hundreds, before inaccessible, listened with avidity, if not with profit. The Association obtained by this act a status with the Churches, the people, and the government which it still retains. The Young Men's Christian Association of Paris is the embodied spirit of youthful Protestantism.

From London and Paris these associations have gone on extending throughout all Protestant Europe. They are to be found in Great Britain, in France, Switzerland, Germany; and, since the revolution, we believe, in Spain, in Holland, Belgium, Italy, and the Mediterranean coasts. Thus not only sectarian distinctions, as we shall presently see, but national and political lines also, are disregarded. In the Young Men's Christian Association there is a congress of nations, and of all Protestant denominations. Between these various organizations there is indeed no other bond of union than that of a common work and a common sympathy, though the latter has found occasional expression in international conferences.

The relations between England and America are such that any religious movement originated in the parent country is sure to be repeated in a modified form in the other. Almost simultaneously associations patterned after the London model were organized in Montreal and Boston. They were followed by similar societies in New York, Washington, Buffalo, and Cincinnati. Smaller towns felt the national pulsation and imitated the example which had been set them. It were well if the fashion which the cities set the country could always be followed to so good advantage. The first association on this continent was organized at Montreal in December, 1851. In one year from that date thirteen were reported. At the time of our writing there are said to be over seven hundred in the United States and the Canadas.

There are two characteristic features of these associations to which we should perhaps advert before passing to speak in detail of their labors. Both are indicated in their title.

The first is, that they embody the youthful enthusiasms and the youthful energies of the Church. They are *Young Men's* Christian Associations. In one or two organizations women have been admitted to equal or nearly equal privileges with their brethren. This is the case in Brooklyn, the activity and efficiency of whose society has been greatly improved by the change. In Washington women have all the privileges of the library and reading-room, and certain hours are set apart for their use of the gymnasium. In Boston, debarred from active participation in the Association, they have organized a Young Women's Christian Association. Thus far, however, they have generally been

excluded from the benefits and the labors of these organizations, or admitted only as spectators to certain of the more public meetings. It is certainly a serious question whether the associations of America have not in this respect followed too closely their transatlantic model, and whether, except possibly in the large cities, the social, moral, and spiritual efficacy of these bodies would not be greatly enhanced by uniting in one society the combined energies of both sexes. In the present form of organization a problem of some difficulty, and of considerable practical importance, is presented by the question, What constitutes a young man? No man is ever old in America till he dies. No man is willing to confess to himself that the life blood flows less vigorously in his veins, or that his eye grows dim, or his step more feeble. Yet it is of the very essence of these associations that they should embody the *youth* only of the country, and that the freedom of their social and religious gatherings should not be impaired by the fear of older and more experienced men.

Forty years has been generally fixed as the utmost limit of youth. When a member passes that age he ceases to be an active and becomes a counseling member only. In France marriage serves practically as the standard which is so purely conventional here. *Old* bachelors are unknown. No man is old who is a bachelor; no man is young after he is married, according to Parisian philosophy. The Young Men's Christian Associations of Paris are therefore chiefly bachelor brotherhoods.

The other characteristic feature of these organizations is their undenominational character, the fact that they are purely and simply *Christian* Associations. We doubt whether they could have been organized half a century ago. They certainly could not have been maintained at any time during the eighteenth century. It is, indeed, a curious fact in the history of religious philosophy that the controversies which for so many years after the birth of free thought in religion imbibited and divided the religious world have simply sunk into oblivion. They are not settled. The problems—that is, the theoretical problems, on which Arminius, Calvin, Wesley, and Edwards expended their strength—are no nearer settlement to-day than they were three hundred, or even fifteen hundred years ago. The Calvinist is just as much Calvinist, the Arminian is just as much Arminian, as ever. But the subjects themselves have been supplanted in the minds of men. They are by a sort of common consent remitted to the store-house where the world keeps its unsolved and insoluble questions. Meanwhile Churchman and Independent, Immersionist and Pedobaptist, the follower of Wesley and the disciple of Calvin, recognizing in One greater than all their only Master, combine in common work for him. Nor is this union the result of a stifling of free discussion, or any doubtful compromise of principle, or any mutual accom-

modation of doctrine. The odious sign forbidding free discussion of political and theological topics is now rarely to be seen in the rooms of any association. For experience has proved that the interest in theological disputes is so slight, and the dread of theological controversy is so great, that the utmost freedom of discussion is not dangerous to the utmost cordiality of good-fellowship. To the general statement that no regard is paid to denominational considerations by the Young Men's Christian Associations one exception ought, however, to be made.

A broad line seems to separate what are generally known as Evangelical Christians from those which represent what is perhaps best known by the title of a Liberal Theology. The differences of temperament, of methods, and of religious convictions between the adherents of these two schools are so great that it has been almost universally regarded best to work in separate organizations. So far as we know this separation has taken place without bitterness of feeling or rancor of controversy. In the sixteenth century Calvin decreed the burning of Servetus, and Protestant Europe approved the sentence. In the nineteenth century it is a long and hotly disputed question whether the followers of this deposed and executed heretic shall not be admitted into full Christian fellowship with those of his austere orthodox judges. Surely in Christian charity the world has made progress.*

Most of these associations are tenants. Halls used at times for other purposes, business offices, generally contracted and not always cleanly, rooms in out-of-the-way buildings, removed from the association's proper centre of operations, are very often the best that can be secured. For the Young Men's Christian Associations are far from rich when compared with other somewhat analogous organizations—the Masons and the Odd-Fellows, for instance. Recently, however, a more ambitious policy has been adopted. "I expect," says D. L. Moody, of Chicago, "to live to see a building for a Young Men's Christian Association in every town of considerable size in the country." This happy day must be somewhat distant as yet, we

* In this country the condition of active membership in the Young Men's Christian Associations is almost, if not altogether, without exception that the applicant be a member of some Evangelical Church. Others are admitted as associate members to all the privileges of the association except voting and holding office. In the London, and generally in the English associations, any person is "eligible for membership who gives decided evidence of his conversion to God." As a general rule, however, none are admitted under this provision unless they are already connected, or about to connect themselves, with some Church. In Holland no such conditions are affixed. Any young man of good moral character is admitted to full membership. "Our associations," says Mr. P. J. Moeton, "are founded upon this principle—that it is not to be expected that any young man comes to us who is not seeking for the kingdom of God, and though he is not decidedly a Christian, when he is seeking for Christ we should welcome him in our midst."

LIBRARY, YOUNG MEN'S CHRISTIAN ASSOCIATION BUILDING, NEW YORK.

think; still, not a little has been done toward its realization. Not only in the larger cities, as New York, Philadelphia, Washington, Chicago, and San Francisco, do the Young Men's Christian Associations own the buildings which they occupy, but they are beginning to do so in some of the more flourishing and prosperous of the smaller towns, as, for example, in Meriden, Connecticut; Bethlehem, Pennsylvania; Newtown, Long Island; Poughkeepsie, New York; Springfield, Massachusetts, and in similar places. A recent report which lies before us estimates that not less than a million and a half of dollars are invested, and under the control of the Young Men's Christian Associations of the United States, either in buildings already erected, or in funds for the purpose of erecting appropriate buildings.

Of the houses which the Church has erected for its young men, undoubtedly the finest, not only in this country but in the world, is that recently completed in the city of New York. It is, indeed, fairly entitled to be designated the handsomest club-house in the city. Club-house we call it, for such in fact it is, both in its appliances and its purposes, though consecrated neither to politics as are some, to social festivities degenerating too often into gambling and intemperance as are others, nor to literature and polite society as are one or two, but to the cause of good morals, of pure religion, and of Him who is the divine inspirer of the one and the divine founder of the other.

This building, erected of dark Belleville

sandstone, in the French Renaissance style of architecture, is five stories in height, and covers about a third of an acre in area. The ground-floor is occupied by stores, the rent of which, with that of the offices in the upper stories, considerably more than pays the interest on the mortgage debt of \$150,000.

The two upper stories are devoted chiefly to artists' studios. The second and third floors are appropriated exclusively for the rooms of the Association. Ascending a grand staircase, and turning to the right at the head of the stairs, the visitor finds himself in the Lecture-room, one of the most convenient halls in the city of New York. It is arranged in modern fashion, with iron seats cushioned, separated from each other by arms, and numbered, for the purpose of lectures and concerts. A large gallery runs the whole length of the room, broadening out in horseshoe form across the rear. Opposite is the stage or platform, with a retiring-room upon one side, and upon the other an organ, which is curiously furnished with a drum, a triangle, and a pair of cymbals, so as to be a martial band as well as a church organ. This hall, which is two stories high, and is capable of seating over fifteen hundred persons, is rarely idle. To-day it is employed for an organ exhibition, to-morrow for a lecture, then for a concert, then for a public meeting of the Association. On Sabbath-day it serves the purpose of a church, where public religious services are held, the different pastors of the various city churches ministering in turn on invitation of a

READING-ROOM, YOUNG MEN'S CHRISTIAN ASSOCIATION BUILDING, NEW YORK.

committee which has these ministerial services in charge.

If the visitor, having glanced in at this Lecture-room, turns back, and enters a large door which stands at the opposite side of the staircase, he will find himself in the Reception-room of the Association. The Secretary's private office opens off of this Reception-room, and here, almost any hour of the day between 10 A.M. and 10 P.M., may be found the Secretary, Mr. Robert R. McBurney, a man of few words in public, little known to fame and little covetous of it, but the one to whom, nevertheless, the Young Men's Christian Association of New York is largely indebted for its prosperity. Here also is to be seen, almost every day, the President of the Association, Mr. William E. Dodge, Jun., who by no means confines his official labors to the nominal work of presiding at its public meetings, but is its real executive head, and whose rare combination of energy and urbanity peculiarly fits him for the post, to which he has now been elected for, we believe, several successive years.

Opening out of this Reception-room, which is occupied only by the desks of some of the Secretary's assistants, are the Reading-room and parlors—Social Parlors they are called; but they rarely present an aspect of sociality, except on the occasion of some public reception or other similar gathering, when they are thronged with members and their friends, and ladies, as invited guests, add their attractions to the scene. In truth, as yet, the most important

part of the work of the Young Men's Christian Associations remains but imperfectly fulfilled—the development of the social life of the homeless and the friendless of the great cities. It is in their social life they experience their greatest dangers. Vice is not bashful, and there are plenty of doors which are open to the young man who, far from home, feels bitterly in the long evenings the lack which nothing but a true home can well supply. Reading-rooms, libraries, and prayer-meetings do not compensate for the loss of the social circle to which in his native village he had free entrance. The difficulties of providing any genuine social life to serve as a tolerable substitute, and the real, and still more the imaginary, dangers of "mixed society," are so great that hitherto conservatism has not really dared to essay to conquer the one and provide the other. The society which the Young Men's Christian Association furnishes is as yet only *club* society.

A flight of stairs leading directly down from the Reception-room conducts the visitor to the best substitute which has as yet been practically employed for the missing home. It is not found that books, papers, and prayer-meetings practically compete with the concert saloons, the theatres, and the gambling hells; at least, not to such an extent as to preserve from them those whose danger is greatest, and whose natures are, because most generous and noble, therefore most susceptible to the temptations of city life. Not only, therefore, are lectures and public receptions added to the attractions of the

Christian club-house, but the means also of physical enjoyment and physical recreation in an admirable Gymnasium and Bowling-Alley. This is open only to members of the Association, and can be reached only by going through the public Reception or ante room.

Returning up the long flight of stairs, and ascending still another flight, the visitor finds himself on the second story of the Association's apartments, the third of the building, and on the same floor with the gallery of the Lecture-room. Here is a very pleasant room appropriated for prayer-meetings and Bible-classes, smaller apartments for week-day classes in the various languages, and, we believe, also in writing and book-keeping, and a very attractive Library-room, which needs only a good collection of books to be one of the most attractive in the city.

We have described thus in detail the new accommodations of the New York Young Men's Christian Association, because they are undoubtedly the finest in the world, and afford the best illustration of the sort of work which, with fewer conveniences, though perhaps with no less real success, the Young Men's Christian Associations throughout the country are endeavoring to do. Generally, however, a single room is compelled to serve the manifold purposes which are served by these spacious and really elegant apartments. An association which has two rooms, one for reading and study, and the other for conversation, considers itself fortunate.

More frequently one room serves the purpose

of library, reading-room, place for quiet conversation, with, perhaps, occasional games of checkers or backgammon, and on occasions, regularly and pretty frequently recurring, for prayer-meetings, Bible-classes, secular lectures, literary exercises, and social reunions.

The Young Men's Christian Association, however, by no means confines itself to the work of a Christian club. One peculiar feature about these organizations is their flexibility. This is due, doubtless, partly to their constitutions, which, very wisely, do not limit them in their methods, but chiefly to the young men themselves, who are little hampered by prejudices or precedents. This flexibility of organization was curiously illustrated at the breaking out of the civil war. The famous bombardment of Fort Sumter, which shocked the whole country with so rude a surprise, threatened the Young Men's Christian Associations with utter disruption. Many of them disbanded; others temporarily discontinued their meetings and closed their rooms. The confederation, which had united the various local societies in one national fellowship, dropped in pieces. The national conventions were abandoned. The publication of the central organ was, we believe, discontinued. The work of the preceding ten years seemed to be demolished at a blow. Then it was that a few thoughtful spirits perceived at once the duty as well as the danger of the hour, and provided for escaping the one by performing the other. A convention of Christian Associations was called in the city of New York. Only forty-three delegates attended; but fifteen

GYMNASIUM, YOUNG MEN'S CHRISTIAN ASSOCIATION BUILDING, NEW YORK.

PACIFIC RAILROAD MISSION.

associations were represented; the entire session lasted but a day and a half. Still the end was accomplished. It was resolved that it was the duty of the associations represented to take active measures to promote the spiritual and temporal welfare of the soldiers and sailors of the United States. A Christian Commission was formed for the purpose. For the three years that followed the Young Men's Christian Associations, without changing their form of organization, became Committees of Supplies. They worked in fact, though not in form, under the direction of the Commission which they had created. To describe their operations in detail is unnecessary, and would take us too far from our theme. But the thousands who gathered in camp at the sound of the evening song, to be wafted by the familiar hymn to the dear fireside and those who gathered about it, and with them up to the throne of Him whose presence makes the tent a temple and the bivouac holy ground—the thousands who in the hospital received their first palatable food from the hands of a Christian stranger, and caught their first gleam of hope from the kindly words of Christian consolation and of Christian invitation which he spoke to them—the thousands of fathers, mothers, wives, sisters, who could not be in person

by the bedside of the sick and wounded ones far away, but who found for their overflowing hearts some relief in the poor privilege of sending messages and mementoes of their love by the hands of Christian delegates going thither—these can never forget that for this ministry of mercy in the nation's hour of peril they are indebted to the prayers, the thoughts, and the labors of the Young Men's Christian Associations.

A scarcely less characteristic indication of the peculiar flexibility of the organization of Young Men's Christian Associations is afforded by what is known as the Pacific Railroad Mission. The building of the Pacific Railroad did not probably tend to produce in the country any greater amount of open and flagrant vice than is usually characteristic of new countries where the civilizing institutions which belong to a more developed state of society, the restraints of an educated public opinion, and, above all, the refining and restraining influence of woman and the purifying power of the home circle, are either altogether or almost entirely wanting. But partly because the Pacific Railroad was a matter of national importance, and every thing which was connected with it was of public interest and made a subject of public comment, and partly because the railroad opened new

land more rapidly than new countries are ordinarily opened by the slower processes of a natural emigration, and partly because it carried with it a rude and ignorant foreign population, and concentrated in temporary towns the people who, but for its existence, would have been scattered over a much greater expanse of country, the open and flagrant vice and crime which accompanied the building of the railroad were at least more apparent, and also more easily accessible to Christian influence, if not positively greater than that which always more or less characterizes border lands, where civilization insensibly melts into barbarism, and the vices of both flourish without being redeemed by the virtues of either. Each new terminus became for the time being a town, generally of tents and rough board shanties. The days were devoted to labor, the nights to drinking, to gambling, and to murderous brawls. The men who accompanied these doubtful pioneers of our boasted civilization had, with a few honorable exceptions, gone West simply to make money, and embraced, with some true and pure as well as energetic spirits, a great quantity of the refuse and offscourings who found the communities which possessed a penitentiary and an organized judiciary disagreeably dangerous to men of their profession. The churches did not keep pace with the railroad, partly because the independence of our Protestant ecclesiastical organizations, with all its advantages, does not fit them for aggressive work outside their own communities so well as the more centralized organization of the Roman Catholic hierarchy; partly because the towns were temporary, and it was impossible for the wisest forethought to adjudge with any approach to certainty where were the locations in which permanent churches should be planted. For if the wilderness of to-day became a city to-morrow, it is also true that the city of to-day, following the railroad, left its site a wilderness to-morrow.

In July, 1868, the members of the Young Men's Christian Association of Omaha organized a movement to meet the peculiar demands of this peculiar field. They sent out a company of lay-preachers whose office it was to keep pace with the dram shops and the gambling hells, and by organized effort to reverse the parable, and sow what wheat they could in a field already pretty well occupied with tares. Accompanying the delegation were members from Chicago and New York. Arrived at a station where the number of tents and barracks seemed to give promise of a population sufficient to justify their labors, they left the train. Separating in companies of twos and threes, they visited every shed and shanty, inviting, without respect of person, every individual to an evening meeting. This was held sometimes in the open air, sometimes in the rough shed which served as a temporary dépôt, sometimes in a big gambling tent which the proprietor surrendered to them for this purpose, induced by a mixed motive in which were

probably intermingled curiosity, the love of notoriety, good-nature, and possibly that intuitive religious sentiment which no career of vice is able utterly to extirpate. At the close of the service, those who were professors of religion were invited to come forward and unite in a more permanent organization. It was not infrequently thus discovered that in a community where no one had supposed there were any religious men there were really not a few. One delegate found in eight families on one street, within thirty yards of each other, seven professing Christians, some of whom were connected with leading Eastern Churches, who had never found each other out as Christians.

To bring these into Christian fellowship was the first but by no means the only aim of this traveling church, this itinerant but unordained ministry. Sometimes a Sunday-school was organized, sometimes a Young Men's Christian Association formed, sometimes the nucleus of a future church was gathered. At all events, at least for once, the old familiar service of prayer and praise was heard, recalling to many a deadened heart dear memories of childhood, and bringing to many a furrowed cheek the tear of at least a transient sorrow and the unaccustomed flush of a brief shame, that sometimes awakened hopes and aspirations not to be repressed, but blossoming out in a resolute purpose of reformation, and fructifying at last in a new and divine life. Whatever faults characterize such a community, miserliness is not one of them. The delegation were rarely suffered to pay their own bills. A little later the National Conference of Young Men's Christian Associations of the United States took up the work thus initiated, and appointed an agent to continue it. He is still in the service. His first annual report lies before us as we write. His whole traveling expenses charged to the Association for nine months' service, in which, by boat and rail, he journeyed over eight thousand miles, is forty-two dollars! This movement, which was started simply to meet a temporary exigency, has thus grown into one of national significance. Until permanent churches and local associations shall render it unnecessary, the Pacific Railroad Mission will probably continue to be no insignificant part of the work of the Young Men's Christian Associations of the United States.

It is time, however, that we returned from this glance at what must, in the nature of the case, be a temporary work, however important, to consider their more permanent, if not their more legitimate, work. Of that work a very important part is performed under the direction of what is known as the Employment Committee. In the great cities, especially in the West, there are always to be found, and most of all in times of commercial depression, numbers of young men out of employment, perhaps far away from home, vainly seeking something to do, and subjected at once to peculiar temptations by reason of their enforced idleness, and to peculiar

depression by reason of their consequent poverty. Often these young men are without a situation through no fault of theirs. Quite as often they have lost it through their own inattention or intemperance. It is at such a time the as yet not abandoned pleasure-seeker is most susceptible to Christian influences.

Less to compete with the various labor agencies, which have been established and maintained by money-making organizations, than to secure the attention of heedless ears and the affection of careless hearts, the Young Men's Christian Associations of the country have established, especially in the great cities, employment agencies. It is the office of the committee under whose direction these agencies are conducted to keep a list of employers and situations on the one hand, and of applicants for service on the other, and to bring employer and employed together. In the city of Chicago, where this department has received the greatest attention and attained the greatest success, it has sometimes provided, in a single year, employment to eight thousand men and boys, besides women and girls. In a season of commercial depression the Labor Bureau affords a singular opportunity for the study of human nature, and presents many a case of real or fancied distress, that can hardly fail to awaken the keenest sympathies. The day-laborer, ready for any job of rough work—the needy mechanic, forced out of employment by a lack of building or by the harsh operation of some of the despotic rules of the despotic trades unions—a gentlemanly clerk, whom adversity has deprived of his jovial friends, and necessity has reduced to the extremity of begging any thing to earn an honest living—the temperate and hard-working unfortunate—the blear-eyed and red-nosed victim of intemperance, who carries in his face the explanation of the reason of his discharge, mingle in a motley crowd, each in turn demanding attention, and each in turn requiring from the attendant clerk something of personal thought and personal sympathy. The associations have scores of letters from those whom they have thus served, testifying to the fact that not only through their instrumentality honest men have been furnished with the means of livelihood, but also that by this very service they have been rescued from lives of present vice and possible future crime.

It may seem at first difficult to perceive upon what principle so many widely different operations are undertaken by one organization, which is alternately a lyceum, a church, a missionary society, a labor bureau, and a soldiers' aid society. The truth is, however, that whatever the association seems to do, it in reality does but one thing. Whether it establishes a gymnasium, or opens a bowling-alley, or provides chess and checker tables, or founds a library and reading-room, or gives concerts and courses of lectures, or opens an employment agency, or sustains a missionary, or engages in tract distribution and neighborhood prayer-

meetings, or holds open-air services, or organizes a Bible-class, however remote the means may seem to be for the end to be gained, that end is rarely forgotten; and it is but right to say that, as a general thing, the prosperity of the association has been in the exact ratio in which that end has been steadily kept in view, and all other things made subservient to it.

Other agencies there are which establish libraries and lectures and labor bureaus and gymnasiums, but none which employ these secular agencies exclusively for a direct religious purpose. If in describing its methods we have devoted a large proportion of our space to those which are somewhat secular in their character, it is because in the ordinary religious instruments which it employs—the prayer-meeting, the Bible-class, the tract distribution, the sermon—there is nothing peculiar, nothing which is not thoroughly familiar to our readers. Of its distinctive religious work there are, indeed, only two features which are so peculiar as to demand special mention—the open-air service and the saloon work.

It is never a difficult matter to gather an audience in the streets of any of our great cities. It is not so easy a matter to retain its interest and to instruct it. A delegation of half a dozen young men start out on a Sunday afternoon. They reach a public square, and take their station at the point selected for their afternoon services. A dry-goods box, a door-step, or an old cart, serves the purpose of a pulpit. There is no indication of the presence of any material from which to gather a congregation. Half a dozen boys are playing marbles on an adjoining sidewalk. Three or four young men are lounging in front of a neighboring dram shop or engine-house. A few pedestrians are passing to and fro, and here and there at the open window of a boarding or tenement house there sits a woman languidly enjoying the summer breeze. The delegation is under the command of one of their number, who acts as leader. He distributes little hymn-books or song-papers, and they commence a familiar hymn. At the first verse the boys drop their game of marbles, and come over to see "the fun." At the second the loungers on the door-step of the dram shop saunter carelessly across to within easy hearing distance. Pedestrians stop. Windows are thrown open. Boys and girls, men and women, come, unexpectedly, from side streets and mysterious lanes. Before the hymn is finished a congregation varying in size from one to five hundred is gathered. It comes no man can tell how, no man can tell whence.

The leader calls on some one to offer a short prayer—short it must be, for this congregation is not accustomed to long prayers. Another hymn is sung. The song-papers are freely distributed through the crowd. There are enough among them who can sing to make a very respectable chorus; and by the end of the second singing the congregation has still further sensibly increased. Then the preacher of the after-

STREET-PREACHING.

noon mounts the temporary pulpit. Let him beware. He speaks to a critical congregation.

If he is honest, earnest, full-souled — if he speaks because his heart is burdened with a message which cries out for utterance, he will not find in costliest cathedral an audience more attentive, more genuinely respectful. He need fear no interruptions. If some single scoffer breaks in upon his address, the sense of the entire audience is against the interruption, and instantly silences him. But there is no audience which detects so instantly, and rejects so remorselessly, the conventional piety and religious finery which, in more cultivated audiences, are suffered to pass unrebuked. There is no such counterfeit detector as a street audience. The speaker must strike the heart of his subject in his opening sentence. He must be short, sharp, clear, ringing, incisive. A truce to all wordy declamation, to all frothing and foaming now. On the other hand, he need not select his words and trim his phrases, lest he offend some sensitive ear. The boldest proclamation of the most obnoxious doctrine will not disturb the serenity of his congregation, if

it is uttered as the honest conviction of the speaker's heart. But woe to the dull speaker who lacks the magnetic power which fixes every eye upon him and compels the attention of the inattentive! Five minutes of dull platitudes suffice to begin the process of dispersion. The outer circle of the ring melts away. The rough-faced washerwoman, with her babe in arms, tires of standing to hear nothing, and starts for her home again. The loungers lounge back to the dram shop. The boys begin to feel in their pockets for their marbles. Now, if the leader be worthy of his place, he measures instantly the mettle of his speaker, and checks the threatened dispersion of the congregation. The battle-field is no place for courtesies. He strikes up a familiar air. The congregation joins in. The astonished speaker comes to an abrupt and enforced pause. A substitute is beckoned to the platform. In three minutes the damage is repaired. The congregation have gathered again, and stand reverently still, with fixed eyes and beating hearts, listening to the truth of God, uttered in the simplest, plainest forms, enforced only by the power

of a conviction so strong as to amount to a passion.

Nowhere have these street services been carried on to a greater extent or with greater success than in Washington. Nowhere, perhaps, are they more needed. They have been held in the parks, and on the street corners, on board the gun-boats, along the wharves, and among the marines at their barracks, in the hospital, and among the soldiers at Lincoln Barracks. On some Sabbaths as many as sixteen or seventeen of these open-air services have been held. To add the labor of this work to those which already overtax the clergy would be a questionable method of doing good. In fact, open-air services would be impracticable, if not impossible, were it not for lay-preaching. For the inauguration of lay-preaching the Church may rightfully hold the Young Men's Christian Associations responsible; its results the Young Men's Christian Associations may fairly claim as among the results of their labors. Among the most effective preachers in America, albeit they have neither clerical education, clerical methods, nor the clerical office, are Judge Smith and Mr. Durant, of Boston, H. Thane Miller, of Cincinnati, D. L. Moody, of Chicago, A. K. Burnell, of Milwaukee, and Major-General O. O. Howard, the President of the Washington Young Men's Christian Association. These names have attained a national prominence; but they are only representatives of a host of preachers whom modern methods of Christian labor have called to the work, though not to the office, of the ministry, and who justify their preaching not by ecclesiastical ordination, but by the success which attends their labors.

If it requires Christian courage to carry on street-preaching, it requires Christian audacity to inaugurate the saloon work.

To gather a transient audience in the public streets, and, without the aid of those sacred associations which cluster about the church and are evoked by its solemn services, to attune all the discordant elements of a mixed assemblage, in which every form of religious faith and religious error, and every type of vice and crime, have their representative, and out of the audience thus assembled call forth the harmonies of true, noble, devout feeling, may well try the utmost powers of the true, because the earnest and inartistic, orator. But to go down to the very haunts and dens of infamy and shame, to make the very grog-shop and gambling hell for the time being a sanctuary, to supplant the ribald song with the song of praise, the loud blasphemy with silent prayer, the obscene story with the story of the Cross, this is an attempt so audacious that wonder that it should ever have been attempted yields only to the greater wonder that it should succeed. But succeed it does; and the singular meetings which have been held in the dance houses and drinking haunts of our great cities, and the more singular results which have attended them, present

a phenomenon so remarkable that we wonder that it has not secured in a larger degree the attention not merely of the Christian Church, but even of the student of psychology. It would be hard to find in any events of ancient or modern times a more singular and striking evidence of the almost irresistible power of the truth, not abstract truth held in invisible solution as vapor in the air, nor truth in fossil forms contained in dogmas, but living truth enshrined in human hearts as a profound conviction. We can not better illustrate this phase of the work of the Young Men's Christian Associations than by describing it as it was prosecuted by the Association in the city of Providence, Rhode Island. For the substantial facts of the narrative we are indebted to Mr. E. R. Holden, the Chairman of the Missionary Committee.

In the fall of 1866 a few earnest members of the Young Men's Christian Association of Providence met in the office of one of the leading manufacturing establishments of the city, to consider what could be done to reach that class of young men for whom the lecture and the library had no attractions which could compete with those of the concert saloon, the card-table, and the dram shop. It was resolved, with some foreboding, to go where they were, and carry to them, in their customary resorts, an invitation to attend a prayer-meeting, which should be held at the rooms of the Association that very evening. The resolution was no sooner taken than it was carried into effect. The little band separated for their work, going in pairs in true apostolic fashion. Each delegation undertook to visit one saloon and carry to those present a personal invitation to the prayer-meeting. The very novelty of the movement attracted attention and awakened interest. Whether induced by curiosity or by higher motives, enough accepted the invitation thus given to fill the room to overflowing on that first night. The next step was to endeavor to inaugurate a meeting in the saloons themselves. The boldest and worst of these saloons was visited, and the permission of the proprietor requested. It was readily granted. He even advertised the prayer-meeting. If he thought thus to gain a cheap notoriety he was not disappointed. If he thought to secure additional customers he failed in his purpose. The saloon was crowded indeed, but there was little drinking, and no gambling. It did not pay. The proprietor forbade further gatherings, but found it easier to open his doors than to close them. The pressure was so strong that he could not resist. The drinking saloon became a house of prayer. The conscience of the proprietor himself was touched. From attending the meetings which were conducted in his own saloon he came to one which was held in the rooms of the Association. "At the close," says Mr. Holden, "he invited several of us to go back to the saloon with him. We went in, found the music there, and quite an audience gathered. Mr. O—— stepped upon the

platform and said to the men he employed that he should need their services no longer. Turning to the audience, he said, 'This is the last night this place will be opened for such purposes. I have decided to be a Christian, and now I beg of you who have listened to me in the days that are past, listen to me now when I have something far better to offer you.' He closed by kneeling and offering prayer." The final result was the permanent abandonment of the saloon and the permanent reformation of its proprietor, who has become a worthy and honored member of society and of the Christian Church.

The victory is not always, however, so easily achieved. Obstacles which at first seem to be invincible are thrown in the way of those who undertake this peculiar form of labor, obstacles which, however, yield in the most surprising manner to the exercise of what Milton has well termed the "invincible might of weakness."

A delegation of a dozen young men resolved to lay siege to another concert and drinking saloon, frequented in large numbers by the fast young men of the city. They set apart an

evening for their visit, entered two by two so as not to attract attention, and requested of the proprietor leave to sing. They met with a surly refusal. Nothing daunted, they took their seats at the card-tables which were scattered about the room. Then simultaneously all bowed their heads in silent devotion. It was impossible to take offense. It was equally impossible to resist the influence of that silent prayer. The shuffling of cards, the rattling of dice, the clinking of glasses, the buzz of busy voices, all ceased. A solemn stillness pervaded the room, a singular awe rested on all hearts. The weapon was one these men knew not how to meet. When the bowed heads were raised half of the occupants of the room had already quietly slipped out. A few weeks later the auctioneer's flag was flying at the door of the Empire Saloon, which has now become a commercial store-house.

To approach the habitués of such dens as these requires, as may be imagined, the utmost caution and the utmost courage—a soul at once audacious and sympathetically sensitive. Four young men are playing cards. A Christian

"HE WHO DRAWS THAT CARD WILL HOLD THE BEST HAND HE EVER HELD IN HIS LIFE."

delegate approaches. Neither time, place, nor circumstances seem auspicious for religious work. But he who waited for an auspicious moment would have long to wait. The Christian delegate watches a moment, studies the scene, then casts upon the table a card. On it is inscribed, "Why am I not a Christian?" "He who draws that card," he says, quietly, "will hold the best hand he ever held in his life." It might be imagined that so sudden an interruption would only provoke a contemptuous, if not an angry, response. No! These young men have been brought up amidst religious influences. They have been educated to respect the religion which they do not possess. Their faults are those of a good-natured thoughtlessness, rather than of a deliberate wickedness. He who neither fears a rencontre nor courts it rarely has it to meet. We can not, perhaps, better describe this phase of the work of the Young Men's Christian Association than by inviting one who was reformed through its labors to tell the story of his reformation. We therefore reproduce a letter received by the Providence Association from a liquor seller of the lower class after, in consequence of the persuasions of one of the members of the Association, he had abandoned his shop and destroyed his stock. We amend neither spelling nor grammar, because we are glad to afford our readers a little insight into the character of a class of men who are seldom mentioned but to be reviled, and who, perhaps, might be found more accessible to kindly and Christian influence than we are apt to imagine.

"— ENGLAND, 3 Month, 10 day, 1867.

"FRIENDS,—We got safe across the Ocean to Liverpool and took the cars for our home our folks were glad to see us Come home once more and when I told them I had been seling liker for a living they told me I ort to be ashamed and when I told them that before I came away from providence I throed my rum away they didnt beleve me and I told them if they didnt beleve to ask hannah and they asked hannah and she said yes and they asked me why I didnt sel my liker and I told them God wouldnt let me and they asked me why I didnt kep on seling liker and I told them that a lot of young men had got to going round in providence to the rum shops and teling the folks that kept them that they would lose their sols if they didnt stop it and I told them that one came in my shop one Saturday nite and I put a tumbler on the bar for him to drink but he didnt step up to the bar but said to me that bisness was dul and I said yes rather and he

said it was because it rained so hard. I didnt know what he was trying to get through him he told me he was a Christian and was a member of the Young Mens Christian Association and he asked if I would give up seling liker and love Jesus and save my sol or kep on seling liker lose my sol and I told him that was a pretty hard question to answer and he asked me three times and I asked hannah and she said Yes Abraham Certainly Abraham and I told him to come next Saturday nite and I would tell him what I would do he came Wensday and said he was going to strike the iron while it was hot I told him to look at the empty bottels on the shelf and I asked him what he thought of that and he didnt say anything and I told him I had throed my liker in the gutter and he didnt beleve me and I took him out and shoed him where I had throed it and went in the house and went up stairs where hannah was and the children and he prayed for us and now we are going to join the church the first sunday in April hannah and me both love Jesus and want you to pray for us and hannah wants you to pray for her two brothers that are not Christians I put this in Mr. —'s for it cost so much to send two letters

"From your friend

"— — —."

Influences unseen and unperceived are the most potent. This fraternity of young men, one hundred thousand strong, leagued together in the name of Christ and for the promotion of the Christian religion, exert by their personal and combined sympathy an influence vastly more powerful than any which they consciously exert by their religious labors. In a word, the Young Men's Christian Association *is* more than it *does*. Into the innumerable discussions to which their operations have given rise it has been no part of our province to enter. The relations of public amusements to sound Christian morality, the extent to which it is proper to provide them, the proper relations between the Association and the Church, the right and duty of the laity to preach, the propriety of endeavoring to carry on the most sacred services of prayer and praise in dens dark with shame, redolent with vice, and from which the echoes of obscenity and profanity have hardly died away, present questions on which the best and wisest men will doubtless continue to differ more or less in the future as they have in the past. But we shall be disappointed if the candid reader does not cheerfully concede that the Young Men's Christian Association is an institution which Protestant America can not fail to nurture and to strengthen by her sympathies, her prayers, and her pecuniary aid.

MORNING-GLORIES.

GAYLY the fragile, aerial blossoms
 Open, in rose and in purple arrayed,
 Bright with the hues of the clouds of the morning,
 Transient as lovely, unfolding to fade:
 Soonest they wilt where the sunbeams are falling;
 Longest they linger within the deep shade.

So with our spirits: the hopes that are purest,
 Hopes with a brightness that is not of earth,
 Which, from our noblest and best aspirations,
 Spring in their heavenly beauty to birth,
 Oft cheer us most in the darkness of sorrow,
 Often fade first in the sunlight of mirth.

SIX WEEKS IN FLORIDA.

WHITE SULPHUR SPRINGS, OLD ENTERPRISE.

IF I were to write all that might profitably be written about Florida, more space would be required than that included within the limits of a magazine article. In its historical associations, Florida has more of romance and dramatic interest than have befallen any other locality on this continent. To these we shall refer incidentally, but the chief intent of this article will be to give entertainment and information to those who may have visited this singular region or hope to go there, or to that other larger class who are not able to journey, and would be interested to know why it should or should not have been called Florida, the Land of Flowers.

Perhaps the best way to accomplish this will be to describe the experiences of a party of us who, last winter, made the excursion. We had already accomplished some twelve hundred miles of steamboat traveling on the Mississippi River; we had passed through New Orleans and Mobile; and, a good Providence, which sometimes stands between merciless railroad

corporations and a helpless public, be ever thanked, passed safely over the ragged, rickety, decayed railroad between Mobile and Montgomery, and from there to Macon. From this place to Savannah, however, thanks to Sherman and his army, who destroyed rails, ties, and rolling stock of this road, every thing is now new and of the best kind.

Savannah is the natural base of operations for the Florida campaign. You can reach this most important of the Southern Atlantic sea-ports by many ways. Steamboat and railroad lines concentrate here from all quarters of the country. And here you had best come if you desire to make a comfortable entry into the land of orange groves and alligators; and to this place you must return to find those comforts not to be obtained except in those localities where large

communities are congregated together.

"There are two ways of getting to Jacksonville from here," was the advice of a gentleman who had spent many winters in Florida. "And whichever you choose, you will be sorry you had not taken the other. There is the night train by railroad, which brings you to Jacksonville in about sixteen hours; and there is the steamboat line, which goes inland nearly all the way, and which may land you in a day, or you may run aground, and remain on board for a week."

With this consolatory counsel we chose the steamboat and coast line for a first experiment, partially by my advice to my traveling companions; for at the termination of the great campaign of the March to the Sea it had been my experience to voyage through these wide wastes of marsh land and islands of sand, and it impressed me as a peculiar aspect of nature which ought to be seen.

It was a showery morning in February when

we got on board the little steamboat *Nick King*, and pushed rapidly out from among the crowd of shipping, down the river, past the threatening obstructions placed in the stream during the war to keep out the Yankee fleet, and finally turned into the big creek, which, by crooked and strange ways, wanders through the waste of marsh land. Sometimes there was hardly room for our little boat to make the turnings; and when, about noon, we came to a full stop, with the nose of the *Nick King* stuck fast on a mud bank, the memory of a similar occurrence came vividly to my mind. Six years before, while yet our soldiers lay in the trenches before, or rather behind, Savannah, I accompanied General Sherman on an expedition which he took, with Admiral Dahlgren, over to Hilton Head. On our way back it was so rough outside that the Admiral considered it unsafe for the *Harvest Moon* (of old a tug-boat) to combat the roaring sea; so we attempted this inside passage, and at very nearly the same hour of the day, and precisely the same spot, went aground. How long the flag-ship remained there I do not know; for the General, who had not been used to a dead halt of this kind, and who had already been absent from his brave men longer than he or they liked, became fearfully impatient, and tearing about the ship, among other places was found on the larboard or starboard—whichever was the improper side—of the fore-castle deck, if, indeed, it was not an altogether heinous offense to be in that part of the ship at all. However that may be, the proper officer, with trembling limbs and pale face, at once ran to Admiral Dahlgren and reported this breach of etiquette; but the Admiral had already become aware that in his visitor he had drawn the elephant, and reassured his subordinate with the words:

“Let him run about; he will do no harm.”

But the General could not wait the movements of the waters or the ship; and the polite and obliging Admiral took us into his gig and pulled up the river until we met a tug-boat, and were finally restored to the bosoms of our families.

When the tide turned we of the *Nick King* got under way, and steamed quickly along; the gray marsh, as we proceeded, stretching away farther until all around the horizon the mist and rain united land and sky, except where a clump of trees varied the strange monotony, or some other steamer came to meet us, standing out above the level of the grasses as if propelled over the land. After a while we came out into Sapelo Sound, and the sun came out from the clouds, and a fresh wind came up from the sea; and then we saw a glorious sight, such as makes the artist's heart ache with despair that then and there he can not fix the fleeting vision upon enduring canvas. Overhead the air was filled with golden mist, pierced by broad beams of sunshine, except where the sky arches to a gray and blue wall, and descends to the glimpse of the sea

which we catch between the islands, and where the white breakers come rolling over the wide sand-bars; while to the left, standing out with indescribable force and distinctness, there is a low island of white sand, crowned with masses of dark cedars, and between us and it the waters spread along in wide sheets of yellow and purple. For an instant it is there, a perfect picture, and then the rain and mists swallow it all up. Soon we approached a portion of the sound which for hundreds of acres was covered with dark objects.

“What is that, captain?” asked a group of observers.

“Ducks,” was the sententious answer.

“Ducks!” exclaimed an incredulous old gentleman.

“Ducks?” inquired an intelligent traveler, who came to see, and believe in all he saw.

“Ducks!” exclaimed a would-be sportsman, who rushed madly for his gun.

“Ducks! ducks! ducks!” was now shouted on all sides, with all sorts of exclamations; for as we neared this black sea the ducks rose into the air by thousands upon thousands; and, united in masses like dark clouds, they floated away toward the ocean.

When night came on we had entered Mud River. Next morning we came to Brunswick, which has a good harbor, and is the terminus of a railroad, whose business it is to bring timber to be shipped. During the same day we touched at St. Mary's, which is one of the most ancient of places on this continent, and before the war quite a village; but one day, in retaliation, it is said, our gun-boats went in and tore the houses all to pieces; and there the ruins stand as they were left eight years ago. This terrible affair is one of the unwritten chapters of the war which I would like to see recorded. Near nightfall we came to Fernandina, where, because of a storm outside, we remained all night and next day, giving us an opportunity to go over to the great beach, where we saw miles of splendid waves come tearing and roaring over the white sand with a force and majesty such as only Andreas Achenbach imitates upon canvas. From Fernandina to Jacksonville the passage is an outside journey of several hours; and as the worthy, broadly built captain of our boat, who, by-the-way, is Nick King himself, feared to take us out into the storm which was still prevailing, a party of the passengers—some thirty in all—chartered a train on the Cedar Keys Railroad, and about nine o'clock of that night we found ourselves in the town of Baldwin, where there is a crossing by the Savannah and Jacksonville Railroad. Here we took such misery as we could not avoid in one of those log shanties, which seem to have had chills and fever since their birth, which form the burg. What this place is in the summer season the demon who presides over all poisonous fevers only knows. In the morning we came forth as out from damp and mildewed tombs, and took our rapid way by rail to Jacksonville, where we ar-

rived in time to take the steamer *Florence* up the St. Johns River.

Just at this point in the narration of our personal experiences we will halt for a space, and try to tell the inexperienced traveler what at the time and place we would have been glad to know, and could not well ascertain. And that was, where we wanted to go. To be sure, St. Augustine was our objective point, and so was the sail up the St. Johns River. But the best place to fix upon as a *point d'appui*, from which to march out and make excursions, and to which we could return for rest and comfort—that we did not know.

It is barely possible that some of my readers are of those who will be content if they can only find some sheltered nook where, out of doors, they can breathe the soft, healing air, and gain such strength as the rough winter winds of the North will not permit. To any of these my advice would be to make their headquarters at either Green Cove Springs, Magnolia, or Pilatka on the St. Johns River. For invalids, either of these places is preferable to the sea-board, for reasons which will be noted hereafter, and from them excursions can be made to any quarter. Of these three places Pilatka has more advantages than any other; for to its spacious wharves come the steamers from New York and Savannah; and the St. Johns Hotel at this place is blessed with a steward who places before you that choicest and rarest of blessings in Florida, wholesome and well-cooked food. From Pilatka also can be made those charming excursions up the Black River, and the Ocklawaha, and other small streams, which will admit the passage only of diminutive examples of steamboat architecture.

If, unlike our party, you do not desert the *Nick King*, and brave the danger of sea-sickness or of shipwreck by dancing about on the sand-bar which impedes navigation at the mouth of St. Johns River, you can be landed at either of these places; but wherever you go, we would strongly urge you to engage your rooms in advance.

From Jacksonville, which is a large and growing city, and where there are fair hotels, you can go by any of several steamboat lines to

GREEN COVE SPRINGS.

any of the places on the St. Johns River, and a steamboat makes two trips a week to St. Augustine, going by an outside passage. The other route to St. Augustine is by river steamboat and stage lines; and this we had chosen, and soon found ourselves comfortably fixed on board the new and excellent steamer *Florence*, whose business it is to take people to and from Pilatka, making stoppages by the way. We were put off at a place called Picolata, where a stage line is supposed to convey you across country to St. Augustine. A more disgraceful, disheartening abomination than Picolata and its stage line I never met with in all my travels. Ever so many years ago, when Buckingham Smith was Secretary of Legation at Madrid, he had occasion to send home to St. Augustine his wife.

"Good-by, and God bless you," he said. "You are comfortably provided for your voyage. You are all safe until you reach Picolata, and then Heaven alone can help you."

What Picolata was ten, twenty years ago, it is to-day. A shaky, rotten wooden pier, at which steamers discharge their burdens; a one-story shanty, and a ten-feet-square grog-shop on the shore—that is the forbidding exterior appearance. The outside of these buildings is all you will see; and if you arrive, as we did, at a season when a fierce, freezing cold wind is blowing from the north, and your invalid ladies are obliged to stand out shelterless in this killing cold air for hours, you will all lose your health, if you do not your patience. Personal-

PICOLATA.

ly, the writer was damaged in both the first and the last; and in as calm tones, and with such persuasive manners as could be mustered, he addressed a diminutive specimen of humanity, who looked as if he might have been the offspring of intermarriage for a hundred generations of Lilliputs, and who was playing "seven up" with a choice party like unto himself, in the grog-shop:

"Why are you keeping us here? Why not send us over to St. Augustine? I understand you have no special hour for starting. Our party make up a load. Please hitch up and send us over."

The man did not like the interruption to his game; but finally answered:

"Now yer wouldn't have me drive them horses right back. They come over here, eighteen miles from Augustine, this morning."

This was an appeal to our respect for suffering horse-flesh which was not to be resisted, whatever may have been our opinions of a stage line which drove a team of horses eighteen miles without change, and then proposed the same day to take them back over the same road.

"But what are our ladies to do meanwhile? They are invalids, and this exposure may be fatal to them. Why can't we get into that house?"

"Because the folks are away," growled the keeper of the grog-shop.

"All the more reason why we should get into it. Who is the owner?"

"I am."

"Won't you let these ladies in?"

"No."

While we were quite ready to have committed some horrible injury upon this man, yet there was nothing for it but to bide our time. And after investing several dollars in soda biscuit, sardines, etc., the surly wretch relented, and our people were able to get into the meanly kept room, where a fire soon restored them to warmth. After waiting some five

hours, about three in the afternoon we started off, leaving all our luggage at Picolata; but bringing in place of one of the trunks an English baronet, who hung on to the rack behind as best he could, preferring that discomfort to the horrible possibilities of being left. The ride over through the monotonous pine barrens was dismal enough. Half of the road was under water, and the poor tired horses could hardly proceed beyond a walk. Added to this, the wind blew cold and dreary, chilling us to the bone. About nine at night we drove into the city of St. Augustine, and at the hotel of that name found welcome and comfortable quarters.

I can remember only one feeling comparable to that which impressed me all the while we were at St. Augustine, and that was when my first introduction was made into the Old World at that noble old city of Rouen in France. The same romantic interest which thrilled me then continued at St. Augustine, with an added peculiar charm. For many weeks we had been journeying through a section of our country

ST. AUGUSTINE.

where every thing was new and crude, and unexpectedly we were ushered into the associations, the architecture, the ruins, of three hundred years ago.

The architecture of this city is altogether unlike that of any upon this continent. The streets are very narrow, while the houses have wide balconies in the second story, which come very near to each other. The material used in their construction is very beautiful, and is called the "coquina" stone. It is formed of a concrete which has a pleasant yellow-gray tone when seen at a distance, and, when examined in detail, presents an exquisite collection of various and delicately formed

shells. Although most of the habitable buildings built in the way described are of modern construction, yet, except in their pitched roofs, they probably resemble those built hundreds of years ago, and whose ruins are met with at every turn. Here you see the stained walls of a blacksmith shop, constructed by the hands of the soldiers of the Spanish governor and cut-throat, Menendez d'Avileis, in 1570. Out from graceful groves of orange-trees will rise jagged walls whose ruins came by the hand of Governor Oglethorpe, of Georgia, in 1732. Side by side with trim villas, the residences of those seeking health from the North, stand the crumbling chimneys of houses destroyed by one or another of the many conquerors who these centuries past have made this oldest of cities on this continent north of the Gulf of Mexico their battle-ground. But perhaps the most picturesque of all its ruins are the gates which stand at the northern end of the city. The pillars of the gates are Moorish in their form of construction, and are square, surmounted by a carved pomegranate. Attached to the pillars on either side are portions of the old wall which formerly surrounded the town to the east and south, while they connected with the Fort San Marco, which stands by the river a few hundred yards to the west. Proceeding from the gates outward are the remains of the causeway, crossing a deep ditch which followed the line of wall.

This noble example of military architecture was a delightful surprise to me; for in all my journeyings in the Old World I had never seen

OLD CITY GATEWAY, ST. AUGUSTINE.

such a complete instance of the high state of the art of defense of two centuries ago. This fort was begun by Menendez himself, and in one and another form had resisted attacks, sometimes successfully. But in the time of Queen Elizabeth that brave old sailor, Admiral Drake, returning from one of his expeditions to South America, saw a look-out on the island of Anastasia, which is just opposite to the fort. So Drake landed, and the Spaniards deserted the place, which he occupied. He captured £2000 of money, which was in an old chest, and several brass cannon. Then he hoisted sail and steered away to report his adventures to the maiden queen. But our fort was called at that time San Juan de Pinas.

After that affair Captain Davis, one of those gentle buccaneers who made it his business to rob and murder the people of the South American settlements, came up the coast in search of a Spanish plate fleet, and, missing his prize, in a fit of spleen went into the harbor, attacked and sacked the town. The fort at this time was an octagon, with round towers, and incapable of resisting the fierce assaults of the British pirate. This was in the year 1665. During the next one hundred years, more or less, the Spaniards were hard at work reconstructing this fort upon its present plan, which I believe is called that of Vauban No. 2. I said the Spaniards were hard at work. This is a mistake—the tribes of Indians which had been conquered did the hard work, the Spaniards superintending. The Appalachians, especially, were

OLD SPANISH FORT, ST. AUGUSTINE.

employed for more than sixty years, while convicts from Mexico were sent to assist. Between one and all the fort was finally completed, and a tablet erected over the spacious portals of the main entrance, which stands for the inspection of the curious to-day, and whereon is an inscription which, being translated, declares that:

"Don Ferdinand the Sixth being King of Spain, and the Field-Marshal Don Alonzo Fernando Heredia being Governor and Captain-General of this Place, St. Augustine of Florida and its Province. This Fort was finished in the year 1756. The Works were directed by the Captain-Engineer, Don Pedro de Brazon y Garay."

As it stands, although often besieged, it has never been taken. It is what is known as a bastioned fort. Over each of the four bastions stand towers which served as outlooks. The main work is surrounded by a wide ditch; and beyond were exterior fortifications, most important of which is a demi-lune that covers the entrance to the fort. The interior of this splendid relic of Spanish domination in this country is full of interest. Out of a large "enceinte," or open space, a wide stairway, whose steps have been worn by many thousand feet, leads upon the broad

rampart. It is not difficult to go back a century ago, and to imagine these iron platforms mounted with the ponderous, clumsy, bronze and brass cannon which now lie piled up in the court-yard below. We can see the royal banner floating from the walls, guarded by Spanish sentinels, in their unique costume, while all around are heard the bustle and confusion of conflict. To-day light twelve-pounders repose in the bastions; while good, trust-worthy Sergeant M'Guire is the sole representative of the power and dignity of the Re-

public of the United States of America.

Of course, attached to the old fort are many stories of thrilling interest; but one which has hair-raising power to every comer is that of the "Dungeon." Not in Chillon nor at Neuschloss, not upon the Rhine nor in all Europe, is there a more genuine dungeon than boasts San Marco. Only a few years ago the parapet above sunk in, revealing a cavity; and, upon inspection, beyond that another was discovered, hermetically walled in, and wherein, when opened, were found the skeletons of two persons. So much is known without question—all beyond is mystery; but the curious traveler, if he stoop low enough, may enter this coffin of stone.

SPANISH FORT AT MATANZAS INLET.

Day after day we went to old Fort San Marco, and found ample material for the exercise of the pencil and imagination; and most heartily do we commend it to the attention of the visitor at St. Augustine. Although it is of little service as a fortification to the United States government, yet it is too rich and rare an example of the art of war, and too valuable in its historical association, to be allowed to fall to utter ruin. Colonel Ludlow, of the Engineer Corps, stationed at Charleston, informed me that a small sum had been appropriated for its

repair. I am sure that this officer is a gentleman of taste and judgment, who will make the restoration completely in the fact and spirit of the ancient work. Further than this, I have the personal assurance of General Sherman that the old fort shall not be neglected.

There is another Spanish fortification, of an entirely different form of construction, situated at Matanzas Inlet, some twenty miles south of St. Augustine. It is as curious as San Marco; but little is known of its history, except that its erection was probably contemporary with that of San Marco.

We were at St. Augustine for several weeks, and had an excellent opportunity to judge of the influences of the climate. On several occasions the air was freezing cold, and then we suffered more discomfort than during the severest season in the North, for the reason that neither were the houses constructed with regard to the cold nor were we expecting it. But for the most of the time the air was mild and gentle, so that an invalid would be able to pass the hours of the day out of doors, which, I take it, is the reason Florida has become the winter home of so many thousands of persons having pulmonary complaints. Whether or not St. Augustine is the best locality for such invalids is a serious question, which must be left to the decision of the physicians who have been there; but I have known of several persons within my own limited experience who found the frequent changes which take place from the warm air of the land to the cool, salt air of the sea to have injurious results, which ceased upon going over to the St. Johns River.

Personally, I found the heat to be inconvenient for the most of the time, and arrayed myself in summer clothing. But in pursuing

STREET SCENE, ST. AUGUSTINE.

the occupation of sketching from nature, I was in the habit of sitting out in the open air with a white sketching umbrella over me; and at such times I have suffered more from the heat than at noonday in August in a Connecticut meadow. This feeling of exhaustion may be attributed to a lack of vitality in the atmosphere which we find in the southern latitudes. Singular as it may seem, there is not much opportunity to go out of doors in St. Augustine unless as pedestrians. For, although all last winter there must have been a thousand or more strangers, and these coming and going all the while, yet such a thing as a livery-stable does not exist. Two or three vehicles there are, which are hired by the month; but neither buggy, carriage, hack, nor even a common road wagon is to be had. It seems utterly incomprehensible that the hotel-keepers, whose interest it is to have such conveniences within reach, should not attend to these matters. This poverty in the way of conveyances is most felt when you desire to get away from the place. You can not go when you wish to, but when you can—watching the chances in advance to secure your place. When our party came away there were three ladies, with their servant, who wished to accompany us up the St. Johns River; but our people filled the stage, top and bottom, and not in all St. Augustine, for money or other consideration, could there be found a conveyance. A few riding horses there are—safe, comfortable little ponies—who will take you about on the road by the river, or across the plain of palmettoes to the “Magnolia Grove”—a picturesque place called by that name because in this tangled bit of woodland there is only one magnolia-tree. While upon this subject of the discomforts of this place that portion of my conscience lying in the region

of the stomach will not permit me to be silent. The food furnished you at the public hotels is simply dreadful. Fresh, nutritious meats there were not. Even chickens would not come at our call; or if they did, it was evident they had made a long journey. We were in the land of wild game, but it rarely ever came to the refreshment of our fainting bodies. This was the soil and the atmosphere from whence proceed early vegetables; but no friendly hand ever strove to induce their appearance above-ground, so far as we knew. In place of wholesome, well-cooked food, we were served with canned meats, canned vegetables; and, as if in compensation, all sorts of fancy tarts, and "meringues à la humbug," and other indigestible jimcrackeries under foreign names, were served up *ad nauseam*.

If excuses could justify this ill-treatment, surely we had enough of them; but under no circumstance is there justification for this disobedience of the Divine command to "feed the hungry," more particularly when the consideration of four dollars a day is exacted.

St. Augustine is not singular in this matter of poor food and bad cooking. It is common to almost all the hotels in the country, especially where they are kept upon the American plan, which abominable system is being fast driven out by the more sensible European method of paying only for what you get, and having that especially cooked for you.

Among the objects of interest in St. Augustine is the sea wall which protects the town from the encroachments of the water, which extends from the water battery at the fort, some three-quarters of a mile, to the arsenal—a handsome building, which is only occasionally used by the government. Every body visits the orange groves of Mr. Buckingham Smith and Dr. Anderson. Orange-trees are not very plentiful in the city or neighborhood, although the perfume of the blossom often enough greets you as you walk through the streets. Indeed, this odor is sometimes so intense as to become unpleasant. The fruit of the orange is quite as costly as in the North. "Uncle Jack," a very small, very ancient, and very peculiar negro at Mr. Smith's, will pull them from the tree at fifty cents per dozen. The most palatable orange we saw came from Indian River, some seventy miles south of St. Augustine, and these found ready purchasers at one dollar per dozen. I was told by the owners of the large orangeries on the St. Johns River that they had sold their crops at about two dollars per hundred. The orange crop of Florida is not so profitable as has been supposed. In 1842 there came an insect known as the "orange locust," nearly destroying all the trees in the country; but that difficulty is fast disappearing. Now and then, however, there comes from the north a yet more terrible invader, in the person of the Ice Fiend, who freezes the life out of the trees, destroying millions of property in a single night.

THE CATHEDRAL.

Although the ruins of former greatness are to be seen at every hand, yet by one and another means the most venerable are passing out of sight. The palace of the British attorney-general, which, it is said, was grand in its proportions, has been torn down so that its material could be used in the construction of other houses. And I was told that one Logan, who was an army quarter-master stationed here, tore down an old powder-house, one of the rarest of the ancient remains of the Menendez régime. Mr. Logan used the stones of this unique ruin for his personal benefit. What shall be said of a person who had so little regard for these priceless relics of the past? There still remains the "Residence of the Spanish Governors," fronting the public square, and now used by the United States authorities. These buildings are highly picturesque, as is the striking façade of an old Spanish treasury building on St. George Street. But the cathedral, of simple Moorish architecture, and which also fronts the square, will attract marked attention. One of the priests who minister there is Father Rousse. A gentle, kind-hearted, humane Frenchman he is, who does his best to take care of the bodies and souls of several hundred negroes and white people, the most of whom are of the poorer class. During our frequent peregrinations we had reason to know of this, and also formed a friendly acquaintance with the good father.

When we came one day to bid him good-by, he said: "Ah, you will become a good Catholic sometime, will you not, *mon ami*?"

"I hope it is not necessary," we replied. "Be sure we shall meet each other in the better world."

"Je l'espère," he answered, sadly, making the sign of the cross.

Certainly the lower, and especially the negro

class here, and, in truth, in all other places we visited in the South, needs the care of some spiritual and religious instructor. Before the war it was for the interest of the master that the slave should be under the control of a religious sentiment. It was one means of subjection, of obtaining obedience; but emancipation loosened that cord, so that the negro in his ignorance is falling from grace, and the elective franchise, with all the carpet-baggers in creation, won't save him. At one of the Protestant churches here, and subsequently at Jacksonville, we saw shocking mummeries, which belonged to the fetich worship of savage Central Africa, and not of Christian America. The necessity of taking care of themselves will be a great assistance to these poor people, but it will require many years to bring about that condition when they can provide for their own needs. Meanwhile the present generation will disappear, and a better intelligence will come with those that follow. But it is my conviction that the present political system will not achieve the desired end. The larger number of the negroes are in darkest ignorance, and in the matter of voting are used by designing men to accomplish their bad selfish ends. It is sad, indeed, to see how these people have in one way and another been made the tools of the white man; but in all their misery they continue to exhibit in a marked way their keen sense of the ridiculous. In illustration of this fact a comical incident occurred to me in one of my sketching expeditions.

One sees a deal of humanity when out of doors making sketches from nature. The people of all ages, colors, and both sexes gather around you, and sometimes in most unpleasant nearness of proximity; you are obliged to listen to lively criticisms of people and things in general; and not unfrequently you, and what you are doing, are made the subject of sharp if not wholesome remark.

One morning, I planted myself, with white umbrella, camp-stool, and paint-box, in one of the principal thoroughfares of the city. It would have been called a narrow lane any where else. In front of me was a most romantic picturesque view, such as could be found nowhere but in this charming old Spanish city. There was a bit of ruined broken wall of what had once been the palace of somebody two hundred years ago. It was built of coquina stone, gray and brown, a patch of old brick, with stained plaster in places, making up a rich mass of shadow, with brilliant dashes of light on the top giving emphasis to the whole. Beyond this precious old wall there was an ancient stone house of one story, with a pitched roof. A window opening in the gable showed dark in the midst of the iron-gray of the wall. Further on—this was at my right—there were the high palings of a fence, then another gray gable end of a house, and against the sky beyond that, the roof of a building glittering in the sunlight. On the left and opposite side of

the street there was a wee bit of an open place called a square, alongside of which ran a wreck of what may have been a respectable dwelling-house a century or two ago. It had yellow, black, and blue walls, and a shattered shingle roof, violet and brown in color. The end to the street was patched with stone and plaster, and had doors and windows, which were hardly visible in the short perspective, but what little there was shone bright in the direct rays of the sun. On the other side of this was a fence, and then a wooden cabin, and then the branches of a tree dancing green in the light; finally another house, with a high pitched roof and a balcony, which almost touched another balcony on the opposite side of the way, both of which ended the line of the street; far beyond that there was a strip of green grass and gray sand; then, following the sea wall, the blue waters of the river in the dim distance, the purple and yellow of Anastasia Island, and above that a sunny sky, such as is found only in these Southern latitudes and by the sea.

This was the picture I was trying to sketch—with indifferent success, I was informed by one of my bare-legged critics.

"He can't draw, Jake," he said to his companion. "This feller can't draw as dat odder man who's takin' the church down. Dat ar's Aunt Phœbe's; isn't down right. He can't draw."

I made no reply to this and similar remarks shouted in my ear, but I had a pretty positive opinion that my spectators were a "poor set;" and this opinion was confirmed when at noon I came to gather up my apparatus, and did not find the leather strap with which I bound in one parcel camp-stool, staff, and umbrella. All about I searched for the missing article, in the fence corner, and on the road; but it had disappeared with my juvenile critics. While yet I was looking I became all at once aware of the presence of one of the most extraordinary of all these astonishing black people. She—for I still believe it was a female—was costumed in a blue infantry jacket, which was buttoned tight over her bosom; below this a pair of bare feet and legs straddled from underneath a dress of many materials, but of a nondescript and indescribable color. I speak as an artist. I should say it had so many shades that the *ensemble* was neutral. On the kinkiest sort of a head, whose perpendicular front side showed all eyes and teeth, was perched the funniest scrap of a dirty frayed straw hat. It had been stuck there for the purpose of covering, whatever other office it served. This person, with both arms akimbo, yelled at me:

"Wha' yer lookin' fer?"

"A strap—a leather strap."

In a second she exploded: "Yah, yah, yah, yah, yah, yah, yah, yah, yah, yah, yah, yah!"

I gazed at the creature in silent astonishment. What cause of merriment was there in the search for a lost strap? But she was not at all depressed by my look, but burst forth

"LOS' HIS STRAP."

with another scream, at the same time bending forward and clapping her hands upon her knees.

"Yu-yu-u-u! Yee-ee-ee! Yah, yah, yah! He's los' his strap! Yah, yah, yah!"

At this point I could resist no longer, and began to laugh most heartily. Up to this time the surrounding crowd had kept a quivering sort of silence in their polite hospitality, not knowing but that I might be offended. The moment, however, I began to laugh, there was a succession of reports such as one hears on a Fourth of July morning from a bunch of double-headed fire-crackers. At first one, and then another, went off, until it got to be an insane mania. Young and old, male and female, gave free vent to their exuberance of feeling. They screamed, roared, and yelled in every key of the chromatic scale. In their extravagance they clutched at each other, shouldered the old wall, hung upon the fence, and rolled in the sand.

Such an extraordinary sight and sound I never saw nor heard; and very soon I beat a safe retreat toward my hotel, followed at a respectful distance by the woman with the infantry jacket, who would erupt at intervals with her thundering laugh. And after that day, whenever I met her on the street, she would scream forth, "Los' his strap!" with a prolonged chorus of "Yah, yahs!"

I have already said that one of the objective points of our expedition was the St. Johns River. If this trip had not formed a part of our original intention we most surely would have adopted it subsequently, for every pil-

grim who came within our acquaintance would at once shoot off the question:

"Have you been up the St. Johns? No? Then you must not miss it. Splendid scenery. Alligators. Lots of fun."

So one day, when one of our folk who had been laid up with a bad cold was sufficiently recovered, we got into the stage, where our places for a week had been engaged, and started back toward Picolata. The prudent reader will wonder that we should go a second time to that wretched place; but there was no alternative short of a voyage by sea to Jacksonville. From this place started the steamer *Starlight*, upon which we supposed we had engaged state-rooms for the round trip up and to Enterprise, the head of the St. Johns River, and back. We expected to take the *Starlight* at Picolata, and if she had failed us, there were other steamers passing, which would have conveyed us somewhere, any where away from Picolata. I ought to have mentioned that our luggage followed us over to St. Augustine some two days after our arrival; so upon our return trip we took good care to start it off several hours in advance in a separate go-cart. We passed that affair half-way on the road over, and some of the passengers avowed that the driver was asleep, and the mule chewing palmetto leaves by the road-side. We ourselves proceeded safely on to Picolata, and, after waiting four hours in the hot sun, found ourselves on board the steamer *Starlight*, and, to our chagrin, learned that our message had not been received, and there were no rooms awaiting us.

This apparent misfortune proved our greatest happiness, for, lying over at Pilatka at the St. Johns Hotel, we obtained delicious food wherewith to assuage the pangs of hunger. Think not, good reader, this is an unnecessary exhibition of feeling over a small matter, for great had been our suffering, and great was our delight. Delicious waffles, noble wild turkey nobly served, tender lamb, adolescent chicken, light, sweet bread, potatoes, green peas, and other delicacies that ravished the heart and made glad the digestive apparatus.

The trip of the *Starlight* to Enterprise, back to Jacksonville, and the return to Pilatka, occupied about three days, and this interval was pleasantly passed, for we saw, for the first time, the distinctive characteristics of physical nature in Florida. Heretofore we had passed through pine barrens and over plains covered with palmetto, but these may be seen in Georgia and the Carolinas; now, however, we were presented to a new, a strange aspect, which filled us with wonder and surprise.

Unlike the mountains and the sea-shore of the North, the scenery of the tropics is greatest in its little things. And so in a row-boat we wandered along the shore, past forests whose sombre depths were veiled to us by vast screens of drooping moss, or, pushing our little craft over and through the wide-spread beds of water-lilies, we entered within the precincts of this solemn Hades.

What weird, wondrous visions then greeted our thrilled senses, as, gliding silently on, the bright heavens were almost shut out from view, and there rose up beside and around us trunks of trees which looked as if they might have been human once, and, like the lost souls of Dante's vision, condemned to this imprisonment!

"We had put ourselves within a wood
That was not marked by any path whatever:
Not foliage green, but of a dusky color;
Not branches smooth, but gnarled and intertangled;
Not apple-trees were there, but thorns with poison;
Such tangled thickets have not, nor so dense,
Those savage wild beasts that in hatred hold
'Twixt Cecina and Corneto the tilled places."

Now stooping as we passed underneath some fallen monarch of the place, we brushed aside the thickly trailing vines, or passed into the embraces of that parasite of death, the pendent moss; and then our keel would disturb the perfect surface of the most marvelous of mirrors, reflecting countless forms of leaf and twig and moss and tree, with here and there bits of blue which told us that there was a heaven above. How intense is the silence of this place, broken only by the splash of a single blue heron, who, wondering at this intrusion, gazes, and then, spreading his great wings, rises slowly and disappears, leaving a deeper silence than before! This is not the forest of Ohio, with its cheerful life and health, its varied growth of beech and birch and oak and buckeye and elm, and a hundred other varieties of tree and bush, with all their beauty, grace, and strength, and glowing youth. All this seems to be in fullness and

reality what the spectacle at the theatre suggests. It is not life: it is the funereal pageant of nature.

It was at Pilatka also we first saw that rare and most beautiful of birds, the swallow-tailed hawk, with his gray back and wings, his snow-white breast and exquisitely graceful flight. The natives will tell you he is the "snake-hawk," because he makes war upon those creatures. They will also tell you that this bird, who rises from the shallow water with wedge-shaped bill and red neck thrust far out from his body, and whose flight is swift and straight, is the water-turkey; but the vulgar are apt to give names without reason. In a day or two, as we ascend the river, you will see this same bird, increased to enormous size, one of that vast flock of black objects which, far in the blue ether above, is circling round and round; and then the ornithologist will tell you he is the "cormorant."

The sky was filled with masses of gray clouds, which roofed in the wall of green through whose narrow avenues we were swiftly gliding. It was the morning after the night we had gone on board of the *Starlight*, and I stepped out of my state-room to gaze upon this most entrancing of all the moods of nature, when the gray clouds seem to sweep the tree-tops, and there is that subdued harmony not to be found in the garish sunlight. As the little steamboat plowed along its narrow channels, the water, rushing in to fill the vacuum she made, would sway the countless lily-pads and bending ferns to and fro, sometimes baptizing them with its generous flood. The forest trees were the same all along the way. Cypress, maple, pine, and live-oak, while the palmetto would sometimes choke out the other growths and send forth for acres around its umbrella-shaped tops. The vines grew every where, and along the bank would trail in masses, sweeping the dark waters with their leafy fringe. Very often the dead, gaunt form of some towering pine would rise above its fellows; and here that noblest of birds, the osprey, would leave his nest, secure from harm, and then, sitting upon some outstretched limb, would dash from his height into the waters and bear his prey aloft to his waiting offspring.

Now and then the steamboat would shoot out into a more open space, and where there did not appear to be any outlet, where the bow of the boat seemed about to be crushed against the land; but it parted before us, and what appeared to have been the solid earth was but a floating island, which went dancing and torn in the wake behind us, its long roots thrown up to the troubled surface of the water. At every turn in the river—and it had an endless twist and turn—the tall forms of the blue and white heron would rise from the shallow waters and fly before us. Thousands of ducks were feeding among the water-plants; and not seldom it was a comical sight when, coming suddenly upon them, they would attempt to rise, but, too

fat to achieve speedy flight, would tremble and flutter and finally scamper away into the tall weeds. Later in the day the sun came out, and then the torpid bodies of huge alligators would be seen lying on the banks.

"That ar's a 'gator slide," said a tall, sun-burnt native to me, at the same time pointing to a smooth spot on the river's bank. So I watched for such places, and soon saw all I desired in the way of "'gators."

On the bow of the boat, and in fact all over the boat, wicked people had stationed themselves with all sorts of fire-arms, firing at every helpless creature they could see. One of these more especially bore the marks of imbecility in face and form. He sat in the extreme bow of the boat, and blazed away at every thing at one time, very nearly shooting some ladies who were stationed near the pilot-house. On another occasion a magnificent female osprey rose from the water near us, and with strong pinions bore a struggling fish to its nest, upon which it settled. Our noble Nimrod at once leveled his gun at her.

"Stop!" cried an alarmed and indignant gentleman. "Surely, you're not going to shoot the mother feeding its young?"

"Well, I guess I'll scare her, any way," was the brute's answer, as he sent a bullet, fortunately not wounding the bird. Shortly after, this same wretch was about to fire at a heron which had evidently been winged by some other coward; for it could only run away, and in the direction of some cattle feeding in the marsh near by. Again this fellow drew bead.

"Take care!" cried one of his companions; "you will kill the cattle."

"They are not mine," was the answer; and this time his bullet hit the mark, and the poor bird was left fluttering and struggling in death. And so, all the way up and down the river, these men sat there and fired at the beautiful birds, which by thousands inhabit the river-bank and the swamps; now and then getting a shot at an alligator; but in no single instance did they hope to fulfill that first requirement of a sportsman—never to shoot at game which you can not bring away. The cowardly fellows shot all day long, without the least prospect of getting a feather. If the officers of the boat can not stop this mean business, the game laws of the State ought to be put in force to the condign punishment of the offenders.

To me the most charming feature of this trip to Enterprise is the presence of these large birds, which I saw for the first time. Nothing could be more beautiful than these flocks of white swan, curlew, cygnets, and heron, constantly rising before us. Powder and ball will soon drive them away, however.

The boat makes several stoppages by the way, usually where some venturesome settler has a place where the sand rises a few feet, has built a hut, and grafted some of the wild orange-trees, which grow in profusion. If the settler be an enterprising man from the North, he will

plant a patch of pea-nuts or vegetables; or he may go further, and put in a few acres of the long-staple cotton; but, except in the products of oranges and pea-nuts, he will obtain very little for his pains. So far as my observation goes, there is very little soil in this region fit for agriculture. Unlike other States of the South, which have received from the great rivers of the North rich alluvial deposits, this is made up chiefly of sand not prolific of vegetable life.

At one time, where there was no evidence that man had ever placed his foot, the boat ran alongside a bank and left a plow-share and a keg of nails—two very significant signs of civilization. At another place we found the oddest sort of an apology for a steamboat, which lay at the bank awaiting our coming, so that it might continue its voyage up some of the smaller tributary streams. The owner of this craft, it appears, had put up in some portion of this benighted region a steam saw-mill; but finding none who wished for lumber, he changed his business and set up his engine in a small flat-boat. A belt, pieced of leather and canvas, ran from the engine to a drum attached to the paddle-wheel, which was about eighteen inches wide, and at the stern. The efforts of this engine, which was laboring under a severe attack of influenza, to turn the wheel were laborious in the extreme. There was not much room to speak of in this little box; and so, to make a place for two ladies and a gentleman who were transferred from our boat, the dog-kennel and chicken-coop were placed over the wheel, much to the horror of the animals, who howled and cackled in unison with the wheeze of the ancient saw-mill engine.

As you approach Enterprise the river widens out into a large lake, which is bordered by swamps filled with the ugly palmetto. Enterprise receives its name from the fact of an utter lack of that quality, which, in places of public resort, brings comfort to the traveler. There is one large hotel, which is open to the same objections noted of hotels at St. Augustine. Enterprise is otherwise celebrated for a very large sulphur spring, out of which the milky-looking water pours in a six-inch stream, and as being one of the means by which whoever wishes can cross the country to Smyrna, on Indian River. At Enterprise I met an interesting character in the person of an old negro, who was the owner of sixty acres of sand and palmetto near the sea-coast. Asking this man a leading question as to his health, he volunteered a good deal of valuable information. He said:

"De fac' is, I wus in de Souf durin' de con-tineration of de wa'. But I thort dat I would seek my fortins in a new country, and so cum down here wid some odder cul'd people, an' bot sixty acres lan' fur two dollars an' a half, which I paid at de office. Dat Freedman's Buyo played de debil wid a lot of our people dat a rascal of an agent brot down dar ter Indjun Ribber an' lef ter starve. It wus a heap better ter lef um

be whar dey wus. I could git along, cos I'se eddicated by Colonel Orr, an' could git along any whar; but de plantation niggers don't know nuffin."

"Have you ever voted?"

"Oh yaas, I've voted twice; once for de President, and todder time fur Colonel Hamilton, member fur dis deestric."

"Hamilton! Why, he lives at Pilatka, and was a rebel. How is that?"

"Yaas, he wus a rebel, but dare cum down hyar a free nigger, a carpet-bagger, from Ohio, or sum odder place Norf, an' put himself up. But wha' did he know 'bout de interests of de people of dis deestric? Nuffin. Ef he'd bin a freedman belongin' ter der Souf I might a voted fur him; but"—and here the old man spoke with great energy—"we've had nuff of dem carpet-baggers. Dey are lookin' out fur demself. Dey don't care fur de cul'd people. Colonel Hamilton has bin in Congress afore, an' knows what we wants. Dat's why I voted fur him."

It seemed to me that the old man had the true philosophy of the matter.

Our journey down the river was not marked

with any new subject of interest. We reached Jacksonville in due time, took the more than excellent sleeping-car to Savannah, and so on north to Washington in safety, notwithstanding the danger from the shocking condition of the railroads.

I can not depart from Florida, however, without a word with regard to that for which she is most famous, her wealth of flowers and foliage. Perhaps if we had remained until April we should have been treated to a more brilliant spectacle in the way of flowers; but, in all the redundance of the growths peculiar to her soil or swamps, we saw nothing comparable for one moment to the magnificent, glorious transformation of the spring in our Middle and Northern States. There is but one season in Florida. We have four, with their infinite moods and changes of majesty and beauty. And of all these, most wonderful is the spring, with its tender green, its leaves, its buds and blossoms, its songs of many birds, its skies of clouds and sunshine; and, more than all, that sense, which never came to us in the land of the Everglades, of elasticity, gladness, hope, that aspiration of the soul for THE NEW BIRTH.

HOW SHARP SNAFFLES GOT HIS CAPITAL AND WIFE.

By WILLIAM GILMORE SIMMS.

I.

THE day's work was done, and a good day's work it was. We had bagged a couple of fine bucks and a fat doe; and now we lay camped at the foot of the "Balsam Range" of mountains in North Carolina, preparing for our supper. We were a right merry group of seven; four professional hunters, and three amateurs—myself among the latter. There was Jim Fisher, Aleck Wood, Sam or Sharp Snaffles, *alias* "Yaou," and Nathan Langford, *alias* the "Pious."

These were our *professional* hunters. Our *amateurs* may well continue nameless, as their achievements do not call for any present record. Enough that we had gotten up the "camp hunt," and provided all the creature comforts except the fresh meat. For this we were to look to the mountain ranges and the skill of our hunters.

These were all famous fellows with the rifle—moving at a trot along the hill-sides, and with noses quite as keen of scent as those of their hounds in rousing deer and bear from their deep recesses among the mountain laurels.

A week had passed with us among these mountain ranges, some sixty miles beyond what the conceited world calls "civilization."

Saturday night had come; and, this Saturday night closing a week of exciting labors, we were to carouse.

We were prepared for it. There stood our tent pitched at the foot of the mountains, with a beautiful cascade leaping headlong toward

us, and subsiding into a mountain runnel, and finally into a little lakelet, the waters of which, edged with perpetual foam, were as clear as crystal.

Our baggage wagon, which had been sent round to meet us by trail routes through the gorges, stood near the tent, which was of stout army canvas.

That baggage wagon held a variety of luxuries. There was a barrel of the best bolted wheat flour. There were a dozen choice hams, a sack of coffee, a keg of sugar, a few thousand of cigars, and last, not least, a corpulent barrel of Western usquebaugh,* vulgarly, "whisky;" to say nothing of a pair of demijohns of equal dimensions, one containing peach brandy of mountain manufacture, the other the luscious honey from the mountain hives.

Well, we had reached Saturday night. We had hunted day by day from the preceding Monday with considerable success—bagging some game daily, and camping nightly at the foot of the mountains. The season was a fine one. It was early winter, October, and the long ascent to the top of the mountains was through vast fields of green, the bushes still hanging heavy with their huckleberries.

From the summits we had looked over into Tennessee, Virginia, Georgia, North and South

* "Uisquebaugh," or the "water of life," is Irish. From the word we have dropped the last syllable. Hence we have "uisque," or, as it is commonly written, "whisky"—a very able-bodied man-servant, but terrible as a mistress or housekeeper.

Carolina. In brief, to use the language of Natty Bumppo, we beheld "Creation." We had crossed the "Blue Ridge;" and the descending water-courses, no longer seeking the Atlantic, were now gushing headlong down the western slopes, and hurrying to lose themselves in the Gulf Stream and the Mississippi.

From the eyes of fountains within a few feet of each other we had blended our *eau de vie* with limpid waters which were about to part company forever—the one leaping to the rising, the other to the setting of the sun.

And buoyant, full of fun, with hearts of ease, limbs of health and strength, plenty of venison, and a wagon full of good things, we welcomed the coming of Saturday night as a season not simply of rest, but of a royal carrouse. We were decreed to make a night of it.

But first let us see after our venison.

The deer, once slain, is, as soon after as possible, clapped upon the fire. All the professional hunters are good butchers and admirable cooks—of bear and deer meat at least. I doubt if they could spread a table to satisfy Delmonico; but even Delmonico might take some lessons from them in the preparation for the table of the peculiar game which they pursue, and the meats on which they feed. We, at least, rejoice at the supper prospect before us. Great collops hiss in the frying-pan, and finely cut steaks redden beautifully upon the flaming coals. Other portions of the meat are subdued to the stew, and make a very delightful dish. The head of the deer, including the brains, is put upon a flat rock in place of grid-iron, and thus baked before the fire—being carefully watched and turned until every portion has duly imbibed the necessary heat, and assumed the essential hue which it should take to satisfy the eye of appetite. This portion of the deer is greatly esteemed by the hunters themselves; and the epicure of genuine stomach for the *haut gout* takes to it as an eagle to a fat mutton, and a hawk to a young turkey.

The rest of the deer—such portions of it as are not presently consumed or needed for immediate use—is cured for future sale or consumption; being smoked upon a scaffolding raised about four feet above the ground, under which, for ten or twelve hours, a moderate fire will be kept up.

Meanwhile the hounds are sniffing and snuffing around, or crouched in groups, with noses pointed at the roast and broil and bake; while their great liquid eyes dilate momentarily while watching for the huge gobbets which they expect to be thrown to them from time to time from the hands of the hunters.

Supper over, and it is Saturday night. It is the night dedicated among the professional hunters to what is called "The Lying Camp!"

"The Lying Camp!" quoth Columbus Mills, one of our party, a wealthy mountaineer, of large estates, of whom I have been for some time the guest.

"THE BIG LIE."

"What do you mean by the 'Lying Camp,' Columbus?"

The explanation soon followed.

Saturday night is devoted by the mountaineers engaged in a camp hunt, which sometimes contemplates a course of several weeks, to stories of their adventures—"long yarns"—chiefly relating to the objects of their chase, and the wild experiences of their professional life. The hunter who actually inclines to exaggeration is, at such a period, privileged to deal in all the extravagances of invention; nay, he is *required* to do so! To be literal, or confine himself to the bald and naked truth, is not only discreditable, but a *finable* offense! He is, in such a case, made to swallow a long, strong, and difficult potation! He can not be too extravagant in his incidents; but he is also required to exhibit a certain degree of *art*, in their use; and he thus frequently rises into a certain realm of fiction, the ingenuities of which are made to compensate for the exaggerations, as they do in the "Arabian Nights," and other Oriental romances.

This will suffice for explanation.

Nearly all our professional hunters assembled on the present occasion were tolerable *raconteurs*. They complimented Jim Fisher, by throwing the raw deer-skin over his shoulders; tying the antlers of the buck with a red handkerchief over his forehead; seating him on the biggest boulder which lay at hand; and, sprinkling him with a stoup of whisky, they christened him "The Big Lie," for the occasion. And in this character he complacently presided during the rest of the evening, till the company prepared for sleep, which was not till midnight. He was king of the feast.

It was the duty of the "Big Lie" to regulate proceedings, keep order, appoint the *raconteurs* severally, and admonish them when he found them foregoing their privileges, and narrating bald, naked, and uninteresting truth. They must deal in fiction.

Jim Fisher was seventy years old, and a

veteran hunter, the most famous in all the country. He *looked* authority, and promptly began to assert it, which he did in a single word:

"Yaou!"

II.

"Yaou" was the *nom de nique* of one of the hunters, whose proper name was Sam Snaffles, but who, from his special smartness, had obtained the farther sobriquet of "*Sharp* Snaffles."

Columbus Mills whispered me that he was called "Yaou" from his frequent use of that word, which, in the Choctaw dialect, simply means "Yes." Snaffles had rambled considerably among the Choctaws, and picked up a variety of their words, which he was fond of using in preference to the vulgar English; and his common use of "Yaou," for the affirmative, had prompted the substitution of it for his own name. He answered to the name.

"Ay—yee, Yaou," was the response of Sam. "I was *afeard*, 'Big Lie,' that you'd be hitching me up the very first in your team."

"And what was you *afeard* of? You knows as well how to take up a crooked trail as the very best man among us; so you go ahead and spin your thread a'ter the best fashion."

"What shill it be?" asked Snaffles, as he mixed a calabash full of peach and honey, preparing evidently for a long yarn.

"Give 's the history of how you got your capital, Yaou!" was the cry from two or more.

"O Lawd! I've tell'd that so often, fellows, that I'm *afeard* you'll sleep on it; and then agin, I've tell'd it so often I've clean forgot how it goes. Somehow it changes a leetle every time I tells it."

"Never you mind! The Jedge never haird it, I reckon, for one; and I'm not sure that Columbus Mills ever did."

So the "Big Lie."

The "Jedge" was the *nom de guerre* which the hunters had conferred upon me; looking, no doubt, to my venerable aspect—for I had traveled considerably beyond my teens—and the general dignity of my bearing.

"Yaou," like other bashful beauties in oratory and singing, was disposed to hem and haw, and affect modesty and indifference, when he was brought up suddenly by the stern command of the "Big Lie," who cried out:

"Don't make yourself an eternal fool, Sam Snaffles, by twisting your mouth out of shape, making all sorts of redickilous *ixcuses*. Open upon the trail at onst and give tongue, or, dern your digestion, but I'll fine you to hafe a gallon at a single swallow!"

Nearly equivalent to what Hamlet says to the conceited player:

"Leave off your damnable faces and begin."

Thus adjured with a threat, Sam Snaffles swallowed his peach and honey at a gulp, hemmed thrice lustily, put himself into an attitude, and began as follows. I shall adopt his language as closely as possible; but it is not possible, in any degree, to convey any adequate

idea of his *manner*, which was admirably appropriate to the subject matter. Indeed, the fellow was a born actor.

III.

"You see, Jedge," addressing me especially as the distinguished stranger, "I'm a telling this hyar history of mine jest to please *you*, and I'll try to please you ef I kin. These fellows hyar have hearn it so often that they knows all about it jest as well as I do my own self, and they knows the truth of it all, and would swear to it afore any hunters' court in all the county, ef so be the affidavy was to be taken in camp and on a Saturday night."

"You see then, Jedge, it's about a dozen or fourteen years ago, when I was a young fellow without much beard on my chin, though I was full grown as I am now—strong as a horse, ef not quite so big as a buffalo. I was then jest a-beginning my 'prenticeship to the hunting business, and looking to sich persons as the 'Big Lie' thar to show me how to take the track of b'ar, buck, and painter."

"But I confess I weren't a-doing much. I hed a great deal to l'arn, and I reckon I miss'd many more bucks than I ever hit—that is, jest up to that time—"

"Look you, Yaou," said "Big Lie," interrupting him, "you're gitting too close upon the eternal stupid truth! All you've been a-saying is jest nothing but the naked truth as I knows it. Jest crook your trail!"

"And how's a man to lie decently onless you lets him hev a bit of truth to go upon? The truth's nothing but a peg in the wall that I hangs the lie upon. A'ter a while I promise that you sha'n't see the peg."

"Worm along, Yaou!"

"Well, Jedge, I warn't a-doing much among the *bucks* yit—jest for the reason that I was quite too eager in the scent a'ter a sartin *doe*! Now, Jedge, you never seed my wife—my Merry Ann, as I calls her; and ef you was to see her *now*—though she's prime grit yit—you would never believe that, of all the womankind in all these mountains, she was the very yaller flower of the forest; with the reddest rose cheeks you ever did see, and sich a mouth, and sich bright curly hair, and so tall, and so slender, and so all over beautiful! O Lawd! when I thinks of it and them times, I don't see how 'twas possible to think of buck-hunting when thar was sich a doe, with sich eyes shining me on!"

"Well, Jedge, Merry Ann was the only da'ter of Jeff Hopson and Keziah Hopson, his wife, who was the da'ter of Squire Claypole, whose wife was Margery Clough, that lived down upon Pacolet River—"

"Look you, Yaou, ain't you gitting into them derned facts agin, eh?"

"I reckon I em, 'Big Lie!' Scuse me: I'll kiver the pegs *direct-lie*, one a'ter t'other. Whar was I? Ah! Oh! Well, Jedge, poor hunter and poor man—jest, you see, a squatter on the

side of a leetle bit of a mountain close on to Columbus Mills, at Mount Tryon, I was all the time on a hot trail a'ter Merry Ann Hopson. I went thar to see her a'most every night; and sometimes I carried a buck for the old people, and sometimes a doe-skin for the gal, and I do think, bad hunter as I then was, I pretty much kept the fambly in deer meat through the whole winter."

"Good for you, Yaou! You're a-coming to it! That's the only fair trail of a lie that you've struck yit!"

So the "Big Lie," from the chair.

"Glad to hyar you say so," was the answer.

"I'll git on in time! Well, Jedge, though Jeff Hopson was glad enough to git my meat always, he didn't affection me, as I did his da'ter. He was a sharp, close, money-loving old fellow, who was always considerate of the main chaine; and the old lady, his wife, who hairdly dare say her soul was her own, she jest looked both ways, as I may say, for Sunday, never giving a fair look to me or my chainces, when his eyes were sot on *her*. But 'twa'n't so with my Merry Ann. She hed the eyes for me from the beginning, and soon she hed the feelings; and, you see, Jedge, we sometimes did git a chaine, when old Jeff was gone from home, to come to a sort of onderstanding about our feelings; and the long and the short of it was that Merry Ann confessed to me that she'd like nothing better than to be my wife. She liked no other man but me. Now, Jedge, a'ter that, what was a young fellow to do? That, I say, was the proper kind of encouragement. So I said, 'I'll ax your daddy.' Then she got scary, and said, 'Oh, don't; for somehow, Sam, I'm a-thinking daddy don't like you enough *yit*. Jest hold on a bit, and come often, and bring him venison, and try to make him laugh, which you kin do, you know, and a'ter a time you kin try him.' And so I did—or rether I didn't. I put off the axing. I come constant. I brought venison all the time, and b'ar meat a plenty, a'most three days in every week."

"That's it, Yaou. You're on trail. That's as derved a lie as you've tell'd yit; for all your hunting, in them days, didn't git more meat than you could eat your one self."

"Thank you, 'Big Lie.' I hopes I'll come up in time to the right measure of the camp."

"Well, Jedge, this went on for a long time, a'most the whole winter, and spring, and summer, till the winter begun to come in agin. I carried 'em the venison, and Merry Ann meets me in the woods, and we hes sich a pleasant time when we meets on them little odd chainces that I gits hot as thunder to bring the business to a sweet honey finish."

"But Merry Ann keeps on scary, and she puts me off; ontill, one day, one a'ternoon, about sundown, she meets me in the woods, and she's all in a flusteration. And she ups and tells me how old John Grimstead, the old bachelor (a fellow about forty years old, and the dear gal not yet twenty), how he's a'ter

her, and bekaise he's got a good fairm, and mules and horses, how her daddy's giving him the open mouth encouragement."

"Then I says to Merry Ann:

"'You sees, I kain't put off no longer. I must out with it, and ax your daddy at onst.' And then her scary fit come on again, and she begs me not to—not *jist yit*. But I swears by all the Hokies that I won't put off another day; and so, as I haired the old man was in the house that very hour, I left Merry Ann in the woods, all in a trimbling, and I jist went ahead, detarmined to have the figure made straight, whether odd or even."

"And Merry Ann, poor gal, she wrings her hainds, and cries a smart bit, and she wouldn't go to the house, but said she'd wait for me out thar. So I gin her a kiss into her very mouth—and did it over more than onst—and I left her, and pushed headlong for the house."

"I was jubous; I was mighty oncertain, and a leetle bit scary myself; for, you see, old Jeff was a fellow of tough grit, and with big grinders; but I was so oneasy, and so tired out waiting, and so desperate, and so fearsome that old bachelor Grimstead would get the start on me, that nothing could stop me now, and I jist bolted into the house, as free and easy and bold as ef I was the very best customer that the old man wanted to see."

Here Yaou paused to renew his draught of peach and honey.

IV.

"Well, Jedge, as I tell you, I put a bold face on the business, though my hairt was gitting up into my throat, and I was almost a-gasping for my breath, when I was fairly in the big room, and standing up before the old Squaire. He was a-setting in his big squar hide-bottom'd arm-chair, looking like a jedge upon the bench, jist about to send a poor fellow to the gallows. As he seed me come in, looking queer enough, I reckon, his mouth put on a sort of grin, which showed all his grinders, and he looked for all the world as ef he guessed the business I come about. But he said, good-natured enough:

"'Well, Sam Snaffles, how goes it?'

"Says I:

"'Pretty squar, considerin'. The winter's coming on fast, and I reckon the mountains will be full of meat before long.'

"Then says he, with another ugly grin, 'Ef 'twas your smoke-house that had it all, Sam Snaffles, 'stead of the mountains, 'twould be better for you, I reckon.'

"'I 'grees with you,' says I. 'But I rether reckon I'll git my full shar' of it afore the spring of the leaf agin.'

"'Well, Sam,' says he, 'I hopes, for your sake, 'twill be a big shar'. I'm afeard you're not the pusson to go for a big shar', Sam Snaffles. Seems to me you're too easy satisfied with a small shar'; sich as the fence-squarrel carries onder his two airms, calkilating only on a small corn-crib in the chestnut-tree.'

"'Don't you be afeard, Squire. I'll come out right. My cabin sha'n't want for nothing that a strong man with a stout hairt kin git, with good working—enough and more for himself, and perhaps another pusson.'

"'What other pusson?' says he, with another of his great grins, and showing of his grinders.

"'Well,' says I, 'Squire Hopson, that's jest what I come to talk to you about this blessed Friday night.'

"'You see 'twas Friday!

"'Well,' says he, 'go ahead, Sam Snaffles, and empty your brain-basket as soon as you kin, and I'll light my pipe while I'm a-hearing you.'

"'So he lighted his pipe, and laid himself back in his chair; shet his eyes, and begin to puff like blazes.

"'By this time my blood was beginning to bile in all my veins, for I seed that he was jest in the humor to tread on all my toes, and then ax a'ter my feelings. I said to myself:

"'It's jest as well to git the worst at onst, and then thar'll be an eend of the oneasiness.' So I up and told him, in pretty soft, smooth sort of speechifying, as how I was mighty fond of Merry Ann, and she, I was a-thinking, of me; and that I jest come to ax ef I might hev Merry Ann for my wife.

"'Then he opened his eyes wide, as ef he never expected to hear sich a proposal from me.

"'What!' says he. 'You?'

"'Jest so, Squire,' says I. 'Ef it pleases you to believe me, and to consider it reasonable, the axing.'

"'He sot quiet for a minit or more, then he gits up, knocks all the fire out of his pipe on the chimney, fills it, and lights it agin, and then comes straight up to me, whar I was a-setting on the chair in front of him, and without a word he takes the collar of my coat betwixt the thumb and forefinger of his left hand, and he says:

"'Git up, Sam Snaffles. Git up, ef you please.'

"'Well, I gits up, and he says:

"'Hyar! Come! Hyar!'

"'And with that he leads me right across the room to a big looking-glass that hung agin the

"'BUT YOU DON'T OBZARVE,' SAYS HE."

partition wall, and thar he stops before the glass, facing it and holding me by the collar all the time.

"'Now that looking-glass, Jedge, was about the biggest I ever did see! It was a'most three feet high, and a'most two feet wide, and it had a bright, broad frame, shiny like gold, with a heap of leetle figgers worked all round it. I reckon thar's no sich glass now in all the mountain country. I 'member when first that glass come home. It was a great thing, and the old Squire was mighty proud of it. He bought it at the sale of some rich man's furniter, down at Greenville, and he was jest as fond of looking into it as a young gal, and whenever he lighted his pipe, he'd walk up and down the room, seeing himself in the glass.

"'Well, thar he hed me up, both on us standing in front of this glass, whar we could a'most see the whole of our full figgers, from head to foot.

"'And when we hed stood thar for a minit or so, he says, quite solemn like:

"'Look in the glass, Sam Snaffles.'

"'So I looked.

"'Well,' says I. 'I sees you, Squire Hopson, and myself, Sam Snaffles.'

"'Look good,' says he, 'obzarve well.'

"'Well,' says I, 'I'm a-looking with all my eyes. I only sees what I tells you.'

"'But you don't obzarve,' says he. 'Looking and seeing's one thing,' says he, 'but obzarving's another. Now obzarve.'

"'By this time, Jedge, I was getting sort

o' riled, for I could see that somehow he was jest a-trying to make me feel redickilous. So I says:

"Look you, Squaire Hopson, ef you thinks I never seed myself in a glass afore this, you're mighty mistaken. I've got my own glass at home, and though it's but a leetle sort of a small, mean consarn, it shows me as much of my own face and figger as I cares to see at any time. I never cares to look in it 'cept when I'm brushing, and combing, and clipping off the straggling beard when it's too long for my eating.'

"Very well,' says he; 'now obzarve! You sees your own figger, and your face, and you air obzarving as well as you know how. Now, Mr. Sam Snaffles—now that you've hed a fair look at yourself—jest now answer me, from your honest conscience, a'ter all you've seed, ef you honestly thinks you're the sort of pusson to hev my da'ter!'

"And with that he gin me a twist, and when I wheeled round he hed wheeled round too, and thar we stood, full facing one another.

"Lawd! how I was riled! But I answered, quick:

"And why not, I'd like to know, Squaire Hopson? I ain't the handsomest man in the world, but I'm not the ugliest; and folks don't generally consider me at all among the uglies. I'm as tall a man as you, and as stout and strong, and as good a man o' my inches as ever stepped in shoe-leather. And it's enough to tell you, Squaire, whatever you may think, that Merry Ann believes in me, and she's a way of thinking that I'm jest about the very pusson that ought to hev her.'

"Merry Ann's thinking,' says he, 'don't run all fours with her fayther's thinking. I axed you, Sam Snaffles, to obzarve yourself in the glass. I telled you that seeing warn't ed-zactly obzarving. You seed only the inches; you seed that you hed eyes and mouth and nose and the airms and legs of the man. But eyes and mouth and legs and airms don't make a man!'

"Oh, they don't!' says I.

"No, indeed,' says he. 'I seed that you hed all them; but then I seed thar was one thing that you hedn't got.'

"Jimini!' says I, mighty conflustered. 'What thing's a-wanting to me to make me a man?'

"Capital!' says he, and he lifted himself up and looked mighty grand.

"Capital!' says I; 'and what's that?'

"Thar air many kinds of capital,' says he. 'Money's capital, for it kin buy every thing. House and lands is capital; cattle and horses and sheep—when thar's enough on 'em—is capital. And as I obzarved you in the glass, Sam Snaffles, I seed that capital was the very thing that you wanted to make a man of you! Now I don't mean that any da'ter of mine shall marry a pusson that's not a perfect man. I obzarved you long ago, and seed whar you was

wanting. I axed about you. I axed your horse.'

"Axed my horse!' says I, pretty nigh dum-founded.

"Yes; I axed your horse, and he said to me: 'Look at me! I hain't got an ounce of spar' flesh on my bones. You kin count all my ribs. You kin lay the whole length of your airm betwixt any two on 'em, and it'll lie thar as snug as a black snake betwixt two poles of a log-house.' Says he, 'Sam's got no capital! He ain't got, any time, five bushels of corn in his crib; and he's such a monstrous feeder himself that he'll eat out four bushels, and think it mighty hard upon him to give me the other one.' Thar, now, was your horse's testimony, Sam, agin you. Then I axed about your cabin, and your way of living. I was curious, and went to see you one day when I knowed you waur at home. You hed but one chair, which you gin me to set on, and you sot on the eend of a barrel for yourself. You gin me a rasher of bacon what hedn't a streak of fat in it. You hed a poor quarter of a poor doe hanging from the rafters—a poor beast that somebody hed disabled—'

"I shot it myself,' says I.

"Well, it was a-dying when you shot it; and all the hunters say you was a poor shooter at any thing. You cooked our dinner yourself, and the hoe-cake was all dough, not hafe done, and the meat was all done as tough as ef you had dried it for a month of Sundays in a Flurriday sun! Your cabin had but one room, and that you slept in and ate in; and the floor was six inches deep in dirt! Then, when I looked into your garden, I found seven stalks of long collards only, every one seven foot high, with all the leaves stript off it, as ef you wanted 'em for broth; till thar waur only three top leaves left on every stalk. You hedn't a stalk of corn growing, and when I scratched at your turnip-bed I found nothing bigger than a chestnut. Then, Sam, I begun to ask about your fairm, and I found that you was nothing but a squatter on land of Columbus Mills, who let you have an old nigger pole-house, and an acre or two of land. Says I to myself, says I, 'This poor fellow's got no capital; and he hasn't the head to git capital;' and from that moment, Sam Snaffles, the more I obzarved you, the more sartin 'twas that you never could be a man, ef you waur to live a thousand years. You may think, in your vanity, that you air a man; but you ain't, and never will be, onless you kin find a way to git capital; and I loves my gal child too much to let her marry any pusson whom I don't altogether consider a man!'

"A'ter that long speechifying, Jedge, you might ha' ground me up in a mill, biled me down in a pot, and scattered me over a manure heap, and I wouldn't ha' been able to say a word!

"I cotched up my hat, and was a-gwine, when he said to me, with his derved infernal big grin:

"Take another look in the glass, Sam Snaffles, and obzarve well, and you'll see jest whar it is I thinks that you're wanting."

"I didn't stop for any more. I jest bolted, like a hot shot out of a shovel, and didn't know my own self, or whatever steps I tuk, tell I got into the thick and met Merry Ann coming towards me."

"I must liquor now!"

V.

"Well, Jedge, it was a hard meeting betwixt me and Merry Ann. The poor gal come to me in a sort of run, and hairdly drawing her breath, she cried out:

"Oh, Sam! What does he say?"

"What could I say? How tell her? I jest wrapped her up in my airms, and I cries out, making some violent remarks about the old Squire."

"Then she screamed, and I hed to squeeze her up, more close than ever, and kiss her, I reckon, more than a dozen times, jest to keep her from gwine into historical fits. I telled her all, from beginning to eend."

"I telled her that thar waur some truth in what the old man said: that I hedn't been keerful to do the thing as I ought; that the house *was* mean and dirty; that the horse was mean and poor; that I hed been thinking too much about her own self to think about other things; but that I would do better, would see to things, put things right, git corn in the crib, git 'capital,' ef I could, and make a good, comfortable home for *her*."

"Look at me," says I, "Merry Ann. Does I look like a man?"

"You're are all the man I wants," says she.

"That's enough," says I. "You shall see what I kin do, and what I *will* do! That's ef you air true to me."

"I'll be true to you, Sam," says she.

"And you won't think of nobody else?"

"Never," says she.

"Well, you'll see what I kin do, and what I *will* do. You'll see that I *em* a man; and ef thar's capital to be got in all the country, by working and hunting, and fighting, ef that's needful, we shill hev it. Only you be true to me, Merry Ann."

"And she throwed herself upon my buzzom, and cried out:

"I'll be true to you, Sam. I loves nobody in all the world so much as I loves you."

"LOOK AT ME, MERRY ANN. DOES I LOOK LIKE A MAN?"

"And you won't marry any other man, Merry Ann, no matter what your daddy says?"

"Never," she says.

"And you won't listen to this old bachelor fellow, Grimstead, that's got the 'capital' already, no matter how they spurs you?"

"Never!" she says.

"Sw'ar it!" says I—"sw'ar it, Merry Ann—that you will be my wife, and never marry Grimstead!"

"I sw'ars it," she says, kissing *me*, bekaize we had no book.

"Now," says I, "Merry Ann, that's not enough. Cuss him for my sake, and to make it sartin. Cuss that fellow Grimstead."

"Oh, Sam, I kain't cuss," says she; "that's wicked."

"Cuss him on my account," says I—"to my credit."

"Oh," says she, "don't ax me. I kain't do that."

"Says I, 'Merry Ann, if you don't cuss that fellow, some way, I do believe you'll go over to him a'ter all. Jest you cuss him, now. Any small cuss will do, ef you're in airnest.'

"Well," says she, "ef that's your idee, then

I says, "*Drot his skin,** and drot my skin, too, ef ever I marries any body but Sam Snaffles."

"That 'll do, Merry Ann," says I. "And now I'm easy in my soul and conscience. And now, Merry Ann, I'm gwine off to try my best, and git the "capital." Ef it's the "capital" that's needful to make a man of me, I'll git it, by all the Holy Hokies, if I kin."

"And so, after a million of squeezes and kisses, we parted; and she slipt along through the woods, the back way to the house, and I mounted my horse to go to my cabin. But, afore I mounted the beast, I gin him a dozen kicks in his ribs, jest for bearing his testimony agin me, and telling the old Squaire that I hedn't 'capital' enough for a corn crib."

VI.

"I was mightily let down, as you may think, by old Squaire Hopson; but I was mightily lifted up by Merry Ann.

"But when I got to my cabin, and seed how mean every thing was there, and thought how true it was, all that old Squaire Hopson had said, I felt overkim, and I said to myself, 'It's all true! How kin I bring that beautiful yaller flower of the forest to live in sich a mean cabin, and with sich poor accommydations? She that had every thing comforting and nice about her.'

"Then I considered all about 'capital;' and it growed on me, ontill I begin to see that a man might hev good legs and arms and thighs, and a good face of his own, and yit not be a perfect and proper man a'ter all! I hed lived, you see, Jedge, to be twenty-three years of age, and was living no better than a three-old-year b'ar, in a sort of cave, sleeping on shuck and straw, and never looking after to-morrow.

"I couldn't sleep all that night for the thinking, and obzarvations. That impudent talking of old Hopson put me on a new track. I couldn't give up hunting. I knowed no other business, and I didn't hafe know that.

"I thought to myself, 'I must l'arn my business so as to work like a master.'

"But then, when I considered how hard it was, how slow I was to git the deers and the b'ar, and what a small chaine of money it brought me, I said to myself:

"Whar's the "capital" to come from?"

"Lawd save us! I ate up the meat pretty much as fast as I got it!

"Well, Jedge, as I said, I had a most miserable night of consideration and obzarvation and concatenation accordingly. I felt all over

mean, 'cept now and then, when I thought of dear Merry Ann, and her felicities and cordialities and fidelities; and then, the cuss which she gin, onder the kiver of 'Drot,' to that dried up old bachelor Grimstead. But I got to sleep at last. And I hed a dream. And I thought I seed the prettiest woman critter in the world, next to Merry Ann, standing close by my bedside; and, at first, I thought 'twas Merry Ann, and I was gwine to kiss her agin; but she drawed back and said:

"Scuse me! I'm not Merry Ann; but I'm her friend and your friend; so don't you be down in the mouth, but keep a good hairt, and you'll hev help, and git the "capital" whar you don't look for it now. It's only needful that you be detarmined on good works and making a man of yourself."

"A'ter that dream I slept like a top, woke at day-peep, took my rifle, called up my dog, mounted my horse, and put out for the laurel hollows.

"Well, I hunted all day, made several starts, but got nothing; my dog ran off, the rascally pup, and, I reckon, ef Squaire Hopson had met him he'd ha' said 'twas bekaise I starved him! Fact is, we hedn't any on us much to eat that day, and the old mar's ribs stood out bigger than ever.

"All day I rode and followed the track and got nothing.

"Well, jest about sunset I come to a hollow of the hills that I hed never seed before; and in the middle of it was a great pond of water, what you call a lake; and it showed like so much purple glass in the sunset, and 'twas jest as smooth as the big looking-glass of Squaire Hopson's. Thar wa'n't a breath of wind stirring.

"I was mighty tired, so I eased down from the mar', tied up the bridle and check, and let her pick about, and laid myself down onder a tree, jest about twenty yards from the lake, and thought to rest myself ontill the moon riz, which I knowed would be about seven o'clock.

"I didn't mean to fall asleep, but I did it; and I reckon I must ha' slept a good hour, for when I woke the dark hed set in, and I could only see one or two bright stars hyar and thar, shooting out from the dark of the heavens. But, ef I seed nothing, I haird; and jest sich a sound and noise as I hed never haird before.

"Thar was a rushing and a roaring and a screaming and a plashing, in the air and in the water, as made you think the univarsal world was coming to an eend!

"All that set me up. I was waked up out of sleep and dream, and my eyes opened to every thing that eye could see; and sich another sight I never seed before! I tell you, Jedge, ef there was one wild-goose settling down in that lake, thar was one hundred thousand of 'em! I couldn't see the eend of 'em. They come every minit, swarm a'ter swarm, in tens and twenties and fifties and hundreds; and sich a fuss as they did make! sich a gabbling, sich a splashing, sich a confusion, that I was fairly

* "Drot," or "Drat," has been called an American vulgarism, but it is genuine old English, as ancient as the days of Ben Jonson. Originally the oath was, "God rot it;" but Puritanism, which was unwilling to take the name of God in vain, was yet not prepared to abandon the oath, so the pious preserved it in an abridged form, omitting the G from God, and using, "Od rot it." It reached its final contraction, "Drot," before it came to America. "Drot it," "Drat it," "Drot your eyes," or "Drot his skin," are so many modes of using it among the uneducated classes.

conflusterated; and I jest lay whar I was, a-watching 'em.

"You never seed beasts so happy! How they flapped their wings; how they gabbled to one another; how they swam hyar and thar, to the very middle of the lake and to the very edge of it, jest a fifty yards from whar I lay squat, never moving leg or arm! It was wonderful to see! I wondered how they could find room, for I reckon thar waur forty thousand on 'em, all scuffling in that leetle lake together!

"Well, as I watched 'em, I said to myself:

"Now, if a fellow could only captivate all them wild-geese—fresh from Canniday, I reckon—what would they bring in the market at Spartanburg and Greenville? Walker, I knowed, would buy 'em up quick at fifty cents a head. Forty thousand geese at fifty cents a head. Thar was "capital!"

"I could ha' fired in among 'em with my rifle, never taking aim, and killed a dozen or more, at a single shot; but what was a poor dozen geese, when thar waur forty thousand to captivate?

"What a haul 'twould be, ef a man could only get 'em all in one net! Kiver 'em all at a fling!

"The idee worked like so much fire in my brain.

"How kin it be done?

"That was the question!

"Kin it be done?" I axed myself.

"It kin," I said to myself; "and I'm the very man to do it!" Then I begun to work away in the thinking. I thought over all the traps and nets and snares that I hed ever seen or haired of; and the leetle eends of the idee begun to come together in my head; and, watching all the time how the geese flopped and splashed and played and swum, I said to myself:

"Oh! most beautiful critters! ef I don't make some "capital" out of you, then I'm not dezarving sich a beautiful yaller flower of the forest as my Merry Ann!"

"Well, I watched a long time, ontill dark night, and the stars begun to peep down upon me over the high hill-tops. Then I got up and tuk to my horse and rode home.

"And thar, when I hed swallowed my bit of hoe-cake and bacon and a good strong cup of coffee, and got into bed, I couldn't sleep for a long time, thinking how I was to git them geese.

"But I kept nearing the right idee every minit, and when I was fast asleep it come to me in my dream.

"I seed the same beautifulest young woman agin that hed given me the incouragement before to go ahead, and she helped me out with the idee.

"So, in the morning, I went to work. I rode off to Spartanburg, and bought all the twine and cord and hafe the plow-lines in town; and I got a lot of great fishhooks, all to help make the tanglement perfect; and I got lead for sinkers, and I got cork-wood for

floaters; and I pushed for home jist as fast as my poor mar' could streak it.

"I was at work day and night, for nigh on to a week, making my net; and when 'twas done I borrowed a mule and cart from Columbus Mills, thar;—he'll tell you all about it—he kin make his affidavy to the truth of it.

"Well, off I driv with my great net, and got to the lake about noonday. I knowed 'twould take me some hours to make my fixings perfect, and git the net fairly stretched across the lake, and jest deep enough to do the tangling of every leg of the birds in the very midst of their swimming and snorting and splashing and cavorting! When I hed fixed it all fine, and jest as I wanted it, I brought the eends of my plow-lines up to where I was gwine to hide myself. This was onder a strong sapling, and my calkilation was when I hed got the beasts all hooked, forty thousand, more or less—and I could tell how that was from feeling on the line—why, then, I'd whip the line round the sapling, hitch it fast, and draw in my birds at my own ease, without axing much about their comfort.

"'Twas a most beautiful and perfect plan, and all would ha' worked beautiful well but for one leetle oversight of mine. But I won't tell you about that part of the business yit, the more pretickilarly as it all turned out for the very best, as you'll see in the eend.

"I hedn't long finished my fixings when the sun suddenly tumbled down the heights, and the dark begun to creep in upon me, and a pretty cold dark it waur! I remember it well! My teeth begun to chatter in my head, though I was boiling over with inward heat, all jest coming out of my hot eagerness to be captivating the birds.

"Well, Jedge, I hedn't to wait overlong. Soon I haired them coming, screaming fur away, and then I seed them pouring, jest like so many white clouds, straight down, I reckon, from the snow mountains off in Canniday.

"Down they come, millions upon millions, till I was sartin thar waur already pretty nigh on to forty thousand in the lake. It waur always a nice calkilation of mine that the lake could hold fully forty thousand, though onst, when I went round to measure it, stepping it off, I was jubous whether it could hold over thirty-nine thousand; but, as I tuk the measure in hot weather and in a dry spell, I concluded that some of the water along the edges hed dried up, and 'twa'n't so full as when I made my first calkilation. So I hev stuck to that first calkilation ever since.

"Well, thar they waur, forty thousand, we'll say, with, it mout be, a few millions and hundreds over. And Lawd! how they played and splashed and screamed and dived! I calkilated on hooking a good many of them divers, in pretickilar, and so I watched and waited, ontill I thought I'd feel of my lines; and I begun, leetle by leetle, to haul in, when, Lawd love you, Jedge, sich a ripping and raging, and bouncing

"BEFORE I KNEWED WHAR I WAS, I WAS TWENTY FEET IN THE AIR."

and flouncing, and flopping and splashing, and kicking and screaming, you never did hear in all your born days!

"By this I knowed that I hed captivated the captains of the host, and a pretty smart chainece, I reckoned, of the rigilar army, ef 'twa'n't edzactly forty thousand; for I calkilated that some few would git away—run off, jest as the cowards alwais does in the army, jest when the shooting and confusion begins; still, I reasonably calkilated on the main body of the rigiments; and so, gitting more and more hot and eager, and pulling and hauling, I made one big mistake, and, instid of wrapping the cends of my lines around the sapling that was standing jest behind me, what does I do but wraps 'em round my own thigh—the right thigh, you see—and some of the loops waur hitched round my left arm at the same time!

"All this come of my hurry and ixcitement, for it was burning like a hot fever in my brain, and I didn't know when or how I hed tied myself up, ontill suddently, with an all-fired scream, all together, them forty thousand geese rose like a great black cloud in the air, all tied up,

tangled up—hooked about the legs, hooked about the gills, hooked and fast in some way in the beautiful leetle twistings of my net!

"Yes, Jedge, as I'm a living hunter to-night, hyar a-talking to you, they riz up all together, as ef they hed consulted upon it, like a mighty thunder-cloud, and off they went, screaming and flouncing, meaning, I reckon, to take the back track to Canniday, in spite of the freezing weather.

"Before I knowed whar I was, Jedge, I was twenty feet in the air, my right thigh up and my left arm, and the other thigh and arm a-dangling useless, and feeling every minit as ef they was gwine to drop off.

"You may be sure I pulled with all my might, but that waur mighty leetle in the fix I was in, and I jest hed to hold on, and see whar the infernal beasts would carry me. I couldn't loose myself, and ef I could I was by this time quite too fur up in the air, and darsn't do so, onless I was willing to hev my brains dashed out, and my whole body mashed to a mammock!

"Oh, Jedge, jest consider my sitivation! It's sich a ricollection, Jedge, that I must rest and liquor, in order to rekiwer the necessary strength to tell you what happened next."

VII.

"Yes, Jedge," said Yaou, resuming his narrative, "jest stop whar you air, and consider my sitivation!

"Thar I was dangling, like a dead weight, at the tail of that all-fired cloud of wild-geese, head downward, and gwine, the Lawd knows whar!—to Canniday, or Jericho, or some other heathen territory beyond the Massissipp, and it mout be, over the great eternal ocean!

"When I thought of *that*, and thought of the plow-lines giving way, and that on a sudden I should come down plump into the big sea, jest in the middle of a great gathering of shirks and whales, to be dewoured and tore to bits by their bloody grinders, I was ready to die of skeer outright. I thought over all my sinnings in a moment, and I thought of my poor dear Merry Ann, and I called out her name, loud as I could, jest as ef the poor gal could hyar me or help me.

"And jest then I could see we waur a drawing nigh a great thunder-cloud. I could see the red tongues running out of its black jaws; and 'Lawd!' says I, 'ef these all-fired infarnal wild beasts of birds should carry me into that cloud to be burned to a coal, fried, and roasted, and biled alive by them tongues of red fire!'

"But the geese fought shy of the cloud, though we passed mighty nigh on to it, and I could see one red streak of lightning run out of the cloud and give us chase for a full hafe a mile; but we waur too fast for it, and, in a tearing passion bekaise it couldn't ketch us, the red streak struck its horns into a great tree jest behind us, that we hed passed over, and tore it into flinders, in the twink of a musquito.

"But by this time I was beginning to feel

quite stupid. I knowed that I waur fast gitting onsensible, and it did seem to me as ef my hour waur come, and I was gwine to die—and die by rope, and dangling in the air, a thousand miles from the airth!

“But jest then I was roused up. I felt something brush agin me; then my face was scratched; and, on a suddent, thar was a stop put to my travels by that conveyance. The geese had stopped flying, and waur in a mighty great confusturation, flopping their wings, as well as they could, and screaming with all the tongues in their jaws. It was clar to me now that we hed run agin something that brought us all up with a short hitch.

“I was shook roughly agin the obstruction, and I put out my right arm and cotched a hold of a long arm of an almighty big tree; then my legs waur cotched betwixt two other branches, and I rekivered myself, so as to set up a leetle and rest. The geese was a tumbling and flopping among the branches. The net was hooked hyar and thar; and the birds waur all about me, swinging and splurging, but onable to break loose and git away.

“By leetle and leetle I come to my clar senses, and begun to feel my sitivation. The stiffness was passing out of my limbs. I could draw up my legs, and, after some hard work, I managed to onwrap the plow-lines from my right thigh and my left arm, and I hed the sense this time to tie the eends pretty tight to a great branch of the tree which stretched clar across and about a foot over my head.

“Then I begun to consider my sitivation. I hed hed a hard riding, that was sartin; and I felt sore enough. And I hed hed a horrid bad skear, enough to make a man’s wool turn white afore the night was over. But now I felt easy, bekaise I considered myself safe. With day-peep I kalkilated to let myself down from the tree by my plow-lines, and thar, below, tied fast, warn’t thar my forty thousand captivated geese?

“‘Hurrah!’ I sings out. ‘Hurrah, Merry Ann; we’ll hev the “capital” now, I reckon!’

“And singing out, I drew up my legs and shifted my body so as to find an easier seat in the crutch of the tree, which was an almighty big chestnut oak, when, O Lawd! on a suddent the stump I hed been a-setting on give way onder me. ’Twas a rotten jint of the tree. It give way, Jedge, as I tell you, and down I went, my legs first and then my whole body—slipping down not on the outside, but into a great hollow of the tree, all the hairt of it being eat out by the rot; and afore I knowed whar I waur, I waur some twenty foot down, I reckon; and by the time I touched bottom, I was up to my neck in honey!

“It was an almighty big honey-tree, full of the sweet treacle; and the bees all gone and left it, I reckon, for a hundred years. And I in it up to my neck.

“I could smell it strong. I could taste it sweet. But I could see nothing.

“Lawd! Lawd! From bad to worse; buried alive in a hollow tree with never a chaine to git out! I would then ha’ given all the world ef I was only sailing away with them bloody wild-geese to Canniday, and Jericho, even across the sea, with all its shirks and whales dewouring me.

“Buried alive! O Lawd! O Lawd! ‘Lawd save me and help me!’ I cried out from the depths. And ‘Oh, my Merry Ann,’ I cried, ‘shill we never meet agin no more!’ Scuse my weeping, Jedge, but I feels all over the sinsation, fresh as ever, of being buried alive in a bee-hive tree and presarved in honey. I must liquor, Jedge.”

VIII.

Yaon, after a great swallow of peach and honey, and a formidable groan after it, resumed his narrative as follows:

“Only think of me, Jedge, in my sitivation! Buried alive in the hollow of a mountain chestnut oak! Up to my neck in honey, with never no more an appetite to eat than ef it waur the very gall of bitterness that we reads of in the Holy Scripters!

“All dark, all silent as the grave; ’cept for the gabbling and the cackling of the wild-geese outside, that every now and then would make a great splurging and cavorting, trying to break away from their hitch, which was jist as fast fixed as my own.

“Who would git them geese that hed cost me so much to captivate? Who would inherit my ‘capital?’ and who would hev Merry Ann? and what will become of the mule and cart of Mills fastened in the woods by the leetle lake?

“I cussed the leetle lake, and the geese, and all the ‘capital.’

“I cussed. I couldn’t help it. I cussed from the bottom of my hairt, when I ought to ha’ bin saying my prayers. And thar was my poor mar’ in the stable with never a morsel of feed. She had told tales upon me to Squaire Hopson, it’s true, but I forgin her, and thought of her feed, and nobody to give her none. Thar waur corn in the crib and fodder, but it warn’t in the stable; and onless Columbus Mills should come looking a’ter me at the cabin, thar waur no hope for me or the mar’.

“Oh, Jedge, you couldn’t jedge of my sitivation in that deep hollow, that cave, I may say, of mountain oak! My head waur jest above the honey, and ef I backed it to look up, my long ha’r at the back of the neck a’most stuck fast, so thick was the honey.

“But I couldn’t help looking up. The hollow was a wide one at the top, and I could see when a star was passing over. Thar they shined, bright and beautiful, as ef they waur the very eyes of the angels; and, as I seed them come and go, looking smiling in upon me as they come, I cried out to ’em, one by one:

“‘Oh, sweet sperrits, blessed angels! ef so be thar’s an angel sperrit, as they say, living in all them stars, come down and extricate me

from this fix; for, so fur as I kin see, I've got no chaine of help from mortal man or woman. Hairdly onst a year does a human come this way; and ef they did come, how would they know I'm hyar? How could I make them hyar me? O Lawd! O blessed, beautiful angels in them stars! O give me help! Help me out! I knowed I prayed like a heathen sinner, but I prayed as well as I knowed how; and thar warn't a star passing over me that I didn't pray to, soon as I seed them shining over the opening of the hollow; and I prayed fast and faster as I seed them passing away and gitting out of sight.

"Well, Jedge, suddently, in the midst of my praying, and jest after one bright, big star hed gone over me without seeing my sitivation, I hed a fresh skeer.

"Suddent I haird a monstrous fluttering among my geese—my 'capital.' Then I haird a great scraping and scratching on the outside of the tree, and, suddent, as I looked up, the mouth of the hollow was shet up.

"All was dark. The stars and sky waur all gone. Something black kivered the hollow, and, in a minit a'ter, I haird something slipping down into the hollow right upon me.

"I could hairdly draw my breath. I begun to fear that I was to be siffocated alive; and as I haird the strange critter slipping down, I shoved out my hands and felt ha'r—coarse wool—and with one hand I cotched hold of the ha'ry leg of a beast, and with t'other hand I cotched hold of his tail.

"'Twas a great b'ar, one of the biggest, come to git his honey. He knowed the tree, Jedge, you see, and ef any beast in the world loves honey, 'tis a b'ar beast. He'll go his death on honey, though the hounds are tearing at his very haunches.

"You may be sure, when I onst knowed what he was, and onst got a good gripe on his hind-quarters, I warn't gwine to let go in a hurry. I knowed that was my only chaine for gitting out of the hollow, and I do believe them blessed angels in the stars sent the beast, jest at the right time, to give me human help and assistance.

"Now, yer see, Jedge, thar was no chaine for him turning round upon me. He pretty much filled up the hollow. He knowed his way, and slipped down, eend foremost—the latter eend, you know. He could stand up on his hind-legs and eat all he wanted. Then, with his great sharp claws and his mighty muscle, he could work up, holding on to the sides of the tree, and git out a'most as easy as when he come down.

"Now, you see, ef he weighed five hundred pounds, and could climb like a cat, he could easy carry up a young fellow that hed no flesh to spar', and only weighed a hundred and twenty-five. So I laid my weight on him, eased him off as well as I could, but held on to tail and leg as ef all life and etarnity depended upon it.

"Now I reckon, Jedge, that b'ar was pretty much more skeered than I was. He couldn't turn in his shoes, and with something fastened to his ankles, and, as he thought, I reckon, some strange beast fastened to his tail, you never seed beast more eager to git away, and git upwards. He knowed the way, and stuck his claws in the rough sides of the hollow, hand over hand, jest as a sailor pulls a rope, and up we went. We hed, howsomdever, more than one slip back; but, Lawd bless you! I never let go. Up we went, I say, at last, and I stuck jest as close to his haunches as death sticks to a dead nigger. Up we went. I felt myself moving. My neck was out of the honey. My airms were free. I could feel the sticky thing slipping off from me, and a'ter a good quarter of an hour the b'ar was on the great mouth of the hollow; and as I felt that I let go his tail, still keeping fast hold of his leg, and with one hand I cotched hold of the outside rim of the hollow; I found it fast, held on to it; and jest then the b'ar sat squat on the very edge of the hollow, taking a sort of rest a'ter his labor.

"I don't know what 'twas, Jedge, that made me do it. I warn't a-thinking at all. I was only feeling and drawing a long breath. Jest then the b'ar sort o' looked round, as ef to see what varmint it was a-troubling him, when I gin him a mighty push, strong as I could, and he lost his balance and went over outside down cl'ar to the airth, and I could hyar his neck crack, almost as loud as a pistol.

"I drewed a long breath a'ter that, and prayed a short prayer; and feeling my way all the time, so as to be sure agin rotten branches, I got a safe seat among the limbs of the tree, and sot myself down, detarmined to wait tell broad daylight before I tuk another step in the business."

IX.

"And thar I sot. So fur as I could see, Jedge, I was safe. I hed got out of the tie of the flying geese, and thar they all waur, spread before me, flopping now and then and trying to ixtricate themselves; but they couldn't come it! Thar they waur, captivated, and so much 'capital' for Sam Snaffles.

"And I hed got out of the lion's den; that is, I hed got out of the honey-tree, and warn't in no present danger of being buried alive agin. Thanks to the b'ar, and to the blessed, beautiful angel sperrits in the stars, that hed sent him thar seeking honey, to be my deliverance from my captivation!

"And thar he lay, jest as quiet as ef he waur a-sleeping, though I knowed his neck was broke. And that b'ar, too, was so much 'capital.'

"And I sot in the tree making my kalkilations. I could see now the meaning of that beautiful young critter that come to me in my dreams. I was to hev the 'capital,' but I was to git it through troubles and tribulations, and a mighty bad skeer for life. I never knowed the valley of 'capital' till now, and I seed the sense in all that Squire Hopson told

me, though he did tell it in a mighty spiteful sperrit.

"Well, I kalkilated.

"It was cold weather, freezing, and though I had good warm clothes on, I felt monstrous like sleeping, from the cold only, though perhaps the tire and the skeer together hed something to do with it. But I was afeard to sleep. I didn't know what would happen, and a man has never his right courage ontill daylight. I fou't agin sleep by keeping on my kalkilation.

"Forty thousand wild-geese!

"Thar wa'n't forty thousand, edzactly—very far from it—but thar they waur, pretty thick; and for every goose I could git from forty to sixty cents in all the villages in South Carolina.

"Thar was 'capital!'

"Then thar waur the b'ar.

"Jedging from his strength in pulling me up, and from his size and fat in filling up that great hollow in the tree, I kalkilated that he couldn't weigh less than five hundred pounds. His hide, I knowed, was worth twenty dollars. Then thar was the fat and tallow, and the biled marrow out of his bones, what they makes b'ars grease out of, to make chicken whiskers grow big enough for game-cocks. Then thar waur the meat, skinned, cleaned, and all; thar couldn't be much onder four hundred and fifty pounds, and whether I sold him as fresh meat or cured, he'd bring me ten cents a pound at the least.

"Says I, 'Thar's capital!'

"Then,' says I, 'thar's my honey-tree! I reckon thar's a matter of ten thousand gallons in this hyar same honey-tree; and if I kint git fifty to seventy cents a gallon for it thar's no alligators in Flurriday!'

"And so I kalkilated through the night, fighting agin sleep, and thinking of my 'capital' and Merry Ann together.

"By morning I had kalkilated all I hed to do and all I hed to make.

"Soon as I got a peep of day I was bright on the look-out.

"Thar all around me were the captivated geese critters. The b'ar laid down perfectly easy and waiting for the knife; and the geese, I reckon they waur much more tired than me, for they didn't seem to hev the hairt for a single flutter, even when they seed me swing down from the tree among 'em, holding on to my plow-lines and letting myself down easy.

"But first I must tell you, Jedge, when I seed the first signs of daylight and looked around me, Lawd bless me, what should I see but old Tryon Mountain, with his great head lifting itself up in the east! And beyant I could see the house and fairm of Columbus Mills; and as I turned to look a leetle south of that, thar was my own poor leetle log-cabin standing quiet, but with never a smoke streaming out from the chimbley.

"'God bless them good angel sperrits,' I said, 'I ain't two miles from home!' Before I come down from the tree I knowed edzactly whar I waur. 'Twas only four miles off from

"THAR'S CAPITAL!"

the lake and whar I hitched the mule of Columbus Mills close by the cart. Thar, too, I hed left my rifle. Yit in my miserable fix, carried through the air by them wild-geese, I did think I hed gone a'most a thousand miles towards Canniday.

"Soon as I got down from the tree I pushed off at a trot to git the mule and cart. I was pretty sure of my b'ar and geese when I come back. The cart stood quiet enough. But the mule, having nothing to eat, was sharpening her teeth upon a boulder, thinking she'd hev a bite or so before long.

"I hitched her up, brought her to my beech-tree, tumbled the b'ar into the cart, wrung the necks of all the geese that waur thar—many hed got away—and counted some twenty-seven hundred that I piled away atop of the b'ar."

"Twenty-seven hundred!" cried the "Big Lie" and all the hunters at a breath. "Twenty-seven hundred! Why, Yaou, whenever you telled of this thing before you always counted them at 3150!"

"Well, ef I did, I reckon I was right. I was sartinly right then, it being all fresh in my 'membrance; and I'm not the man to go back agin his own words. No, fellows, I sticks to first words and first principles. I scorns to eat my own words. Ef I said 3150, then 3150 it waur, never a goose less. But you'll see how to 'count for all. I reckon 'twas only 2700 I fotched to market. Thar was 200 I gin to Columbus Mills. Then thar was 200 more I carried to Merry Ann; and then thar waur 50 at least, I reckon, I kep for myself. Jest you count up, Jedge, and you'll see how to squar' it on all sides. When I said 2700 I only counted what I sold in the villages, every head of 'em at fifty cents a head; and a'ter putting the money in my pocket I felt all over that I hed the 'capital.'

"Well, Jedge, next about the b'ar. Sold the hide and tallow for a fine market-price; sold the meat, got ten cents a pound for it fresh—'twas most beautiful meat; biled down

the bones for the marrow; melted down the grease; sold fourteen pounds of it to the barbers and apothecaries; got a dollar a pound for that; sold the hide for twenty dollars; and got the cash for every thing.

"Thar warn't a fambly in all Greenville and Spartanburg and Asheville that didn't git fresh, green wild-geese from me that season, at fifty cents a head, and glad to git, too; the cheapest fresh meat they could buy; and, I reckon, the finest. And all the people of them villages, ef they hed gone to heaven that week, in the flesh, would have carried nothing better than goose-flesh for the risurrection! Every body ate goose for a month, I reckon, as the weather was freezing cold all the time, and the beasts kept week after week, until they waur eaten. From the b'ar only I made a matter of full one hundred dollars. First, thar waur the hide, \$20; then 450 pounds of meat, at 10 cents, was \$45; then the grease, 14 pounds, \$14; and the tallow, some \$6 more; and the biled marrow, \$11.

"Well, count up, Jedge; 2700 wild-geese, at 50 cents, you sees, must be more than \$1350. I kin only say, that a'ter all the selling—and I driv at it day and night, with Columbus Mills's mule and cart, and went to every house in every street in all them villages. I hed a'most fifteen hundred dollars, safe stowed away onder the pillows of my bed, all in solid gould and silver.

"But I warn't done! Thar was my beehive. Don't you think I waur gwine to lose that honey! no, my darlint! I didn't beat the drum about nothing. I didn't let on to a soul what I was a-doing. They axed me about the wild-geese, but I sent 'em on a wild-geese chase; and 'twa'n't till I hed sold off all the b'ar meat and all the geese that I made ready to git at that honey. I reckon them bees must ha' been making that honey for a hundred years, and was then driv out by the b'ars.

"Columbus Mills will tell you; he axed me all about it; but, though he was always my good friend, I never even telled it to him. But he lent me his mule and cart, good fellow as he is, and never said nothing more; and, quiet enough, without beat of drum, I bought up all the tight-bound barrels that ever brought whisky to Spartanburg and Greenville, whar they hes the taste for that article strong; and day by day I went off carrying as many barrels as the cart could hold and the mule could draw. I tapped the old tree—which was one of the oldest and biggest chestnut oaks I ever did see—close to the bottom, and drewed off the beautiful treacle. I was more than sixteen days about it, and got something over two thousand gallons of the purest, sweetest, yellowest honey you ever did see. I could hairdly git barrels and jimmyjohns enough to hold it; and I sold it out at seventy cents a gallon, which was mighty cheap. So I got from the honey a matter of fourteen hundred dollars.

"Now, Jedge, all this time, though it went very much agin the grain, I kept away from

Merry Ann and the old Squire, her daddy. I sent him two hundred head of geese—some fresh, say one hundred, and another hundred that I hed cleaned and put in salt—and I sent him three jimmyjohns of honey, five gallons each. But I kept away and said nothing, beat no drum, and hed never a thinking but how to git in the 'capital.' And I did git it in!

"When I carried the mule and cart home to Columbus Mills I axed him about a sartin farm of one hundred and sixty acres that he hed to sell. It hed a good house on it. He selled it to me cheap. I paid him down, and put the titles in my pocket. 'Thar's capital!' says I.

"*That waur a fixed thing for ever and ever.* And when I hed moved every thing from the old cabin to the new farm, Columbus let me hev a fine milch cow that gin eleven quarts a day, with a beautiful young caif. Jest about that time thar was a great sale of the furniter of the Ashmore family down at Spartanburg, and I remembered I hed no decent bedstead, or any thing rightly sarving for a young woman's chamber; so I went to the sale, and bought a fine strong mahogany bedstead, a dozen chairs, a chist of drawers, and some other things that ain't quite mentionable, Jedge, but all proper for a lady's chamber; and I soon hed the house fixed up ready for any thing. And up to this time I never let on to any body what I was a-thinking about or what I was a-doing, until I could stand up in my own doorway and look about me, and say to myself—this is my 'capital,' I reckon; and when I hed got all that I thought a needcessity to git, I took 'count of every thing.

"I spread the title-deeds of my fairm out on the table. I read 'em over three times to see ef 'twaure all right. Thar was my name several times in big letters, 'to hev and to hold.'

"Then I fixed the furniter. Then I brought out into the stable-yard the old mar—you couldn't count her ribs *now*, and she was spry as ef she hed got a new conceit of herself.

"Then thar was my beautiful cow and caif, sealing fat, both on 'em, and sleek as a doe in autumn.

"Then thar waur a fine young mule that I bought in Spartanburg; my cart, and a strong second-hand buggy, that could carry two pussons convenient of two different sexes. And I felt big, like a man of consekence and capital.

"That warn't all.

"I had the shiners, Jedge, besides—all in gould and silver—none of your dirty rags and blotty spotty paper. That was the time of Old Hickory—General Jackson, you know—when he kicked over Nick Biddle's consarn, and gin us the beautiful Benton Mint Drops, in place of rotten paper. You could git the gould and silver jest for the axing, in them days, you know.

"I hed a grand count of my money, Jedge. I hed it in a dozen or twenty little bags of leather—the gould—and the silver I hed in shot-bags. It took me a whole morning to count it

up and git the figgers right. 'Then I stuffed it in my pockets, hyar and thar, every whar, whar-ever I could stow a bag; and the silver I stuffed away in my saddle-bags, and clapped it on the mar'.

"Then I mounted myself, and sot the mar's nose straight in a bee-line for the fairm of Squaire Hopson.

"I was a-gwine, you see, to supprise him with my 'capital;' but, fust, I meant to give him a mighty grand skeer.

"You see, when I was a-trading with Columbus Mills about the fairm and cattle and other things, I ups and tells him about my courting of Merry Ann; and when I telled him about Squaire Hopson's talk about 'capital,' he says:

"'The old skunk! What right hes he to be talking big so, when he kain't pay his own debts. He's been owing me three hundred and fifty dollars now gwine on three years, and I kain't git even the *intrust* out of him. I've got a mortgage on his fairm for the whole, and ef he won't let you hev his da'ter, jest you come to me, and I'll clap the screws to him in short order.'

"Says I, 'Columbus, won't you sell me that mortgage?'

"'You shill hev it for the face of the debt,' says he, 'not considerin' the *intrust*.'

"'It's a bargain,' says I; and I paid him down the money, and he signed the mortgage over to me for a vallyable consideration.

"I hed that beautiful paper in my breast pocket, and felt strong to face the Squaire in his own house, knowing how I could turn him out of it! And I mustn't forget to tell you how I got myself a new rig of clothing, with a mighty fine over-coat, and a new fur cap; and as I looked in the glass I felt my consekence all over at every for'a'd step I tuk; and I felt my inches growing with every pace of the mar' on the high-road to Merry Ann and her beautiful daddy!"

X.

"Well, Jedge, before I quite got to the Squaire's farm, who should come out to meet me in the road but Merry Ann, her own self! She hed spied me, I reckon, as I crossed the bald ridge a quarter of a mile away. I do reckon the dear gal hed been looking out for me every day the whole eleven days in the week, counting in all the Sundays. In the mountains, you know, Jedge, that the weeks sometimes run to twelve, and even fourteen days, specially when we're on a long camp-hunt!

"Well, Merry Ann cried and laughed together, she was so tarnation glad to see me agin. Says she:

"'Oh, Sam! I'm so glad to see you! I was afeard you had clean gin me up. And thar's that fusty old bachelor Grimstead, he's a-coming here a'most every day; and daddy, he sw'ars that I shill marry him, and nobody else; and mammy, she's at me too, all the time, telling me how fine a fairm he's got, and what a nice carriage, and all that; and

mammy says as how daddy'll be sure to beat me ef I don't hev him. But I kain't bear to look at him, the old griesly!'

"'Cuss him!' says I. 'Cuss him, Merry Ann!'

"And she did, but onder her breath—the old cuss.

"'Drot him!' says she; and she said louder, 'and drot me, too, Sam, ef I ever marries any body but you.'

"By this time I hed got down and gin her a long strong hug, and a'most twenty or a dozen kisses, and I says:

"'You sha'n't marry nobody but me, Merry Ann; and we'll hev the marriage this very night, ef you says so!'

"'Oh! psho, Sam! How you does talk!'

"'Ef I don't marry you to-night, Merry Ann, I'm a holy mortar, and a sinner not to be saved by any salting, though you puts the petre with the salt. I'm come for that very thing. Don't you see my new clothes?'

"'Well, you hev got a beautiful coat, Sam; all so blue, and with sich shiny buttons.'

"'Look at my waistcoat, Merry Ann! What do you think of that?'

"'Why, it's a most beautiful blue welvet!'

"'That's the very article,' says I. 'And see the breeches, Merry Ann; and the boots!'

"'Well,' says she, 'I'm fair astonished, Sam! Why whar, Sam, did you find all the money for these fine things?'

"'A beautiful young woman, a'most as beautiful as you, Merry Ann, come to me the very night of that day when your daddy driv me off with a flea in my ear. She come to me to my bed at midnight—'

"'Oh, Sam! *ain't* you ashamed!'

"'Twas in a dream, Merry Ann; and she tells me something to encourage me to go for'a'd, and I went for'a'd, bright and airly next morning, and I picked up three sarvants that hev been working for me ever sence.'

"'What sarvants?' says she.

"'One was a goose, one was a b'ar, and t'other was a bee!'

"'Now you're a-fooling me, Sam.'

"'You'll see! Only you git yourself ready, for, by the eternal Hokies, I marries you this very night, and takes you home to *my* fairm bright and airly to-morrow morning.'

"'I do think, Sam, you must be downright crazy.'

"'You'll see and believe! Do you go home and git yourself fixed up for the wedding. Old Parson Stovall lives only two miles from your daddy, and I'll hev him hyar by sundown. You'll see!'

"'But ef I waur to b'lieve you, Sam—'

"'I've got on my wedding-clothes o' purpose, Merry Ann.'

"'But I hain't got no clothes fit for a gal to be married in,' says she.

"'I'll marry you this very night, Merry Ann,' says I, 'though you hedn't a stitch of clothing at all!'

"'Git out, you sassy Sam,' says she, slapping my face. Then I kissed her in her very mouth, and a'ter that we walked on together, I leading the mar'.

"Says she, as we neared the house, 'Sam, let me go before, or stay hyar in the thick, and you go in by yourself. Daddy's in the hall, smoking his pipe and reading the newspapers.'

"'We'll walk in together,' says I, quite con-sekential.

"Says she, 'I'm so afeard.'

"'Don't you be afeard, Merry Ann,' says I; 'you'll see that all will come out jest as I tells you. We'll be hitched to-night, ef Parson Stovall, or any other parson, kin be got to tie us up!'

"Says she, suddently, 'Sam, you're a-walk-ing lame, I'm a-thinking. What's the matter? Hev you hurt yourself any way?'

"Says I, 'It's only owing to my not balanc-ing my accounts even in my pockets. You see I feel so much like flying in the air with the idee of marrying you to-night that I filled my pockets with rocks, jest to keep me down.'

"'I do think, Sam, you're a leetle cracked in the upper story.'

"'Well,' says I, 'ef so, the crack has let in a blessed chaine of the beautifulest sunlight! You'll see! Cracked, indeed! Ha, ha, ha! Wait till I've done with your daddy! I'm gwine to square accounts with *him*, and, I reckon, when I'm done with him, you'll guess that the crack's in *his* skull, and not in mine.'

"'What! you wouldn't knock my father,

Sam!' says she, drawing off from me and look-ing skeary.

"'Don't you be afeard; but it's very sartin, ef our heads don't come together, Merry Ann, you won't hev me for your husband to-night. And that's what I've swore upon. Hyar we air!'

"When we got to the yard I led in the mar', and Merry Ann she ran away from me and dodged round the house. I hitched the mar' to the post, took off the saddle-bags, which was mighty heavy, and walked into the house stiff enough I tell you, though the gould in my pockets pretty much weighed me down as I walked.

"Well, in I walked, and thar sat the old Squire smoking his pipe and reading the newspaper. He looked at me through his specs over the newspaper, and when he seed who 'twas his mouth put on that same conceited sort of grin and smile that he ginerally hed when he spoke to me.

"'Well,' says he, gruffly enough, 'it's you, Sam Snaffles, is it?' Then he seems to dis-kiver my new clothes and boots, and he sings out, 'Heigh! you're tip-toe fine to-day! What fool of a shop-keeper in Spartanburg have you tuk in this time, Sam?'

"Says I, cool enough, 'I'll answer all them iligant questions a'ter a while, Squire; but would prefar to see to business fust.'

"'Business!' says he; 'and what business kin you hev with me, I wants to know?'

"'You shill know, Squire, soon enough; and I only hopes it will be to your liking a'ter you l'arn it.'

"So I laid my sad-dle-bags down at my feet and tuk a chair quite at my ease; and I could see that he was all astare in won-derment at what he thought my sassiness. As I felt I had my hook in his gills, though he didn't know it yit, I felt in the humor to tickle him and play him as we does a trout.

"Says I, 'Squire Hopson, you owes a sartin amount of money, say \$350, with intrust on it for now three years, to Dr. Columbus Mills.'

"At this he squares round, looks me full in the face, and says:

"'What the old Harry's that to you?'

"Says I, gwine on cool and straight,

"IT'S A BONNY TODDER 'SIGNMEANT!"

'You gin him a mortgage on this fairm for security.'

"'What's that to you?' says he.

"'The mortgage is over-due by two years, Squire,' says I.

"'What the old Harry's all that to you, I say?' he fairly roared out.

"'Well, nothing much, I reckon. The \$350, with three years' intrust at seven per cent., making it now—I've calkelated it all without compounding—something over \$425—well, Squire, that's not much to *you*, I reckon, with your large capital. But it's something to me.'

"'But I ask you again, Sir,' he says, 'what is all this to you?'

"'Jist about what I tells you—say \$425; and I've come hyar this morning, bright and airly, in hope you'll be able to square up and satisfy the mortgage. Hyar's the dockymment.'

"'And I drewed the paper from my breast pocket.

"'And you tell me that Dr. Mills sent you hyar,' says he, 'to collect this money?'

"'No; I come myself on my own hook.'

"'Well,' says he, 'you shill hev your answer at onst. Take that paper back to Dr. Mills and tell him that I'll take an airly opportunity to call and arrange the business with him. You hev your answer, Sir,' he says, quite grand, 'and the sooner you makes yourself scarce the better.'

"'Much obleeged to you, Squire, for your ceveelity,' says I; 'but I ain't quite satisfied with that answer. I've come for the money due on this paper, and must hev it, Squire, or thar will be what the lawyers call *four closures* upon it!'

"'Enough! Tell Dr. Mills I will answer his demand in person.'

"'You needn't trouble yourself, Squire; for ef you'll jest look at the back of that paper, and read the 'signmeant, you'll see that you've got to settle with Sam Snaffles, and not with Columbus Mills!'

"'Then he snatches up the dockymment, turns it over, and reads the rigilar 'signmeant, writ in Columbus Mills's own handwrite.

"'Then the Squire looks at me with a great stare, and he says, to himself like:

"'It's a *bonny fodder* 'signmeant.'

"'Yes,' says I, 'it's *bonny fodder*—rigilar in law—and the titles all made out complete to me, Sam Snaffles; signed, sealed, and delivered, as the lawyers says it.'

"'And how the old Harry come you by this paper?' says he.

"'I was gitting riled, and I was detarmined, this time, to gin my hook a pretty sharp jerk in his gills; so I says:

"'What the old Harry's that to *you*, Squire? Thar's but one question 'twixt us two—air you ready to pay that money down on the hub, at onst, to me, Sam Snaffles?'

"'No, Sir, I am not.'

"'How long a time will you ax from me, by way of marciful indulgence?'

"'It must be some time yit,' says he, quite sulky; and then he goes on agin:

"'I'd like to know how you come by that 'signmeant, Mr. Snaffles.'

"'Mr. Snaffles! Ah! ha!'

"'I don't see any neecessity,' says I, 'for answering any questions. Thar's the dockymment to speak for itself. You see that Columbus Mills 'signs to me for full *consideration*. That means I paid him!'

"'And why did you buy this mortgage?'

"'You might as well ax me how I come by the money to buy any thing,' says I.

"'Well, I do ax you,' says he.

"'And I answers you,' says I, 'in the very words from your own mouth, What the old Harry's that to you?'

"'This is hardly 'spectful, Mr. Snaffles,' says he.

"'Says I, 'Spectful gits only what 'spectful gives! Ef any man but you, Squire, hed been so onrespectful in his talk to me as you hev been I'd ha' mashed his muzzle! But I don't wish to be onrespectful. All I axes is the civil answer. I wants to know when you kin pay this money?'

"'I kain't say, Sir.'

"'Well, you see, I thought as how you couldn't pay, spite of all your "capital," as you hedn't paid even the *intrust* on it for three years; and, to tell you the truth, I was in hopes you couldn't pay, as I hed a liking for this fairm always; and as I am jest about to git married, you see—'

"'Who the old Harry air you gwine to marry?' says he.

"'What the old Harry's that to you?' says I, giving him as good as he sent. But I went on:

"'You may be sure it's one of the woman kind. I don't hanker a'ter a wife with a beard; and I expects—God willing, weather premitting, and the parson being sober—to be married this very night!'

"'To-night!' says he, not knowing well what to say.

"'Yes; you see I've got my wedding-breeches on. I'm to be married to-night, and I wants to take my wife to her own fairm as soon as I kin. Now, you see, Squire, I all along set my hairt on this fairm of yourn, and I detarmined, ef ever I could git the "capital," to git hold of it; and that was the idee I hed when I bought the 'signmeant of the mortgage from Columbus Mills. So, you see, ef you kain't pay a'ter three years, you never kin pay, I reckon; and ef I don't git my money this day, why—I kain't help it—the lawyers will hev to see to the *four closures* to-morrow!'

"'Great God, Sir!' says he, rising out of his chair, and crossing the room up and down, 'do you coolly propose to turn me and my family headlong out of my house?'

"'Well now,' says I, 'Squire, that's not edzactly the way to put it. As I reads this dockymment—and I tuk up and put the mortgage in my pocket—the house and fairm are

mine by law. They onst was yourn; but it wants nothing now but the *four closures* to make 'em mine.'

"'And would you force the sale of property worth \$2000 and more for a miserable \$400?'

"'It must sell for what it'll bring, Squire; and I stands ready to buy it for my wife, you see, ef it costs me twice as much as the mortgage.'

"'Your wife!' says he; 'who the old Harry is she? You once pertended to have an affection for my da'ter.'

"'So I hed; but you hedn't the proper affection for your da'ter that I hed. You pre-far'd money to her affections, and you driv me off to git "capital!" Well, I tuk your advice, and I've got the capital.'

"'And whar the old Harry,' said he, 'did you git it?'

"'Well, I made good tairms with the old devil for a hundred years, and he found me in the money.'

"'It must hev been so,' said he. 'You waur not the man to git capital in any other way.'

"Then he goes on: 'But what becomes of your pertended affection for my da'ter?'

"'Twa'n't pertended; but you throwed yourself betwixt us with all your force, and broke the gal's hairt, and broke mine, so far as you could; and as I couldn't live without company, I hed to look out for myself and find a wife as I could. I tell you, as I'm to be married to-night, and as I've swore a most eternal oath to hev this fairm, you'll hev to raise the wind to-day, and square off with me, or the lawyers will be at you with the *four closures* to-morrow, bright and airly.'

"'Dod dern you!' he cries out. 'Does you want to drive me mad!'

"'By no manner of means,' says I, jest about as cool and quiet as a cowcumber.

"But he was at biling heat. He was all over in a stew and a fever. He filled his pipe and lighted it, and then smashed it over the chimney. Then he crammed the newspaper in the fire, and crushed it into the blaze with his boot. Then he turned to me, suddent, and said:

"'Yes, you pertended to love my da'ter, and now you are pushing her father to desperation. Now ef you ever did love Merry Ann, honestly, raally, truly, and *bonny fodder*, you couldn't help loving her yit. And yit, hyar you're gwine to marry another woman, that, perhaps, you don't affection at all.'

"'It's quite a sensible view you takes of the subject,' says I; 'the only pity is that you didn't take the same squint at it long ago, when I axed you to let me hev Merry Ann. Then you didn't valley her affections or mine. You hed no thought of nothing but the "capital" then, and the affections might all go to Jericho, for what you keered! I'd ha' married Merry Ann, and she me, and we'd ha' got on for a spell in a log-cabin, for, though I was poor, I hed the genwine grit of a man, and would come to something, and we'd ha' got on; and yit,

without any "capital" your own self, and kivered up with debt as with a winter over-coat, hyar, you waur positive that I shouldn't hev your da'ter, and you waur a-preparing to sell her hyar to an old sour-tempered bachelor, more than double her age. Dern the capital! A man's the best capital for any woman, ef so be he is a man. Bekaise, ef he be a man, he'll work out cl'ar, though he may hev a long straining for it through the sieve. Dern the capital! You've as good as sold that gal child to old Grimstead, jest from your love of money!'

"'But she won't hev him,' says he.

"'The wiser gal child,' says I. 'Ef you only hed onderstood me and that poor child, I hed it in me to make the "capital"—dern the capital!—and now you've ruined her, and yourself, and me, and all; and dern my buttons but I must be married to-night, and jest as soon a'ter as the lawyers kin fix it I must hev this fairm for my wife. My hairt's set on it, and I've swore it a dozen o' times on the Holy Hokies!'

"The poor old Squire fairly sweated; but he couldn't say much. He'd come up to me and say:

"'Ef you only did love Merry Ann!'

"'Oh,' says I, 'what's the use of your talking that? Ef you only hed ha' loved your own da'ter!'

"Then the old chap begun to cry, and as I seed that I jest kicked over my saddle-bags lying at my feet, and the silver Mexicans rolled out—a bushel on 'em, I reckon—and, O Lawd! how the old fellow jumped, staring with all his eyes at me and the dollars!

"'It's money!' says he.

"'Yes,' says I, 'jest a few hundreds of thousands of *my* "capital." I didn't stop at the figgers, you see.

"Then he turns to me and says, 'Sam Snaffles, you're a most wonderful man. You're a mystery to me. Whar, in the name of God, hev you been? and what hev you been doing? and whar did you git all this power of capital?'

"I jest laughed, and went to the door and called Merry Ann. She come mighty quick. I reckon she was watching and waiting.

"Says I, 'Merry Ann, that's money. Pick it up and put it back in the saddle-bags, ef you please.'

"Then says I, turning to the old man, 'Thar's that whole bushel of Mexicans, I reckon. Thar monstrous heavy. My old mar'—ax her about her ribs now!—she fairly squelched onder the weight of me and that money. And I'm pretty heavy loaded myself. I must lighten; with your leave, Squire.'

"And I pulled out a leetle doeskin bag of gould half eagles from my right-hand pocket and poured them out upon the table; then I emptied my left-hand pocket, then the side pockets of the coat, then the skairt pockets, and jist spread the shiners out upon the table.

"Merry Ann was fairly frightened, and run out of the room; then the old woman she come

in, and as the old Squire seed her, he tuk her by the shoulder and said:

“‘Jest you look at that thar.’

“And when she looked and seed, the poor old hypercritical scamp sinner turned round to me and flung her airms round my neck, and said:

“‘I always said you waur the only right man for Merry Ann.’

“The old spooney!

“Well, when I hed let ’em look enough, and wonder enough, I jest turned Merry Ann and her mother out of the room.

“The old Squire, he waur a-setting down agin in his airm-chair, not edzactly knowing what to say or what to do, but watching all my motions, jest as sharp as a cat watches a mouse when she is hafe hungry.

“Thar was all the Mexicans put back in the saddle-bags, but he hed seen ’em, and thar was all the leetle bags of gould spread upon the table; the gould—hafe and quarter eagles—jest lying out of the mouths of the leetle bags as ef wanting to creep back agin.

“And thar sot the old Squire, looking at ’em all as greedy as a fish-hawk down upon a pairch in the river. And, betwixt a whine and a cry and a talk, he says:

“‘Ah, Sam Snaffles, ef you ever did love my leetle Merry Ann, you would never marry any other woman.’

“Then you ought to ha’ seed me. I felt myself sixteen feet high, and jest as solid as a chestnut oak. I walked up to the old man, and I tuk him quiet by the collar of his coat, with my thumb and forefinger, and I said:

“‘Git up, Squire, for a bit.’

“And up he got.

“Then I marched him to the big glass agin the wall, and I said to him: ‘Look, ef you please.’

“And he said, ‘I’m looking.’

“And I said, ‘What does you see?’

“He answered, ‘I sees you and me.’

“I says, ‘Look agin, and tell me what you obzarves.’

“LOOK AGIN, AND TELL ME WHAT YOU OBZARVES.”

“‘Well,’ says he, ‘I obzarves.’

“And says I, ‘What does your *obzarving* amount to? That’s the how.’

“And says he, ‘I sees a man alongside of me, as good-looking and handsome a young man as ever I seed in all my life.’

“‘Well,’ says I, ‘that’s a correct obzarvation. But,’ says I, ‘what does you see of *your own self*?’

“‘Well, I kain’t edzackly say.’

“‘Look good!’ says I. ‘Obzarve.’

“Says he, ‘Don’t ax me.’

“‘Now,’ says I, ‘that won’t edzactly do. I tell you now, look good, and ax yourself ef you’re the sawt of looking man that hes any right to be a feyther-in-law to a fine, young, handsome-looking fellow like me, what’s got the “capital?”’

“Then he laughed out at the humor of the sitivation; and he says, ‘Well, Sam Snaffles, you’ve got me dead this time. You’re a different man from what I thought you. But, Sam, you’ll confess, I reckon, that ef I hedn’t sent you off with a flea in your ear when I hed you up afore the looking-glass, you’d never ha’ gone to work to git in the “capital.”’

“‘I don’t know *that*, Squire,’ says I. ‘Sarcumstances sarve to make a man take one road when he mout take another; but when you meets a man what has the hairt to love a woman strong as a lion, and to fight an inimy big as a buffalo, he’s got the raal grit in him. You knowed I was young, and I was poor, and you knowed the business of a hunter is a mighty poor business ef the man ain’t born to it. Well, I didn’t do much at it jest bekaise my hairt was so full of Merry Ann; and you should ha’ made a kalkilation and allowed for *that*. But you poked your fun at me and riled me consumedly; but I was detarmined that you shouldn’t break *my* hairt or the hairt of Merry Ann. Well, you hed your humors, and I’ve tried to take the change out of you. And now, ef you raally thinks, a’ter that obzarvation in the glass, that you kin make a respectable feyther-in-law to sich a fine-looking fellow as me, what’s got the “capital,” jest say the word, and we’ll call Merry Ann in to bind the bargain. And you must talk out quick, for the wedding’s to take place this very night. I’ve swore it by the eternal Hokies.’

“‘To-night!’ says he.

“‘Look at the “capital,”’ says I; and I pinto to the gould on the table and the silver in the saddle-bags.

“‘But, Lawd love you, Sam,’ says he, ‘it’s so suddent, and we kain’t make the preparations in time.’

“Says I, ‘Look at the “capital,” Squire, and dern the preparations!’

“‘But,’ says he, ‘we hain’t time to ax the company.’

“‘Dern the company!’ says I; ‘I don’t b’lieve in company the very night a man gits married. His new wife’s company enough for him ef he’s sensible.’

"'But, Sam,' says he, 'it's not possible to git up a supper by to-night.'

"Says I, 'Look you, Squaire, the very last thing a man wants on his wedding night is supper.'

"Then he said something about the old woman, his wife.

"Says I, 'Jest you call her in and show her the "capital."'

"So he called in the old woman, and then in come Merry Ann, and thar was great hemmings and hawings; and the old woman she said:

"'I've only got the one da'ter, Sam, and we *must* hev a big wedding! We must spread ourselves. We've got a smart chainece of friends and acquaintances, you see, and 'twon't be decent onless we axes them, and they won't like it! We *must* make a big show for the honor and 'spectability of the family.'

"Says I, 'Look you, old lady! I've sworn a most tremendous oath, by the Holy Hokies, that Merry Ann and me air to be married this very night, and I kain't break sich an oath as that! Merry Ann,' says I, 'you wouldn't hev me break sich a tremendous oath as that?'

"And, all in a trimble, she says, 'Never, Sam! No!'

"'You hyar that, old lady!' says I. 'We marries to-night, by the Holy Hokies! and we'll hev no company but old Parson Stovall, to make the hitch; and Merry Ann and me go off by sunrise to-morrow morning—you hyar?—to my own fairm, whar thar's a great deal of furniter fixing for her to do. A'ter that you kin advertise the whole county to come in, ef you please, and eat all the supper you kin spread! Now hurry up,' says I, 'and git as ready as you kin, for I'm gwine to ride over to Parson Stovall's this minit. I'll be back to dinner in hafe an hour. Merry Ann, you gether up that gould and silver, and lock it up. It's *our* "capital!" As for you, Squaire, thar's the mortgage on your fairm, which Merry Ann shill give you, to do as you please with it, as soon as the parson has done the hitch, and I kin call Merry Ann, Mrs. Snaffles—Madam Merry Ann Snaffles, and so forth, and afore-said.'

"I laid down the law that time for all parties, and showed the old Squaire sich a picter of himself, and me standing aside him, looking seven foot high, at the least, that I jest worked the business 'cording to my own pleasure. When neither the daddy nor the mammy hed any thing more to say, I jumped on my mar' and rode over to old Parson Stovall.

"Says I, 'Parson, thar's to be a hitch to-night, and you're to see a'ter the right knot. You knows what I means. I wants you over at Squaire Hopson's. Me and Merry Ann, his da'ter, mean to hop the twig to-night, and you're to see that we hop squar', and that all's even, 'cording to the law, Moses, and the profits! I stand treat, Parson, and you won't be the worse for your riding. I pays in gould!'

"So he promised to come by dusk; and come he did. The old lady hed got some supper, and tried her best to do what she could at sich short notice. The venison ham was mighty fine, I reckon, for Parson Stovall played a great stick at it; and ef they hedn't cooked up four of my wild-geese, then the devil's an angel of light, and Sam Snaffles no better than a sinner! And thar was any quantity of jimmyjohns, peach and honey considered. Parson Stovall was a great feeder, and I begun to think he never would be done. But at last he wiped his mouth, swallowed his fifth cup of coffee, washed it down with a stiff dram of peach and honey, wiped his mouth agin, and pulled out his prayer-book, psalmody, and Holy Scrip—three volumes in all—and he hemmed three times, and begun to look out for the marriage text, but begun with giving out the 100th Psalm.

"'With one consent, let's all unite—'

"'No,' says I, 'Parson; not all! It's only Merry Ann and me what's to unite to-night!'

"Jest then, afore he could answer, who should pop in but old bachelor Grimstead! and he looked round 'bout him, specially upon me and the parson, as ef to say:

"'What the old Harry's they doing hyar!'

"And I could see that the old Squaire was oneasy. But the blessed old Parson Stovall, he gin 'em no time for iplanation or palaver; but he gits up, stands up squar', looks solemn as a meat-axe, and he says:

"'Let the parties which I'm to bind together in the holy bonds of wedlock stand up before me!'

"And, Lawd bless you, as he says the words, what should that old skunk of a bachelor do, but he gits up, stately as an old buck in spring time, and he marches over to my Merry Ann! But I was too much and too spry for him. I puts in betwixt 'em, and I takes the old bachelor by his coat-collar, 'twixt my thumb and forefinger, and afore he knows whar he is, I marches him up to the big looking-glass, and I says:

"'Look!'

"'Well,' says he, 'what?'

"'Look good,' says I.

"'I'm looking,' says he. 'But what do you mean, Sir?'

"Says I, 'Obzarve! Do you see yourself? Obzarve!'

"'I reckon I do,' says he.

"'Then,' says I, 'ax yourself the question, ef you're the sawt of looking man to marry my Merry Ann.'

"Then the old Squaire burst out a-laughing. He couldn't help it.

"'Capital!' says he.

"'It's capital,' says I. 'But hyar we air, Parson. Put on the hitch, jest as quick as you kin clinch it; for thar's no telling how many slips thar may be 'twixt the cup and the lips when these hungry old bachelors air about.'

"'Who gives away this young woman?' axes the parson; and the Squaire stands up and does the thing needful. I hed the ring ready, and

"I PUTS IN BETWIXT 'EM, AND I TAKES THE OLD BACHELOR BY HIS COAT-COLLAR," ETC.

before the parson had quite got through, old Grimstead vamoosed.

"He waur a leetle slow in onderstanding that he warn't wanted, and warn't, nohow, any party to the business. But he and the Squire hed a mighty quarrel a'terwards, and ef 't hedn't been for me, he'd ha' licked the Squire. He was able to do it; but I jest cocked my cap at him one day, and, says I, in the Injin language:

"'Yaou!' And he didn't know what I meant; but I looked tomahawks at him, so he gin ground; and he's getting old so fast that you kin see him growing downwards all the time.

"All that, Jedge, is jest thirteen years ago; and me and Merry Ann git on famously, and thar's no eend to the capital! Gould breeds like the cows, and it's only needful to squeeze the bags now and then to make Merry Ann happy as a tomtit. Thirteen years of married life, and look at me! You see for yourself, Jedge, that I'm not much the worse for wear; and I kin answer for Merry Ann, too, though, Jedge, we hev hed thirty-six children."

"What!" says I, "thirty-six children in thirteen years!"

The "Big Lie" roared aloud.

"Hurrah, Sharp! Go it! You're making it spread! That last shot will make the Jedge know that you're a right truthful sinner, of a Saturday night, and in the 'Lying Camp.'"

"To be sure! You see, Merry Ann keeps on. But you've only got to do the ciphering for yourself. Here, now, Jedge, look at it. Count for yourself. First we had *three* gal children, you see. Very well! Put down three. Then we had *six* boys, one every year for four years; and then, the fifth year, Merry Ann threwed deuce. Now put down the six boys a'ter the three gals, and ef that don't make thirty-six, thar's no snakes in all Flurriday!

"Now, men," says Sam, "let's liquor all round, and drink the health of Mrs. Merry Ann Snaffles and the thirty-six children, all alive and kicking; and glad to see you, Jedge, and the rest of the company. We're doing right well; but I hes, every now and then, to put my thumb and forefinger on the Squire's collar, and show him his face in the big glass, and call on him for an *obzarvation*—for he's mighty fond of going *shar's* in my 'capital.'"

THE OLD LOVE AGAIN.

By ANNIE THOMAS.

CHAPTER X.

MR. MANNERS'S PROJECT AND PEARLS.

"I KNEW it already," Nina said, in a low voice.

"You have heard from him, then?" he asked, with prompt jealousy.

"I have seen him," she said. And his heart throbbed with a quicker pulsation as he thought, "The game is up, then, for me." He did not seem inclined to continue the conversation, and so, after a few moments, Nina said,

"Tell me how you know that Mr. Barrington is in town."

"How? Oh! When I found that there was no chance of seeing my mother and you in the park, I took a cab down to her house, hoping to find you there still. I heard that you had all gone out together, and that my mother was expected back in half an hour. A friend of mine, who happened to be an acquaintance of Mr. Barrington's, was with me; and while we were standing at the window, waiting for my mother to come back, my friend pointed out a man, who was calling at the house opposite, as 'Gerald Barrington.' Of course he had no idea that I had any interest in the name; but he pointed Barrington out as a man he knew."

"Calling at the house opposite to your mother's?" Nina almost gasped. "Are you sure—sure?"

"Yes, quite sure," he answered, in some surprise.

"You did not hear from your mother, then, that that was the very house Mrs. Eldon is living in?"

"No. Is it? I didn't wait for my mother, after all. I was anxious to get home and have a quiet think by myself. Mrs. Eldon didn't mention to you that she expected Mr. Barrington?"

"No. Perhaps she didn't expect him," Nina suggested.

"I don't know; but I should imagine that he was expected. There was a man waiting to take his horse, and a pretty woman was standing at the window, dressed in black, and beaming with smiles; he had the air of being expected, too, as he knocked at the door." John Manners would not say a word more than the truth, but he would not keep back a particle of it that might pain Nina. He was not ready to kill her, in order to effect her cure; but he was ready to hurt her very much indeed for her future health's sake.

"And did not he tell you that he was on intimate terms with Mrs. Eldon?" he returned, after a brief silence.

"How should he tell me?" Nina said, irritably.

"Why should he not? It would have been only natural and straightforward for him to

mention such a fact to you, particularly as she was your intimate friend with whom you were staying when you met him in the country, at a time he did not know her."

"I detest digging and delving into people's motives," Nina said, warmly. "Perhaps he forgot it."

"In the joy of seeing you, perhaps he did. When did you see him?"

"This afternoon, after I parted with your mother," Nina said, gazing round upon him.

"Then he must have been on his way to the lovely widow's house," he said, coldly and rather cruelly. "It could not have escaped his memory, then."

"We did not speak to each other," Nina said, feeling driven to open confession.

"Thank Heaven for it!" Mr. Manners said; and as he said it he came a little nearer to Nina; and the light in the room was very soft and low, and they were alone.

"We only bowed to each other," Nina explained. And then she thought, "He will think, if I don't tell him the truth, that I gave the initiative—that I repulsed him." And her heart and her taste revolted at practicing any form of deceit toward this man at her side.

"I was prepared to hear many words from Gerald Barrington when I did see him," she said, firmly. "I was expecting very important words from him. I can only hope you will not quite despise me when I tell you that my depression just now was due to disappointment. He passed me almost coldly."

"For your sake I can only say, thank Heaven for it!" Mr. Manners said. But he sat more upright, and he moved his arm from the back of the sofa; and Nina felt that the crisis had come that evening for him, and that he had passed it safely.

"If I could only condescend to make it clear to him that in my heart I am glad that it is so with Gerald Barrington, it would be all right, even now; but I can't stoop to conquer." So she thought as she sat twisting her fan and her handkerchief to pieces. And he watched her nervous movements and deplored her misguided fancy.

"To think that she should wear the willow for a fellow who can leave her for the first fair face bent kindly upon him!" he thought. "To think that he should know so little of me as to believe me capable of continuing to love Gerald Barrington, after all!" she thought. And by "after all" she meant all that intimate communion and companionship which she had enjoyed with John Manners, and after the possibility had entered her mind of being offered a slight by Gerald Barrington.

But they could not see each other's thoughts. Consequently they sat there, side by side, each

misunderstanding the other's silence and embarrassment, and both being misunderstood by sundry sauntering guests, who came in and looked at them and went out again, and whispered it about that "Miss Delany was really getting desperate! She didn't care how much she compromised herself, provided she could only compromise John Manners by that seclusion into which she had plunged with him." And a few who knew a little—and but a little—of his domestic relations, "wondered what Miss Graves would say!" for it was getting pretty generally known in circles into which Mrs. Manners's mind had penetrated that the pretty little cousin was brought up to town to marry John Manners.

Miss Delany saw the looks, and guessed at the whisperings, and was superbly indifferent to both. She had nothing to lose and nothing to gain, now that John Manners seemed to be calmly resigning her and his opportunity. In reality, their intercourse was restricted to the merest commonplaces after she told him that Gerald Barrington and herself had held no communication. In appearance, it was warm, close, and confiding.

"When I went into the room Mr. Manners was leaning on his elbow by her side, with his head on her shoulder almost," one lady said, moving John Manners many inches nearer to Nina than the facts of the case warranted. "If we don't hear that it's an engagement in a few days after this it will be an outrage on society, and on your house in particular," another guest said to the hostess, who was daughterless and lenient.

Appearances confirmatory of the worst that was feared, namely, that Mr. Manners was really and properly engaged to the belle whose brightness had been the theme of far too universal praise for far too long a time, were kept up to the last. It was on Mr. Manners's arm that Miss Delany descended at length to get into her step-mother's carriage. He had dutifully waited, close at hand, while she made her adieus, and he did not appear again. Inquiring friends were at once "satisfied" and savage.

It chanced just about this time that old Mrs. Manners was seized with a mighty longing for uninterrupted routine, and a return to the normal quiet of a country life. She wanted to have her days and her hours and her habits and little fidgets to herself; and dear as her niece was to her, that niece, by reason of her youth, interfered with the placid harmony of the programme. "It is high time that John made up his mind," the old lady thought, as she was dressing on the morning after that party at which John and Nina had been considered to compromise each other. And then she resolved that she would speak to her son that day.

She would have a capital opportunity for doing so—at least, so she thought. John was coming to dine with them; and after dinner, while Edith was discoursing sweet music in the

front drawing-room, Mrs. Manners would, over the coffee that he loved, open her heart and unfold her desires to her son. Edith, as a niece, had been all that was desirable. She had been what some people would have called subservient to the masterful old lady; but it came easy to Edith to be so. As a daughter-in-law, she would, of course, be the same. Besides, Mrs. Manners, having watched over them all her life, felt sure of Edith's morals, "which was more than she did of most young women's," she added to herself. Additionally, she had a strong incentive to arranging the match without delay in a dawning fear she had of what she termed "Miss Delany's ways."

Mrs. Manners did a great deal in the quiet, comfortable preparation line that day. She went out herself, in the heat of the day, and selected a bit of the biggest, pinkest salmon that the old court suburb could supply. Perfectly oblivious of the fact that her son was in the habit of dining at the best and most *recherché* clubs, Mrs. Manners organized what she imagined would be a treat to him, in the shape of a repast in which many of the delicacies of the season had a place. "Men are always more amenable to reason after a good dinner," she told herself, complacently, when she had made all her arrangements. And then, it being late in the afternoon, she went up to Edith's room to see what the girl thought of wearing.

"John will be here soon. Are you nearly ready, Edith?" Mrs. Manners said, coming in with the animation of self-satisfied bustle upon her face. Edith was lying on the bed, reading, unexcited, sleepy, in fact, and consequently unsympathetic.

"He surely won't be here two hours before dinner, aunt? It's only half past four."

"At any rate, I should like you to be ready when he does come," the old lady said, testily; and then she bustled up to the door of the wardrobe, and asked what dress Edith meant to wear.

"Oh, it doesn't much matter," Edith said, indifferently, without looking up from her book.

"But I tell you it does matter; not more than one girl in a thousand can afford to disregard her appearance, and you're not that one, my dear."

"Who is coming?" Edith asked, languidly—the afternoon heat was making her very heavy; moreover, she was in the midst of a very pleasant page of "Jenny Bell's" adventures.

"John is coming."

"Any one else, aunt?"

"No."

"Oh, then, John never does notice dress. I shall wear that same spotted muslin."

Mrs. Manners took out the spotted muslin and looked at it, and shook her head.

"It's tumbled," she said, "and to-night you must look your best, my dear; put on your new white llama, with the blue velvet trimmings, and I will give you what I have always intended for you, that pearl necklet and bracelets that make your white skin look whiter."

Then Edith roused up to the full knowledge of all that was expected of and for her, and got off the bed, and began her toilet, looking very flushed and pretty. For though it was "only John" who was coming to see how well she looked in the white llama, and the pearl necklace and bracelets, he became of importance in her eyes the instant she assumed (from his mother's manner) that he had the will as well as the power to confer upon her the dignity of "a married woman." For blue-eyed Edith was a booby of the purest water, and she believed that the badge of matronhood would bring only honor and glory and consideration to her, with very few cares and unpleasant duties to balance these things. So she arrayed herself in full armor, and was ready to do battle against him long before John arrived.

He came just at the right moment, just as the dinner was ready, just as his mother was getting impatient for his presence. It was pleasant to the old lady, since she had ordered her *cuisine* so carefully, to find that his appetite was hearty, and his palate pleased with that which she had provided for him. But it was not pleasant to her to find that he was grave, silent, self-absorbed; that he was not amenable to the subtle flattery of dishes that "had been favorites of his." "He will relax over the coffee," Mrs. Manners thought; so she set Edith down to the piano in the front-room, and drew her son away to the softly cushioned sofa in the shaded back-room, where they were screened from the actual presence of the girl by the falling curtains that draped the division doorway.

Edith played, glibly, decidedly badly, as half-instructed girls are apt to do. She played popular airs arranged for the display of much execution with a spirit and dash that attracted the ear and favorable regard of perambulating pot-boys on the delivery of "supper-beer" bent, but that did not strike a corresponding chord in the breast of John Manners. And she played dreamy pieces most undreamily, and bent her fair head about the while in eager attempt to catch the slightest sound of approbation from the other room.

But all she did hear when she paused presently, in impatient vanity, were the words, "Go on, my dear," from Mrs. Manners. So she went on, without heart or soul or taste, feeling sulkily convinced that her music and white llama and whiter skin, to which the pearls were designed as a foil, were alike unnoticed and unappreciated.

Meanwhile Mrs. Manners had opened her battery.

"John," she began, when Edith was in the middle of one of the most prolonged thunder-claps, "I am thinking that when I leave this house in September I shall be glad to let it for the remainder of my term."

"Are you tired of London, mother? I fancied you would be before long."

"If it suited my health I shouldn't be tired of it," Mrs. Manners said; "but I find that rest

and quiet and my own old ways suit me best. Dear Edith, good as she is, is a charge to an old woman who has lived alone so long."

"I thought she was rather more of a comfort than a charge," John said.

"So she is," Mrs. Manners said, decidedly; "much more. Who could doubt it that knows her? The girl is goodness itself, John; and when I think that she may be thrown away, no wonder I feel her to be a charge!"

"Has she fallen in love with a wrong man?" he asked, laughing.

"Far from it," she said, hastily. "If"—and here Mrs. Manners began to speak very significantly—"if her affections are engaged at all, it is by a man whom I should be the last person in the world to think the 'wrong' one in one sense, though I *shall* think him very wrong indeed if he does not respond."

"My dear mother, come out as a match-maker!" he said, as she put her hand on his arm and sunk her voice to a most impressive whisper.

"No, John. I should scorn to be that," she said, energetically; "but I should act a lie if I pretended not to wish for a certain match that might be made if only both were willing."

"And are not both willing?" he said, carelessly.

"You can answer for one of them, my son."

"Then I answer No," he said, sadly. "Mother, I am sorry that you have set your heart on this, but we can't have things as we like. You must resign this cherished wish, as I may have to resign mine after long years of pertinacity. Don't grieve for Edith. My little cousin cares exactly as much for me as she would care for any other man who might possibly marry her."

Mrs. Manners sat tapping her clasped hands upon her lap for a few moments. He was her very dear son, but he had disappointed, thwarted, overruled her, and for a minute or two she had no sorrow, no sympathy to bestow upon his possible disappointment and heart-sickness. When she spoke it was to ask:

"John, is it that girl who comes here out of affected civility to me who is wasting your youth and spoiling your life—is it Miss Delany that you love in vain?"

"It is Miss Delany that I have loved in vain," he said, quietly. Then he rose up, adding: "I shall not keep you up late to-night, mother; while I stay let us go into the other room with Edith."

Then they went in, and he sat himself down by Edith's side, and talked that kind of "polite conversation" to her which no man ever can talk to the woman he loves. And Edith knew that she had worn white llama and pearls in vain.

He was very considerate as to their possible fatigue in the midst of that anxiety and doubt that he was feeling about Nina, and Nina's wishes and desires respecting Gerald Barrington, and her own future. "I know that you dislike late hours," he said to his mother about

half past nine o'clock, and then he rose up to go away, and she did not seek to detain him.

They did not make much pretense of cheerfulness when John was gone. Old Mrs. Manners was unconditionally and unmistakably cross, and Edith began to quake with the fear that she should be called upon to surrender her pearls. Though she had not been told so in so many words, she felt sure, from the whole manner of the gift, that it had been bestowed in hope. What if it should be taken away in despair! Edith looked at them fondly as she unclasped and laid them down in their velvet case that night; and she thought rather bitter things of her cousin John.

Presently Mrs. Manners came to see her young charge, as was her wont the last thing before retiring to rest herself.

"Well, Edith," she began, "have you had nearly enough of London?"

"Not nearly," Edith said, truthfully.

"Then you won't like my plan just at first, my dear; but you'll see the wisdom of it by-and-by. I shall give this house up in September, and go back to our Hampshire home, where we have friends and people to care for us."

"Oh!" Edith said.

"I find that I must give up a project that was dear to me," Mrs. Manners went on, with a tremulous voice. "What that project was I needn't tell you now, for you can't help me to carry it out; and my son is deaf to my wishes; so I have nothing to stay for."

"I shall be happy to go back, since you think it better," Edith said, blushing a little; and then Mrs. Manners rose up and kissed her niece; and Edith murmured, "Will you take the pearls now, aunt?" and the answer was:

"No, child; keep them, keep them." So Edith slept with a light heart, after all.

CHAPTER XI.

HOW SHE HEARD IT.

SIR ARTHUR DELANY had been calmly content to know that the widow of his ward was well jointured and in good health while she staid far away from him. But as soon as he heard that she was accessible, easily accessible from Eccleston Square, he became anxious to see her well-being with his own eyes, and to hear "what she meant to do, poor thing!" with his own ears.

Accordingly, the morning after the day on which Nina had accidentally met with Mrs. Eldon, Sir Arthur declared it to be his intention to "drive into Kensington about four, with his wife and daughter, and call on Frank's widow." But Lady Delany, who did not know Gertrude, chose to picture the latter as a fretful, sorrowful, uninteresting country lady; and so Lady Delany excused herself from making the visit; therefore it fell upon Nina to go while her wound was still fresh. For it was a wound,

this discovery she had made, that Mrs. Eldon was concealing something relating to Gerald Barrington from her (Nina). It might be a very slight something—it might be the merest casual intimacy, of such an uninteresting nature that Mrs. Eldon did not think it worth mentioning. It "might be" that this was the true solution of the mystery that had been maintained. But Nina did not believe it.

Mrs. Eldon was at home. Mrs. Eldon received them in her fascinating, seductively furnished little drawing-room, looking rather languid from the heat, but very much happier than Sir Arthur had expected to see her look. Even her mourning, deep as it was, had almost a coquettish gracefulness about it, Nina thought, angrily. Why could not Gertrude be content to look her worst for a little time longer for poor Frank's sake, instead of putting on that cloud of airily falling crape which she called a domino, and declared she wore for coolness?

"You left me so quickly yesterday that I had scarcely a moment to speak to you, Nina," Mrs. Eldon said, when Sir Arthur had expressed his gratification at seeing her "at all," and "well," and "there," and had congratulated her on the situation of her house, and its arrangement, and on its being "so easy of access."

"I had better leave Nina with you until the evening," Nina's father said, in a burst of good feeling. He was rather anxious to get away himself, now that he had done his duty to the "poor young widow of his poor young ward." Mrs. Eldon was very pretty, but in these latter years of his life he had come to have a feeling of distrust for young pretty women. His own wife was "one of them," and in his innermost heart he knew that he would have been a far happier man if he had never sought to win and wear that youthful prettiness of hers. Moreover, he was apt to bore himself in the society of people who were not sympathetic to his interests, and prompt in rejoinder and allusion to the topics of the day. Accordingly, now he felt that he should be glad to get himself away as speedily as possible; but as he wished to seem cordial and hearty and pleasant, he determined that he would leave Nina.

"Papa," Nina said, quickly, "my staying may interfere with Mrs. Eldon's plans; another evening, Gertrude, not this."

"Yes, this, please," Mrs. Eldon said, impatiently. "Plans! I have no plans. I shall be charmed if you will stay and cheer my loneliness, Nina." Then Nina protested again against doing so, but more faintly this time, and her protests were overruled; and, finally, Sir Arthur Delany went away without her.

The hostess took her guest up into her flower-perfumed chamber, and even before Nina had taken off her bonnet she felt that there was constraint between them, and that she had been unwise to stay. "Papa has almost forced me to board you, Gertrude," she said; "and you look tired, and would rather be alone, I dare say."

"No, I wouldn't. What makes you say that?"

Mrs. Eldon said, shaking her head. "We are not quite accustomed to one another up here yet. I am glad we are to have this evening together; we shall wear off our stiff edges."

But the stiff edges did not wear off speedily. They both seemed afraid to go back to the old days and to discuss them; and the new ones had not supplied them with sufficient matter in common to converse about. An oppression that was not entirely atmospheric hung over them, and they could not disperse it with *eau de Cologne* and fans. A dozen times, at least, Nina was on the point of mentioning Gerald Barrington; but a vivid remembrance of what Gertrude had considered her (Nina's) folly of old about him restrained her. "Whatever he may be to her now," Miss Delany thought, "lover or friend, whatever he is, if he is not mentioned between us to-night, he will be unmentionable almost in future. I wish, without telling her so bluntly, she could understand that I haven't an atom of love for him now."

Dinner was a diversion. They relaxed a little during dinner—relaxed into naturalness and cordiality, so much so that Nina resolved within herself to have the truth out, by some means or other, when they should get back to the drawing-room.

It was hard to begin, though. In the first place, Gertrude was very restless. She kept on flitting about, from sofa to chair and from chair to fender-stool, in a way that was very unlike her usual calm. She made Nina try her "new piano;" she became engrossingly anxious to hear Miss Delany. In fact, she fidgeted to a degree that made the introduction of a serious subject almost impossible.

At last, about quarter to eight o'clock, after giving a glance out of her flower-wreathed window, Mrs. Eldon seated herself abruptly on the sofa by Nina, and said:

"How opinions alter and get modified and softened by fuller knowledge of that which they were formed upon originally; how we all change, don't we, Nina?"

"Yes; happily and unhappily," Nina said, in some confusion.

"Happily, or unhappily, we *do* change; that is the great point. Nina, I have had great difficulty in making up my mind what I ought to do by you just at present; whether I ought to let events roll on and you be taken by surprise, or whether I ought to prepare you for something."

"Prepare me, by all means," Nina said.

"I will, then. At eight o'clock an old friend of yours is coming here, Mr. Barrington." She paused and looked eagerly into Nina's face. Nina was absolutely composed.

"I am glad you have told me," she said.

"Yes? I could not hesitate to tell you," Mrs. Eldon said, warmly, forgetting the statement she had just made relative to the difficulty she had had in making up her mind as to what she ought to do. "I could not trap you into meeting him without knowing your wishes about it."

"You have learned to tolerate him, then," Nina said. And for a few moments she wrestled with a strong inclination she had to remind Gertrude how she used to rail at and censure the man who was coming.

"I have learned to know him," Mrs. Eldon said, gravely. "During that long, sad time that I staid at Ardleigh alone he was thoughtful and considerate for me in a way I did not appreciate at the time."

"But you have learned to do so since," Nina said, with the shadow of a sneer on her lip. Mrs. Eldon saw and was quick to resent the shadow.

"I should have been blind—dull, indeed—if I had not, Nina."

"You have prepared me now. Tell me something more," Miss Delany said.

"Nina, there are things that are too hard to explain all in a minute."

"Gradual changes of sentiment rank among these hard things, don't they, Gertrude? I will understand without your telling me."

"It has come on so gradually, and yet so quickly, that I have never been able to decide at which point I ought to have begun confiding in you," Mrs. Eldon said, softly. "Nina, I am longing to ask you something; may I?"

"Yes," Nina said. But before Mrs. Eldon could ask her question there came a knock at the door, and the next instant Mr. Barrington was ushered into the room.

"My dear Gertrude—" he began; and then he stopped, for he saw Nina, and he looked at once angry, confused, ashamed, and agitated. And so she met the old love again.

"I have been having a long pleasant talk with Gertrude," Nina said, rising, without a trace of embarrassment, and holding out her hand to him. "And you have been our theme for the last few minutes. But I had not time to hear all your address to her has told me. I do congratulate you so thoroughly, and wish you such happiness."

He was obliged to shake her hand and to look her in the face, feeling that "fickleness and false position" were stamped legibly on his brow. But Nina looked frank and beaming, and Gertrude looked radiant and lovely, and he recovered his normal debonair bearing, and secretly congratulated himself on this dread ordeal being passed.

The Delanys' carriage came for Nina soon after this, and Gertrude snatched a minute alone with her old friend, when the old friend went up to put on her bonnet.

"Nina, what do you think of me?" she exclaimed. "Are you horrified, disgusted—what?"

"Neither one nor the other. A little surprised; but that is a feeling that will soon wear off. What were you going to ask me when Mr. Barrington came in and stopped you?"

"This conclusion to which we have come does not clash with your feelings, does it?"

"No, no, no! not one!" Nina said, vehemently.

"There will be nothing but pleasure, there will not be a shadow of awkwardness, in our interviews with you when we are married?" Gertrude asked, eagerly and inquiringly. And Nina's reply was:

"Certainly not—if we all wish it." Then she took leave of Gertrude and went down, and Gerald Barrington handed her to her carriage, and breathed a benediction upon her for going away so soon.

He had not quite resumed his easy air when he re-entered the room where Gertrude was; he knew that she had marked his confusion, and he was not quite sure how she might feel about it. But Mrs. Eldon, secure in his present undivided homage, was very tender to the feelings of the man she loved.

"I think Nina is prettier than ever; don't you?" she said, without looking at him.

"No, indeed—I do not. I hear she is engaged to a Mr. Manners; do you think it's true?"

"I know he wants her to be engaged to him, and I believe she is very fond of him; so, that being the case, we will hope it is true." So they got over their little difficulty concerning her.

CHAPTER XII.

HOW SHE TOLD IT.

SEVERAL days elapsed between Nina's discovery of the fact of the pretty widow's engagement to her (Nina's) own old love and the necessity of imparting it to John Manners. "I shall tell him myself the instant I see him," she thought; "and I shall add that I was shocked just at first. He will think that I was stung by jealousy, and he will be mistaken, but I can't help that." Then she went on to explain to herself, with much elaboration of argument, that it would be utterly impossible to explain the facts of the case satisfactorily to John Manners. And then she resented such an idea obtruding itself upon her—and arranged a form of explanation to be offered to him, after all.

It was not speedily demanded. The current of events carried them apart for several days—quite long enough for Nina to feel that her everyday life would be more dreary henceforth without John Manners than it had ever been before. Young Lady Delany was now the mother of two daughters, and, in her maternal anxiety for their future well-being, she foresaw much that was detrimental to them in Nina's continued presence. "When my own girls are old enough to go out I shall be hampered with that old maid—for Nina will be an old maid by that time," Lady Delany would say indiscriminately to her husband, her maid, and any one else who would listen to her. Sir Arthur resignedly declared that perhaps she was contemplating a trouble that never might arise—their small daughters might not live to grow up; but this view of the case was not found consolatory.

The projected alliance between Mrs. Eldon and Gerald Barrington was a fruitful theme of annoyance in the Delany household, and Nina was compelled to hear it discussed daily with nearly every visitor who came to the house. There was poignant pain to the girl in this, for her own engagement to Gerald Barrington was an unforgotten thing with many of the old friends of the family. Moreover, she could not bring herself to avow that she saw any thing "indecent" in Mrs. Eldon's marrying a second time. And when she would not avow this, her step-mother sarcastically suggested that "Nina feared being suspected of tasting sour grapes, but that in her prudence she overshot her mark, and was too generous for it to be believed true." Altogether, Nina repented herself of having unearthed her old friend, and of having surprised her old friend's secret.

For three or four days after Mrs. Manners and her son had come to the clear and definite understanding as to each other's hopes and intentions which has been described, John staid away from the maternal roof and tried to persuade himself that his mother would be indifferent as to her non-success in the furthering of that scheme which the dear old domestic diplomatist had come to London to carry out. Still, though he tried to persuade himself that this was the case, he felt shy of going down and facing the girl who had been offered to him in matrimony, and whom he had rejected—rejected kindly and politely, but still rejected. He felt a little flushed in the face as he thought of the possibility of Edith knowing what was going on in the back-room that night while she was making sweet music in the front. And when he had reflected upon this possibility he did hope that the poor little thing with the pure white brow and the forget-me-not eyes and the feeble mind had not learned to love him. If she had—! Well, at any rate he would see Nina Delany first, and give her clearly to understand that he did not think it well for man to live alone.

Fraught with this determination he went to Eccleston Square and knocked at the Delanys' door at an hour in the afternoon when he knew that the hottest sun would never drive Lady Delany to seek the shelter of her own roof. He was fortunate—there was no exception this day to that rule on which he had relied. Lady Delany was not at home, and Miss Delany was.

He had to wait alone in the drawing-room for some little time before she came to him. And while he was waiting he made up his mind definitely, as he believed, as to what he would say and do. He had no false shame in the matter. Twice before he had asked this lady to marry him, and twice she had refused to do so. But in her last refusal there had been an element of regret for her own determination. This third time would be the last of his asking her, not because he would be ashamed to make a fourth, or a fifth, or even a sixth application for that which he much desired, but because

time was going on; and he knew that if she said him nay now, he would never again be able to feel very ardent about her saying yes.

Lady Delany's drawing-room was a very pleasant place to wait in. The wide windows were open on to the balcony, and broad beds of scarlet geranium and mignonnette spread out in that subtle London sweetness of theirs before him. They had attained their fullest luxuriance now in the autumn, as metropolitan horticultural efforts always do, just as people are about to quit town, and they gave him pleasant ideas of how the outside of his house in Vere Street might be made to look under the management of a wife. "I hope with all my heart that Nina will be the one to manage them; but if she will not, why, then—" He could not completely word his thought, for at that instant the door opened and Nina came in.

Prettier than ever—ay, and looking as young as ever too, he fancied, in his great admiration for her. And far more cordial than ever, it seemed to him. Both hands came out to greet him. Cheeks flushed and eyes sparkled with pleasure. Even under the excitement of recently acquired pearls, Edith could never look like this.

She seated herself close to the open window, in the shade that was cast by the pink striped awning that covered the balcony, in the current of sweet air that was wafted in over the blooming mignonnette. He placed himself opposite to her, feeling almost sorry that time was going on so fast, and that he had so definitely made up his mind that this was to be the last time of asking.

"Have you seen my mother and my cousin since I dined there the other night?" he began, for it was part of his plan to tell her his mother's wishes about Edith and himself.

"No; but I have seen Mrs. Eldon and Mr. Gerald Barrington again."

"And they have solved the little mystery?" he asked.

"Yes. After all, it is no mystery; it is the natural result of a certain set of circumstances. They are engaged, and will be married to each other as soon as her year of mourning has expired."

"I am heartily glad of it," he said.

"So am I," she put in, quietly.

"Nina," he began, feeling rather more agitated than he had felt on the previous occasions, "before you told me this, even, I had resolved upon asking you that old question again: this confirms me in that resolve. Shall I tell you why I made it, and why I mean this to be the last time?"

"Yes, tell me," she stammered out. So he too was going to show her that ties, strongly as they bound him now, would not bind him forever if she tested them too severely.

"Well, until the other day—the day after I met you last—the possibility of my ever marrying any other woman never entered my mind. On that day my mother worded the idea very

distinctly; and since then I have been thinking that even if I can not love, I may be a happier man than I am now in being loved by a single-minded, good-hearted little creature like my cousin. But before I fall back upon this silver possibility I will try once more to realize that golden one which I have had before me so long. That you have come to like me better, I am sure—have you come to like me well enough to marry me?"

"Yes," Nina said; "I have done that for a long time. I did that when you asked me in the garden at Pont de Brigne; but I thought myself half-pledged." And then she told him all her indiscretion in going to Sedgwick.

CHAPTER XIII.

AT NIGHT IN VERE STREET.

THE lady's family heard of it with the greatest satisfaction, and Lady Delany offered at once to take all the trouble of furnishing off Mr. Manners's hands. "Nina's a baby about bargains," she said, "but I have a natural aptitude for making them; besides, I shall have such pleasure in doing it, for if that house is done with taste it will be perfect." Lady Delany was so warm on the subject in her goodwill that they had some difficulty in saving themselves from the carpets and curtains of her heart, and the consequent bills. However, she was restrained by the statement from Nina that they meant to marry first, and furnish afterward—an unconventional proceeding that robbed Lady Delany of half her pleasure in the marriage.

But the gentleman's family did not hear of it with pleasure. On the contrary, when Edith heard of it she manifested a little spiteful scorn that betokened any thing but pleasure. John had been closeted with his mother an hour before dinner, and had gone away when dinner was announced; and Mrs. Manners had sat down to the table in tears and anger. From the hour in which she had taken Edith to live with her she had fully intended that her son should marry her niece. Now this intention was frustrated by a girl whom she (Mrs. Manners) did not like. Accordingly she felt angry and hardly used; and her mood when she was these things was not pleasant.

She had not been pleasant to her son. He had told her of his engagement, and his hope that the marriage would soon take place, in as few words as possible. And she had received the communication in grim silence. Then he had asked her affectionately to say something hopeful and kind to him on this the realization of his long-cherished hope. Then she had broken the grim silence to utter even grimmer words.

"You might as well have told me this the other evening when I spoke to you about Edith."

"But, mother, I did not know it myself then."

"Oh, I dare say you knew very well that she would snap at you directly you asked her!" Mrs. Manners said. And then he could not

help laughing as he remembered how his experience contradicted his mother's aspersion.

"I shall ask Edith to be one of the bridesmaids," he said; and at that Mrs. Manners did grow very wrath indeed, giving her son to understand clearly that she would not give her consent to any act by which his bridal with Miss Delany might be the more graced in the eyes of the world.

"It's a trifling obstacle to the carrying out of that plan," she said, "that I shall be far away from here by the time you're married, and that I do rely on Edith's gratitude so far as to expect that she won't desert me."

After this John went away, feeling that he could do no good by remaining, and Mrs. Manners went down to dinner, as has been said.

Edith had scented a disclosure and a secret in some mysterious way, and was disappointed that her cousin had gone away, instead of staying to dinner, as was his wont, when he came to see them late in the afternoon.

"John seems to have been in a hurry to day, aunt," she said, as she seated herself; and Mrs. Manners made no reply for a minute or two, but took the opportunity, when the servant went out of the room, of saying:

"John had nothing very pleasant to say, so he's just as well gone."

"Oh!" Edith said.

"He came to tell me that he is going to be married to Miss Delany," Mrs. Manners said, hesitatingly, half fearing how Edith might take it, for it seemed to her as unnatural that Edith should not love John as it was that John should not love Edith.

"Then she's tired of waiting any longer for Mr. Barrington," Edith said, vivaciously; and then she told how she had heard from their maid, who had heard it from Mrs. Eldon's maid, that Mr. Barrington had jilted Miss Delany for the beautiful widow. "It really would have looked better if she had waited a month or two longer, wouldn't it, aunt? for she must think that, living so near, you will hear this about Mrs. Eldon, and she must think that when you hear you'll tell John."

But in spite of all this violence that was done by it to the sensitive feelings of those connected with him, John Manners was very happy in his engagement—quite happy enough to make him anxious to terminate it in marriage—about the best tribute that can be paid by a man to the preliminary stage.

It was expedient that they should be married before the Delanys left town for the end of the summer and the autumn, and so Nina's time was well taken up, and she was able to justify herself to herself for suffering such a long time to pass before she went to acquaint Mrs. Eldon with the coming change. At last, two days before the one appointed for her wedding, she went down to the Victoria Road, and found the widow alone and sad; and yet not sad exactly, but most strangely quiet, and suppressed in look and manner.

"Gertrude," Nina said, after about ten minutes' talk on desultory subjects, "you don't say you wonder why I have not been here for a long time."

"I think I have left off wondering at any thing," Gertrude said, smiling softly.

"Then I'll create the emotion for you again. I am going to marry John Manners."

"I have not lost the power of being glad, I find," Gertrude said, heartily.

"Thank you. That's nicely, judiciously, sweetly, kindly said. I am going to marry him, and to love him, and to be very happy with him. I have not lost the power of wondering. I wonder if our married paths will cross!"

Just for an instant a look of pain swept over Gertrude's face. Then she smiled it down, and said:

"I shall cross your married path often, I hope, dear; but that is all over between Mr. Barrington and me. I am bound to tread my path without a guide, pledged to be one instead."

"What do you mean? Broken off your engagement? Has Gerald Barrington shown himself weak and unstable to you?"

"No; indeed he has not; but poor Frank's child will be born soon. In my grief and excitement I did not know that I was to be a mother. Now I do know it, and I'll have my child to myself, since it has lost its own father; but I am very weak about it, Nina." Here she began to cry. "I have only just strength enough to stick to my determination—not to talk about it."

As may be supposed, in spite of this declaration they did talk about it a great deal, and Nina found herself advocating the cause of this man, who would lose a good woman whom he loved a second time in his life, if Gertrude did not relent. But Gertrude gave no signs of relenting; indeed, she seemed to think that it would be idle to do so now, for she had taken what she called her last leave of Gerald Barrington, and believed that he had gone abroad. At any rate he had left London, and gone she knew not whither.

There was a happy coming home to the pretty house in Vere Street, some six months after this. John Manners and his wife had curtailed their wedding tour, and come back to lodgings adjacent to their own house, in order that they might personally superintend the arrangement of the furniture, which Lady Delany had not been allowed to select. And now, on this particular night, the house was ready, and they were on their way to it in a cab, packed with their traveling trunks, and the trifles that will accumulate even when one is in lodgings, and doing without every thing. They were talking about Gertrude, who was the mother of a pretty boy, and well enough to have promised to come and spend the following day with them, and Nina was affecting to half shake her head about the pretty boy having come after all, since his doing so was the cause of poor Gerald Barrington being cast adrift again.

"She never did a wiser thing in her life than in casting him adrift," John Manners said.

"I can understand your feeling that about me, but not about Gertrude."

"Can't you understand my feeling it about any woman worthy of a thought? He hadn't it in him to be faithful; if he had he would have been more favored. *What* he turned to from you the first time! You yourself have described his wife to me."

"And you yourself have told me you contemplated the idea of Edith, if I had said No, the last time you asked me," Mrs. Manners said, laughing.

"Ah! that was a different thing," Mr. Manners remarked. And then the cab stopped at their own door, and they got out.

But after they had got out of the cab, and before they could get into the house, a gentleman came strolling past, with a young and very lovely girl leaning on his arm; and the girl was looking up into his face with an impassioned warmth that can never be feigned, and chokingly, regardless of those in the street, was imploring him to "marry her now, or she would—she would—" And he, turning a careless ear to her, half glanced at the lady who was going to cross from the cab to the door; and his face was the face of Gerald Barrington.

To think of all he had suffered for her in years gone by, and of all she had suffered for him—of the trials and temptations he had

brought upon himself—of his easy modes of self-consolation—of all the weakness and all the charm of the man, was the work of one instant. Then she remembered the evil effect the out-cast feeling is sure to have on a man. And she stretched her hand out to him and called him by name, and bid him "mark the address and come and see her husband and herself tomorrow."

"So I mark my entrance into your home with an indiscretion, John," she said, half deprecatingly, when they had got themselves into the house.

"Not with an indiscretion," he said, approvingly. "But he won't come."

"I judge him more leniently and more kindly. He will come. It is Gertrude's desertion which has brought him to this; but he shall not revenge himself on Gertrude by cruelly treating that poor girl."

"He will not come," Mr. Manners repeated. And the result proved him right. The morrow came, and Nina watched for him anxiously, and watched in vain. But the four o'clock post brought her a letter from him, containing these few words:

"This morning I married the girl you saw with me last night. She was good till she knew me; and an angel interposed for her last night, and saved her. Since my marriage I have taken our passage to Australia, where I am going to work and lead a new life."

She never heard of the old love again.

THE DETECTIVE.

A TALE OF THE OLD WALTON HOUSE.

THE remarkable skill and penetration shown by our modern detectives in "shadowing" suspected persons until sufficient proof has been obtained to warrant their arrest is illustrated by the daily history of crime. By the term "shadowing" is meant that vigilant watch kept upon the culprit by some one who follows him like his own shadow, and to do this successfully indicates no small degree of skill on the part of the "detective." This last expression recalls to memory some strange facts which came to my knowledge in the early part of my life, and I can never meet the term in print or hear it in conversation without a painful reminiscence. This I now offer to the world, inasmuch as its lessons may be not altogether useless.

The old Walton House is one of the few historic buildings in this city, not historic in the highest sense of the term, but simply as commemorating commercial and social greatness of a past age. The Waltons, for several generations, were the merchant princes of this city, but their glory began to wane before the Revolution, and since then no one of the name has restored its greatness. William Walton, in whom the family culminated, built a mansion in the fashionable suburbs of the city, in which was exhibited the highest reach of colonial

architecture. The locality, which is now known as Franklin Square, was then the most fashionable spot in New York. Mr. Walton's mansion was surrounded by spacious grounds which sloped down to the East River, and afforded a fine view of the fields of Broekelklyn, as the place opposite was called by the Dutch settlers. These grounds are now cut off from the river by Water, Front, and South streets, and huge warehouses now stand on the spot where the Waltons (like the renowned Izaak) were wont to amuse themselves with piscatorial sport.* The Walton House still stands, but it is so grievously changed that its author would hardly know it. It is hedged in with buildings, it is defaced with alterations, and is cut up into small rooms after the fashion of a tenement house. These changes have been gradual, and at the time to which I have reference it retained much of its former grandeur. The Walton family had become, as it was supposed, extinct, and

* William Walton built the mansion referred to in 1752. He died, childless, in 1768, leaving his estate to his grand-nephew, William Walton. The latter joined the British during the Revolution, and his estates were in part confiscated. His children went to England, and one of them entered the British navy, in which he rose to the post of Rear-Admiral.—*Vide* HISTORY OF CHAMBER OF COMMERCE.

THE OLD WALTON HOUSE.

the property had passed into other hands, when suddenly a member of this ancient house reappeared in the person of a British sea-captain. This event of course made a sensation in the society of New York, which, sixty years ago, was limited to Wall Street and the lower part of Broadway, and hence was easily stirred. Captain Guilford Walton had nothing, however, to recommend him beyond the prestige of his name and former rank—not in the royal navy, but in the merchant service. He had sailed many years, but, though sea-captains generally make money, he brought with him no reputation of wealth. He was well built in form, and might have been called good-looking, had it not been for an expression peculiarly sinister which his countenance bore when in repose, but which, however, passed away as soon as he began to speak. He was an intelligent and agreeable companion, and could fascinate with his strange sea tales; but at times he became silent, and even moody. Such a man could at once command access to the best society of New York, and Captain Walton was accordingly received among the Hamiltons, the Crugers, the Gracies, and other aristocratic families whose mansions fronted the Battery, or were to be found near by in Broadway or Greenwich Street. His own residence was far distant on the east side of town, and, in fact, was the mansion to which reference has been made. It was no longer in a fashionable neighborhood, but was occupied by a well-to-do family, who were glad to let a suit of furnished apartments to a gentleman whose name was identified with the house. Here he exhibited an orderly life, and thus dif-

fered much from other sea-faring men, who, when ashore, indulge in gaming, drinking, and other degrading habits. It was noticed that he gradually cultivated a recluse habit, or rather yielded to an inclination of this sort, for he seldom mixed with gay society, and when he did so he readily showed that it was from a desire for its excitement rather than for any gratification of thought or sentiment. As he was unmarried, it was supposed that such a prudent, steady bachelor (of forty-five or thereabout) would live and die a celibate, and, perhaps, immortalize his memory by some great deed of posthumous charity.

These ideas, however, were soon overset by his introduction to a young lady who lived in the upper suburbs of the city, and was of a respectable though not aristocratic family. Her father had been a Tory during the Revolution, and had lost a large fortune. He now occupied a few acres near what is now called Spring Street, and this, with a small house, was all that was left of his once splendid estate. I do not know how Captain Walton formed the acquaintance of Anna Barrington, but as soon as made it seemed to act upon his nature with great power. Anna, though neither rich nor beautiful, had the charm of innocence, and this could not but win the admiration of one who had gone the world's round and met its conventional politeness, so selfish and heartless. In addition to this, Miss Barrington was well educated, and had been so long intimate with the aristocratic British families of the city as to acquire a national tone, which attracted a true Briton like Captain Walton. The acquaintance, therefore, readily ripened into intimacy, and, as a natural result, their strong mutual affinities led to a matrimonial engagement. Captain Walton became a constant visitor at Kirtle Grove, as Mr. Barrington's residence was called, and enjoyed that degree of privilege which is accorded to an expectant bridegroom.

Such was the condition of things when the strange and perplexing train of circumstances of which I am about to write took place. They were generally known in New York, and were, at the time, the subject of much remark; but the impression they made on the public mind was greatly abated by that far more astounding event which occurred a few months afterward—the murder of Gulielma Sands. This tragedy was exceedingly mysterious. Weeks was tried and acquitted, though since then his guilt has been made quite apparent. He no doubt seduced Miss Sands under promise of marriage, and then murdered her and threw her body into a well. The latter was in a vacant lot not far from Kirtle Grove, and there the body was subsequently discovered. The popular novel, by T. S. Fay, entitled “Norman Leslie,” is founded upon this affair, which, as I said, absorbed public attention to the exclusion of all other topics.

I have stated that the captain had rooms at the Walton House, in Franklin Square, which was separated from Kirtle Grove by a mile's

distance. It would have been farther were it not the captain's custom to take a short cut through several new streets, half built up with small wooden houses. The path thus indicated would be from Kirtle Grove to Broadway, and thence across to Mulberry Street. This street was hardly more than a crooked highway, skirting the Collect, or pond, which covered what is now the site of Centre Street. After reaching Chatham Street the city was closely built all the way to Franklin Square, but up to this avenue all was rural and lonely.

One night, shortly after his engagement with Anna Barrington had commenced, he happened to remain unusually late in company with his *fiancée* and a lady friend. The conversation had taken a religious turn; and, as Miss Barrington was of a pious and meditative habit, the evidences of revelation were discussed, or, at least, were talked about, and Captain Walton was quite free to utterly deny them. This shocked Miss Barrington, but the hope that her lover might change his views induced her to ply him with arguments until the late hour referred to. I may remark, *en passant*, that French philosophy was then quite fashionable, especially since it was understood that Jefferson had returned from France a confirmed infidel. The conversation shifted from one aspect of the subject to another until it fell on the supernatural and the marvelous, so much of which is found in common life. Miss Barrington, though not superstitious, in the common acceptance of the term, maintained a belief in these things, which the captain, on the other hand, treated with ridicule. This is not at all suprising. Men of the world become hardened in unbelief, because their experience is solely with material objects. Captain Walton could only speak of that which he knew, and the supernatural was to him an unknown world. This fact needs to be borne in mind, because the victim of the fearful work I am now to describe was, from deliberate conviction, an utter disbeliever in the supernatural.

The conversation was so interesting that the hours stole away with unobserved rapidity, and it was one o'clock before the captain bade the ladies good-night and commenced his lonely walk homeward. His mind was so engrossed with thought that he reached Broadway before he was aware, and crossing over that avenue, which then was but a country road, he soon reached Mulberry Street, the upper part of which merely traversed vacant lots. Then came unfinished houses, with heaps of brick and mortar in front, scenes of active labor during the day, but now still and deserted as a grave-yard. There was something painful in that very silence. It was so solemn and almost oppressive that his very steps seemed peculiarly loud and distinct. While thinking upon the contrast which I have suggested, it occurred to him that he was not utterly alone, for he heard other footsteps regularly falling, and near by, too; not over thirty feet behind, it would seem, if one judged by sound. Might

it be the city watch? No; for this was out of his regular beat, which did not extend so far from the Park. Then some one must be on his track, "dogging him," as the phrase is. This suspicion at once aroused the captain, and he turned immediately to confront his pursuer. The moon shone clearly, and would have revealed any human form; but none was to be seen; and the only conclusion was, that it might have been the echo of his own footsteps. To assure himself on this point, he stamped violently on the ground, and then walked rapidly to and fro, in the vain attempt to awaken an echo. After these efforts he considered the whole an illusion, and resumed his walk; but before he had proceeded a dozen paces the mysterious footfalls were again heard in his rear. It seemed as though there was a fixed purpose to prove that they were not an echo, for the steps were varied in a very peculiar manner. Sometimes they were slackened almost to a halt, and then there would be a series of eight or ten rapid strides, and followed by a slow walk. Captain Walton felt the increasing power of this annoyance. He again turned in a very sudden manner, glancing keenly in the rear, but with the same result, for no living thing was visible above the level of the silent and deserted street. He then retraced his steps, determined to give the matter a thorough search; but after walking fifty feet or more, he found his attempt fruitless. His nervous frame was intensely excited, especially when he found himself thus balked; but what was to be done? Nothing but to return home unsatisfied. As he resumed his walk toward Chatham Street he felt, in spite of his avowed unbelief, that some of Miss Barrington's opinions were taking possession of his mind, and, worse than this, a really superstitious feeling began to creep upon him. He contended in vain with these thoughts, and in this wretched frame he pursued his way. For a time the footsteps were unheard; but when passing the old wooden building which still stands at the corner of Pearl and Chatham Streets they were resumed, sometimes in a slow march, and then with sudden starts, as though his pursuer would run him down. Some strange vagaries marked these movements, for sometimes they seemed to be performing a dance, or beating time, so as to allow him to get on, and thus maintain the same distance between them. Captain Walton was filled with vague and indescribable apprehensions, and his excitement at last found relief in the exclamation, "Who goes there?" No answer was received, and the sound of his voice broke in upon the stillness of the hour with a harsh and grating jar which aggravated his nervousness. He now felt disposed to run, if by so doing he might escape his pursuer. He did so, and immediately heard the clatter of some one of equal speed maintaining the usual proximity. Worn out with the exertion, he then resumed a walk, which was at once followed by his pursuer; and in this manner he

at last reached his abode. It was not until he sat in his snug and cozy room, by a bright sea-coal fire, that he could collect his mind sufficiently to reconsider these strange occurrences. His skepticism had not vanished, but it was considerably shaken, and nature was beginning to show in his case that weakness which bids us tremble at the approach of the unseen world.

Captain Walton did not retire before three, and it was a long time before he could sleep. As a consequence, he rose late, and found himself in a nervous and very distressed frame. And yet he reflected on the events of the past night with more surprise than alarm. Daylight had flung its cheer over the world, and the occurrence of a night lost its power. He was endeavoring to reason out the thing on natural causes, when Fensford, his servant, handed in the morning's mail, which was a single letter of small and unimportant appearance, addressed to Captain Walton, Walton House. The contents read thus:

"You appear not to recognize me, but perhaps you may when we see more of each other. Meanwhile it is hardly worth while for you to be so shy. However, I will advise you to keep clear of Mulberry Street, unless you wish to meet

THE DETECTIVE."

The captain read the strange epistle several times. He scrutinized the handwriting, and was satisfied he had never met it before. It was a rude, coarse hand, such as illiterate people generally write; but there was a boldness in the characters that spoke the tone of familiarity; and then the term "detective"—what could it mean? Was the writer a friend, or foe? If the latter, why should he send warning? If he was the former, why should he subscribe himself as one whom he had reason to dread? Taking the whole thing into view, it was an inexplicable mystery, and one with very unpleasant associations.

The next question was, should this affair be mentioned to Miss Barrington? It certainly would interest her, inasmuch as she was a believer in the supernatural; but then it might, on the other hand, excite apprehensions, and hence he concluded to say nothing about it. This conclusion was strengthened by subsequent considerations. The mysterious footfall might be a delusion, while the letter might be a hoax; but yet, while he endeavored to treat the matter with this indifference, it still haunted him, and filled him with perplexing thoughts. One thing was certain, on returning from his next visit to Miss Barrington's, he was careful to avoid Mulberry Street. In order to do this, he took the broad highway on the North River side of the city (at present known as Hudson Street), and then turned up Vesey Street, passing St. Paul's church-yard, crossed Broadway, thence down Partition Street (now Fulton) to Pearl, and up Pearl to his residence. During this long walk Captain Walton heard nothing to disturb or annoy him; and his unpleasant feelings had about worn off, when, ten days subsequently, another incident occurred which

revived them with full power. He had been to the theatre—the Park Theatre, of course, for it was then the only institution of the kind in New York, and for years afterward headed its posters in this simple but dignified style: "Theatre"—and had escorted Miss Barrington to the carriage which contained her father. The old gentleman seldom went, except when some fine play of Shakspeare's was performed; and on this occasion, having seen one of Cooper's best impersonations, he insisted on taking Anna home, and thus relieving the captain of a long excursion to their residence and back. The latter then turned down Beekman Street, and, as it was one o'clock, this locality was altogether deserted. Walking quietly along, with the poetry and sentiment of Shakspeare welling up in his heart, and mingling with the memory of Miss Barrington's fine thoughts and pleasant conversation, he became suddenly aware of the sound of steps dogging him, as on the previous occasion. Several times he turned back, earnestly hoping that he might see some form from whom these sounds might naturally proceed. But all was quiet, the street was deserted, and no form was visible. He continued his way, nervous and miserable, for the sounds became clear and unmistakable, and filled him with dread. As he reached St. George's Chapel they seemed to strike simultaneously with his own steps. Then they changed, and exhibited the former inequality; sometimes slow, sometimes lagging very far behind, and then hurrying up in a run until the usual propinquity was reached; and this was not subsequently exceeded nor diminished. Again and again Captain Walton turned, glancing over the shoulder or facing square around, but no one was visible. The horrors of this intangible, unseen persecution became intolerable; and when, at last, he reached the old mansion, his nerves were in such an excitement that rest was utterly out of the question, and he did not even attempt to lie down until after daylight. He was awakened by a knock at his chamber door, proceeding from his servant, who had the morning's mail. There were several letters, among which one instantly excited his attention, and he read its contents with an eager eye. They were as follows:

"Do you think, Captain Walton, to escape me? You may as well escape your own shadow. I will be with you when I will, and you shall not only hear me, but meet me also; for I am not disposed to conceal myself, though you may think so. Still, why should this trouble you or break your rest? for, if you have a clear conscience, you surely need fear nothing from

THE DETECTIVE."

It is hardly necessary to dwell upon the feelings consequent on the perusal of this strange and most unwelcome letter. Captain Walton's friends observed that he was unusually moody and absent-minded for several days, but none of them could imagine the cause. As for himself, however he might desire to look upon the phantom steps as a mere illusion, there could be no question concerning the letters. There

they lay before him, identical in handwriting; and he not only read but studied them in every word and syllable, until they were printed on his memory. The whole of this affair gradually became connected with certain passages in his own life which, above all others, he had tried to forget, but which now came fresh into his memory. It was therefore a fortunate circumstance, inasmuch as it assisted to divert and to occupy his mind, that he then conceived the idea of recovering Mr. Barrington's confiscated estates, or, rather, Anna Barrington's. This grew out of a very remarkable position of the case. Mr. Barrington owned, prior to the Revolution, a large tract of land in the suburbs of the city, which was now worth five thousand dollars per acre, and hence would bring an enormous sum of money. This land, however, was the property of his wife; but during the hurry and confusion of military proceedings it had been viewed as belonging to himself, and hence had been sold. Anna Barrington was now her mother's sole heir; and, having been wronged by the sale of the estate, it would be proper for Congress to correct the error and to restore her to her possession. To further this end Captain Walton had obtained the influence of Aaron Burr; and any measure recommended by him was sure to be carried. It is true, Burr was unpopular in New York, but his influence in Congress, notwithstanding this, was very great. The excitement growing out of this claim so engrossed Captain Walton's mind that it lost its gloom, and seemed once more elastic and natural, so that his friends congratulated him on his improved appearance, and Miss Barrington could not conceal her delight. After a while, however, he was dismayed by occasional renewals of the same annoyance, which occurred in the daytime, in lonely places, as well as at night. Sometimes they appeared so faint that it was difficult, if not impossible, to distinguish between them and the fancies of an excited imagination; and when he was in company they were heard by him and by none else. For instance, one night he was returning from a public meeting held in Martling's tavern, which afterward became Tammany Hall; for, although not a politician, he would occasionally go to hear a fine speaker, and on this occasion it was expected that Burr would make an address. In this we were disappointed. I say *we*, because I was one of that number, and, though but a boy of sixteen, I took a vast interest in politics, and felt all the importance of my position as one of the rising generation. I well remember that a group, of which I was a member, walked down Frankfort Street to Pearl, and another member of this group was Captain Walton. He seemed taciturn and absent-minded, and so different from his usual conversational mood that one might imagine that some deep anxiety was preying on his heart. I afterward learned that during this walk he heard those footsteps dogging him all the way home. I have understood, though I am not positive,

that this was the last time the annoyance appeared in this peculiar shape; and it was soon to take a new and more terrible form.

What this new form was to be might have been supposed from one of the events of this night. We had reached Franklin Square, and the captain was about to cross the street to reach the Walton House, when a stranger appeared in our front. He was a short man, had a foreign look—at least such was my impression from a clear moonlight view—wore a cap, and seemed to be of sea-faring life. We saw him full thirty feet ahead, walking toward us with rapid step and manner indicating fierce excitement, muttering to himself in tones which indicated deep and bitter perturbation. This startling individual walked toward Captain Walton, and then halted directly in his front, and gazed upon him for a moment with a look that seemed almost diabolical with fury and revenge. He then turned abruptly and disappeared in an alley. I must confess that I was exceedingly shocked at this sudden and startling appearance, which impressed me with a sense of danger such as I never before or since have felt in the presence of any human being. I had seen a countenance peculiarly evil lit up by the excitement of bad passions; still it was not sufficient to carry terror to the heart of a brave man. Hence I was much surprised by the effect it had on Captain Walton; I knew his reputation for courage, which indeed, according to report, he had shown on several occasions, and this made his conduct the more noticeable. As the stranger advanced he recoiled a few steps and grasped my arm in silence, but in a manner which indicated a spasm of terror. Then, as the figure disappeared, he shoved me back and sought to follow it a short distance, when he suddenly stopped, in evident confusion, and sat down upon a door-step. His countenance appeared ghastly and haggard. It was a strange moonlight scene, and we all felt its weird power.

The first to speak was Mr. Melford, on whose invitation Walton had gone to the meeting.

"For God's sake, Captain, what's the matter? Did the fellow hurt you? What can it mean?"

For a moment no reply was made, and then Walton looked around distractedly, and exclaimed, in a manner which showed his inattention to the question:

"What did he say? I did not hear it clearly. Did you make it out? I know he said *something*."

"No matter what he said," remarked Saunders, another of the group. "It's only some fellow whom rum makes combative—a bad one to meet, though, any where, for he might handle cold steel."

"You seem unwell, Captain Walton," rejoined Melford. "We will assist you home; 'tis only across the street."

"I am not exactly unwell," replied Walton,

evidently trying to rally; "but how it is I can not tell, unless hard work on my land claim had worn me out, and then late hours at a political meeting, you know. I have felt badly all day and evening too, and so this upset me; but I am better now. We'll go on."

We accompanied the captain to his lodgings, and then passed down toward Hanover Square, in which vicinity most of us dwelt. As a matter of course, the strange event was the subject of conversation; and though it might have been reasonably supposed that intoxication was the cause of that fellow's conduct, yet, after all, we could not shake off the idea of mystery which accompanied it.

Although I had but lately been introduced to Captain Walton, I took the liberty to call next day at his lodgings to inquire concerning his health, and learned that he kept his room, though not, as he said, "really ill," and hoped to be about by the next day. I subsequently learned that a short time after I left he sent for Doctor Hosack, who then was considered the best physician in New York, and there ensued one of those strange interviews which city physicians occasionally meet. The physician felt the patient's pulse and inquired his symptoms. Instead of making a direct reply, the latter talked in a desultory and abstracted manner, referring but little to the matter of disease, but in some way suggesting that there must be a more important subject on his mind. Still, he complained of occasional palpitation and nervous distress. The doctor was a thorough man, and did not care to dismiss the case so lightly. Hence he asked if there was any painful circumstance or experience which was then distressing his patient's thoughts. The latter instantaneously denied this, and even seemed worried by the suggestion. Doctor Hosack then remarked that he could see nothing out of the way in all this, although, perhaps, there might be a slight difficulty in digestion. He then, as usual, wrote a prescription, and was about to withdraw, when Captain Walton suddenly stopped him, as though a new idea was suggested to his mind.

"Doctor, I had almost forgotten a question which sometimes occurs to me. I hardly know, after all, whether it be strictly a medical one, but if not you will excuse it."

"Well, Sir," replied the physician, "go on and propose your question."

The captain seemed either embarrassed by this prompt reply or else he had some difficulty in framing his interrogatory, for he was silent, took a turn about the room, opened a book in an abstracted manner, and then sat down facing the doctor like one who had determined to meet a difficulty, and said:

"I suppose you will think my question a foolish one, but I desire to know whether, when a man is dead, and is pronounced so by medical authority—I mean by a surgeon of respectable standing—may such a person be restored to life?"

Doctor Hosack smiled, and a negative motion of the head indicated his reply.

"But a little farther—I will say a word farther," remarked the captain. "Suppose a blunder to have been made. Suppose the surgeon to have been a mere quack, could he be so far deceived as to have pronounced a man dead when the case involved only a temporary suspension of nature occasioned by extreme pain or disease?"

"Death," replied the physician, "is generally unmistakable; the *rigor mortis* soon proves the difference between this and any resemblance, whether it ensue from violence or is the effect of slow disease."

"That is a very satisfactory reply," said the captain. "Now one word more, for I presume that you are advised on all such points. If a man be in danger, or may fear that he is in danger, of violence at the hands of a lunatic, can he not get a warrant and have the fellow locked up?"

"I suppose he can," replied the physician; "though such a matter belongs to the law rather than to medicine."

Doctor Hosack took his leave. He was a man of rapid perception and deep penetration, and he saw from these questions that the mind rather than the body of his new patient was the seat of suffering. A few days afterward the following advertisement appeared in the *Commercial Advertiser*:

IF GODFREY BURTON, formerly boatswain on board the ship *Petrel*, will apply to Edward King, Attorney, 14 Wall Street, he will hear something to his advantage. Should he prefer to come after dark, he may call up stairs on the family at any time up to 11 o'clock.

The *Petrel* was the vessel Captain Walton had sailed, and as Doctor Hosack knew this, he suspected when he saw the paper that his patient's distress must in some way be identified with the individual to whom this advertisement was addressed. This, however, was mere conjecture, for no information as to the real purpose of the advertisement was ever divulged by the attorney.

Captain Walton's distress had been generally noticed by his friends, who ascribed it to hypochondria, and hence they were gratified to once more see an improvement in his spirits. One of the earliest symptoms of this was his appearance at a grand supper of the Masonic fraternity, to which he belonged. This institution was then strongly established in New York.

On this occasion the captain's friends had their eyes upon him, and observed that he plied the bottle freely, and, though at first gloomy and abstracted, he soon became mellowed and conversational. This was a subject of pleasant remark; but they did not know that a secret anxiety impelled him to this course, and that his excessive vivacity arose not only from the use of wine, but also from a strong counter effort of the mind. He left the table early, and, in obedience to his present passion, he proceeded

to the Barringtons', where he spent a couple of delightful hours. At the end of this time his elation of spirits began to flag, and his undefined apprehensions threatened a return; and when he took his leave he felt a foreboding of coming mischief, and his mind was haunted by mysterious apprehensions, which he could not altogether repel. He pursued his way homeward, with a dogged resolution to meet whatever might occur, and, as no return of the footsteps happened, he began to feel a restoration of confidence. He had walked half a mile, and was just reaching the long line of twinkling lamps that marked the city proper, and which then commenced near Duane Street. At this moment he heard the report of a musket behind him, and the whistle of a bullet added a still more startling sensation. His first impulse was to turn in pursuit of the assassin; but the road was much encumbered with heaps of rubbish, and the surrounding fields, so vague and indefinite in the distance, discouraged the pursuit. For a solitary individual to attempt the arrest of a murderer was absurd; and as he gazed around all was dark and solitary. Hence he turned to his onward path, but under the excitement of the alarm his pace quickened rapidly, and he was approaching Broadway, when suddenly he caught a view of the man in the fur cap. They met; but the encounter was only momentary. The figure was walking at the same rapid step and with the same threatening air as before, and as it passed him he thought he could hear whispers of vengeance. This might have been a mistake; but it was enough to have seen that feared and horrid countenance, which he could not banish from his mind. He soon reached his room, and vainly endeavored to seek repose; but the events of the past night awoke a nervous excitement of intense degree—the festive scenes of the supper and the visit at Kirtle Grove, in contrast with murder on himself, and the repeated apparition of this object of dread. The effect of all this was easily seen when the captain once more made his appearance in public. The state of his mind was now shown by its effect on his body, and his friends began to remark this relapse; but still he strove to present to the world a confident and cheerful bearing. The cause of his suffering and every circumstance connected with it he guarded with a reserve of the most jealous character. It evidently was of a nature which he could not, or would not, disclose.

The mind thus turned in upon itself, and haunted by an anxiety which it dared not reveal or confide to any friend, even the dearest, became the scene of extreme excitement. And in this condition the unfortunate man was compelled to endure, with constant repetition, the visitations of the dreaded apparition.

At this time there were several distinguished preachers in New York, the most noted of whom were Bishop Moore of the Episcopal, Doctor Rodgers of the Brick Church (Presbyterian), and Doctor John M. Mason of the Cedar Street

Church. The latter institution was of the Scottish order, and the congregation had the name of being clear-headed people. Their pastor enjoyed a great reputation for intellectual power, and was probably the finest pulpit orator New York has ever seen. His logical and metaphysical turn was well known, though as a preacher he was simple and direct.

One day Doctor Mason was visited by a stranger, who, on introducing himself, proved to be none other than Captain Walton. The clergyman was in his study, full of work, when the visitor was announced, and when the latter entered the room the former was impressed with the consciousness that his visitor must have recently been subjected to intense mental suffering. After the usual interchange of courteous greeting the captain, who easily perceived the surprise which his visit had elicited, remarked thus:

"This is a strange call, Doctor Mason. I should not under ordinary circumstances have ventured to disturb you, but my visit is neither idle nor an impertinent intrusion. You are somewhat accustomed, I presume, to have people ask advice. I need not only advice, but sympathy; indeed, I may add compassion, for I have been a great sufferer."

"Sir," replied the clergyman, "it will give me great pleasure if I can afford any man relief in mental or spiritual distress; but—"

"I know what you would say," resumed the captain, hurriedly; "but I am what you call an unbeliever, and therefore incapable of deriving that help from religion which you would recommend; and yet I must say that circumstances have lately forced upon me the study of psychological matters—rather let me say matters of the mind and soul—so that my unbelief has been disturbed, and I am now disposed to review the question in a more teachable spirit than ever before."

"Am I to understand," said the clergyman, "that your difficulties refer to the evidences of revelation?"

"I have had such difficulties," was the reply, "and yet I am not prepared to state them; but there is one subject on which I feel a peculiar interest."

He again paused, and Doctor Mason urged him to proceed.

"The fact is," said Walton, "whatever may be my uncertainty as to the truth of what men call 'revelation,' there is one fact connected with it of which I am deeply and even horribly convinced—namely, that there is beyond our present condition a spiritual world. This I *know*, although its operations may be in a large part hidden from us, for sometimes it is terribly, even though partially, revealed. I am sure that there is a God;" continued Walton, with increased emotion, "and that to the wicked he is a dreadful God, and I *know* that retribution follows guilt."

The clergyman looked with intense interest on his visitor, who proceeded as though unburdening a pent-up mind:

"In ways the most mysterious and inexplicable, and even I may say the most terrific, it is proven that there is a spiritual system, and that an implacable and omnipotent power administers punishment. Under this system I now suffer a persecution which no tongue can describe; I may say, indeed, I endure the torments of the damned. Yes, there is a hell, and I feel it."

As Walton said this his agitation became so vehement that the clergyman was shocked and even alarmed. The wild rapidity with which the former spoke, and above all the undisguised horror which stamped his features, afforded a contrast to his ordinary self-possession striking and painful in the extreme.

"My dear Sir," exclaimed Doctor Mason, "it is evident that you have been suffering much; but can it not be that your mind is affected by your body? May it not be that the state of mind you describe is due to causes of a physical nature? I am not a physician, and yet perhaps a change of air, or the use of a few tonics, may be of more use than any mental remedies, though, under all circumstances, we need God's mercy."

It was evident that the clergyman supposed his visitor to be slightly deranged, or at least in a condition which required other treatment than that purely spiritual.

"Doctor," replied Walton, "I thank you for this reference to diet, exercise, and change of air; but let me say I can not accept the hope which you would thus establish. No; that would be self-delusion. I am no enthusiast. I know what I say to be awful reality. My only hope is, that by some spiritual agency more potent than that which now tortures me it may be combated, and its victim be delivered. If this can not be accomplished I am a lost man—lost now and forever!"

"But, Sir, it must be remembered that others have suffered similar conflicts, and have—"

"No, no, no," interrupted the unfortunate man; "I am neither credulous nor superstitious. I am and have been far the reverse—too skeptical. But now, unless I were beyond the power of all testimony, unless I reject the perpetual evidence of my own senses, I am forced to believe—I have no escape from the horrible certainty—that I am haunted, go where I may, by a DEMON!"

There was an almost preternatural energy of horror in Walton's face, as its damp and death-like lineaments turned toward his clerical listener. Doctor Mason had attended some scenes of fearful character, but had never witnessed one like this.

"God help you, unfortunate man!" he exclaimed. "You *are* a sufferer, no matter how these sufferings were occasioned."

"God help me!" said Walton, with a look of surprise. "Will God help me? Yes, I ask, will He help me?"

"Pray to Him. He bids us call on Him in the hour of trouble."

"Pray to Him!" re-echoed the visitor. "Pray to Him! I can't pray. I could as easily move a mountain by an effort of my will. There is something within me that will not pray. You prescribe an impossibility."

"You might not find it such an impossibility were you but to try."

"Try! I *have* tried, and the attempt only fills me with confusion and terror. The awful, unutterable idea of eternity oppresses and maddens my brain, and whenever my mind approaches the contemplation of the Almighty I recoil. I am repelled, confounded, terrified. The idea of God is intolerable. I can not support it."

"Then, my dear Sir, if such be your unfortunate case, say how you would have me serve you. What can I do to relieve you?"

"Listen to me first," replied Captain Walton, a little subdued in manner, and with an evident effort to abate his excitement. "Listen to me, while I relate the circumstances of the terrible persecution which has rendered my life intolerable, and still makes me fear *death* and the world to come as much as I hate existence."

The minister then listened to the recital which the captain gave of the incidents which we have described, to which he added: "This has now become habitual. It is a part of my daily experience. I do not mean the actual sight of that man (or thing); that, thank God! is not a daily infliction. From the unutterable horror of that visitation I have been mercifully allowed times of repose, though none of security. But I never have any respite from the consciousness that a malignant spirit is following me wherever I go. I am pursued with blasphemies, with cries of despair and of appalling hatred. I hear those awful sounds calling after me as I turn the corners of streets. They come to me at midnight as I sit in my room. They charge me with hideous crimes, and—great God!—they threaten me with coming vengeance. Hush! do you hear *that*?" he cried, with an expression of renewed horror. "There! there! will *that* convince you?"

The clergyman felt his heart chill with horror as, during the sough of a sudden gust of wind, he heard, or fancied he heard, the half-articulate sounds of rage and derision.

"Well, what do you think of *that*?" said Walton, drawing a long breath through his teeth.

"I heard the wind," replied Doctor Mason; "but what of that?"

"The prince of the powers of the air," muttered Walton, with a shudder.

"Not quite that," exclaimed the preacher, with an ill-concealed unpleasantness upon his countenance, the effect of his visitor's excitement. "You must not give way to such thoughts; truth is one thing, and imagination is another. You should resist them."

"Yes, of that I have heard; they say, Resist the devil, and he will flee from thee," said Walton; "but *how* resist him? There is the rub. What can I do?"

"And has imagination no part in this?"

"No, Sir, none! Was it imagination, or even fancy, that made *you*, as well as me, hear but a moment ago those appalling tones of hell? No, Sir, it was not imagination."

"But, since you have seen this person frequently," replied the preacher, "why have you not spoken to him, and why have you not arrested him? Is it wise to assume the operation of supernatural agency when this might be explained, if pains were taken to sift the matter?"

"My reply to this, and my reason why I have never employed the police, are found in this fact: there are circumstances connected with this *appearance* which are proof of its unearthly nature. I know that the being that haunts me is not *man*. I repeat I *know* this; and I believe that, were I to undertake it, I could prove this to your own conviction. As to accosting it as you suggest, I dare not; I can not do it. When I see it I am powerless, and I stand thus in the triumphant presence of supernatural power and malignity. Not only my strength, but memory and all other faculties, desert me. Oh, Sir! I am satisfied you know not my case. Mercy! mercy! Heaven pity me!"

He leaned his elbow on the table, and passed his hands before his eyes, as if to exclude some image of horror, repeating the last words of the sentence again and again in a subdued mutter.

"Doctor Mason," he abruptly resumed, raising himself, and looking upon the preacher with an imploring eye, "I know you will do for me all that can be done. I have laid before you, in all their fullness, the circumstances and agency of which I am the victim. Now, Sir, I tell you I can not hope to escape. I can not escape. I am utterly helpless. Therefore, I conjure you, let my case receive a deep consideration; and if any thing can be done by your prayers, or by the prayers of your people, I do beseech you give me the benefit of that intercession. Deliver me, I pray you, from the body of this death!"

Drops of perspiration gathered on the speaker's brow as he proceeded: "Strive for me. It is my last chance. Yes, I know you will; you can not refuse such a request. For this I came to your presence. Oh! protect me. Send me away with some hope of ultimate deliverance; and, with that to sustain me, I will nerve myself to endure, day after day, the hideous curse until it be removed."

Doctor Mason was deeply moved by the appeal, as well he might be, and he assured Captain Walton that he would make him the object of his prayers, and that his case should, in an impersonal manner, be brought before their meeting.

Having received this assurance Captain Walton departed, while the preacher returned to the study overwhelmed by the strange interview.

It was not to be expected that Captain Walton's changed and, so to speak, eccentric habits

should long escape general discussion, and the explanations suggested were of a very opposite character. Some attributed the change to secret pecuniary embarrassments, while others ascribed it to a repugnance against his matrimonial engagement; but the most plausible of the different theories was that mental disease was the cause.

From the very commencement of this change Miss Barrington had been aware of it, and its gradual but steady advances had filled her with distress. His visits became at length so interrupted, and his manner, whenever they occurred, so abstracted, and at the same time so agitated, that her father was compelled to demand an explanation.

Captain Walton respected Mr. Barrington's course, and at once laid the matter fully before him. The latter, with all regard for the captain's opinion, was inclined to treat the thing in a skeptical manner.

"Your annoyance, then," said he, "proceeds from the frequent appearance of a man in cap and great-coat, with a red vest and a bad countenance, who meets you without ceremony, and throws you into ague fits. Now, Sir, I will make it my business to *catch* this mischievous fellow, and have him whipped through the city before we are a month older."

"If *you* knew what *I* know," replied Walton, with gloomy agitation, "you would speak very differently. Do not imagine that I am so weak and foolish as to assume, without proof of an overwhelming character, my present conclusions—the proofs are locked up here." As he spoke he tapped on his breast, and, with an anxious sigh, he continued to walk up and down the room.

"Well, well, Captain, though I am not a betting man, I would be willing to wager a heavy stake that I will yet collar the ghost."

He was running on in much the same strain when he was not a little shocked by observing Walton, who had been looking out of the window, stagger slowly back—his arm extended toward the street, his face and his very lips white as ashes, while he muttered, "There! there! there!" Mr. Barrington started forward instantaneously, and, looking out of the window, saw a figure corresponding with the description of the person who had so constantly terrified his friend. He snatched his hat and cane and rushed into the street, hoping to arrest the mysterious stranger. He looked around, but in vain, for any trace of him. He ran anxiously to the nearest corner, expecting to see at least the retreating figure, but no such figure was visible. Backward and forward, from one corner to the other, he ran, but still remained at fault until the laughter of the populace reminded him of his absurd appearance. Vexed and disappointed he returned to the room, and found Walton pale and trembling. They both remained silent, but under emotions of a very different character. At last Walton whispered, "You saw it, then?"

"*It?* I saw *him*, you mean. To be sure I did! But what of that? Where is either the good or the harm in seeing him? The fellow runs like a thief. I meant to have had him in my hands, but he had disappeared before I could reach the corner where he stood. However, next time I shall be a little more spry, and he shall at least feel the weight of my cane."

But, notwithstanding Mr. Barrington's promises, Captain Walton continued to suffer from the same mysterious cause. Wherever he might choose to go he was still constantly dogged or confronted by the hateful being who had established over him so baleful and so mysterious an influence. At no time and at no place could he consider himself secure against that appearance which haunted him with this diabolical perseverance. His depression and misery became more settled every day, and his mental agonies began so to tell upon him that Mr. Barrington persuaded him to try a voyage to Halifax, where some of his Tory friends were residing, and where he would be sure of a warm welcome. It was his opinion that a change of scene and the fresh air of the ocean, together with the new society they would meet, would break through the force of local association. Mr. Barrington was now convinced that Walton's persecutor was not an illusion, but a substantial form of flesh and blood, inspired by malignant and perhaps murderous hate. Unpleasant as the theory might be, it was better than Walton's notion that it was an evil spirit, and he thought if he could convince the latter of this, he would remove at least a very important part of the trouble. In order to prevent the enemy from following, the voyage was kept secret from all but the captain and Mr. and Miss Barrington, and at the appointed day the former two stepped on the brig *Penelope*, and in half an hour more were under sail. The trip was a pleasant one, and on the tenth day they made their port. Mr. Barrington's confidence in the result of the voyage rose day by day, for Walton had not suffered any repetition of those experiences which in New York had plunged him in horror. This exemption from what he had been led to contemplate as part of his destiny, and the security with which it inspired him, caused inexpressible delight, and hence he indulged in a thousand happy anticipations. In short, the couple could exchange congratulations on the termination of those persecutions which had created in one of them such unsupportable agony.

It was a beautiful day when they reached Halifax, and the usual crowd of idlers stood on the quay to receive the passengers. They landed, and Mr. Barrington walked a few paces ahead of the captain. As he made his way through the crowd a small man touched him by the arm and said, "The gentleman is walking too fast; he will lose his sick friend in the throng, for, by my faith, the poor fellow seems almost fainting."

Mr. Barrington turned and looked. It was true; Walton had turned pale as death. He hastened to his side.

"My dear Captain, are you ill?" he asked, anxiously.

The question was unheeded, and hence was twice repeated, when Walton stammered:

"I saw him—I saw him!"

"*Him*—the wretch! Who—where—when did you see him?" cried Mr. Barrington, looking around him.

"I saw him—but he is gone," repeated Walton, faintly.

"But where—where?" exclaimed Barrington. "For God's sake, speak!"

"It is but this moment—*here*," said he.

"But what did he look like—what had he on—what did he wear? Quick—quick!" urged Mr. Barrington, ready to plunge into the crowd and collar the offender.

"He touched your arm—he spoke to you, and he pointed to me. God be merciful to me! there is no escape," added Walton, in the low, subdued tones of intense despair.

Mr. Barrington had by this time penetrated the crowd, but, although the singular garb and countenance of the stranger were vividly impressed upon him, yet he failed to discover any one bearing the slightest resemblance to him.

"Oh, my friend, it won't do," said Walton, with the faltering voice and ghostly look of one who has been stunned by some mortal shock; "there is no use contending with it. Whatever it is, the dreadful association between me and itself is now established. I shall never escape—never—never!"

"Nonsense, nonsense," replied Barrington; "don't talk so. You must not, I say. We'll jockey the villain yet. Never mind, I say; never mind."

There was a look of dismay on Barrington's face even while he spoke, and it was evidently lost labor to try to inspire Walton with a single ray of hope. The latter now determined to return to New York, where, as he expressed his belief, he would soon die. They sailed by the next packet, and one of the first faces he saw on his arrival in this city was that of his implacable destroyer. Walton now seemed to have lost not only all enjoyment, and every hope in existence, but also all independence of will. He submitted himself impassively to the management of his friends, whose leading adviser was Mr. Barrington; and, with the apathy of despair, he accepted their suggestions. It was determined, as a last resource, to place him in a large country house near Kip's Bay, where a family and a special medical attendant should have charge of him. The physician believed that his patient was only subject to a nervous derangement, and that his imagination supplied the fearful apparition. To guard specially against all room for the exercise of fancy, Walton was directed to confine himself to the house and to the yard, which had a high fence whose gates were kept locked. This precaution would

secure him against the casual appearance of any one whom he might confound with the spectre which, as the physician maintained, his imagination recognized in every one who bore any similarity of size or shape. It was hoped that a few months' seclusion would stop this series of terrible imaginations, and eventually break up the associations which had confirmed the supposed disease. Cheerful society was abundantly supplied by his friends, who entertained sanguine expectations that this obstinate hypochondria might thus be subdued. The occupants of the mansion, in addition to the physician, the patient, and the family which kept house, were Mr. Barrington and his daughter. The latter, indeed, desired no other pleasure than to minister to her affianced bridegroom, and to help guard him from the threatening horror. In due time a steady carrying out of this system began to manifest its result in Walton's continued though gradual improvement, both in health and general spirits. This was welcomed with delight by all, and especially by Anna, whose attachment to him, and whose painful position, rendered her an object of pity. A week had passed, then a fortnight, a month, and yet no recurrence of the hated vision had taken place. Hence the treatment was viewed as an entire success. The chain of association had been broken, and the pressure on the mind had been removed; and under these circumstances a love of society and an interest in public affairs began to reanimate his mind.

About this time Mrs. Anderson, the housekeeper, sent her servant to the kitchen-garden to gather some herbs; but the maiden returned in a state of alarm, before her task was half completed. Her explanation of her retreat was to her mistress rather startling. It appeared that, while in an extreme corner of the garden gathering thyme and rosemary, and amusing herself by singing, she was suddenly interrupted by a loud, coarse laugh. Looking up, she saw, through the loosely tangled bushes, a very strange-looking man, small of stature, and with a countenance of malignant and threatening aspect. She was utterly unable to move while the man was gazing on her. He ordered her to bear a message to Captain Walton, to the effect that he must come abroad as usual, and show himself out of doors, or else expect a visit in his own room. On concluding this message the stranger instantaneously climbed the fence, while the girl turned and ran into the house, in a state of fright. Mrs. Anderson commanded her to say nothing of the kind to Captain Walton. At the same time she ordered search to be made, by some workmen who were repairing the front of the house, through the neighboring fields. No one, however, was to be seen; and with many misgivings she communicated the fact to the Barringtons, who united in the plan of keeping it secret.

Walton had, by this time, begun to walk occasionally in the grounds, which, as has been stated, were guarded by a high fence. Here

he considered himself secure from all intrusion; and but for an act of carelessness by one of the laborers, he might have, for some time longer at least, enjoyed the same immunity. The yard was entered from the road by a gate, and strict orders had, as I have said, been given to keep this locked. This order must have been neglected; for one day, as Walton was pacing this inclosure, on turning to retrace his steps he saw the gate ajar and the face of his tormentor gazing upon him through the aperture. For a few moments he stood riveted to the earth—breathless and bloodless—in the fascination of that dreaded gaze, and then fell, insensible, to the ground. There he was found a few minutes afterward, and was conveyed to his room—the spot which he was never afterward to leave alive.

From this time a marked change, and one not easily accounted for, was observed in his mental frame. He was no longer the excited being he had been, no longer oppressed with extreme despair. A strange alteration had passed over him, and his mind seemed so tranquil that it might have suggested the approaching stillness of the grave.

"Mr. Barrington," said he, one day shortly afterward, with a look of fixed and fearful awe, "I have at last some relief bestowed upon me from that world of spirits out of which my punishment has come. I now am assured my sufferings will soon be over."

Mr. Barrington listened with sorrowful attention.

"Yes," said he, in a subdued voice, "my punishment is nearly ended. As regards sorrow, perhaps I shall never, either in time or eternity, escape it. But this, *this* agony is almost over. A ray of comfort has been revealed to me, and in view of this I will bear with submission all that remains of my allotted struggle."

"I am glad to hear you speak so tranquilly," replied Mr. Barrington. "Peace and cheerfulness are all that you need to make you what you formerly were."

"No, no! I can never be that," said Walton, in a mournful manner. "I am no longer fit for life. I am soon to die; but I do not shrink from death as once I did. I am to see *him* but once again, and then all will be ended."

"He said so, then?" Mr. Barrington suggested.

"*He*?—no, no! Good news like this would not come from *him*. They came so solemnly and sweetly, with love and melancholy such as I could not relate without saying more than is needful of long passed scenes and characters." As the captain said this he buried his face in his hands to hide his tears.

"Come, come," replied Mr. Barrington, who utterly mistook the cause of this emotion. "You must not give way thus. What is it, as the doctor says, but a series of dreams, or, at worst, the practices of a cunning rascal, who enjoys the sport of playing on your fears? Perhaps it is a sneaking scoundrel, who owes you a grudge, and who thus tries to pay you off."

"A grudge, indeed, he does owe me," replied Walton, with a shudder. Then adding, in an abstracted way, and after a brief pause, "When the justice of Heaven permits the Evil One to carry out a scheme of vengeance—when its execution is committed to the lost victim of sin who owes his ruin to the very man he is commissioned to pursue—then, indeed, the torments of hell are let loose on earth. Such, Sir, have been my experiences, but mercy has reached me at last; and if death could come without the dreadful sight which I am doomed to see, I would gladly die this moment. But, though death is welcome, I shrink with an agony you can not understand—yes, with a maddening agony—from the last encounter with that demon. I am to see him once more, but under circumstances unutterably more terrible than ever."

As Walton said this he trembled so violently that Mr. Barrington was alarmed, and hastened to lead his mind back to the topic which at first seemed to tranquilize it.

"It was not all a dream," said he, after a long pause. "I was in a different condition. No, it could not have been a dream; for it was all as real, as clear, and vivid as the scene before me. It *must* have been a reality."

"And what *did* you see and hear?" asked Mr. Barrington, in a most anxious tone.

"When I saw him at the gate I fell, as usual, into a swoon, from which I recovered very slowly. I found myself reclining on the bank of a large lake surrounded by beautiful hills, and all was illuminated by a soft rose-colored light. The scene appeared unusually sad and lonely, and yet it was more beautiful than any thing on earth. My head was leaning upon the lap of a girl, and she was singing a strange and wondrous song that seemed to tell of all my life. With that song the old feelings that I thought had perished within me came back, and tears flowed from my eyes. I knew that voice—oh, how well!—and while I listened I was spell-bound by it; and, gazing in those lovely eyes, I hardly stirred for fear I should break the charmed scene. Then I turned from that countenance, for painful memories began to shoot within me, and I only listened to the voice; but slowly the song and the scene grew fainter till all seemed lost in darkness again. Then I wakened to this world, comforted, as you have noticed, for I felt that much had been forgiven me. Yes, *she* forgave me." As he said this Walton wept bitterly, and with long, protracted emotion, amidst which Mr. Barrington judiciously withdrew.

From this time the tone of Walton's mind was one of profound and gentle melancholy. But this was not without its interruption. He was thoroughly convinced that he was yet to receive a final visitation which should transcend in point of unutterable horror all that he had yet experienced. From this unknown but inevitable agony he often shrunk in paroxysms of abject terror, such as filled the entire household with dismay, and even with superstitious

panic. The least skeptical of the family were often visited during the solitude of the night with secret apprehensions which they did not care to confess, and hence none of them sought to dissuade Walton from his new-made resolution to shut himself in his own apartment. The window-blinds were kept closed, and his body-servant slept in the same chamber, and was not out of it day or night. The physician, who had at first dwelt with them, had left, being no longer required, and the servant referred to was fully adequate to his duties. These, in addition to ordinary attentions, were summed up in the precautions necessary to prevent the dreadful recurrence of a visit from the "detective," as he was generally styled. The door was to be kept carefully closed, not a window to be left un-screened, and the patient was not to be left alone, even for a minute, day or night. Total solitude had become to him unsupportable. It was a distinctive anticipation of some dreadful event.

Miss Barrington, though now all expectations of a matrimonial character were broken, ceased not to minister to Walton with assiduous devotion. She read entertaining books, and sought in every way to win him from himself; but it was apparent that, whatever might be her temporary success, his fears soon preyed upon him with increased power.

Such was the state of things in this strange household when the closing scene occurred. It was about two o'clock of a winter's night, and Walton was, as usual, in his bed. His servant slept on a small couch in the corner of the room, and a lamp was burning. The man was suddenly aroused by his master, who said:

"I can't get it out of my head that there is something strange in the room or the passage-way. Get up, Wilson, and look about. Make a thorough search. Such hateful dreams!"

The servant arose, lit a candle, and examined the chamber, and then entered the passage, and proceeded a few steps, when the door behind him slowly swung to as though moved by some gentle current of air. This brief separation from his master did not disturb the servant, inasmuch as the ventilator over the door was open. As he advanced in the passage he heard his master calling him, but he omitted to reply in the loud tones which distance would have rendered necessary, for fear of alarming the house. However, he walked hurriedly back, when, to his amazement, he heard a strange voice in the room responding to Walton. Pal-sied by terror, yet still alive to curiosity, he stood breathless and listening at the threshold, unable to summon resolution to open the door. A moment more and he heard Walton exclaim: "Oh God! Oh my God!" which utterance was repeated in agonizing tones several times. Then came a momentary silence, which was broken by a yell of agony so appalling and hideous that, under an impulse of ungovernable horror, the man strove to open the door. This seemed beyond his power; but whether it was really se-

"GREAT GOD, HE IS DEAD!" HE MUTTERED, AS HE GAZED UPON THE FEARFUL SPECTACLE.

cured on the inside, or whether his agitation prevented him from perfectly turning the knob, is yet a question. As he stood there, trembling in awful dread, yell after yell rang louder and wilder through the chamber. Almost freezing with horror, and scarcely knowing what he did, he turned and ran up and down the passage until he was encountered by the pallid form of Mr. Barrington.

"What is it? Who—where is your master, Wilson?" inquired the latter, in an incoherent manner. "For God's sake, is there any thing wrong?"

"Lord have mercy on us!" exclaimed Wilson, staring wildly on Mr. Barrington.

Without waiting for explanation, the latter burst the door open and entered the room, followed by the servant.

"The lamp has been moved from the table," said Wilson. "See! they have put it by the bed."

"Draw the curtains, fellow," replied Mr. Barrington, sternly, "and don't stand gaping there."

Wilson hesitated.

"Hold this, then," said the former, impatiently thrusting his candlestick into the man's hand; and then advancing to the bed, he drew the curtains apart. The light fell upon a figure huddled together and half upright at the head of the bed. It appeared to have slunk back as far as the solid paneling would admit, and the hands were still clutched in the bed-clothes.

"Walton, Walton, Walton!" cried Mr. Barrington, with mingled awe and vehemence, at the same time taking the light from the servant and holding it so that it shone full on the face. The features were fixed, stern, and white. The jaw was fallen, and the sightless eye, still open, gazed vacantly toward the front of the bed.

"Great God, he is dead!" he muttered, as he gazed upon the fearful spectacle. They both continued to look in silence for a few minutes. "Cold, too!" added the servant, touching the dead man's hand; "and see, see," added he, with a shudder, "there was something else on the bed with him! Look there—look there—see that, Sir!" As Wilson spoke he pointed to a deep indenture, as if caused by a heavy pressure, near the foot of the bed.

Mr. Barrington was silent.

"Oh, come away, Sir!" whispered Wilson, at the same time glancing fearfully around. "It is an awful spot."

At this moment they heard the steps of several of the family approaching, and Mr. Barrington, to prepare them for the sight, loosed the rigid grip with which the fingers of the dead man clutched the bed-clothes, and drew the figure as well as possible into a reclining posture. Then they all gazed with bewildered feelings on the victim of the implacable detective.

* * * * *

I have spoken of these events as first bringing the term to my notice, and, having given this narrative, I am not under any obligations to afford a solution to the mystery it contains. I never heard from Walton's friends that any clew was found by which a solution could be wrought out. On the other hand, they were very anxious to hush the matter up. The house at Kip's Bay was pulled down, and both the Andersons and the servants soon left the city, being, as some supposed, influenced by pecuniary inducements. The Barringtons, and all others who had a family interest in this strange affair, are dead, and they left no record of an explanatory character. Reports, however, floated in from a foreign shore, which took shape, so as

to lead to the theory that Captain Walton had, during the latter years of his life, been compelled by a higher power to work out a retribution for some grievous and disgraceful sin. This theory was gradually established in the minds of many who were acquainted with the affair, and their version may thus be put into shape: Captain Walton, ten years before coming to New York, had, while lying at Deptford, where his boatswain kept his family, formed a guilty attachment with the daughter of the latter. The father had visited the frailty of his child with extreme harshness, and she had died of a broken heart. Presuming upon Walton's implication in her guilt, the man had behaved with insolence toward his captain, and the latter degraded him from his office as soon as they were at sea. He also retaliated on him for his cruelty to the girl, and during the voyage subjected him to those terrible severities which are within the reach of a sea-captain. The unfortunate wretch made his escape at the West Indies, and died soon afterward of the wounds received from the bloody use of the cat. Such is the story in connection with the first use of the term "detective," and I never meet it, either in voice or in print, without thinking of Captain Walton, and the fearful retribution unfolded in his history.

FREDERICK THE GREAT.

XI.—BATTLES AND VICTORY.

THE decisive battle of Hohenfriedberg, by which victory Frederick probably escaped utter destruction, was fought on the 4th of June, 1745. From early dawn to the evening twilight of the long summer's day the dreadful work of slaughter had continued without a moment's intermission. As the Austrians, having lost nearly one-fourth of their number, retreated, the Prussians, in utter exhaustion, threw themselves upon the ground for sleep. The field around them was covered with fourteen thousand of the wounded, the dying, and the dead.

Early the next morning Frederick commenced the vigorous pursuit of the retiring foe. A storm arose. For twelve hours the rain fell in torrents. But the Prussian army was impelled onward, through the mud, and through the swollen streams, inspired by the almost supernatural energy which glowed in the bosom of its king. It seemed as if no hardships, sufferings, or perils could induce those iron men, who by discipline had been converted into mere machines, to wander from the ranks or to falter on the way. As we have mentioned, there were throughout all this region two religious parties, the Catholics and the Protestants. They were strongly antagonistic to each other. Under the Austrian sway the Catholics, having the support of the government, had enjoyed unquestioned supremacy. They had often very cruelly persecuted the Protestants, robbing them of their churches, and, in their zeal to defend what

they deemed the orthodox faith, depriving them of their children and placing them under the care of the Catholic priests to be educated.

"While the battle of Hohenfriedberg was raging," writes an eye-witness, "as far as the cannon was heard all around, the Protestants fell on their knees praying for victory for the Prussians." Indescribable was the exultation when the bugle peals of the Prussian trumpeters announced to them a Protestant victory. When Frederick approached, in his pursuit, the important town of Landshut, the following incident occurred, as described by the pen of his Prussian majesty:

"Upon reaching the neighborhood of Landshut the king was surrounded by a troop of two thousand Protestant peasants. They begged permission of him to massacre the Catholics of those parts, and clear the country of them altogether. This animosity arose from the persecutions which the Protestants had suffered during the Austrian domination.

"The king was very far from granting so barbarous a permission. He told them they ought rather to conform to the precepts of Scripture, and to 'bless those that curse them, and pray for those that despitefully use them.' Such, the king assured them, was the way to gain the kingdom of heaven. The peasants, after a little reflection, declared that his majesty was right, and desisted from their cruel intention."¹

¹ *Œuvres de Frédéric*, t. ii. p. 218.

THE RETREAT OF THE AUSTRIANS.

For several weeks the Austrians slowly and sullenly retired. Their retreat was conducted in two immense columns, by parallel roads at some distance from each other. Their wings of foragers and skirmishers were widely extended, so that the hungry army swept with desolation a breadth of country reaching out many leagues. Though the Austrian army was traversing the friendly territory of Bohemia, still prince Charles was anxious to leave behind him no resources for Frederick to glean. Frederick with his army pressed along, following the wide-spread trail of his foes. The Austrians, with great skill, selected every commanding position on which to erect their batteries and hurl back a storm of shot and shell into the bosoms of their pursuers. But Frederick allowed them no rest by day or by night. His solid columns so unrelentingly and so impetuously pressed with shot, bullets, bayonet, and sabre blows upon the rear ranks of the foe that there was almost an incessant battle, continuing for several weeks, crimsoning a path thirty miles wide and more than a hundred miles in length with the blood of the wounded and the slain.

The region through which this retreat and pursuit were conducted was, much of the way, along the southern slope of the Giant Mountains. It was a wild country of precipitous rocks, quagmires, and gloomy forests. At length prince Charles, with his defeated and dispirited army, took refuge at Königsgrätz, a compact town between the Elbe and the Adler, protected by one stream on the west, and by the other on the south. Here, in an impregnable position, he intrenched his troops. Frederick, finding them unassailable, encamped his forces in a position almost equally impregnable, a few miles west of the Elbe, in the vicinity of a little village called Chlum. Thus the two hostile armies, almost within sound of each other's bugles, defiantly stood in battle array, each watching an opportunity to strike a blow.

"War is cruelty," said general Sherman; "and you can not refine it." "No man of refined Christian sensibilities," said the duke of Wellington, "should undertake the profession of a soldier." The exigencies of war often require things to be done from which humanity revolts. "War," said Napoleon I., "is the

science of barbarians." One of the principal objects of Frederick, in this pursuit of the Austrians through Bohemia, was to lay waste the country so utterly, destroying its roads and consuming its provisions, that no Austrian army could again pass through it for the invasion of Silesia. Who can imagine the amount of woe thus inflicted upon the innocent peasants of Bohemia? Both armies were reduced to the necessity of living mainly upon the resources of the country in which they were encamped. Their foraging parties were scattered in all directions. There were frequent attacks of outposts and bloody skirmishes, in which many were slain and many were crippled for life. Each death, each wound, sent tears, and often life-long woe, to some humble cottage.

There are sometimes great and glorious objects to be attained—objects which elevate and ennoble a nation or a race—which warrant the expenditure of almost any amount of temporary suffering. It is not the duty of the millions to suffer the proud and haughty hundreds to consign them to ignorance and trample them in the dust. In this wicked world, where kings and nobles have ever been so ready to doom the masses of the people to ignorance, servitude, and want, human rights have almost never made any advances but through the energies of the sword. Many illustrious generals, who, with saddened hearts, have led their armies over fields of blood, have been among the most devoted friends and ornaments of humanity. Their names have been enshrined in the affections of grateful millions.

But this war into which the Prussian king had so recklessly plunged all Europe was purely a war of personal ambition. Even Frederick did not pretend that it involved any question of human rights. Unblushingly he avowed that he drew his sword and led his hundred thousand peasant boys upon their dreadful career of carnage and misery simply that he might enlarge his territories, gain renown as a conqueror, and make the world talk about him. It must be a fearful thing to go to the judgment-seat of Christ with such a crime weighing upon the soul.

War has its jokes and merriment, but the comedies of war are often more dreadful than the tragedies of peace. Frederick in his works records the following incident, which he narrates as "slight pleasantry, to relieve the reader's mind:"¹

The Prussians had a detached post at Smirzitz. The little garrison there was much harassed by lurking bands of Austrians, who shot their sentries, cut off their supplies, and rendered it almost certain death to any one who ventured to emerge from the ramparts. Some inventive genius among the Prussians constructed a straw man, very like life, representing a sentinel with his shouldered musket. By a series of ropes this effigy was made to move from

right to left, as if walking his beat. A well-armed band of Prussians then hid in a thicket near by.

Ere long a company of Austrian scouts approached. From a distance they eyed the sentinel, moving to and fro as he guarded his post. A sharp-shooter crept near, and taking deliberate aim at his supposed victim, fired. A twitch upon the rope caused the image to fall flat. The whole band of Austrians, with a shout, rushed to the spot. The Prussians from their ambuscade opened upon them a deadly fire of bullets. Then, as the ground was covered with the mutilated and the dead, the Prussians, causing the welkin to ring with their peals of laughter, rushed with fixed bayonets upon their entrapped foes. Not a single Austrian had escaped being struck by a bullet. Those who were not killed outright were wounded, and were taken captive. This is one of the "slight pleasantries" of war.

Frederick's army was now in a state of great destitution. The region around was so stripped of its resources that it could afford his foragers no more supplies. It was difficult for him to fill his baggage trains even in Silesia, so much had that country been devastated by war. And wherever any of his supply wagons appeared, swarms of Austrian dragoons hovered around, attacking and destroying them. To add to the embarrassments of the Prussian king, his purse was empty. His subjects could endure no heavier taxation. All the plate which Frederick William had accumulated had been converted into coin and expended. Even the massive silver balustrades, which were reserved until a time of need, were melted and gone. He knew not where to look for a loan. All the nations were involved in ruinous war. All wished to borrow. None but England had money to lend; and England was fighting Frederick, and furnishing supplies for his foes.

The expenses of the war were enormous. Frederick made a careful estimate, and found that he required at least three hundred and seventy-five thousand dollars a month. He could not carry on another campaign with less than four million five hundred thousand dollars. He had been expecting that Louis XV., who in person was in command of the French army on the Rhine, would send him a reinforcement of sixty thousand troops to enable him to crush the forces of prince Charles. But week after week passed, and no reinforcements came. The French, intent upon their conquest, were as selfishly pursuing their own interests on the Rhine as Frederick was pursuing his in Silesia.

The great victory of Fontenoy, gained by the French on the Rhine, caused boundless exultation through France. "The French," writes Carlyle, "made immense explosions of rejoicing over this victory; Voltaire celebrating it in prose and verse to an amazing degree; the whole nation blazing out over it into illuminations, arcs of triumph, and universal three times three; in short, I think nearly the heartiest na-

¹ *Œuvres de Frédéric*, t. iii. p. 123.

A SLIGHT PLEASANTRY.

tional huzza, loud, deep, long-drawn, that the nation ever gave in like case."

But this victory on the Rhine was of no avail to Frederick in Bohemia. It did not diminish the hosts which prince Charles was gathering against him. It did not add a soldier to his diminished columns, or supply his exhausted magazines, or replenish his empty treasury. Louis XV. was so delighted with the victory that he supposed Frederick would be in sympathy with him. He immediately dispatched a courier to the Prussian king with the glad tidings. But Frederick, disappointed, embarrassed, chagrined, instead of being gratified, was irritated by the news. He sent back the scornful reply "that a victory upon the Scamander,¹ or in the heart of China, would have been just as important to him."

Louis XV. felt insulted by this message, and responded in a similar strain of irritation. Thus the two monarchs were alienated from each other. Indeed, Frederick had almost as much cause to be dissatisfied with the French

¹ Scamander, a small stream in Asia Minor, celebrated in the songs of Homer.

as they had to be dissatisfied with him. Each of the monarchs was ready to sacrifice the other if any thing was to be gained thereby.

Frederick was now in such deep pecuniary embarrassment that he was compelled to humble himself so far as to apply to the king of France for money. "If your majesty," he wrote, "can not furnish me with any reinforcements, you must, at least, send me funds to raise additional troops. The smallest possible sum which will enable me to maintain my position here is three million dollars."

Louis XV. wrote a very unsatisfactory letter in reply. He stated, with many apologies, that his funds were terribly low, that he was exceedingly embarrassed, that it was impossible to send the sum required, but that he would *try* to furnish him with a hundred thousand dollars a month.

Frederick was indignant. Scornfully he rejected the proposal, saying, "Such a paltry sum might with propriety, perhaps, be offered to a petty duke of Hesse-Darmstadt. But it is not suitable to make such a proposition to the king of Prussia."

Poor Valori, the French ambassador, was placed in a very embarrassing situation. The anger of the Prussian king vented itself upon him. He was in complete disgrace. It was his duty daily to wait upon Frederick. But the king would seldom speak to him, or even look upon him; and if he did favor him with a glance, it was with an expression of scorn.

Frederick was rapidly awaking to the consciousness that Maria Theresa, whom he had despised as a woman and a young wife and mother, and whose territory he thought he could dismember with impunity, was fully his equal, not only in ability to raise and direct armies, but also in diplomatic intrigue. About the middle of August he perceived from his camp in Chlum that prince Charles was receiving large reinforcements from the south. At the same time he saw that corps after corps, principally of Saxon troops, were defiling away by circuitous roads to the north. It was soon evident that the heroic Maria Theresa was preparing to send an army into the very heart of Prussia to attack its capital. This was, indeed, changing the aspect of the war.

Berlin was almost defenseless. All Saxony was rising in arms behind Frederick. The invader of Silesia was in danger of having his own realms invaded, and his own capital sacked. Frederick was thoroughly roused. But he never allowed himself to appear agitated or anxious. He ordered Leopold, the old Dessauer, to march immediately, with all the troops he could rally, to the frontiers of Saxony. He even found it necessary to detach to the aid of Leopold some corps from his own enfeebled forces, now menaced by an Austrian army twice as large as he could oppose to them.

While affairs were in this posture, the English, eager to crush their hereditary rivals, the French, were very anxious to detach the Prussians from the French alliance. The only way to do this was to induce Maria Theresa to offer terms of peace such as Frederick would accept. They sent sir Thomas Robinson to Schönbrunn to endeavor to accomplish this purpose. He had an interview with her Hungarian majesty on the 2d of August, 1745. The queen was very dignified and reticent. Silently she listened to the proposals of sir Thomas. She then said, with firmness which left no room for further argument:

"It would be easier for me to make peace with France than with Prussia. What good could possibly result now from peace with Prussia? I must have Silesia again. Without Silesia the imperial sceptre would be but a bauble. Would you have us sway that sceptre under the guardianship of Prussia? Prince Charles is now in a condition to fight the Prussians again. Until after another battle, do not speak to me of peace. You say that if we make peace with Prussia, Frederick will give his vote for the grand duke as emperor. The grand duke is not so ambitious of an empty honor as to engage in it under the tutelage of

Prussia. Consider, moreover, is the imperial dignity consistent with the loss of Silesia? One more battle I demand. Were I compelled to agree with Frederick to-morrow, I would try him in a battle to-night."¹

On the 13th of September the German Diet met at Frankfort for the election of emperor. Frederick had determined that the grand duke Francis, husband of the Hungarian queen, should not be elected. Maria Theresa had outgeneraled him. Francis was elected. He had seven out of nine of the electoral votes. Frederick, thus baffled, could only protest. Maria Theresa was conscious of her triumph. Though the imperial crown was placed upon the brow of Francis, all Europe knew that the sceptre was in the hands of his far more able and efficient wife. Maria Theresa was at Frankfort at the time of the election. She could not conceal her exultation. She seemed very willing to have it understood that her amiable husband was but the instrument of her will. She took the title of empress queen, and assumed a very lofty carriage toward the princes of the empire. Alluding to Frederick, she said, in a very imperial tone, for she deemed him now virtually vanquished:

"His Prussian majesty has unquestionably talent; but what a character! He is frivolous in the extreme, and sadly a heretic in his religious views. He is a dishonorable man, and what a neighbor he has been! As to Silesia, I would as soon part with my last garment as part with it."

Her majesty now wrote to prince Charles, urging him to engage immediately in a fight with Frederick. She sent two of the highest dignitaries of the court to Königgrätz, to press forward immediate action. There was an eminence near by, which the Austrian officers daily ascended, and from which they could look directly into the Prussian camp and observe all that was transpiring there.

The position of Frederick became daily more embarrassing. His forces were continually decreasing. Reinforcements were swelling the ranks of the Austrians. Elated in becoming the *Imperial Army*, they grew more bold and annoying, assailing the Prussian outposts and cutting off their supplies.

On the 18th of September, when the rejoicing Austrians at Königgrätz were firing salutes, drinking wine, and feasting in honor of the election of the grand duke to the imperial dignity, Frederick, availing himself of the carousal in the camp of his foes, crossed the Elbe with his whole army, a few miles above Königgrätz, and commenced his retreat to Silesia. His path led through a wild, sparsely inhabited country, of precipitous rocks, hills, mountain torrents, and quagmires. One vast forest spread along the banks of the Elbe, covering with its gloom an extent of sixty square miles. A few miserable hamlets were scattered over

¹ Robinson's Dispatch, August 4, 1745.

this desolate region. The poor inhabitants lived mainly upon the rye which they raised and the swine which ranged the forest.

Along the eastern edge of this vast wilderness the army of Frederick marched for two days. But Hungarian Pandours, in swarms, savage men, on their fleet and shaggy horses, were continually emerging from the paths of the forest, with gleaming sabres and shrill war-cries, assailing the flank of the Prussian line wherever there was the slightest exposure. In the vicinity of the little village of Sohr the king encamped for two days. The halt seemed necessary to refresh his horses, and to send out foraging parties to replenish his stores. But the light horsemen of the foe were so thick around him, so vigilant, and so bold, that no baggage train could enter his camp, unless protected by eight thousand foot and three thousand horse.

Just at the break of day of Thursday morning, September 30, as the king was in his tent, busy with his generals, examining maps in preparation for the immediate resumption of the march, an orderly came, in breathless haste, to inform the king that the Austrians were advancing rapidly upon him, and in great force. While he was yet speaking another messenger arrived, confirming the tidings, and stating that, apparently, the whole Austrian army, in battle array, was coming down upon him.

It was a cold, dreary, autumnal morning. The Austrian army, according to Frederick's statement, amounted to sixty thousand men.¹ But it was widely dispersed. Many of the cavalry were scouring the country in all directions, in foraging parties and as skirmishers. Large bodies had been sent by circuitous roads to occupy every avenue of retreat. The consolidated army, under prince Charles, now advancing to the attack, amounted to thirty-six thousand men. Frederick had but twenty-six thousand.²

In this hour of peril the genius of the Prussian monarch was remarkably developed. He manifested not the slightest agitation or alarm. His plan was immediately formed. Indeed, there was no time for a moment's delay. The Austrians had moved rapidly and silently, concealing their approach by a thick veil of hussars. They were already in solid columns, confident of victory, advancing upon the Prussian camp. Frederick was compelled to form his line of battle under fire of the Austrian batteries. The discipline of the Prussians was such that this was done with a recklessness of danger, rapidity, and mechanical precision which seemed almost miraculous, and which elicited the admiration of every one who beheld it.

The reader would not be interested in the

details of the battle which ensued. It lasted for five hours. It was, as is every battle, an indescribable scene of tumult, uproar, and confusion. The result was long doubtful. Defeat to Frederick would have been utter ruin. It is wonderful how one determined man can infuse his spirit into a whole host. Every Prussian seemed to have the same desperate valor, and determination to conquer or to die, which animated his king.

The sun had just risen above the horizon when the conflict commenced. It reached its meridian. Still the storm of battle swept the plains and reverberated over the hills. Heights had been taken and retaken; charges had been made and repelled; the surges of victory had rolled to and fro; over many leagues, now covered with the dying and the dead, the thunderbolts of battle were thickly flying; bugle peals, cries of onset, shrieks of the wounded crushed beneath artillery wheels, blended with the rattle of musketry and the roar of artillery; riderless horses were flying in all directions; the extended plain was covered with the wreck and ruin of battle, and every moment was multiplying the victims of war's horrid butchery.

At length the Austrians were routed—utterly routed—broken, dispersed, and driven in wild confusion into the glooms of the forest. The victory of Frederick was complete. As a warrior, he was winning the title he so greatly coveted, of Frederick the Great.

It was a glorious victory. What was the price? Five thousand six hundred Prussian young men lay in their blood upon the field, dead or wounded. Six thousand seven hundred young men from Austrian homes lay by their side, silent in death, or groaning in anguish, lacerated by the missiles of war.¹

Frederick was elated with his victory. He had taken three thousand three hundred prisoners, twenty-one cannon, and twenty-two standards. He had added to the renown of his name, and strengthened his hold upon Silesia.

Prince Charles, as he was leading the main body of his army to the assault, sent a squadron of his fleet-footed cavalry to burn the Prussian camp, and to assail the foe in their rear. But the troops found the camp so rich in treasure that they could not resist the temptation of stopping to plunder. Thus they did not make the attack which had been ordered, and which would probably have resulted in the destruction of the Prussian army. It is said that when Frederick, in the heat of the battle, was informed that the Pandours were sacking his camp, he coolly replied, "So much the better; they will not then interrupt us."²

After the retreat of the Austrians, Frederick returned to his camp to find it plundered and burned. The semi-barbarian assailants had also consigned to the flames eight or ten sick Prussians, whom they found there, and several wo-

¹ *Histoire de mon Temps.*

² In this, as in most other similar cases, there is considerable diversity of statement as to the precise number of troops engaged on either side. But there is no question that the Austrians were in numbers far superior to the Prussians.

¹ MÜLLER, *Tableaux des guerres de Frédéric le Grand.*

² *Mémoires de Frédéric baron de Trenck.*

men whom they caught. "We found the limbs of these poor men and women lying about," writes general Lehwald.

The camp was so utterly destroyed that Frederick could not even obtain pen and ink. He was obliged to write with a pencil. Not a loaf of bread nor a cup of wine was left for the exhausted king. The hungry soldiers, after a conflict of five hours, having had neither breakfast nor dinner, found no refreshments awaiting them. Yet without a murmur they smoked their pipes, drank some spring-water, and rejoiced in their great victory.

"Never mind," said the king; "it is a cheap price to pay for escaping an attack from Pandours in the rear, while such a battle was raging in front."

Frederick remained at Sohr five days. The country was scoured in all directions to obtain food for his army. It was necessary that the troops should be fed, even if the poor inhabitants starved miserably. No tongue can tell the sufferings which consequently fell upon the peasantry for leagues around. Prince Charles, with his shattered army, fell back to Königsgrätz, remorselessly plundering the people by the way. Frederick, ordering his army to retire to Silesia, returned to Berlin.

The victory of Sohr filled Europe with the renown of Frederick. Still his peril was great, and the difficulties before him apparently insurmountable. His treasury was exhausted. His only ally, France, would furnish him with no money, had no confidence in him, and was in heart exasperated against him. Not a single court in Europe expressed any friendship for Frederick. On the contrary, nearly all would have rejoiced at his downfall. There seemed to be no end to the campaigns which were opening before him. Yet Frederick knew not where to obtain the money to meet the expense even of a single campaign.

Under these circumstances, Frederick made indirect but vigorous exertions to bring the war to a close. "I am ready and desirous now," he said, "as at all times, for peace. I will immediately sheathe the sword, if I can be guaranteed the possession of Silesia."

"I, too, am anxious for peace," Maria Theresa replied, "and will joyfully withdraw my armies, if Silesia, of which I have been robbed, is restored to me."

Thus his Prussian majesty and the queen of Hungary met each other like two icebergs in a stormy sea. The allies were exasperated, not conquered, by the defeat of Sohr. Maria Theresa, notwithstanding the severity of winter's cold, resolved immediately to send three armies to invade Prussia, and storm Berlin itself. She hoped to keep the design profoundly secret, so that Frederick might be taken at unawares. The Swedish envoy at Dresden spied out the plan, and gave the king warning. Marshal Grüne was to advance from the Rhine and enter Brandenburg from the west. Prince Charles, skirting Western Silesia, was to march

upon Brandenburg from the south. General Rutowski was to spring upon the old Dessauer, who was encamped upon the frontiers of Saxony, overwhelm and crush his army with superior numbers, and then, forming a junction with marshal Brüne, with their united force rush upon Berlin.

Frederick was astounded, alarmed, for a moment overwhelmed, as these tidings were clearly made known to him. He had brought all this upon himself. "And yet," the wretched man exclaimed, "what a life I lead! This is not living, this is being killed a thousand times a day!"

This despondency lasted, however, but a moment. Concealing his emotions, he smoothed his furrowed brow, dressed his face in smiles, and wrote doggerel verses and jocose letters as if he were merely a fashionable man of pleasure. At the same time he rallied all his marvelous energies, and prepared to meet the exigency with sagacity and intrepidity rarely surpassed. Orders were immediately dispatched to the old Dessauer to marshal an army to oppose Grüne and Rutowski, while the king hastened to Silesia to attack prince Charles. Leopold, though he had nearly numbered his three score years and ten, according to Frederick, was very glad to fight once again before he died. The veteran general ventured to make some suggestions in reference to the orders he had received. The king sternly replied:

"When your highness gets armies of your own, you will order them according to your mind. At present, it must be according to mine."

Frederick had an army of thirty-five thousand men at Liegnitz, in Silesia, under the command of young Leopold. Every man was a thoroughly trained soldier. The army was in the best possible condition. At 7 o'clock in the morning of November 15, 1745, the king left Berlin at full speed for Liegnitz. He arrived there the next day, and at once took the command. "There is great velocity in this young king," writes Carlyle; "a panther-like suddenness of spring in him; cunning too, as any *felis* of them; and with claws as the *felis leo* on occasion."

Prince Charles was *en route* for Berlin—a winter's march of a hundred and fifty miles. He was not aware that the king of Prussia was near him, or that the king was conscious of his bold design. On Saturday night, November 20, the army of prince Charles, forty thousand strong, on its line of march, suspecting no foe near, was encamped in villages, extending for twenty miles along the banks of the Queiss, one of the tributaries of the Oder. Four marches would bring them into Brandenburg. It was the design of Frederick to fall with his whole force upon the centre of this line, cut it in two, and then to annihilate the extremities. Early in the morning of Sunday, the 21st, Frederick put his troops in motion. He marched rapidly all that day, and Monday and Tuesday.

In the twilight of Tuesday evening, a dense fog enveloping the landscape, Frederick, with his concentrated force, fell impetuously upon a division of the Austrian army encamped in the village of Hennersdorf.

The assault was as sudden and resistless as the sweep of the avalanche. The Austrian division was annihilated. Scarcely a man escaped. This achievement was deemed a very brilliant passage of war. It cut the Austrian army in twain and secured its ruin.

The next morning the Prussian troops, led by their indomitable king, were early on the march, groping through the thick mist to find more of the foe. But the blow already given was decisive. The Austrian army was shattered, demoralized, ruined. The king could find nothing but broken tumbrils, abandoned wagons, and the debris of an utterly routed army. Prince Charles, bewildered by the disaster, had wheeled his columns around, and fled through the passes of the mountains back to Bohemia. Five thousand of his troops he left behind, in killed or prisoners.

Frederick was not overelated with his victory. He was still terribly harassed for money. There were campaigns opening before him, in an unending series, requiring enormous expenditure. Even many such victories as he had just gained would only conduct him to irretrievable ruin, unless he could succeed in conquering a peace. In these dark hours the will of this extraordinary man remained inflexible. He would not listen to any propositions for peace which did not guarantee to him Silesia. Maria Theresa would listen to no terms which did not restore to her the lost province.

Frederick, in this great emergence, condescended again to write imploringly to France for pecuniary aid. He received a sarcastic reply, which exasperated him, and which was couched in such polite terms that he could not openly resent it. Marshal Grüne, who was advancing rapidly from the Rhine to Berlin, hearing of the defeat of his confederates at Hennersdorf, and of the retreat of prince Charles, wheeled his columns south for Saxony. Here he effected a junction with general Rutowski, near Dresden. Their combined troops intrenched themselves, and stood on the defensive.

On the 29th of December the old Dessauer, with thirty-five thousand men, crossed the frontiers and entered Saxony. He marched rapidly upon Leipsic, and seized the town, from which a division of Rutowski's army precipitately fled. Leopold found here quite a supply of commissary and ordnance stores. He also replenished his empty army chest by levying a contribution of two hundred and fifty thousand dollars upon the inhabitants. Then, by a rapid march northeast to Torgo, on the Elbe, he captured another imperial magazine. Turning south, he pressed his troops along up the river to Myssen, which was within two days' easy march of Dresden. Here there was a bridge across the Oder. Frederick was pushing his

troops, by forced marches, from Hennersdorf, to effect a junction with Leopold at Myssen. Unitedly they were to fall upon Grüne and Rutowski at Dresden. In the mean time, also, prince Charles, a despondent man, crushed by domestic woe and humiliating defeats, was moving, by not very energetic steps, to reinforce the allied troops at Dresden.

It was two o'clock in the afternoon of Sunday, December 12, when the banners of the old Dessauer appeared before Myssen. The Sax-on commander there broke down the bridge, and in the darkness of the night stole away with his garrison to Dresden. Leopold vigorously but cautiously pursued. As the allied army was near, and in greater force than Leopold's command, it was necessary for him to move with much discretion. His march was along the west bank of the river. The ground was frozen and white with snow.

On Wednesday morning, December 15, the advance guard of the Prussians saw before them the allied army, thirty-five thousand strong, occupying a very formidable position. Marshal Grüne and general Rutowski had advanced a few miles north from Dresden to meet the Prussians. Their troops were drawn up in battle array, extending from the river Elbe, on the east, to the village of Kesselsdorf, on the west. A small stream, with a craggy or broken gully or dell, extended along their whole front. The southern ridge, facing the advancing Prussians, bristled with artillery. Some of the pieces were of heavy calibre. Leopold had only light field-pieces.

In the cold of the winter morning the old Dessauer carefully reconnoitred the position of his foes. Their batteries seemed innumerable, protected by earth-works, and frowning along a cliff which could only be reached by plunging into a gully and wading through a half-frozen bog. There was, however, no alternative but to advance or retreat. He decided to advance.

Forming his army in two parallel lines, nearly five miles long, facing the foe, he prepared to open the battle along the whole extent of the field. While thus engrossing the attention of the enemy, his main attempt was to be directed against the village of Kesselsdorf, which his practiced eye saw to be the key of the position. It was two o'clock in the afternoon ere all his arrangements were completed. The old Dessauer was a devout man—in his peculiar style a religious man, a man of prayer. He never went into battle without imploring God's aid. On this occasion, all things being arranged, he reverently uncovered his head, and in presence of the troops offered, it is said, the following prayer:

"O my God, help me yet this once. Let me not be disgraced in my old days. But if Thou wilt not help me, don't help those scoundrels, but leave us to try it out ourselves."

Having uttered this prayer, he waved his hat to his troops, and shouted, "On, in God's name!"

"The Prussians," writes Carlyle, "tramp on

FREDERICK AND THE OLD DESSAUER.

with the usual grim-browed resolution, foot in front, horse in rear. But they have a terrible problem at that Kesselsdorf, with its retrenched batteries and numerous grenadiers fighting under cover. The very ground is sore against them; up-hill, and the trampled snow wearing into a slide, so that you sprawl and stagger sadly. Thirty-one big guns, and near nine thousand small, pouring out mere death on you from that knoll-head. The Prussians stagger; can not stand it; bend to rightward to get out of shot range; can not manage it this bout. Rally, reinforced; try it again. Again with a will; but again there is not a way. The Prussians are again repulsed; fall back down this slippery course in more disorder than the first time. Had the Saxons stood still, steadily handling arms, how, on such terms, could the Prussians have ever managed it?"¹

At the second repulse the Saxon grenadiers, greatly elated, gave a shout of "victory," and rushed from their works to pursue the retreating Prussians. This was their ruin.

¹ CARLYLE, vol. iv. p. 171.

"Old Leopold, quick as thought, noticing the thing, hurls cavalry on these victorious, down-plunging grenadiers; slashes them asunder into mere recoiling whirlpools of ruin; so that few of them got back unwounded; and the Prussians, storming in along with them, aided by ever new Prussians, the place was at length carried."¹

And now the Prussians from the centre press the foe with new vigor. Leopold, at the head of his victorious division, charged the allied troops in flank, pouring in upon them his resistless horsemen. Whole regiments were made prisoners. Ere nightfall of the short December day the whole allied army, broken and disordered, was on the retreat back to Dresden. The night alone protected them from utter ruin. They had lost six thousand prisoners, and three thousand in killed and wounded.²

¹ CARLYLE, vol. iv. p. 171.

² Voltaire, speaking of this action, says: "It was the famous old prince of Anhalt who gained this decisive victory. He had been a warrior fifty years, and was the first who had entered into the lines of the French army at Turin in 1707. For conducting the in-

Prince Charles had arrived in Dresden the night before. He heard the roar of the cannonade all the day. But for some unexplained reason he did not advance to the support of his friends. The very unsatisfactory excuse offered was, that his troops were exhausted by their long march; and that having been recently twice beaten by the Prussians, his army would be utterly demoralized if led to another defeat.

On the evening of Tuesday, the 14th, Frederick, with his advanced guard, reached Myssen. All the next day, Wednesday, he was hurrying up his troops from the rear. In the afternoon he heard the deep booming of the cannon far up the Elbe. In the evening the sky was ablaze with the glare of the watch-fires of Leopold's victorious troops. The next morning Frederick pressed forward with all haste to join Leopold. Couriers on the way informed him of the great victory. At Wilsdruf, a few miles from the field of battle, he met Leopold, who had advanced in person to meet his king. Frederick dismounted, uncovered his head, and threw his arms around the old Dessauer in a grateful embrace.

Together the king and his sturdy general returned to Kesselsdorf, and rode over the field of battle, which was still strewn with the ghastly wrecks of war. Large numbers of the citizens of Dresden were on the field searching for their lost ones among the wounded or the dead. The queen of Poland and her children remained in the city. Frederick treated them with marked politeness, and appointed them guards of honor. The king of Poland, who, it will be remembered, was also elector of Saxony, applied for peace. Frederick replied:

"Guarantee me the possession of Silesia, and pay me seven hundred and fifty thousand dollars for the expenses of this campaign, and I will withdraw my army."

M. D'Arget, private secretary of the French minister Valori, gives an interesting account of an interview he held with Frederick at this time. M. D'Arget was quite a favorite of the king, who conversed with him with unusual frankness.

"These kind condescensions of his majesty," writes M. D'Arget, "emboldened me to represent to him the brilliant position he now held, and how noble it would be, after being the hero of Germany, to become the pacificator of Europe."

"I grant it, my dear D'Arget," said the king, "but it is too dangerous a part to play. A reverse brings me to the edge of ruin. I know too well the mood of mind I was in the last time I left Berlin ever to expose myself to it again. If luck had been against me there, I saw myself a monarch without a throne. A bad game that. In fine, I wish to be at peace."

fantry he was esteemed the most experienced officer in Europe. This great battle was the last that filled up the measure of his military glory—the only glory which he had enjoyed, for fighting was his only province."—*Age of Louis XV.*, chap. xvii.

"I represented to him," continues M. D'Arget, "that the house of Austria would never, with a tranquil eye, see his house in possession of Silesia."

"Those that come after me," said the king, "will do as they like. The future is beyond man's reach. I have acquired. It is theirs to preserve. I am not in alarm about the Austrians. They dread my armies; the luck that I have. I am sure of their sitting quiet for the dozen years or so which may remain to me of life. There is more for me in the true greatness of laboring for the happiness of my subjects than in the repose of Europe. I have put Saxony out of a condition to hurt me. She now owes me twelve million five hundred thousand dollars. By the defensive alliance which I form with her I provide myself a help against Austria. I would not, henceforth, attack a cat, except to defend myself. Glory and my interests were the occasion of my first campaigns. The late emperor's situation, and my zeal for France, gave rise to the second. Always since, I have been fighting for my own hearths—for my very existence. I know the state I have got into. If I now saw prince Charles at the gates of Paris I would not stir."

"And would you regard with the same indifference," M. D'Arget rejoined, "seeing us at the gates of Vienna?"

"Yes," the king replied. "I swear it to you, D'Arget. In a word, I want to have some good of my life. What are we, poor human atoms, to get up projects that cost so much blood!"

On the 25th of December, 1745, the peace of Dresden was signed. The demands of Frederick were acceded to. Augustus III. of Saxony, Maria Theresa of Austria, and George II. of England became parties to the treaty. The next day Frederick attended sermon in the Protestant church. Monday morning his army, by slow marches, commenced its return to Brandenburg. Frederick, highly elated by the wonderful and almost miraculous change in his affairs, entered his carriage in company with his two brothers, and drove rapidly toward Berlin. The next day, at two o'clock in the afternoon, they reached the heath of Britz, five miles out from the city. Here the king found an immense concourse of the citizens, who had come on horseback and in carriages to escort him to his palace. Frederick sat in an open phaeton, accompanied by the prince of Prussia and prince Henry. The throng was so great that the horses could only proceed at the slowest pace. The air resounded with shouts of "Long live Frederick the Great." The king was especially gracious, saying to those who eagerly crowded around his carriage wheels:

"Do not press each other, my children. Take care of yourselves that the horses may not trample upon you, and that no accident may happen."

It was remarked that the whole behavior of the king upon this occasion exhibited the ut-

most mildness, gentleness, and affability. He seemed to be influenced by the most tender regard for the welfare of the people.

Upon reaching the palace he stood for a moment upon the grand stairway, and, surveying the thronging thousands, took off his hat and saluted them. This gave rise to a burst of applause louder and heartier than Berlin had ever heard before. The king disappeared within the palace. Where the poor neglected queen was at this time we are not informed. There are no indications that he gave her even a thought.

At six o'clock in the evening the whole city was illuminated. Frederick entered his carriage, and, attended by his two brothers, the prince of Prussia and prince Henry, rode out to take the circuit of the streets. But the king had received information that one of his former

preceptors, M. Duhan, lay at the point of death. He ordered his carriage to be at once driven to the residence of the dying man. The house of M. Duhan was situated in a court, blazing with the glow of thousands of lamps.

"It was an affecting sight," says M. Bielfeld, "to see a dying man in the midst of a brilliant illumination, surrounded by princes, and visited by a triumphant monarch, who, in the midst of the incessant clamor of exultation, sought only to alleviate the sick man's pangs, participating in his distress, and reflecting upon the vanity of all human grandeur."

The king having taken a tender adieu of M. Duhan, who died the next morning, traversed the brilliant streets of the rejoicing city, and returned to the palace about ten that evening.

Frederick now entered upon a period of ten years of peace.

FREDERICK AT THE DYING BED OF M DUHAN.

THE SPECTROSCOPE.

THE SPECTROSCOPE.

THE greatest invention, or rather discovery and invention combined, of modern times, in respect to *practical utility*, is probably the electric telegraph. The one most important, in respect to the development of *scientific truth*, is the spectroscope. The history of this instrument, now attracting so much attention, is briefly this:

It was about fifty years ago that Fraunhofer, a distinguished German optician residing in Munich, by means of some very perfect optical apparatus, and some new and delicate observations which he made with it, discovered the existence of certain very mysterious lines, some dark and some bright—the latter of various colors—crossing the solar spectrum, among the colored bands which form it. As ordinarily observed, by means of a common prism, the different colors are blended together, passing into each other by insensible gradations. The reason of this is that in the ordinary spectrum the images produced by the different colored rays, or rather the images produced by rays of *different refrangibility*, on which the effect of different colors is produced in the human sensorium, are superposed upon each other, and their confines blended. The great point was so to perfect the apparatus as to separate these component portions of the spectrum as much as possible by the use of the most perfect lenses and prisms, and by the nicety of the arrangements for making the observation.

This Fraunhofer succeeded in doing, and thus brought the lines above referred to fully into view. This was in 1815. He studied these lines very attentively, and made a very carefully prepared colored drawing, representing the spectrum, as he developed it, with the principal lines laid down upon it. He counted in the spectrum more than six hundred of these lines, and he laid down upon his map three hundred and fifty-four of them. The principal of them he designated by letters of the alphabet, and they continue to be known as Fraunhofer's lines, and to be distinguished severally by the letters which he gave them, to this day.

The discovery of these lines, and the exhibition of the map delineating

them, copies of which were multiplied and disseminated throughout Europe, excited great attention; but the nature and the meaning of the lines remained for many years a profound and inscrutable mystery.

It was at length discovered that while the position and character of the lines in the spectrum formed from the sun were always the same, yet they varied greatly in spectra of rays issuing from different artificial sources of light, though constant for each particular source. And it was finally ascertained that they depended on the chemical constitution and physical condition—as whether solid, liquid, or gaseous—of the ignited substance from which the light came; and also in some degree upon the character of the intervening media through which the light passed on its way from the source to the instrument. It would lead to too much detail to enter here into particulars in respect to these points, the object of this article being only to give a summary idea of the nature of the discovery, about which so much is said at the present day, and of the form and appearance of the instrument, sufficient for the purposes of the general reader.

The engraving represents one of the various forms of the instrument. It consists of a stand with three branches, each supporting a telescopic tube; all three of the tubes being directed toward a glass prism which occupies the centre of the stand. This prism is covered, in the

actual instrument, by a metallic box to protect it from injury—openings being left in the sides of the box opposite to the orifices of the three telescopic tubes.

The tube to the right is directed toward the source of light, whatever it may be, the spectrum of which is to be examined. It is represented in the engraving as receiving the light from a gas flame, the flexible pipe by which the gas is supplied being seen below upon the table. The head of the stand supporting the burner is provided with the means of intermingling various substances with the flame, in order to examine the spectra which they severally produce.

This telescope may also be turned toward any natural source of light—as the sun, for example, or a star, or the aurora borealis, or a portion of the Milky-way.

The rays emanating from the source of light, whatever it may be, pass into this right-hand tube through a very narrow vertical slit, not seen, of course, in the engraving. The ribbon-like beam thus formed, passing through the tube, strikes upon the prism, and the various rays separated by the prism, through their different refrangibility, enter the object-glass of the tube on the left, where an image of the spectrum is formed, and can be seen, magnified, by the observer, who places his eye at the left hand of this tube, where the eye-glass is placed. There is a screen placed here near the end of the tube, to protect the eye from rays coming to it on the outside of the instrument.

There is a third tube, smaller than the others, seen in the centre, and directed toward the spectator. In the orifice of this tube in the engraving can be indistinctly seen a small micrometer scale, illuminated by a candle placed upon a stand. The light from this arrangement passes through the small tube, and the image of the micrometer scale is reflected from one of the surfaces of the prism, and enters the left-hand tube, and is seen by the observer *superposed* upon the spectrum, and in such a position as to enable him to measure the distances from one spectral line to another, and to determine with precision the place of any one under examination.

The object of this article is simply to give to the general reader an idea of the construction and form of the instrument and the mode of making observations with it, and not to enter at all into a discussion of the results which have been obtained. It may, however, not be out of place to state the three general principles which form the foundation of the science of spectral analysis—or perhaps, rather, the three great divisions within which all the phenomena are comprised. The distinction depends on the conditions under which the light to be examined emanates.

1. It may emanate from an incandescent *liquid* or *solid* body.

2. It may emanate from an incandescent *gaseous* body.

3. It may emanate from an incandescent

liquid or solid, and pass through an incandescent gaseous medium on its way.

In the first case, that is, where the source of the light is an incandescent liquid or solid body, the spectrum is continuous, showing no traversing lines of any kind.

In the second case, that is, where the source of light is an incandescent substance in a gaseous state, the spectrum produced, instead of being continuous, consists of a certain number of variously colored bands, which are always rigorously the same for the same substance, but vary infinitely in number, color, and position when different substances are compared.

In the third case, that is, where light comes from an incandescent solid or liquid—and so would, if not modified in its passage, give a continuous spectrum—and passes, in its course, *through a flame*, that is, through a gaseous substance in a state of incandescence, the *bright* lines which the substance of the incandescent gas would have produced if it had been solid are changed into *dark* ones. That is, the gaseous substance *intercepts* and *absorbs* the peculiar luminous vibrations which it would have *emitted* if it had been the *source of the light* instead of being the *medium* through which a *brighter light from another source* beyond it was transmitted.

Thus, if the spectrum given by any light, when examined in the spectroscope, consists of a continuous longitudinal band of prismatic colors, it is known that the source of the light must be an incandescent solid. If it consists of transverse bars or bands of color on a dark back-ground, the observer infers that the source of the light is an incandescent gas; and the number, positions, and colors of these bands show what the substance is, provided it is one the spectrum of which is known. If, in the third place, the spectrum consists of a longitudinal band of prismatic colors traversed by dark lines or bars crossing it at various intervals, the indication is that the light under examination, coming from some source beyond, traverses an incandescent gas or flame in its way; and the dark lines, in this case, are found to correspond for any substance, in breadth and position, with the bright colored lines seen when the substance itself is the source of light instead of the medium through which a brighter light from an incandescent solid or liquid beyond passes on its way.

These transverse bars, whether bright, as in the second case, or dark, as in the third, are exceeding delicate, though perfectly distinct, and are very sharply defined; so that by means of a micrometer, which forms a part of the instrument, the position of any one can be very precisely determined, and its identity ascertained. And by means of them those who have attained to the necessary knowledge and skill required to read and interpret these wonderful revelations can determine, with apparent certainty, a great many facts in relation to the elementary constitution and physical condition

of the substances which constitute the sources of the light, not only of those which are near, but also, with equal facility, those which are inconceivably remote. The test is applied with the same success to the light emitted from artificial sources in the laboratory, and to that coming to us from the aurora borealis, from the disk, or from the marginal coruscations of the sun, and from the remotest nebula or star.

Every different substance, so far as is known, has its spectrum marked by its own peculiar and characteristic lines. Even those which have never been analyzed, and so are classed by the chemists as simple substances, have usually more than one, which seems to indicate that they are really compounds, and that their actual elements have not been ascertained. This being so, and as the photosphere of the sun contains a great number of elements, the number of these lines in the solar spectrum is very great. It requires, however, great delicacy and exactness in the prism, and in the arrangement of the apparatus for observing them, to bring them into view. Sir Isaac Newton, as early as 1675, succeeded in forming a spectrum which showed the prismatic colors; but his apparatus and his method were too imperfect to bring the *lines* into view. Dr. Wollaston, in the early part of this century, was the first to do this, and to him is accordingly ascribed the honor of first discovering the existence of the lines. Afterward, by means of great improvements made in the construction of optical instruments, the celebrated optician Fraunhofer, as we have already seen, brought a great many more into view, and made a map of the spectrum, in which he laid down the positions of about six hundred of them. This map excited great attention throughout Europe, as has already been stated, and the lines were long known as Fraunhofer's lines, though no one had the least idea of the cause or of the significance of them, excepting that surmises were made by different observers that there was some connection between the position and character of the lines and the chemical constitution of the substances from which the light emanated. The number of lines since brought to view in the solar spectrum is more than six thousand!

Nothing can be more wonderful than the inconceivable delicacy of the test which the spectrum, fully developed and microscopically observed, affords. It detects the presence of quantities of an element so exceedingly minute as to be wholly inappreciable by any other means. One of the most curious illustrations of this fact is afforded by the discovery of two new metals in a certain German mineral water, by Professor Bunsen, in 1860—metals which existed in the water in quantities so exceedingly minute that by no other possible means than spectral analysis could their presence have been detected. Bunsen was led to suspect the existence of some new element in the water by observing two bright lines in the spectrum produced by a flame in which the alkalies left by

the evaporation of a portion of the water had been introduced—which lines he had never observed in any other spectrum. The ordinary chemical tests gave no indications of the presence of such elements. This Bunsen attributed to the minuteness of the quantities; and in order to increase the quantities so as to bring the substances within the reach of the usual methods of analysis, he went to work to evaporate no less than *forty-five tons* of the water, and from the residue thus obtained he succeeded in obtaining an appreciable quantity of the metals in question. The names given to them are *cæsium* and *rubidium*.

Another very curious instance of the delicacy of this test is afforded in the case of sodium, the spectrum of which is very remarkable, and is characterized by one line in particular by which exceedingly minute quantities can be detected. Now sodium is one of the most universally diffused substances in nature. It is one of the constituent elements of common salt, and so exists in enormous quantities in the ocean. And as two-thirds of the surface of the earth is covered with water, and as the winds are continually carrying up a fine spray from the crests of the waves into the air, the water of this spray in evaporating leaves the air full of infinitesimally minute particles of salt, which pervade the atmosphere every where, and form, as it were, a portion of its very substance. And although the quantity of sodium thus present is too small to be detected in ordinary cases by any of the usual chemical tests, it reveals itself at once in the spectrum whenever the minutest quantity of dust which has subsided from the atmosphere is thrown into the flame.

It would require many months' study to understand fully the character and the working of this instrument, and the nature and extent of the revelations which it has made, and which it is still making, in respect to the chemical and physical constitution of the distant bodies which form the sources of natural light. The knowledge which it brings to us is different in its character, as well as more subtle and precise in its minuteness, in comparison with the knowledge which we obtain by other means. With the telescope the observer sees the form and the colors of the object which comes into the field of view, and so vastly magnified that details are clearly distinguished that are wholly invisible to the naked eye. With the spectroscope he sees no form, and no color characteristic of the object which he is studying; but simply a beautiful iridescent band, across which are drawn at intervals certain delicate and well-defined lines, which by their position and character form for him a perfectly intelligible language, which expresses the result of almost accurate, and thoroughly trust-worthy analysis of the hidden constitution of the material of which the object is composed.

Nor is it wholly to the constitution and character of distant and inaccessible objects that the revelations of the spectroscope have been

confined. Some very important truths have been brought to light by it in regard to the chemical constitution of substances in the laboratory which have long been subject to the closest analytical examination, and many facts have been elicited which had baffled all preceding modes of investigation. In a word, the "spectral analysis" opens an entirely new avenue of exploration for man into the realms of nature around him—an avenue which runs in an entirely different direction from all previously known, and extends to an infinitely greater distance than any of them.

THE JESSOPS' WISH.

"**D**EARY me," sighed Mrs. Jessop, who was turning Patty's last summer's dress in order to get it as near this summer's fashion as the cloth and her native skill would allow, "if a body could spend a cent without smarting for it, Patty'd have as fine a gownd as Square Harris's daughters. It's enough to wear the life out of ye, to keep a-turning and a-twisting of things, year after year, till there ain't a thread of 'em left."

"What makes you do it, then, Roxy?" put in Mr. Jessop.

"Do it! You're enough to provoke a saint. How are we going to git along without doing of it? How's Patty to look like other girls?"

"I don't want her to look like other gals; she's a sight better-looking."

"There, don't you be turning of the child's head. I say, Nathan, if we only had a *little* of your uncle Reuben's hoard, we'd shine, now, wouldn't we?"

"You might as well wish for the wind to change, or the north star to change places with your kerosene lamp. I reckon you'd better git *that* bee out of your bonnet, unless you want it to sting you."

"Oh yes, you're allus a-throwing of cold water on every thing. Now, if we had a crumb of his plenty, think how we could trig up like. You could buy the clover-field of Deacon Jackman, and put up new fences, and raise the roof, and build on an L—goodness, how the neighbors would gape!" which prospect appeared to be highly satisfactory to Mrs. Jessop.

"It isn't worth thinking about, Roxy; it only riles you up. I guess we shall pull through without it."

"Yes, with our noses ter the grin'stone all our days, when we might be a-dressing in the best of the land, and living like gentry."

"Lor," said Patty, who had been vexing herself over the trimming of her last year's hat, "if wishes were horses, beggars would ride; and we'd be sure to get a lift. But I'd just like to see how 'twould seem to ride in your own carriage, and that not a hay-cart. I should like a silk gown, or satin, I don't care, that would stand alone, with a train as long as the moral law, and to go sweeping up and down a big parlor, over a velvet carpet; and a diamond

ring, such as Miss Harris's lover gave her, on my finger; and a piano; and to go out every night to balls and operas, and have fellows sending me bouquets with little notes in 'em; and to have more names on my dancing card than the rest of the girls! There, how does that look, mother? It's awfully old-fashioned!"—trying the hat on before the glass.

"It looks jest like the picter of Maud Mulder I see in a winder in town," said her father, "when she was a-raking hay, and the judge put his eye on her. If *that's* old-fashioned, I should think every body'd be a-running after the old fashions."

"Lor, pa, pictures don't have any thing to do with the fashions!"

"I'm glad there's something don't!" he persisted; and then he returned to his planting, and left Patty and her mother to their own devices.

"You go and look after the pie-plant, Patty," said Mrs. Jessop, "while I finish this gownd off. I do declare it's discouraging enough ter have ter fix over old duds; if Uncle Reuben had to pinch a little himself, he'd know how good it is. Now I leave it ter any body if it isn't provoking ter hev all that money in the family, so ter speak, and it all shet up in a bank or suthing; and goodness knows if we'll git a cent of it, after he's gone; like as not he'll leave it all ter some destitute asylum or other. Reuben allus was contrary."

While Patty prepared the pie-plant she built a castle out of Uncle Reuben's timber. "Not that I want the poor old soul to die," she assured herself; "but it would be so nice to have every thing you wanted, and wear kid gloves and bronze boots, and never have to do the cooking, or sprawl your hands out of shape at the wash-tub. Heigh-ho! I suppose I should miss something about the farm! It's sort of nice when the pease are coming up, and the larches are coming out, and the fields are getting greener every day, and when the scarlet beans are in blossom. Then there isn't any thing to compare with the apple-blows, 'except my cheeks,' Elijah says; but Elijah's a goose, sometimes. Still, when the orchard is all in bloom it's more like an enchanted land than common earth; and there's the birds, too! But yet, I shouldn't have to wear my gowns till they dropped to pieces if I was rich; and then there'd be such splendid lovers coming to see me, only—I suppose—I should miss—Elijah!" And just then a shadow darkened the kitchen door, and Elijah's honest bronzed face beamed upon her, and made the kitchen fairly radiant with its smile. It mattered very little to Patience Jessop, in that instant, whether she sat in a hovel or a palace, whether the walls were hung with tapestry or were simply yellow-washed. She forgot all about Uncle Reuben's wealth in view of her own; the petty things that annoyed her vanished like fog before the sun. What if she did have to wear her old clothes till they were shabby? Elijah loved her!

What if the house *was* old, and the land unfer-
tile, and the mortgage unpaid? Elijah loved
her. Did not that make amends for all? Oh,
wonderful power of love, that gilds the cloudi-
est horizon, and without which nothing is sweet,
nothing satisfying! Probably Mrs. Jessop
would have answered these questions different-
ly—Mrs. Jessop, to whom Elijah's love was not
such a warm and vital thing as to her daugh-
ter, since he could offer Patty nothing better
than a farm life of hard-earned plenty and con-
tentment. Had she worked night and day,
and denied herself many of the necessities of
life, that Patty might have a year's finishing at
South Hadley, after the district school had done
all it could for her, to this end? Was there no-
thing better for her child than a life patterned
after her own, a life of hardship and self-denial?
So when Squire Harris's son had dropped
in to sit with Patty, Patty's mother had felt as
if events were conspiring with her ambitions;
but for handsome Elijah she had few words
and fewer smiles. However, this may have
signified little to the young man, so long as the
daughter made up the deficiency.

"Good-morning, Elijah," said Patty. "You
have made yourself a stranger lately. I haven't
seen your shadow since Wednesday night.
Come in and sit down, and give an account of
your misdoings!" This was shameful neglect,
you know, for it was now Friday morning!

"You see," began the culprit, "I could not
get away last night, because mother had some
friends from town, and she wanted me to stay
and amuse them."

"Indeed!" said Patty, shortly, and hacked
spitefully at the poor pie-plant. Then she re-
flected a little. Perhaps these "friends" were
some kinsfolk, some elderly dames. In that
case she would put up with it—if only they
were not the Spicer girls, who had boarded last
summer at Elijah's mother's, for country air and
country fare; who had ridden with Elijah on
the hay-cart and hunted butterflies with him in
the field; who had worn fashionable dresses and
jaunty hats into the little vestry; who had called
Patty "a pretty country lass," and had lent their
books to Patty's lover, and kept Patty's heart in
a constant flutter. No, no. If Elijah had staid
at home to entertain the Spicer girls, she should
feel it her duty to be aggrieved.

"And who were your friends from town?" she
asked, trying hard to speak with indifference.

"Well, you see, it was an accident brought
them here—"

"Oh, I dare say!"

"They were going on to Hixon in their own
carriage—"

"I know it's the Spicers," thought Patty.

"And they got run into just as they reached
here."

"How unfortunate!" said she, feelingly.

"Yes; and so, of course, they came straight
to our house, and mother, she persuaded them
to spend the night, and I'm to take them over
this afternoon in our team, which happens quite

handily, as I was going any way, and their car-
riage is all in splinters."

Now there had been some talk of Patty's
going over to Hixon on this occasion; and, if
the truth must be told, it was to do credit to
this little journey that she had remodeled her
hat and gown.

"If I were to be Uncle Reuben's heir," she
thought, away back in a corner of her grieved
soul, "he wouldn't dare to treat me so." There-
by doing great injustice to her lover, since, be-
ing so much a part of himself, he had felt that
he might slight or thwart her pleasure as well
as his own. She left her seat now, and went to
put the pie-plant to stew. Keeping her back to-
ward Elijah, while she said her say, lest looking
at his face, and remembering how she loved
him, she might be silly enough to relent.

"Well, Elijah," said she, "what I've got to
say is, that, considering all things, if you go with
them to Hixon to-day, or any other day, you
needn't come here to see *me* again!"

"Patty! what on earth do you mean?" he
cried. "Not go with them to Hixon? Why
not? It would be downright uncivil; and then
my mother wishes it."

"And *I* do *not* wish it! We shall see whose
wish has the most influence with you!"

"What's the matter with you, Patty?
You're the most unreasonable girl alive. I tell
you it *isn't* a matter of choice. *I must go*.
How will they get there, unless I do?"

"They can hire a team at Job Parsons's;
there's no dearth of horses and wagons, nor
drivers either, for the matter of that." She
was waiting idly by the stove now, watching
the seething pie-plant; having made her stand
upon this question, she was ready to back it
with argument, and grimly to abide the issue.

"But I must go, all the same, Patty," he
persisted. "I've promised; and then they are
our guests."

"Very well; that settles it, I suppose."

"And you won't go back on me, Patty, for
such a nothing?" he asked, laying his hand on
her shoulder; but Patty moved away from
under his touch.

"I have told you what I should do," she re-
plied, "and it is as important for me to keep my
word as it is for you. If you go to Hixon, you
know the consequences."

"Well, Patty, I shall certainly go."

"Then you needn't come back to me."

"Patty, Patty, do you mean it? Is it
final?"

"I do mean it, and you will find that it is
final." And then Elijah walked out of the
house, without another word, and home. Har-
nessed his horse into the family carriage, and
carried his friends to Hixon, though I'll ven-
ture to say it was not a pleasant drive for the
poor perplexed fellow.

As for Patty—well, she had earned what
she got. Every thing went awry that day—
her pies burned to a cinder, her mother scolded,
she broke the eggs that she was bringing in

from the nests in her apron, and strained the milk into the colander. It was a wretched, wretched day, repeating itself in how many to-morrows! By-and-by she got a trick of watching the road to catch a glimpse of Elijah as he went by. Sometimes whole weeks slipped away without one sight of him; then she used to manage to get a little late to church to see him as she went in; though, after all, she never dared to look. She would have given worlds to have known if he so much as raised his eyes at her approach. More than ever, she longed inexpressibly now for a little of Uncle Reuben's hoard, that she might make herself lovely and irresistible in Elijah's eyes. Yet, had he loved her, would he have ran counter to her wishes so stubbornly? Would he allow a hasty word to part them? Would he not have returned in spite of her interdict? And then, if he loved her not, all the purple and fine linen of the looms would never win him back. The thing that had been so easy to do, how hard to undo!

Once, when a shower came up, just before church was over, and while Patty stood in the doorway, debating whether she should subject her best dress to the storm or wait for the movements of destiny, a familiar voice asked over her shoulder, "Will you walk home under my umbrella?" and at that moment Tom Harris ran up the steps to meet her, and said: "They have sent the carriage for Liz and Lu; will you let me drive you home, Patty?"

"Perhaps she didn't hear me," thought Elijah, trudging home alone, under his umbrella. "At any rate, it's a great deal nicer to drive than to walk in this mud."

Silly Patty, whipping along the highway in Squire Harris's carriage, dreamed her dreams in the pauses of the chat, upon the unstable basis of Uncle Reuben's money, which might easily furnish her with just such a luxury as this she was enjoying, with fine India muslins and wrought scarfs like the Misses Harris's, with the perfumes that seemed a part of the fabric of their garments, floating, not fixed, as the perfumes of the summer air. But underneath all her dreams there lurked a gnawing suspicion that she had dealt cruelly in slighting Elijah's good-will. "But then," she reasoned with herself, "he offered it as if he felt it a duty and not a pleasure; and what, for pity's sake, could we have talked about all the way home?" Perhaps she remembered other walks from church, when it had not been difficult to find themes; when even silence had not been an embarrassment.

One day Patty went to a quilting at Farmer Dwight's; she did her best to appear lively, while she stitched in herring-bone and diamond, for Elijah might come in the evening along with the other young fellows, and—at least, she would be able to see him; though it should be only torture, it was a kind that she coveted. While she was conjecturing what might happen if Elijah were to come, what he

might say, and how she might answer, Miss Emery, on her left, the little dress-maker, who lived out at Carter's Crossing, was telling "how frightened she got, a month come Thursday, when a runaway horse went plump into a carriage with two women-folks in it, and broke every thing to splinters."

"I was all of a prickle with fright, and my teeth chattered in my head enough to crack 'em."

"Du tell!" cried Mrs. Holbrook. "What become of the women-folks?"

"Oh, they picked themselves up as pert as could be, and shook the dust off their black gowns; and a man come and gathered up the pieces; and the hoss, he'd took to his heels in the beginning."

"Lor," said Mrs. Tewksbury, "they be the folks as was stopping at Elijah Gowan's." Patty pricked up her ears, left off thinking, and began to listen. "Whose got the scissors?" continued Mrs. Tewksbury. "I see Elijah take 'em off in his kerridge the next day in the direction of Hixon. I s'pose *you* know all about it, Patty?" she said, turning abruptly to that person.

"Who was they?" asked Mrs. Holbrook.

"The—the Spicers," answered Patty, with an effort.

"Lor, no; bless your heart, 'twan't them Spicers, nor nothing like 'em. I guess if I don't know them Spicer girls there ain't nobody as ought ter. I used to say to Eben last summer, says I, 'Now you mark my word, Eben Tewksbury, but that Lucy Spicer's got her cap sot for Elijah Gowan, and she won't leave no stone unturned along of catching of him.' 'Pooh!' said he, they be jest his words; 'he won't look at her as long as Patty's a Jessop!' But I must say that she was allus that much hanging around him as it made me blush for her, a-looking out between the blinds of my parlor chamber, where I mostly sets o' hot summer days. It was Mr. Elijah here, and Mr. Elijah there; and when she went home for good and all, I do believe there was tears a-running down her two cheeks, like a freset, and she hugged Miss Gowan within an inch of her life, and said as how she'd been a mother to her, and Elijah'd been more'n a brother to her! Which, between us, I reckon, was jest what she wanted him to be. No; it wa'n't the Spicer girls, it was two oldish women; one had gray curls, and both on 'em black gowns, not fashionable at all, like the Spicers' was, nor full of their airs and graces. Gracious, I thought you'd hev know'd, Patty!"

"I guess," said Patty, brightening at this—"I guess they were Mrs. Jordan and her sister; they're connections of Mr. Gowan's first wife. I have met them at—at Elijah's. One had gray curls and was short; they both wear black."

"Precisely," said Mrs. Tewksbury; "and t'other had gold-bowed specks, and wasn't neither tall nor short."

"Yes; it *must* have been Mrs. Jordan and her sister;" and Patty drew a long breath.

What a relief it was to find that Elijah had not braved her displeasure for the sake of any Spicer that ever lived! That she had issued her mandate for naught. She felt as gay as any lark, till it occurred to her that he must have thought her a born fool in objecting to have him take two elderly relatives to Hixon; and how should she acquaint him of her mistake?

What if he didn't come to-night? What if no chance offered of exchanging a word with him? Or how should she say it? He certainly had shown no great amount of affliction at her dismissal; he had taken her at her word without contesting it desperately. He might, at least, have come and made certain that she had meant it all; that it was not the pique of the moment. Consistent in her own pride, she gave him no credit for the same emotion. Of course, he must know that she loved him; how should she be sure if the converse were true unless he were to show it by unmistakable signs? And then, as night drew on, and Farmer Dwight brought out his old fiddle, and the young men came flocking in, in their Sunday suits, and the dancing began—then, as Elijah had failed to put in an appearance, her spirits fell, like the mercury in February, and she retired from the well-swept and roomy kitchen to where the matrons, gathered in the best room, discussed the new pastor, the way to distill rose-water, to preserve grapes, the pounds of butter made that week, Miss Growler's rheumatism, or any other local interest. By-and-by Tom Harris hunted her out and begged her to come and make out a set.

"Aren't there enough without me?" she asked.

"There's never enough without you, Patty," he answered, gallantly, while the matrons looked on, nodding and whispering to each other: "I shouldn't wonder, now!" and "It would be a good thing for her!" and "How would his father take to it?" and "What would Elijah Gowan say about it?"

"I don't think," said Patty, overhearing the last query—"I don't think it is any of Elijah Gowan's affair!" and then she rose, defiantly, and took Tom's arm to the kitchen. However, on reaching the dancers, what was Patty's surprise to find herself in the same set with Elijah! Her heart began forthwith to thump out the "Anvil Chorus" to a charm; she wondered if every body didn't hear it—if Elijah himself did not notice it when he swung her, with the tips of his fingers, in that indifferent manner!

"You're as white as a ghost, Patty," said Tom Harris. "Aren't you well?"

"I'm a little dizzy," said she. "I guess I will sit down, if you don't mind."

"I'll get you a glass of water;" and when he returned he whispered, "Your father has sent for you; shall I take you home?"

"Thank you; but is any one sick? Has any thing happened?"

"Ahem!—well, nothing very—nothing—in

fact, your father has just received news of your uncle Reuben's death."

Involuntarily Patty's eyes glanced across the room to where Elijah was making himself agreeable to Kitty Tewksbury. "Maybe you'll be able to look at me next time we meet!" she thought; and then nature asserted itself, and a cold shiver shot through her as her soul shudderingly cried out, "Oh, I have been all the time wishing for his money, yet how could I have it unless he died? Then—I have—murdered—him!"

Dead men's shoes were not such pleasant things as she had esteemed them; they had a trick of pinching; they struck a chill to her very marrow, and froze the words on her lips and the emotions of her heart; and Tom Harris was heard to say, afterward, "Patty must have thought a sight of old Reuben Jessop, for she was as glum as a cypress-tree all the way home."

"Dear heart!" said Mrs. Jessop, when Patty had dismissed her escort and bolted the door. "Patty, we're as rich as Cracis, whoever he was! Your poor uncle Reuben's gone and left us the hull property!"

"I—I wish he had—not died!" said Patty.

"Yes, poor man, it's a pity for him; but you know he wouldn't hev been like to hev give it to us while he was living!"

"Oh, I feel as if we had murdered him!" cried Patty, bursting into tears.

"Lor!" said her mother, jumping out of her chair; "what a start you give me, to be sure, Patience Jessop! Me, that wouldn't hurt a hair of his head! Murdered him!"

"But, you know, we have always been wishing for his money, and that's the same thing as wishing him dead," sobbed Patty; "and, of course, when people murder other people," getting perplexed between her logic and her conscience, "they begin by wishing them dead!"

"Du tell! Then perhaps I murdered the fust Miss Harris, she that was Tildy Grosvenor, along of wishing ter hev a house as grand as hern, that night I was watching with her, and I not able to hold up my own head, along of neighborliness; and maybe I've shortened the days of old Deacon Jackman, a-wishing for the clover-field a-joining our land!"

"I don't mean that," said Patty. "It wouldn't have done us any good to have *them* die. We shouldn't have had the house nor the clover-field, if they'd died twenty times over. Oh, I wish the money was all in the Red Sea! We shall never enjoy a cent of it."

"Trust *me* for that; I'm beginning to enjoy it already; you'll git over this nonsense by-and-by. You're a leetle bilious jest now with the excitement; when you come ter be hevins as splendid gownds as any body, and laces from goodness knows where, and diamonds from Galcondy, and 'pearls from the ocean,' you'll feel a sight better. Now, Patty, wipe your eyes, and guess how much it is. There ain't

a blessed letter of a will, and we're the only heirs."

"I don't care. I wish it wasn't a cent. I wish there *had* been a will, and he had left it all to the Harrises, or the Tewksburys, or *any body* but us."

"There, Patty, you'll be a monomany if you take on so for nothing. Who'd 'a thought, now, of your being that fond of your uncle Reuben?"

"I wasn't fond of him. I never could bear the sight of him; but I don't want to be killing folks just for the sake of wearing silks and satins, and feeling like a criminal in 'em."

"Lor, I do believe you're a fool, Patty. He was lost overboard, child, on the way home from Chiny, where he'd a-went on business. I don't see as how we could 'a helped it, one way or t'other; and, Patty, there's three hundred thousand dollars, every cent of it, to console you."

"It *can't* console me. I won't touch it. We shall never prosper with it, I know we sha'n't."

"Pooh! I don't hev no fear about that. I guess the neighbors will open their eyes some. You see, me and your father think we'd better sell out here and move right into your uncle's house in the city and enjoy ourselves. Think of that, Patty! And who knows but you'll marry some great shakes out there? So dry your eyes, and go off ter bed, and dream you hain't got money enough ter buy a cow, but wake up and find you're as rich as any body."

But Patty couldn't dream any thing so rational; and she woke up from a nap wringing her hands like Lady Macbeth, and crying, "I can not wash it off—*it is murder!*" After that she lay awake, thinking very unwholesome thoughts. She hated herself for ever having wished for Uncle Reuben's money. What should they do with three hundred thousand dollars? They were like people thrown on a desert island with the ship's treasure. Moreover, how could they, who knew next to nothing of polite life, hope to figure respectably in aristocratic circles—they, with their bad grammar and false taste and awkwardness? How should they learn the fashionable manner of entertaining or visiting? What was the etiquette of parlor or ball-room, of dinner and breakfast? Would not her father hobnob with the butler, and her mother join issue with the cook? Of herself she felt equally doubtful, be it said. And then, was it not a million times veltar to be poor and innocent, than rich and vulgar and sin-burdened? Finding no answers for any of these pretty little conundrums, they continued to propound themselves. And to leave the country, too, where she had been born and bred; the fields, that were like familiar faces; the woods, that seemed to welcome and to open up all their sacred depths to her, withholding no secret of flower or fruit; to leave the place where every one knew and cared for her, in a way of their own, and to go out to people who knew not Joseph, to adopt their customs and bear with their slights and caprices; and always, every where, to have

the feeling that God had taken her at her word and would require Uncle Reuben's life of her at last! Always to have this shadow haunting her in all places! And then, if spirits walked—and old Grandmarm Tewksbury declared she had seen them—what was to prevent Patty's victim from confronting her whenever he fancied the amusement? What a trouble and responsibility had suddenly fallen upon them in the shape of a fortune, which they were incompetent to spend! Should she ever again feel like the Patience Jessop to whom Elijah had once made love? And then—oh, dreadful remembrance!—Elijah had once said, when she had been teasing him about Lu Harris, just to make sure that he didn't care a farthing for her, "I shall never ask a rich woman to marry me, Patty; never!" And now she was a rich woman herself, and Elijah would never, never ask to marry her! And even if he should, she must refuse; she could never carry a stained conscience into his home and heart. She would not endure to hear him call her good and innocent, and some day to know the truth.

So the Jessop Farm was advertised and sold—to Elijah Gowan. Having bought the farm, business brought him to the house now and again, where he found Patty, soberly packing the household gods, such as were to flit with them; but after giving him a civil good-morning, she paid him no more heed than the shadow of the lime-trees.

"If it's the money," thought he, "I'm just as well off without her love;" but, for all this fine reasoning, he sighed deeply whenever he closed the door behind him at Jessop's Farm. "Perhaps I ought not to have taken her at her word so exactly; maybe she didn't mean it all. One always says too much or too little; yet it's mighty hard to take a rebuff from the girl you love; but it's all up now. If I were to try and make it up, she'd be sure to think I was hankering after the money, and I couldn't bear that."

"What under the sun do you s'pose Elijah's going to do with the old farm?" asked Mr. Jessop; "I don't git his idee in buying of it. I told him up and down 'twan't worth nothing!"

"Mabbe he wants it to look at," said his wife, "it's sich a putty place. Leastways 'tain't no affair of ourn."

Old Reuben Jessop's fine mansion in the city was now awaiting the arrival of its new possessors, who were to move in during the following month. In the mean time the neighbors made the most of the Jessop family, before they should get beyond their reach, in discussing their income and its tax, offering advice and admonition. "Lor sakes a day!" said Grandmarm Tewksbury, bringing over her knitting to sit with Mrs. Jessop a while; "I knowed a family when I was a gal who heired three times as much agin; but, goodness, they come ter want arter all, every soul on 'em! Riches takes wings ter themselves and flies away—unless you clip 'em."

"Mercy!" cried Mrs. Jessop; "how did it happen? For I feel as if we was that rolling in wealth that it couldn't never hev no eend!"

"So did they! And they spent like water, and give dinner-parties, and evening parties, and—"

"Now *that's* one thing I'll put my foot down agin."

"Lor, 'tain't no good. They couldn't keep theirselves. Every body expected it of 'em. When you're in Rome you must do as the Roamings do. They went ter folk's houses, and they had ter hev folks ter thein—tit for tat, you know. People in them cityfied places don't give away good victuals for nothing like raisin cake and wine, mind ye; they expect ter git jest as good back agin, and they usual gits it. Wa'al, that warn't all, they had money in the bank, and the bank broke and spilled the money, and stocks they went down to the bot-tomless pit."

"Dear me," mused Mrs. Jessop, "I wonder what's best ter invest money in? There don't seem no security nowhere nowadays. Do you s'pose stocks is good as a general thing?"

"I'd a heap rather invest in a stocking," said grandmarm, laughing; "you put it in a stocking, and there you hev it handy and sure as shot."

"Yes, but there's burglars!" suggested by the mention of shot, which had illustrated a vivid picture of a midnight assault in the mind of Mrs. Jessop.

"I know; burglars is to be considered, and the help too. Now there's Miss Golding—she that was a Brown—she merried quite fore-handed, and went ter Newmarket ter live; they had three folks ter wait on two, and a pretty mess they made of it, and one of 'em stole the teeth out of her head—they was on a gold plate, you see. Then I heerd Lucy Spicer tell as how a help of thein come within an ace of pisening the hull family—'twas all accident; but that wouldn't hev done 'em no good if they'd a-died of it."

"Gracious! I won't hev a servant a-near *my* house; Patty and me'll do all there is ter do atween us."

"And receive callers looking like crazy Jane," said Patty.

"Callers may mind their own business, and let folks be, in the fore part of the day."

"Law, they does all their gadding in the morning out there," persisted her comforter.

All this set Mrs. Jessop to thinking, and, from being unwontedly silent, she burst out at the dinner-table, saying:

"I think, on the hull, the stocking'd be best!"

"Which stocking?" asked Nathan. "There's a plaguey peg in my boot's torn a hole clean through this left un."

"There, Nathan, you don't never carry any responsibility about with you!"

"You hug it so tight, Roxy, there's no gitting a pull at it."

"I guess it don't worry you; I was a-think-ing how ter invest the—the— Was any body a-trying of the pantry door, Patty?"

"Only the wind."

"Wa'al, ter tell the truth, I don't like ter mention it, for fear some vagabone may be ly-ing round under the winders, or somewhere, and 'll think we've got it in the house, and 'll creep in after dark, and—and—do some harm, you see!"

"Maybe Uncle Reuben lived in the same dread," said Patty, maliciously.

"But," objected the perplexed Nathan, "if you don't mention of it, how'm I ter know what you mean?"

"Dear me, I do believe it's more bother to be—be—fore-handed than as poor as pisen!"

"I told you we shouldn't prosper. It's the blood-money," said Patty, who was fast fulfill-ing her mother's prediction and becoming a "monomany" on the subject. "Mother wants to know how it is best to keep it beyond the reach of other murderers."

"Whist, child, what do you mean? Well, there's the Topsy-turvy Railway Company, that pays good dividends; there's insurance and bank shares, and houses and—"

"But banks fail, you see, and houses they go and burn down, and railroads smash up. Can't you think of nothing better, Nathan?"

"There's the Hocus-pocus Mining Company, the Rocket Gars Company—"

"I never heerd of 'em. Now, I leave it to you, Nathan, if it's safe ter trust money ter a man you never see nor heerd on!"

"'Tain't a man, Roxy; it's a *company*!"

"Wa'al, what's a company but a lot of men as you never laid eyes on? And a fool knows it's a sight easier to steal and rob in a crowd."

"Lor, Roxy, you're awful sharp on 'em. Why not leave the money, then, jest where Uncle Reuben invested it?"

"I dunno; I don't feel safe noway. I do believe the stocking's best."

"The stocking be hanged! I tell ye, Roxy, we sha'n't ever feel safe, if we're going on like this, till we're in our graves."

They had the little dress-maker, Miss Emery, who lived out at Carter's Crossing, over, about this time, to assist in supplying a wardrobe suitable for city life.

"I hope you're posted on the newest fash-ions," said Mrs. Jessop, "'cause we don't want to look as if we'd jest stepped out of the ark."

"I guess I can fix you up genteel," retorted Miss Emery; "me that learnt my trade of Ma-dame Furbelow in the city; and she says to me, only the other day, when I was in a-pur-pose for you, says she, 'Come in ter my rooms, Hitty, any time, and help yourself to any hints ye can find lying round loose.' And there was a lady, all dressed ter pieces, come in, and says she, 'I hear as how the Jessop heirs are coming for ter live in the old place, and as we are next-door neighbors, and hev allus been in the way of seeing a good deal of the old gentle-

man, I should like to find out suthing about them.'

"'You've come ter the right shop, then,' says Madame Furbelow; 'for here's a 'prentice of mine as works for Mrs. Jessop.'

"'Yes,' says I; 'and there isn't a better woman living.'

"'Is that true?' says she. 'I've heerd tell that they was poor farmer folks, who murdered the king's English, and—'

"'What does that mean?' asked Mrs. Jessop, aghast.

"'Speaking bad grammar,' answered Patty. 'That isn't the worst kind of murder, either.'

"'And she went on ter say,' continued Miss Emery, 'as how she hoped they was people she'd be pleased to know, not vulgar, sich as some folks said, as would make a laughing-stock of theirselves in perlite society. You going ter hev these sleeves cut Lady Washingtoning, or sabot? You'll cut a figger in this gownd, or I don't know what's what.'

"'Lady Washingtoning,' said Mrs. Jessop, smartly, just as if she knew all about it.

"'You'll hev ter git some kid gloves ter match the color. What numbers do you happen ter wear now?'

"'I dunno, ter save me. I never had one on in all my born days. I guess Lisle thread 'll do.'

"'Lor! you mustn't begin cheap like, or folks 'll say you're miserly.'

"'Seems ter me folks is awful meddlesome. It's rather hard, at my time of life, ter hev ter begin ter do every thing ter please folks as hasn't no business ter interfere. I've allus dressed ter please myself, so fur.'

"'But now you've got ter dress and talk and move round generally to please Mrs. Grundy!' put in the dress-maker.

"'Lor! who's she? The lady you was speaking of?'

"'She's one of 'em.'

"'Oh! then there's quite a family of 'em? Goodness knows, Patty, I don't s'pose we shall be able ter draw a long breath without their leave.'

"'Mercy, mother!' said Patty, 'Miss Emery's laughing at you. Mrs. Grundy is every body.'

"'Every body! Wa'al, I never! She's the most wonderfulest body!' Then, after a pause of thought, 'Wa'al, if that's the case, we're one of 'em too, ain't we?'

"'Of course,' said Miss Emery, soothingly.

"'I'm glad of that. It sort of makes things equal. Turn and turn about is fair play. And if they're bound ter pick me ter pieces, I can oblige 'em in the same way, you see.'

"'So you'll be really going off soon,' said Mrs. Dwight, coming in for a farewell call. 'Well, I hope you'll never regret it. Square Harris's fust wife was a-telling of me, one day, how glad she was ter git back ter simple manners and steady hours, after she'd spent a winter in the city. Fust, you see, the help kept a-giving warning, or a-going up chambers and a-putting on the young ladies' things, whilst they was out, and going off ter a frolic of their

own. Then a burglar got in at the basement winder, and stole the silver off of the table all ready laid for a dinner-party; and then, what does a fire do but break out in the attic, along of them help a-keeping of a light a-burning all night; and the young ladies, they took the varyloid from a beggar-woman as they'd had in ter eat up the cold victuals; and the water-pipes, they up and bursted, and like ter hev drowned the hull lot, and spiled the carpets, let alone the paper that cost two dollars a roll and putting on!'

"'Yes,' added Miss Emery; 'and something got into the furnace and like ter hev smothered them ter death.'

"'Eggsactly, Miss Emery. I s'pose you heerd about it at the time. They like ter hev choked along of that there car—ahem, cardamon gars. And there's so much ceremony,' persisted Mrs. Dwight. 'You must do this and that, or you're nobody nor nothing; and you must know all about the operay, which, I say, it ain't noways reasonable, when it's all in furren words; and you must know whose picter is better'n whose, and change your gownd for dinner, and hev a hair-dresser.'

"'And I that could never bear a body touching of a hair of my head!' cried Mrs. Jessop.

"'Yes; and Patty'll hev ter learn ter dance the German,' said Miss Emery.

"'I thought they jest talked the German,' said Patty's mother. 'I didn't s'pose any body was expected ter dance it. Wa'al, I s'pose it's progress, as Nathan's allus telling of.'

It must be confessed that Mrs. Jessop hardly entertained the cheerful views of wealth and its enjoyments which had possessed her some months before. The two birds in the bush were beginning to excel the one bird in the hand; she was beginning to discover that pleasant places are not always paved with gold, and that thorns are incident to every career, however splendid outwardly. However, they were very nearly ready to commence their butterfly existence now; and one afternoon, as Patty and her mother were making some of their last preparations, Mrs. Jessop suddenly observed:

"'Tain't often that people in lowly circumstances gits riz to be as good as any body, is it, now?'

"'No,' said Patty. 'It can't be done in a moment.'

"'I've heerd as how if you keep a-wishing and a-wishing, by-and-by you'd be sure and git it. It's uncommon lucky. And yet, I dunno; we hain't got nothing more ter wish for, now I look back on it; it was kinder nice to plot and plan, and be a-looking for'ard ter suthing you ain't got. Then when I'm fixed up, with nothing ter do, there don't seem no place under the sun for ter put my hands in, and them so big and red, till it seems as if I wasn't any thing else but claws, like a lobster.'

"'I guess it's the old story,' said Patty, 'that 'Satan finds some mischief still for idle hands to do.'

The afternoon was very still and sunny, the shadows of the lime-trees wove a pretty tracery upon the grass-plots outside. Now and then a bird winged across the sky, or a bee boomed in at the open window.

"That's a sign of news," said Mrs. Jessop, who had fallen to thinking after her own fashion. Far away a belt of blue mist curled about the hills, pierced by a spire or two; the distant woods lay like a dream of solitude against the remote horizon; and in the meadow yonder, if she chose to lift her eyes, Patty could see the red shirts of the hay-makers, one of whom she knew to be Elijah Gowan. Sweet odors, tangled in the wind, swept abroad like spirits, manifest, but invisible. One seemed to hear nature astir and growing athwart the silence. Presently there came a step, deliberate as Fate's, along the gravel; some one unhasped the gate; it creaked on its hinges as it swung back; then the steps came on toward the house.

"There's your father," said Mrs. Jessop; "go down and put on the tea-kettle, Patty—for, though they were to be grand folks next week, they had not abandoned the simplicities to-day. Patty, however, staid to change her worky-day apron for a white ruffled affair, and smoothed her hair; for after all it might not be father. Perhaps Elijah had come up for a drink; it was well to be prepared. Her heart was trembling in her bosom as she walked slowly down stairs and waited a second before the open door of the kitchen to gain breath and composure. The shadow of a tall man blotted the patch of sunshine that fell in at the broad window. Patty stepped forward, resolutely, and paused, smothering a scream in her palpitating white throat.

"Hulloa, Patty!" sung out a cheery voice; "is that you or your ghost?" And then, the color shifting in her cheeks, Patty had her arms about the neck of this intruder, and was crying as if her heart would break upon his shoulder.

"Oh, Uncle Reuben!" she shouted; "I am so glad, so glad! You are not really dead, are you? It was all a stupid mistake, and I wasn't to blame, was I?"

"The deuce, Patty!" cried Uncle Reuben. "I didn't know you cared so much for me. Come, do I look like a dead man? But, Patty, what do you mean? You're out some hundred thousands by my unexpected appearance. If I had been a generous sort of fellow, now, I should have staid in the back-ground, shouldn't I?"

"And made us all miserable. Oh, I don't care a cent for the money. I hate it. It was getting to be the awfulest bother, you can't think."

"Yes I can; it has plagued me this good while."

"And yet you go on making more and more, and risking your life," reproachfully.

"It's the way of the world, child; always getting and never satisfied. I shall give you a wedding dower when you marry, Patty, because you are the only person who was ever disinterestedly glad to see me."

"Oh, don't say so, uncle; and then, I shall never marry."

"That's a pretty story for a pretty girl to tell! The young men aren't fools, Patty, mark my word."

"Perhaps that's the reason," she said, archly; "but I can't take your money, uncle; and I want to make you a confession, and then you won't want to give it to me. You see, we were so poor, that is, we had to contrive so hard to make things hold out, that mother and I both used to—I *will* own it—we used to feel a little hard that you had so much and we so little; and I'm afraid—that is, I know—we often wished we had some of your money, which was very wrong; and when the news came that—that it was all our own, and you were—gone, why, I just felt as if I had murdered you, and I haven't had a minute's peace ever since; and I tell you this, just to explain why I was so delighted to see you alive and well, and not at all because I was so fond of you, which, if the truth must be told, I never was, though, perhaps, it was because I didn't know you, as much as any thing."

"Humph!" said Mr. Reuben, who didn't relish being hugged in such a cause. "Well, Patty, you're a good girl. I understand. You might have taken advantage of this occasion, and you wouldn't. You preferred honesty. I like you all the better. I foresee we shall really get fond of each other in time, and you shall have the dowry all the same."

"Thank you; I don't think there'll be any occasion for it."

You see, it was the old story of a passenger overboard, and a hen-coop thrown out to his relief, from which he was rescued by an outward-bound vessel, and so Mr. Reuben Jessop took a new lease of life.

"I must say," confessed Mrs. Jessop, in Nathan's conjugal ear, "it's a great relief. I'd no idee means was so troublesome; and then to think of all we'd 'a had ter hev went through with, in the way of society, and not jest knowing what ter do, and us a-murdering of the king's English, and a-making of ourselves a laughing-stock; and what with the investing, and the banks a-breaking, and the furnace a-choking, and the maids a-stealing till you was black in the face, and the gars a-acting like the mischief, and the pipes a-taking on—on the hull, I'm glad we've got out of it."

"So am I," said Nathan; "and what's more, I was never glad ter git into it."

The news of Reuben Jessop's return spread like wild-fire.

"I know'd it was all a flash in the pan," said Mrs. Tewksbury; "but they've made quite a good thing of it. Old Reuben, he's been and gone and bought the farm back, and paid off the mortgage, and bought the clover-field of Deacon Jackman. I wish rich old uncles would come ter life every day, as thick as raspberries in the burnt land."

"And he's going for ter give Patty a dowry,"

put in Grandmarm Tewksbury — “a dowry, when she gits merried, so you’d better look sharp there, boys.”

“Now,” said Farmer Jessop, after he had paid the purchase-money over to Elijah, “what on arth did you want ter buy the old place for?”

“To remind me of Patty,” said Elijah, as bold as brass, with his eyes upon her. “Patty,” said he, as her father went into the next room to lock his papers into a desk, “have you forgiven me for taking Mrs. Jordan and her sister to Hixon?” He went toward her as he spoke, and held out his hand.

“I—I thought they were the—the Spicers,”

faltered Patty. “I was such a fool;” and then Elijah had her in his strong arms, and his great dark eyes were shining into hers, and bronze and pink cheek brushed each other tenderly.

“I am so glad that Uncle Reuben came back, and that we didn’t get our wish,” said she, “for you know you would never ask a rich woman to marry you.”

“Well, it never rains but it pours,” said Patty’s mother, on being told of this love affair. “If Patty likes him I’m not the one ter stand in the way. Young men are pretty much alike now’days. I used ter wish she’d do better; but, lor, if we had all our wishes granted, we should be the miserablest creturs alive.”

THE SACRED FLORA.

[Part X.]

THE symbolism of flowers is a very old poetic theme. Long ago Cowley wrote:

“If we could open and unbind our eyes,
We all like Moses should espy,
E’en in a bush, the radiant deity.”

With the same poet originated the comparison of flowers with stars. After him Longfellow calls flowers “stars of earth;” and Margaret Fuller wrote, “The stars whisper all their secrets to the flowers, and if men only knew how to look around them they need not look above.” These poetic fancies have been justified by the scientific discovery of a coincidence between the relative distances of leaves from each other on their stem and the distances of the planets from each other, suggesting that the starry heavens may be proved, after all—as the Scandinavian Ygdrasill myth represents—a vast flower. But, long before poets or astronomers had affirmed these mystical analogies, human instinct had been at work feeling out a certain correspondence between the growths of the earth and the mysterious heavens. Mr. Ferguson, who has given us interesting details concerning what he calls “tree-worship” in India, has yet not made it clear that the sacred trees were actually regarded as deities, nor how the religious associations with them originated. They represent probably in their rudiments very various experiences and ideas. In hot countries way-side prophets and worshipers would naturally seek their shade, and the grove would become their primitive temple. Gautama means “a tree,” the legend being that the prophet was born under—some say out of—a tree. In regions where serpents were worshiped certain trees and plants may have acquired sanctity, because such reptiles were found twined about them. But oftener, no doubt, trees were revered for their bountiful uses to man, as in the case of the oak, which furnished the most durable material for the hut or raft; and the palm, which, by fruit, bark, leaf, or sap, is said to yield as many uses as there are days in the

year.* The word “book” (Ang.-Sax., *bōc*; Ger., *buch*; old High Ger., *puohha*) is simply beech, the wood of which writing-boards were made (Grimm). The earliest scriptures of races were written, too, on the leaves and bark of trees—whence *biblos* and *liber*, both meaning bark, came to mean book. Much of the Koran was written thus, and we can not forget that the word bible means papyrus bark. The laws of Solon were written on wood. It must be remembered, also, that in the formation of language many experiences and sensations must have found expression at first through illustration in the growth and life of plants. “The righteous shall flourish like the palm-tree.” The African proverb runs, “If the alguana-tree will die tomorrow for want of water, water will come tomorrow.” In the “White Lotus of the Good Law,” it is said, “The sons of Buddha, who quietly, and full of reserve, cultivate charity, and conceive no doubt concerning the rank of heroes among men, are named trees.” Zoroaster said, “There is a certain Intelligible which is to be apprehended with the flower of the intellect.” It is said in the Bible that Gideon “took thorns of the wilderness and briers, and with these he taught the men of Succoth.” The beautiful metaphors of the Brahmins, which Sir William Jones has made so familiar, by which the oak, giving shade to the wood-cutter, and the sandal-tree, perfuming the axe which lays it low, are made to teach the love of enemies, and many other ethnical scriptures, show how deeply the poetical and moral sentiment of primitive races became associated with trees and flowers. It seems to me that the religious homage paid to trees or flowers must be referred to a much later period in the development of races, to a period after poets had invested them with ideals and myths, or priests divined in them the decrees of fate; nor

* See the beautiful hymn of Anastasius Grün to the palm.

do they seem ever to have been mere fetiches. This question, however, can be better dealt with after we have considered more particularly the sacred trees and plants themselves.

Of all fruits the APPLE seems to have had the earliest, widest, and most mystical history. In Greece the name of the hardy fruit, which, having appeared on earth about the same time as man, has followed him in his migrations around the globe, became the name for sheep (*Μηλον*), and all manner of wealth, as in Rome the flock, *pecus*, became *pecunia*, or money. Theophrastus enumerates it as among the more civilized fruits (*urbaniores*). Tacitus says that it was the favorite fruit of the ancient Germans, and a shriveled apple is among the recoveries from the lake-dwellings of Switzerland. The myths concerning it meet us in every age and country. Aphrodite bears it in her hand as well as Eve. The serpent guards it; the dragon watches it. It is celebrated by Solomon; it is the healing fruit of Arabian tales. Ulysses longs for it in the gardens of Alcinoüs; Tantalus grasps vainly for it in Hades. In the Prose Edda it is written, "Iduna keeps in a box apples which the gods, when they feel old age approaching, have only to taste to become young again. It is in this manner that they will be kept in renovated youth until Ragnarok"—the general destruction. Azrael, the Angel of Death, accomplished his mission by holding it to the nostril; and in the Northern Folklore "Snowdrop" is tempted to her death by an apple, half of which a crone has poisoned, but recovers life when the apple falls from her lips. The Golden Bird seeks the golden apples of the King's Garden in many a Norse story; and when the tree bears no more, "Frau Bertha" reveals to her favorite that it is because a mouse gnaws at the tree's root. Indeed the kind mother goddess is sometimes personified as an apple-tree. But oftener the apple is the tempter in Northern mythology also, and sometimes makes the nose grow so that the sacred pear alone can bring it again to moderate size.

A Polish legend, given by Mannhardt, says: There is a glass mountain, on the top of which stands a golden castle, before which is a tree with golden apples. In the castle lives the enchanted daughter of a prince. Many vainly try to get on the mountain; but at last the youth who has fastened the claws of a lynx to his hands and feet is successful. With the golden apples he calms a dragon which he finds at the entrance; and, finally, having broken the spell that bound the princess, he must remain with her, and not return to the lower earth. In the goddess Holla's garden the favorite fruits are the apple and pear—the latter of which fruits retained its sanctity in France long after the introduction there of Christianity. A Hanoverian legend says that a girl was asked by the

dwarfs to be god-mother to one of their children. On the fixed day she was led down a beautiful staircase, which was under an apple-tree in a court, to a superb garden, whose trees were laden with fruits. She was repaid for coming by an apronful of apples, which, when she returned to the earth's surface, were found to be of solid gold.

These golden apples are often met with in the Northern mythology. In some legends it is related that such may be taken from a tree growing over a fountain of holy-water with a rejuvenating power—all of these myths being traceable to the tree and fountain of Urd, one of the Nörmir. In the Edda, Skirnir offers eleven golden apples and the ring Draupnir (from which, on every ninth night, eight equally heavy rings drop) to Gerda, if she will return Freyr's love. The golden apple is mentioned by Uhland in the poem beginning:

"Bei einem Wirthe wundermeld
Dar war ich jüngst zu Gaste;
Ein goldner Apfel war sein Scheld
An einem grünen Aste."

The apple has been a phallic emblem with many races. In various parts of England, where ancient customs have survived, the young people join hands and dance around apple-trees and carol their hopes for a prolific year, much in the same fashion as if the tree were the clearly phallic May-pole. The blossoming of an apple-tree in harvest betokens a marriage, or, sometimes, the funeral of the master of the house. In many parts of Germany apples are believed to be oracular in all love matters. On New-Year's night it is the custom to shoot an apple seed from between the fingers with an invocation; and in the direction of its flight the sweet-heart may be looked for. In Austria, on St. Thomas's night, the apple is cut in two, and the seed counted in each half; if they are even, one will be married soon. If a seed be cut in two, the course of love will not be smooth; if two be so cut, it is a sign of coming widowhood. Modifications of these experiments survive in the rustic amusements, quite common in England, of counting the apple seed with "One I love, two I love," etc., and in sticking them, each being named after some person, on the forehead—the right sweet-heart being proved by his or her seed adhering longer than the rest. On New-Year's Eve, in Silesia, the maiden, having bought an apple at the exact price first demanded for it, lays it under her pillow, and at midnight expects to see her future husband in a dream. In Suabia a widow who eats half of an apple on St. Andrew's Eve, and places the other half under her pillow, expects a similar vision. In Austria the apple must be cut in two on Christmas-eve, in the dark, and without touching it with the naked hand; the left half being placed in the bosom, the right laid behind the door, the beloved may be looked for at midnight near the right half. In Hessa, Silesia, and Bohemia, the apple is carried about the person, as a love-charm, in

* Even so said the serpent in Eden, "Ye shall become as gods."

ways indicating very plainly the phallic association with the fruit; and the first apple borne by a tree is thought to be an infallible cure for sterility. In Erzgebirge the maiden, having slept on St. Andrew's or Christmas night with an apple under her pillow, takes her stand with it in her hand on the next festival of the Church thereafter; and the first man whom she sees, other than a relative, will become her husband. The custom of throwing the peeling of an apple over the head, marriage or single-blessedness being foretold by its remaining entire or breaking, and that of finding in a peeling so cast the initial of the coming sweet-heart, are very old, and both well known in England and America.

The relation of the apple to health is traceable to Arabia. In various parts of Germany it has been deemed potent against warts, on which decayed apples are still rubbed in some regions of England. Sometimes it is regarded as a bane. In Hessa it is said an apple must not be eaten on New-Year's Day, as it will produce abscess. In Suabia it is believed that an apple, plucked from a graft on the white thorn, will, if eaten by a pregnant woman, increase her pains. But generally it is curative. In Pomerania it is eaten on Easter morning against fevers; in Westphalia (mixed with saffron), against jaundice; while in Silesia and Thuringia an apple is scraped from the top to cure diarrhea, and from the bottom to cure costiveness. In some regions the custom survives of placing an apple in the hand of a child when it is buried, "to play with in Paradise."

But it is not even chiefly the most useful trees that have been most venerated. It is probable that the sanctity of the OAK antedates its ordinary uses in art. From the oracular oak of Dodona to the sacred oaks amidst which the Druids* worshiped, it has been held profoundly sacred; and when Augustin came to bring Christianity to Britain he sagaciously took his stand under that tree to make his first appeal to Ethelbert. He might easily have claimed that the oak was as sacred a tree among the Hebrew patriarchs as among the Saxons; and indeed its Hebrew name, *El*, is substantially that of the Deity himself. The chair of St. Peter, in the Vatican, is made of oak board on a frame of acacia. The tree under which Abraham was said to have received his heavenly visitors, the "oak of mourning" under which Deborah was buried, the oak under which Jacob hid the idols at Shechem—the same probably with that which stood near the sanctuary under which Joshua set up a stone—the oak of Ophra under which the angel sat when it spoke with Gideon, the oak on which Absalom hung, that under which the prophet sat at Bethel (1 Kings, xiii. 14), that under which Saul and his sons were bur-

ied—all preceded the period when Isaiah had to rebuke those who carved idols from oak, and when Ezekiel proclaimed the wrath of Jehovah against the idols standing "under every thick oak." The oak of Finnish legends, which ever grew stouter and harder the more it was cut with axes, might be taken for a symbol of the strength with which the superstition concerning the oak survived the efforts to destroy it in Judæa and in Europe. In the Northern mythology we find all fairy-land gathered at its roots. There are several old oaks in Europe which have probably been preserved by the traditions of sacredness surrounding them. We find many old Saxon laws protecting oaks from injury. It was believed, also, that the elements respected them. In England the lightning was accosted thus:

"Strike elm, strike rowan,
Not the oak."

Another runic phrase groups "aik, ash, elm" as the three sacred trees. In the Palatinate there is a belief that though the lightning strike an oak it will never set it on fire. Oaks were often used as marks in fixing territorial boundaries. At Saintes, in the Charente-Inferieure, is the most ancient of holy oaks—said to be nearly two thousand years old—unless we can still call the *Stock am Eisen* at Vienna one. The latter tree, into which each apprentice going forth on the "Wanderjahr" thought it an omen of good to leave his nail, has become a mass of nails, and it is only by tradition that it can be recognized as the last survivor of the oak grove (Wienwald) whose sanctity led to the building of the cathedral in it. In Oldenburg and Brandenburg it is esteemed a remedy for toothache. To bore the tooth with a nail till it bleeds, and then drive the nail (silently) into an oak-tree, on the north side, at a point where the sun will not shine on it. So long as the oak stands the tooth will not ache. The pain ceases as soon as the nail rusts; and a nail beginning to rust is generally chosen. It may be remarked that the nail is the chief Buddhist talisman in Thibet to drive away all manner of evil spirits. "Devil's" oaks, like that near Marburg, are frequent in Germany. One of these at Gotha is held in great regard; and, as the people gather under it on festivals, it is called "Volkenrode." The same custom prevails with the seven great oaks of Ivenach. In some remote German villages the custom of placing acorns in the hands of those who are buried prevails. It is not an accident that so many events in English tradition should have oaks for their monuments—as the Parliament Oak of Robin Hood, John Lackland's Oak in Sherwood Forest, William Rufus's Oak in the New Forest, Herne's Oak at Windsor, and others. But there are few trees which preserve such distinct traces of sanctity as the strange collection of dwarf oaks on Dartmoor, known as Wistman's Wood. These trees are evidently very ancient, and are covered with gray mosses. Their queer fantastic shapes

* The derivation of the word Druid from *Δρυς*, an oak, by Pliny, is not, however, certainly correct. It may be from the ancient Thracian city of that name, and so indirectly from the oak. Grimm derives it from the Gaelic *druide*, oak; Welsh, *derw*. (See Max Müller's "Lectures.")

make them look like transformed gnomes hiding among the granite blocks. The name "Wistman" has been traced by Kemble to Wisk, one of the names of Wodin, which seems to mean "the waste." The "Wish Oak" of Somersetshire recalls probably the same title.

Grimm has shown that the use of oaks as temples led to much of their sanctity in Germany, and the fury with which the early Christian prelates cut down such trees—as Winfoid did the holy oak near Gaismar, for example—shows how deep was the popular feeling concerning such. Bishop Unwin, of Bremen, was notorious for his pious devastations of this kind. Many of them survive, however, as we have seen, as at Minden, where the young people still dance around one on Easter-Sunday, and at Wormeln, where there is a solemn procession to a holy oak every year.

The well-known superstition in India, that holes in trees are the doors through which the special spirits of those trees pass and repass, reappears, as Grimm has pointed out, in the German superstition that the holes in the oak are pathways of elves; and that various local troubles, especially of hand or foot, may be cured by contact with these holes. In Westphalia, where forests of oak are called "Holy Woods," and Brandenburg, the peasant afflicted with fever and ague will sometimes address the oak thus: "Gode Abend, du gode Olle, ick bringe di dat Warme un dat Kolle." In Westphalia the superstitious seek to relieve toothache by relating how, as Peter stood *under an oak-tree*, Christ asked him why he was sad. "I may well be sad," said Peter, "for I have the toothache." Then Christ told him to go down to the dale, take water in his mouth, and spit it out again. In Old Germany the custom in a case of "St. Anthony's fire" is for the sufferer to go thrice under an oak and cry: "Oak-tree, I complain to thee of the wild-fire which plagues me; may the first bird that flies over take it away!" There seems to have been no other tree so completely identified with preternatural beings. Near Gundalskol there long stood an oak which was popularly believed to have been the habitation of a "Bhjarmand" for two centuries, but he was driven away when the church-bells came into the country. It is said a farmer was engaged to an elf-girl, but instead of a lovely bride he embraced an oak-tree. In a church-yard in Heddinge, Seeland, are the remains of an oak wood, which are declared to be the soldiers of the Erl-king. By day they are trees, but at night armed beings of terrible power. In Westphalia the nearest oak is sometimes formally told of a death having occurred in the family.

There is a curious superstition that has been traced from Rugen in the Baltic to Waldeck in Lower Austria, that a child's rupture may be cured in the following manner: Split a piece of oak on Christmas or Good-Friday (these church days are simply interpolations on older beliefs), and let the child be passed naked between the

split pieces three times backward; tie the pieces together again with the child's shirt; fill up the cracks well with clay; and, if all this has been done amidst entire silence, the joined pieces may be thrown on the fire, and when they have disappeared the rupture will have disappeared also.

This form of the superstition is, however, not constant. At Rauen, near Fürstenwalde, a child with rupture is taken to a young oak, which being split in two lengthwise and the rent held open, the child is passed through naked. The parts of the tree are bound together again, and the rent plastered with loam. The rupture will heal if that of the oak does. White, in his "History of Selborne," shows that this custom was known in England, though in connection with another tree. "In a farm-yard near the middle of the village," he says, "stands at this day (1789) a row of pollard ashes, which, by the seams and long cicatrices down their sides, manifestly show that, in former times, they have been cleft asunder." These trees, when young and flexible, were severed and held open by wedges, while ruptured children, stripped naked, were pushed through the apertures, under a persuasion that, by such a process, the poor babes would be cured of their infirmity. As soon as the operation was over the tree, in the suffering part, was plastered with loam, and carefully swathed up. If the parts coalesced and soldered together, as usually fell out, where the feat was performed with any adroitness at all, the party was cured; but when the cleft continued to gape, the operation, it was supposed, would prove ineffectual. We have several persons now living in the village who, in their childhood, were supposed to be healed by this superstitious ceremony, derived down, perhaps, from our Saxon ancestors before their conversion to Christianity."

It may be remarked that in all Saxon countries in the Middle Ages a hole formed by two branches of a tree growing together was esteemed to be of highly efficacious virtue for one passed through it. Such an abnormal growth would be visited by the ailing from great distances. It being esteemed especially helpful to pregnant women, they frequently lost their lives by attempting to pass through small apertures of the kind. In certain old dolmen doorways there are holes which are supposed to have been used to pass persons through either to punish or heal. One of these in Cornwall has been described by Borlase. It closely resembles one in the Indian temple at Malabar, through which penitents squeeze themselves to obtain the remission of their sins. It is worthy of mention, also, that there is in the Saxon crypt of Ripon cathedral a curious hole through which, as the old saying of the neighborhood runs, only the chaste can pass. As it is considered also a good omen for the unmarried, the majority of visitors to the cathedral sportively pass through the hole, which was originally, in all probability, made

as an accommodation to pagan weaknesses. In Somersetshire there still lingers a superstition that cattle may be cured of disease by driving them through the hollowed stumps of trees. In Tyrol and Bohemia water after a thunder-storm that may have got on the stump of an oak is held to be a cure for warts. If any one rubs a piece of oaken wood silently over his body on St. John's Day, before sunrise, it is held to heal all open wounds. It is a widely known superstition, but found chiefly in the neighborhood of Brandenburg, that if a cow's milk be affected it will be made pure if it passes into the pail (at milking) through a bit of perforated oak wood. In Oldenburg it is thought well to spread oak boughs over the beer when it is laid up in the spring. In Westphalia there is a strange legend that the Wandering Jew can only rest when and where he shall find two oak-trees growing in the form of a cross.

The OLIVE is of very ancient sanctity. The dove bearing an olive leaf—which betokened to Noah the subsidence of the flood—may have been a symbol of a still earlier date; at any rate, we find the olive revered by the Israelites in ways which seem to bear no relation to that tradition. In Abimelech's fable the Olive says: "Should I leave my fatness, wherewith by me they honor God and man?" (Judges, ix. 9.) In the Holy Temple two doors and two posts were of olive wood, and from the same tree were carved the two cherubim of the oracle. It was written too: "They shall bring thee pure oil-olive, beaten for the light, to cause the lamp to burn always." In the time of David we find a special officer, Baal-hanan, appointed to superintend the olives and sycamores; among the sacred hills around Jerusalem was the Mount of Olives; and the word Gethsemane means "a press for olive-oil." Amidst the luxuriant historic gardens of Greece—the gardens of Midas, of Cyrus, of Alcibiades, which recall in their descriptions the traditions of Eden—we find the olive pre-eminent, one of the names of Zeus himself being *Ζεύς Μόριος*—the Guardian of the Sacred Olives. The name *Moriae* applied to the olives is significant whether we regard it as derived from *Μόριμος*, a poet, or *Μορος*, fate—words radically identical. It was sacred to Minerva, who was said to have caused it to spring up beside the fountain which Poseidon, with whom she was contending, had evoked from a rock by the stroke of his trident; and it stood as the serpent-guarded tree of Athenian destiny in the Parthenon. Its oil fed the sacred lamps there also. Under Christianity it became the emblem of peace, chiefly because it had become, both in Greece and Italy, the favorite tree to mark the limits of landed property, probably on account of its almost imperishable durability. That it had become a symbol of conciliation is shown by a line in "The Frogs," where Bacchos warns Æschylus: "It will be all right provided your anger does not transport you beyond the olives." Virgil calls the olive "pacifera." The inhabitants of Thebes ap-

peared before the altars of Artemis with olive boughs, in order to avert the plague. The ancient Cistercian cloister near Dantzic was named Oliva, as an indication of peaceful intent toward the pagans.

Many trees and plants, no doubt, acquired sanctity through patriotic association, simply because they are characteristic of certain countries—as the banana-tree, which an Otaheitan clasped in the *Jardin des Plantes*, exclaiming, "Tree of my country;" and the heather, which the Scottish emigrants in Canada tried so long to raise there. But that the sacred respect for trees has been in great part due to their poetic symbolism is proved by the general reverence which has been attracted by the useless evergreens. The Jews dreaded Senacherib's threat to destroy the cedars of Lebanon more than all other dangers from his invasion. The HOLLY (*i. e.*, holy) which invests our churches at Christmas was a sign of the life which preserved nature through all the desolations of winter to the ancient races of the North, and was gathered into pagan temples to comfort the sylvan spirits during the general death. It is a singular fact that it is used by the wildest Indians of the Pacific coast in their ceremony of Purification. The CYPRESS, of which, as we learn from the Bible, idols were carved, was sacred as an evergreen. In the "Gulistan" of Sadi it is written: "They asked a wise man, saying, 'Of the many celebrated trees which the Most High God has created lofty and umbrageous, they call none *azad*, or free, excepting the cypress, which bears no fruit; what mystery is in this?' He replied, 'Each has its appropriate produce and appointed season, during the continuance of which it is fresh and blooming, and during its absence dry and withered; to neither of which states is the cypress exposed, being always flourishing; and of this nature are the *Azads*, or religious independents. Fix not thy heart on what is transitory; for the Tigris will continue to flow through Bagdad after the race of caliphs is extinct. If thy hand have plenty, be liberal as the date-tree; but if it afford nothing to give away, be an *azad*, or free man, like the cypress.'" Mr. Tylor found among the American Indians an aged cypress held sacred and loaded with offerings. The use of yew and cypress to plant beside graves in the East meant unfading virtues or perennial remembrance. In Greece cypresses were the daughters of Eteocles, hated by the goddesses they rivaled. Virgil associates cypress with Sylvanus. A beautiful piece of symbolism existed among the North American Indians in their early custom of burying their dead at the root of a young maple, whose leaves in autumn glow like clusters of living embers. The word "yew" is probably from the same root as "ever."—Ang.-Sax., *yf*.

The compromising custom which the early Christian missionaries had of adopting the myths of the countries to which they went, and associating their symbols, after sprinkling them

with holy-water, with Christianity, has raised much difficulty in the path of the archæologist. The Russian peasant now tells you that the ASPEN trembles because Judas hung himself upon it; but his belief that it is the right wood to lay upon a witch's grave to keep him or her from riding abroad after death seems to point to some pre-historic potency. In Bohemia aspen is held to be a bar to thieves, and if planted in fields it prevents the ravages of moles. As a general thing, however, its reputation with the German peasant is not good. Its name seems related to *aspiro*, and in Lithuania its name is *drebulė* (*drebeti*, to tremble); and the credulous explain its trembling by saying that on one occasion when the trees bowed before Jesus the haughty aspen refused, and has since trembled under the curse he pronounced upon it. Elsewhere its unrest has made it the symbol of the Wandering Jew. The reverence for the carob-tree in the East is not confined to those who call it St. John's tree, in the belief that its pods furnished his food in the wilderness. St. Patrick borrowed, rather than originated, the sanctity of the shamrock (*Medicago lupulina*), held in the hand of Hope among the Greeks, when he illustrated the Trinity in its three, or found the cross in its four, leaves.* Josephus tells us that the flaming bush in which God appeared to Moses on Mount Horeb was previously sacred. The Portuguese Catholics have almost denuded Madeira of its myrtle groves for saints' festivals; but we know that the myrtle has a sanctity older than any Christian saint. The MYRTLE was sacred to Quirinus, the Sabinian Mars. Pliny relates that two myrtles stood for a long time before the old temple of Quirinus, one being called the patrician, the other the plebeian, myrtle. So long as the Senate had pre-eminence, and the common people were oppressed, the former of these flourished and the latter withered. But when the democracy came uppermost the plebeian myrtle grew rapidly, and the other faded away. These two myrtles seem, however, to be modifications of the two laurels which stood before the temple of the Roman Mars, and symbolized, as some think, the union of the Roman and Sabine peoples. When this alliance was established, after a bloody battle, the combatants are said to have cleaned themselves, before the temple of Venus Cloacina, with branches of myrtle. The Athenian magistrate wore myrtle as his symbol—possibly on account of its being used to make implements of war, as mentioned by Virgil; and from an emblem of Mars it became the wreath of Aphrodite, because, after coming out of the sea, as she sat drying her hair, she was pursued by satyrs, and found refuge in a myrtle thicket. The *bona dea*, Fauna, is said to have been beaten with myrtle branches by Faunus, an evident symbol of fertility. The poets also related that

the most beautiful and most persecuted virgin in Attica was changed into a myrtle-tree. Associated thus with beauty, procreation, sorrow, and war, it became the prize of medieval chivalry, and is retained as the bridal wreath in Germany to this day. In some regions it is the funeral wreath also, as in Bohemia, where it is said that the myrtle will wither or flourish as it is a bridal or a funeral wreath that is taken from it. In the far East it is still held sacred. The Jews gather it for their Feast of Tabernacles. The Arabs have a legend that when Adam was driven out of Paradise he was permitted to take with him three things—"the myrtle, which is the chief of sweet-scented flowers in this world; an ear of wheat, which is the chief of all kinds of food; and dates, which are the chief of the fruits." In Prussia it is held by the superstitious to be an evil omen for a bride or a maid to plant myrtle; but three leaves eaten from a bridal wreath is held to cure any fever.

The subtle sympathy which Nathaniel Hawthorne felt between the ash-trees in front of his Old Manse at Concord and his own sombre genius might, if analyzed, reveal to us the secret of the spell which the ASH has exercised on the human imagination from the earliest times. The Greeks called this tree, Daubeney thinks, *'Apia*, which would relate it to *'Aṓnē*, Mars—who was the god of agriculture before he was the god of war—and also to *ἀρετή*, virtue. Its English name has certainly a curious identity with that which in Syria means "the fire of the sun," and appears in *Asia*—"the sun-burnt land." In Genesis, iii. 12, it is the name given to man as one formed of dust and ashes. *Ashel* in Hebrew means a sacred tree; and Assyria represents *Ashera*, a sacred grove. Though the word, as it comes to us, is from the Anglo-Saxon *æsc* (O. N., *askr*; Swd.-Dan., *ask*; High Germ., *asch*), it is difficult not to imagine that it has some distant relation to the *Ash* of the East, which, from being a sacred tree or grove, became, under various modifications, a name for the deity among sun-worshipping races. There is an Arthurian legend that the knights, when very cold, found to their delight that the ash would burn readily while green; and it is possible that this combustible character of the tree led to its early association with fire and the sun. In regions where the Arthurian legends are very strong, as in Somersetshire, the "ashen fagot" is prominently included in the Christmas customs, there being a superstition that misfortune will overtake the house in which it is not annually burned. It is common to hear the claim that the fagot has been burned in this or that house for so many centuries. At Taunton there is an annual "Ash Fagot Ball." The fagot is bound with three withes, which are severally chosen to represent them by the young people present—the first withe that breaks in the fire signifying that they who selected it will be the first to be married. The ordinary Christmas log is a modification of the ash fagot. It is probable that the association of the ash with King Arthur grew

* In an old edition of Camden it is said that the Irish, in their flight, took shamrocks from the streams and ate them, which looks as if the plant they originally called by that name was the water-cress.

out of its dedication to the gods of strife, its Latin name, *fraxinus* (lance), indicating its use in making weapons.

Most of the surviving superstitions concerning the ash may be traced to the great Ash Ygdrasill—the Tree of the Universe. In the carvings of many old churches, especially in Flanders, one may trace this tree and its concomitant symbols—the eagle, squirrel, etc.—which is usually said to represent the Tree of Knowledge. Although Ygdrasill was certainly an ash, there is some reason to think that, through the confluence of races and their traditions, other sacred trees blended with it. Thus, while the ash bears no fruit, the Eddas describe the stars as the fruit of Ygdrasill. This, with the fact that the serpent is coiled around its root, and the name Midgard—i. e., “midst of the garden”—suggest that the apple-tree of Eden may have been grafted on the great ash. There is a chapel near Coblenz where a tree is pictured with several of the distinctive symbols of Ygdrasill, while on it the forbidden fruit is represented partly open, disclosing a death’s-head. The serpent is coiled around the tree’s foot. When Christian ideas prevailed more completely, and the Norse deities were transformed to witches, the ash was supposed to be their favorite tree. From it they plucked branches on which to ride through the air. In Oldenburg there is a superstition that the ash appears without its red buds on St. John’s Day, because the witches eat them the night before on their way to the orgies of Walpurgisnacht. Various popular superstitions are connected with the tree in Germany. No snake can live for a moment under it. To rub the body with it cures rheumatism, provided the branch has been plucked before sunrise by one approaching it backward—a notion found in Erzgebirge; and it is also said that a carriage whose axle is of ash will go more swiftly than any other.

The SORB (*Sorbus aucuparia*), commonly called ash, derived its sanctity from the legend that it once saved Thor’s life. It was when he was wading the river Vimur that the god, in danger of being swept away, grasped this bush, and afterward the proverb ran, “The sorb is Thor’s salvation.” For some generations after the violent conversion of the North by Olaf to Christianity, it was common in Scandinavian countries to cut every staff from this tree, and to have a bit of its wood in the hull of every ship, since the Thunderer would never direct any bolt against the tree which had saved him. In the same regions it is held by some still to be a charm against formidable clouds; and there is a proverb that to strew ash branches in a field on Ash-Wednesday is equal to three days’ rain and three days’ sun. In Suabia it is said to be a good treatment for wounds to insert a bit of ash in them, and then bury the twig where neither sun nor moon can shine upon the spot.

As the ROWAN the sorb appears still invested with the most vigorous superstitions remaining in the Scottish Highlands. The “rowan-cross”

may be sometimes seen over the door, and the milkmaid may occasionally be seen taking it with her to keep off the witches which are said to enter cows and make them unruly. An old rhyme of Scotland runs:

“Black buggie, cammer bead,
Rowan-tree, and red-thread,
Put the witches to their speed.”

It was for a long time a custom at Strathspey to make large hoops of rowan and drive the cattle through them. The word rowan, which has occasioned perplexity to etymologists, is not improbably related to *rune*, an old phrase of enchantment which has been traced to the Sanscrit *ru*, to whisper (whence *run-stafa* and *buch-staf*), and is preserved in the old word used by Dryden, “to round,” in the sense to whisper mysteriously. It was on this wood that “runes” were written, whence it was called “rountree;” but why that wood was selected has not been explained. There is good reason to believe that the rowan was held sacred in Druidical times, it being often found near the megalithic monuments under circumstances indicating that it had been planted there. I learn from Mr. Jön Hjaltalin, a careful scholar in Scandinavian antiquities, that in his own country, Iceland, the chief tree-superstition relates to the sorb. It is there said that when innocent persons have been put to death it will spring up over their graves. On Christmas-eve lights will emanate from it which nothing can put out. It must not be used for fuel, else those who surround the fire will become enemies. It must not be used in building a house, else no woman can be safely delivered of a child in it. If used in a ship, the effect is just the reverse of that once ascribed to it in other Northern countries: the vessel will sink, unless indeed juniper be used in the same. *Reyner* (sorb) and *einir* (juniper) are, say the Icelanders, great enemies, and if they be planted each on the opposite side of a tree they will split it; and if both be kept in the same house, the house will be burned.*

Mannhardt gives many curious instances of

* In Iceland there are so few trees that most of the superstitions are represented by stones. The plant-superstitions which exist are somewhat peculiar. The blodeik (blood-oak) will cause a ship built of it to be lost. Selja (*Salix caprea*), if kept in a house, prevents people from expiring, but also prevents safe childbirth. If a wound be received in cutting it, it will not easily heal. Lasagras (herb of locks, *Paris quadriflora*) will open any lock. Mariustakker (*Alchemilla vulgaris*) gives quiet sleep if placed under the pillow. Elskugras (love-grass, *Satyrion albidum*) has a masculine and a feminine root; the lover who puts one of these under the pillow of the beloved secretly, and the other under his or her own, will obtain the requital of love. Mjadurt (*Spiraea ulmaria*), if taken on St. John’s Day, will, if put in water, reveal a thief; it will float if the thief be a woman, sink if it be a man. Thieves are also revealed by freyngras, which is steeped in water three nights and placed under the pillow: the thief will be seen in a dream. Lakjasoley (*Caltha palustris*), if taken with certain ceremonies and borne about, will prevent the bearer from having an angry word spoken to him. Sortulyng (*Arbutus uva-uroi*) will keep off ghosts.

the survival of rowan-tree superstitions in Germany and Scandinavia. Its leaves are regarded as remedial in diseases of the back, and its wood furnishes the best yoke to keep bulls quiet. In Norway, Denmark, and North Germany, branches of it are put over stables to prevent flying dragons entering them. Butter comes easily if the churn be of rowan wood. In Westphalia the herdsman cuts, with one stroke, a young sorb on which the sun has that day shone, and with it strokes his cow on back, hip, and udder—exorcisms being intoned—and the cow is named. By that means the animal will give plenty of milk, especially if she be fed on sorb occasionally. The custom is also Swedish and Esthonian. On the Swedish islands there is a fungus called by the inhabitants witches' dung (*trull-skid*). If it be put into a hole in a rowan stick, sealed up, and the stick burned, the witch will become ill, and can only become well again by coming to ask for some bread-and-milk at the house. In Bohemia it is said that if a gun will not shoot well it should be washed with a decoction of rowan leaves. In Sweden, where Thor's fondness for beer is well known, vessels for beer are made of sorb. On one of the Orkneys is an old rowan sacred to Thor, and the peasants hold that the Norwegian empire would cease if a branch of that tree should be carried off.

It is remarkable that while the sanctity of this same species of tree is found in India, where it is revered as nimbu (*Melia azodacta*), a kind of manna-ash,* they should have an exactly similar method of making cows give milk as that found in the North, but associated with another tree altogether. There is a passage in the Vedas which prescribes that the cow be stroked thrice with rods of the *acvatha*, and the Hindoo herdsman touches the cow just as the Scandinavian does. In Normandy the rod is hazel, but the procedure is identical.

The mantle of the ash seems to have fallen in Germany upon the LINDEN, which surrounds so many churches. The Slavonians, after the Greeks, who named it *φιλύρα*, regarded it as the habitation-tree of the goddess of love. In Slavonian countries, indeed, the linden enjoyed a reputation equal to that of the oak among the Germans. There are various indications that the sanctity of the linden in Germany is comparatively modern, and derived from the Russians. Leipsic, for instance, is really *Lipsk*, the Slavonic name for linden. (The word means "gentle.") In Germany linden wood was chiefly used for carving images of saints, and the oldest "Marienbild" on the Nonnenburg, that of Salzburg, is carved from it. There is a general superstition that the linden-tree is

never struck by lightning, and that it will protect the house near which it is planted from both lightning and witches. Under this tree Siegfried, the hero of the *Nibelungen Lied*, was laid, for it was regarded as the tree of the resurrection. A large linden stands over the grave of Klopstock at Ottensen, in Holstein. In the cemetery at Annaburg there stands a venerable linden under which every year a sermon on the resurrection is delivered. In the earlier ages of Germany judgments were pronounced under holy lindens.

The child who, fortunate enough to get hold of the original version of *Cinderella*, sympathizes with poor Ashputtel as she sits under the HAZEL, saying,

"Shake, shake, hazel-tree,
Gold and silver over me,"

and glows with delight as the bird alights with all that is desirable, is catching the faint echo of a profound faith which once held the hazel to be in the secret of all the treasures of the earth. The name of the divining-rod tree might be traced, did the Aryan philologists permit, from the Syrian word *hazeh*, signifying sleepy or hazy, enchantments being generally shown in that effect. To haze is to mystify, and the name suggests that the miserable practice of "hazing," which still disgraces some of our schools, may be a degenerate pagan rite. (The schoolmaster's rod used sometimes to be of hazel too.) Groves of hazel, or of elm, which thence may have been called witch-hazel, were frequently chosen by the Saxons for their temples, the hazel being one of Thor's trees, and considered an embodiment of lightning. A rod of it was for a long time hung up in Bavarian court-rooms as a symbol of authority, and from it was also made the officer's baton in the same country. Hazel-nuts are frequently planted in old German graves. Branches of hazel were hung up in orchards as a protection of fruit trees against lightning. So deep was the faith of the people in the relation of this tree to the thunder god, that the Catholics adopted and sanctioned it by a legend one may still hear in Bavaria, that on their flight into Egypt the Holy Family took refuge under it from a storm. Many peasants carry a sprig about with them as a charm against lightning. The East Prussians cut a green hazel stick in the spring, and, when the first thunder comes, make a cross with it over every heap of grain, believing the corn may thereby be kept pure for many years. In Switzerland it is thought to protect horses from all manner of illnesses, if their oats be stirred with a hazel stick, which, however, one must cut standing backward, and while the church bells are ringing. In Bohemia the cure of fever is as follows: A hazel stick must be bought without bargaining; or it may also be broken from the woods before sunrise; then it must be laid in the corner of the church, and three paternosters and three aves said. He who takes the stick away will

* The word *manna* is said to be from the Hebrew *man hu*, "what is this?" The question is as difficult to answer now as when the Israelites found it. That which is now called manna by the Arabs is a gum from the *tarfa*, or tamarisk shrub (*Tamarix gallica*); but it has been supposed to have been the buds of various shrubs, many of them of the *sorbus* species.

have the fever, and can only get rid of it by breaking the same into three pieces. The priests used it on Palm-Sunday for an aspersory. In South Bavaria it is cut on Palm-Sunday to make handles for whips to drive cattle, and is supposed to be potent in driving away the demons to which the antics of flocks are ascribed. These whips are in some regions first sprinkled with milk. They are hung up in cattle-stalls against "possessions." Three pins made of hazel wood stuck in the beams of a house will prevent its catching fire. In Bohemia it is said that one who bears hazel about him, cut at 12 o'clock on Walpurgis night, will never fall into any hole. A rod cut in Suabia, on Good-Friday or on St. John's Eve—at midnight—in North Germany, enables the possessor of it to strike an absent person. In Bohemia and Westphalia it is believed that where hazel-nuts abound there will be many illegitimate children. In Silesia young men and girls throw hazel-nuts at each other at a wedding-feast. If one find a nut with two kernels, 'tis a sign of speedy marriage. In the Middle Ages the nuts of all trees were symbols of fruitfulness, and it is an old German custom to present them, with apples, to young brides. The superstitions concerning the divining-rod, referable to the caduceus of Mercury, bear traces also of having been christened. In Suabia and the Tyrol it is said they must be cut on Good-Friday; in Bohemia on a Sunday of the new moon before sunset; but generally, in other countries, on the midnight before St. John's Day. It must be hidden, according to the traditions of the Hartz and Brandenburg, in the dress in which some child has been christened, and one must baptize the rod in the name of the three Holy Kings—or in the name of Caspar, if it be gold, of Balthasar, if silver, of Melchior, if water, that the rod is meant to discover. Along with this Christian performance are mingled pagan incantations and observances. In cutting it one must go backward and, drawing it only between his legs, cut it before him. In the Tyrol it is added, one must cut it only with a knife never before used. In Bohemia it is held that it must not be touched before the cutting with the naked hand, but a white handkerchief must be wrapped around the hand. The nearer it can be cut in the semblance of the human figure the better; at any rate, it must be forked; and it is held by the two legs for purposes of divination. The rod is supposed to sink suddenly when near treasures, and is held not only to discover things in the earth, but secrets in men, thieves, murderers, etc. The persistency of the belief in the potency of the divining-rod is singular. Mr. Lesley, an able geologist of Pennsylvania, who has much to do in examining the petrolean regions of that State, declares, in his very valuable work, "Man's Origin and Destiny," that "Of ten or twelve thousand wells bored during the last eight years in the Venango County oil region in Pennsylvania, a thousand

(more or less) were located by diviners with a divining-rod; or with a pendulum made of a deer-skin bag inclosing a ball of musk; or by spiritualists falling into trances and executing spasmodic evolutions when they felt the influence of the spot to be selected." It is also said that truffles, relished by modern as much as they were by ancient Greeks, are by them hunted with divining-rods. In a lecture delivered at the Royal Institution last year, Mr. Tylor showed the resemblance between the spiritualistic implement called "Planchette" and a divining-needle, pointing to cabalistic signs, used by the Tartars. Both are certainly modifications of the divining-rod, and it would be interesting to know whether any particular wood is generally employed by the Tartars for their oracle.

The WILLOW holds, in popular superstitions, an equivocal reputation. The weeping-willow preserves in its name, *Salix babylonica*, an allusion to the sorrows of Israel when they hung their harps on the willows. The sisters of Phaeton, bewailing his death on the shores of Eridanus, were changed into willows. And the sad pendent branches have told their story to the heroine of Lammermoor, who holds the willow branch given by her brother; and to Desdemona, when she sings:

"All a green willow must be my garland."

When Pentecost feast is over the Samländer sets up a tent of willows before his home. At an early period it was common in Bavaria to surround the sick with willow. In many countries—England among others—it was selected, because it flowered just before Easter, to furnish a substitute for palms on Palm-Sunday, willow branches that had been thus used being regarded as of great virtue.

"And willow branches hallow,
Which they palmes do use to call."

On the other hand, we find in Bohemia the belief that it was the tree on which Judas hung himself, and accordingly that the devil has given it a particular attraction for suicides; also, that a child flogged with a switch of it will waste away. In East Prussia one still meets with the belief that it gives birth to serpents. In Hesse it is held that with knots tied in willow one may slay a distant enemy. In Baireuth the girls go at Easter midnight to a fountain, silently, and without being seen; into the water they throw little willow rings, each named for a person; whose ring sinks first will die first. Willows are also attractive to witches. In Oldenburg it is said that, if a woman would become a witch, she must sit down with another witch under a willow, and renounce God and the saints thus:

"Hier sitte ick unnern Willgen
Un verswäre Gott un alle Hillgen."

After which she must write her name with her own blood in a book. The willow is often used

to transfer toothache, etc., in the same way as the oak. In Bohemia ninety-nine leaves from ninety-nine willows, dried and taken in three powders, are a remedy for fever. In the Voigtland toothache is cured by spitting five times on a yellow willow, and making five knots in a branch of it. The toothache ends when the branch withers. In a few places willow is used to make divining-rods.

The superstitions concerning the PALM (*Phoenix dactylifera* of Linnaeus) would require a volume for their treatment. It is to Arabia what the holy fig is to India. To the Mohammedan the date-palm is sacred as the fruit which Adam was suffered to bring with him out of Eden; by the Christian all palms are revered, as having furnished the leaves which were strewn in the path of the Messiah. In Syria its name, *Tamar* (Ezekiel, xlvii. Solomon calls it *Tadmor*), became a generic term for river-streams, of whose proximity it was a sign; and some have even traced to that word the names of the river Tamaro in Italy, the Tamar of Cornwall, and the Thames. Robinson identifies the θαμάρω of Ptolemy as the palm; but the usual Greek name for it was φοίνιξ, from its association with Phœnicia. That the mythical bird, phenix, bore the same name, suggests the possibility that the myth might have arisen from the springing of new plumage-like leaves from the faded ones. The temple of Sais, in Egypt, was decorated with palm, and it is now used in Assyrian temples. (Cf. 2 Maccabees, x. 7; 2 Esdras, ii. 44-47.) In Heliopolis, where the phenix myth had its greatest strength, it was said that when, at the end of five hundred years, the bird came to burn and renew itself, the altar was kindled with thorn and live sulphur, no mention being made of palm. In some districts of the East the date-palm has been regarded as the tree of the forbidden fruit in Paradise; and it may be noted that the coat of arms of the State of South Carolina is a palmetto with a serpent twined around it—a device, I believe, of Spanish origin, so far as that State is concerned, and not impossibly a relic of the Palmers. As the traditional tree whose branches sweetened the bitter waters of Marah, as the festal boughs of the Feast of Tabernacles, as the title—"City of Palms"—of the valley which was shown to Moses from the top of Pisgah, the palm became to the Jews an emblem of victory worthy to greet the entry of Jesus into Jerusalem, and to be held in the hands of saints amidst the splendors of the New Jerusalem. The glory of Judæa seems to have taken its palms with it. The last palm in Jericho disappeared some years back, and there are few, if any, in the country. The trunks of them are sometimes washed up from the Dead Sea.

In Germany the might of the Wild Huntsman was conquered by a leaf of palm.* The water

demons are especially in terror of it—which seems to point to its potency over the Marah spring; and, in this connection, it may be mentioned that in ancient Rome palm was steeped in wine to sweeten it. In Slavonian regions it is supposed to be especially endowed on Easter-day, and will secure the field in which it is then planted from injury by bad weather. In Germany it is naturally the chief banner of Palm-Sunday, on which day—like the mistletoe before it—there is hardly any good result that may not be secured by it. In Southern Germany one may sometimes meet with the superstition that if as many Easter palms as there are members of a family be thrown on a coal-fire, each with a name on it, he or she whose leaf burns first will die first. In Bavaria one who, during an eclipse of the sun, throws an offering of palm with crumbs on the fire will never be harmed or annoyed by working or walking in the sun. In a storm palm switches laid cross-wise on the table procure safety. In Silesia three bits of palm swallowed are supposed to cure fever. In Bohemia the charm against fleas is this: During Passion-week put a leaf of palm behind a picture of the Virgin; at the first stroke of the resurrection-bell—i. e., on Easter morning—take down the leaf, swing it thrice, saying, "Depart, all animals without bones!" There will be no more fleas in the house for that year. It is equally good against field-mice, if laid cross-wise, with an egg, in the afflicted field by night. The Suabians put it for the same object in their granaries. In many regions palms are thrown on the fire on All-Souls' Day for the poor souls that are on that day freed from purgatory.

The POPLAR has been thought by some to have derived its name from *pappeln*—"the pampered tree"—by others from being the tree near which the *populus* of Rome assembled, which would bring it nearer *papeln*, to babble; and it is curious that the place in Athens where the taxes were let out to the farmers of the revenue should have been called *Lenke*, because of a venerable poplar (Λεύκη) which stood there. This was the white poplar (Theoph.), and corresponds with Ἀχρωίς, the lofty tree alluded to in the Iliad, xiii. 389. This name is from Acheron, whence Hercules was said to have brought it. The black poplar is the αἴγυρος of Homer (Odyssey, ix. 141), the word also indicating that it bore the shades of the nether world upon it. The grove of Academus, near Athens, was a poplar avenue. It was sacred to Hercules, "*populus Alcidae gratissima*." A well-known Phœnician legend concerning Hercules relates that, when suffering from a serpent's bite, he sailed west, in obedience to an oracle, to find a certain plant which would cure him. The plant was found at Gades (Cadiz), the cure effected, and the Pillars of Hercules raised to commemorate the event. The tree, the serpent, and the two pillars, constituted a device on the coins of Tyre, and are partly preserved to this day in the dollar-mark. If, as is

* In this and most of the cases following the tree used is that which has been consecrated instead of the Oriental palm, ordinarily the willow.

probable, the poplar was the healing tree meant in this fable, the strong belief of the Bohemian peasantry that the white poplar is an antidote to the poison of serpents is a significant fact.

Grimm mentions the superstitions concerning the ALDER in Bohemia, where it is an omen of evil to cut it down. It prevents the ravages of moles, and removes fevers. The legend of the Erl (alder) King, which inspired Goethe's ballad, is a well-known one under various forms in Germany, though his application of it to the alder is the result of a curious blunder. In Herder's "Stimmen der Völker," the Danish word *ellerkonge*, i. e., elfin-king, was mistranslated *erlkönig*, by which Goethe was misled. It is not improbable, however, that *elf* and *erl* are related words. In Yorkshire elves used to be called "addlers," probably because they addled the brain. In Silesia and Erzgebirge wreaths of alder are hung on the house gables, on Good-Friday, to protect them from lightning.

The BIRCH is a sacred tree in Teutonic countries. In the forests of Bohemia its root is carried about to secure the bearer against attacks or wounds from men or animals, and is believed also to cure barrenness. In Brandenburg it is used to extirpate caterpillars. In the Oberland it is planted before houses to ward off lightning. In Oldenburg bunches of birch found growing on a tree are called "Herenvester," and are considered potent against the evil-eye. In East Prussia one expects to get rid of a fever by going to a birch-tree and shaking it, with the words: "Shake me as I shake thee, and then cease." In Bohemia the plan with gout is this: One must prick, on March 1, the limb with a needle, and the blood must be caught with a new piece of cloth, which is put (no word being spoken) under the bark of a birch. If the bark grows together again the gout will cease. The *fascies* of the Roman magistracy were made of birch; and it may, from this cause, have come into the schoolmaster's hand as the sceptre of authority, and the wand with which to control the spirits that sometimes possess boys. Birch was much used on Corpus Christi play-days, and in Germany rods of it so used were put in flax-fields. Stowe, speaking of London, says: "On the Vigill of St. John Baptist, and on St. Peter and Paul the Apostles, every man's doore being shadowed with greene birch, long fennel, St. John's wort, orpin"—the common name for which was Midsummer Men—"and such like, garnished with beautifull flowers, had also lamps of glasse with oyle burning in them all night." Sharp says he had seen (1780) in Staffordshire circles of birch-trees surrounding the May-pole, and called the Bower, which was evidently the origin of the coop of birch branches with which the children invest themselves in London on May-day now.

Few plants were held in so much honor in ancient Germany as the ELDER, probably because so often found about bogs and marshes where the will-o'-the-wisp abounded, and curious animals lingered longest. Even within this cen-

tury it was a plant which none dared destroy, but the German peasant taught his child to say, when he encountered it: "Frau Ellhorn, gib me was von deinem holze, dann will ich dir von meinem auch was geben, wenn es wächst im Walde."* Its German names, *hollunder*, *holer*, *holder*, *ellhorn*—from the third of which our "elder" comes—indicate its association with Huldah, the Good Mother of the Northern mythology, whose offspring are the "elves." She was known by almost as many tender appellations as the Madonna who succeeded her—Helle, Hilda, Bertha, Spillaholle (i. e., Spindle Huldah), "Frau Rose." The varieties of the superstitions connected with the plant especially sacred to her correspond to the varied helpfulness to mankind attributed to her; and as she seems to have had rites performed in her honor, along with Freyja, in the Venusberg near Eisenach so late as the fifteenth century, it is hardly to be wondered at that the superstitions concerning her should still be singularly strong. In Denmark the legends concerning the elder are most vivid. There its name is *hildemoer* (elder mother), and Hilda herself was once supposed to dwell with her elves near its roots. It is yet much planted by walls, and an old elder is often pointed out as having a mysterious history. Thorpe mentions one in a court-yard in Copenhagen which is said to move about at dusk and peep in at windows. The idea that the elves resent any injury done their favorite plant is carried very far. One must not cut it down without saying, "Elder, elder, may I cut thy branches?" He will then, if no rebuke be heard, spit three times and proceed. Nevertheless, if the Danish grannies are to be believed, Hilda's curse attends the cut-up wood. They say children laid in cradles made of it, or even in rooms boarded with it, have been known to complain of being pulled by the legs. In Styria Bertha-night (January 6) is believed to be a time when the devil is abroad in great force. One may then make a magic circle, and stand in the centre of it with elderberries or blooms gathered on St. John's night. By these means he may obtain some magic fern seed, which will come wrapped in a chalice-cloth, and the seed will confer on one the strength of thirty or forty men. In West Germany the elder, besides being generally a charm against wicked magic, is regarded as furnishing the safest shade under which to sleep, because it keeps off snakes and midges. In Thuringia the peasants take care not to burn it, and regard it as a specific against toothache and nervous disorders. In the neighborhood of Dresden and Leipsic its proximity insures a house from attack, and guarantees that one will die at last quietly in his own home. In Westphalia it is much used as an emetic and an aperient. On the Rhine it is believed that no poison can be taken from copper or other utensils which have been cleaned with elder leaves, and that no worm can get into furniture so cleaned. On

* Grimm.

the Lower Rhine it is held that elder sticks protect fields from moles and other enemies, and they also lay on their dead in the coffin a cross made of it. In earlier times, according to Montanus, elder was among the plants burned with human bodies, and even later the driver of a hearse had a staff made of it, which he sometimes used as a whip. In the Tyrol it is common to trim an elder-bush in the form of a cross, and plant it on the new grave; if it blooms after that it is a sign that the soul of the dead person is happy. The idea recalls the weird conception of Hawthorne, in his "Scarlet Letter," of a dark secret buried with a human being coming up afterward in the form of a noxious plant. It is good luck to bury the cuttings of one's hair or nails under elder. It is still a widely prevalent custom to cut cobbolds and gnomes out of the pith of elder, and hang them up as "Stehaufmännchen." In Bohemia three spoonfuls of the water which has been used to bathe a sick person are poured under an elder, which is accosted thus: "Elder, God sends me to thee that thou mayst take my fever upon thee." This must be repeated on three successive days, and if the patient has, meanwhile, not passed over water he will recover.

Virgil, in the Tenth Eclogue, connects elder with Pan:

"Pan deus Arcadiæ venit; quem vidimus ipsi
Sanguineis ebuli baccis minioque rubentem."

The German legend of "the JUNIPER tree" has long been a favorite subject of speculation with the comparative mythologists. A little boy is tempted into a chest by an apple, and there slain by his step-mother, who then, having made a soup of his flesh for her husband, buries the bones under a juniper. The juniper burns, and a bird leaps from it, which goes about singing the story of the crime. After letting fall various gifts on his kind sister, and a millstone on the head of the cruel step-mother, the child is resuscitated amidst flames from the bird form. In the fable of Osiris the chest, the tree, and the bird are found. In the Cretan fable of Bacchus we have the apple, the repast of flesh, the burial under the oracular tree at Delphos, and the palingenesis. It is a question whether there be not traces of the same fable in the story of Elijah, who, when threatened with death by Jezebel, sits under a juniper-tree, praying that he might die, and where, as he slept, the angel touched him. Elijah ascended soon after in a chariot of fire, letting fall his mantle on Elisha, and Jezebel was dashed to pieces against a stone. In Germany we find, in various regions, that juniper is held to be an antidote to wicked devices; and in Bohemia it is said that no animal will harm juniper. A very direct reference to the burial of human beings under it is found in a Swedish fable, that once, when a farmer was about to cut down a juniper, a voice from it said: "Friend, hew me not!" The farmer having persisted, blood followed his every stroke. In Westphalia, when

one has lost something by a thief whom he suspects, he bends a juniper down with his left hand, and says: "Juniper, I bend and squeeze thee till the thief, A. B., has returned the stolen thing to its place;" then a stone must be laid upon the branch, and, if possible, the brain-pan of an executed criminal; when the thief has restored the article the stone must be put carefully in its former place. In the Tyrol it is believed to be a remedy for corns to break as many twigs of a juniper as one has corns, and leave the broken twigs hanging until they wither, when the corns will disappear. The resemblance between the words *machandel* (juniper) and *mandel** (almond), in some German dialects, suggests that the juniper may have been invested with somewhat similar powers to those ascribed to the almond in the East, particularly the power to promote reproduction. It was an almond that impregnated the daughter of the river-god Sangarius with Atys, the beautiful shepherd-priest of Cybele, whom the goddess changed, for his unchastity, to a fir-tree; and the almond is the Persea of Isis on Egyptian temples. It indeed has retained its character for promoting fruitfulness to this day, it being an ancient custom still observed in some parts of Germany to give an almond to both bride and bridegroom at the wedding banquet. In Thuringia an almond is put in the wedding "wine-soup," and the attendant into whose cup it chanced to fall will be married that year. Three almonds were frequently given in old times to cows to help their milk. It is a somewhat anomalous superstition which leads the Saxon peasant to write the inscrutable word *Xavia* on three bits of paper, each of which holds a bitter almond, and swallow one almond on each of three successive evenings (carefully throwing the paper in the fire), all as a remedy for fever.

It is one of the anomalies of tree-superstition that the useful WALNUT should have a diabolical character attributed to it in various places. It was thought to be the great enemy of the oak in the North, the hereditary enmity of Ormuzd and Ahriman, as Dr. Masius has remarked, penetrating the vegetable world in the hatred of black thorn for white thorn, sorb and juniper, and of oak and walnut. If these are planted near each other one must die. Where the Church del Popolo, at Rome, stands, a walnut once stood, in whose foliage the people believed evil demons had their abode. The tree was destroyed by Paschal II., and the church built by the people.

THE PINE, consecrated in Greece to Poseidon and Dionysus, was held sacred by many races. Its soft wood was the first to yield to the earliest implements which man could construct, and the rude raft transmitted its name (*pinus*) to the ship—on which account it was consecrated to the sea-god Poseidon. It was the tree which the Israelites chiefly used to make their booths dur-

* *Mandel* is from Latin, *amandola*, deformed from Greek, ἀμυγδαλή.

ing the feast of the Seventh Month. The soft musical whisper yielded by its needles under the breath of the wind may have suggested the idea that the pine was inhabited by wind spirits, like Ariel—an idea traceable in the Greek legend that the pine was the mistress of Boreas and Pan—and this superstition would be heightened in Germany by the large number of holes and knots characteristic of it, such, in all trees, being universally believed, as we have seen, to be doors for the ingress and egress of wood spirits. In Smaland, Sweden, a beautiful woman, really an elf, is said to have left her family through a knot-hole in the wooden house-wall. As nearly all ailments were regarded as the work of mischievous spirits, those whose bountiful or beautiful trees indicated their benevolence were invoked to cure the ill effects produced by the former. In Silesia the pine, commonly called there "Frau Fichte," is still supposed to have great healing powers. On Midlent-Sunday pine boughs, bound with variegated paper and gold spangles, are carried about by the children with songs, and then hung over stable doors to keep the animals from misfortune. In the pine cone there are found rich kernels, which Pliny says the Romans used to eat; and it is remarkable that the same is a favorite food of some Indian tribes in America. It is possible that the Bohemian superstition which associates the pine with great strength grew out of its use by the Romans. Sometimes a branch of young pine is trained to grow in a hoop and worn round the neck. The Bohemian poacher thinks he can make himself shot-proof for twenty-four hours by finding, on St. John's Day, pine cones on the top of a tree, creeping around them, taking them home, and eating a single kernel on each day that he wishes to be invulnerable. In Thuringia it is esteemed a cure for the gout to climb a young pine and tie a knot in its topmost shoot, saying: "Pine, I bind here the gout that plagues me." The same form must be gone through to cure film on the eye, care being taken that it shall be on St. John's night. When the Puritan pilgrims landed in New England, in 1620, the pine was the only green thing they saw, and their first shelter. It thus became the coat of arms of Massachusetts.

The FIR has had a sanctity beginning with its consecration in the Temple of Solomon, for whose ceiling it was used. Pliny speaks of it as a funereal tree (Natural History, xvi. 10), which was probably due to the legend that, when Atys was turned into a fir, Cybele sat under it, mourning, until Zeus promised that the tree should always remain green. In France it was held in such veneration by the early inhabitants that, while they permitted St. Martin to destroy their temples, they rallied to the defense of their holy fir groves, which he was compelled to spare. In the religious festivals of the Hartz district, especially those of Christmas, the maidens dance and sing most heathenish songs around the fir, which is decorated with variegated eggs, flowers, and other

ornaments—this being the origin of the Christmas-tree, the normal Santa Claus being no doubt a fair representative of the demon, who was supposed to be "treed" in the green branches, where he had sought refuge from the general desolation. Having been found and surrounded, he must give his gifts. In Voigtland it is held that the number of lights on the Christmas-tree must be even. In Anspach it is held that, of the shadows of persons cast by these lights, those of persons who will die during the year will appear headless. It is now certain, through the labors of Grimm, Wolff, and others, that Wodin has taken Christian form in St. Nicholas (Santa Claus), and he even preserves some of the diabolism attributed to him by missionaries under his sacred name, *i. e.*, Old Nick. In Suabia it is said that if one will make out of fir wood a small milking-stool, and on Christmas look through the three holes made for its legs into a church, he will see all the witches assembled, with milk-pails on their heads, and all of them (the witches) sitting inverted!

This, however, and the Anspach notion of the headless shadows cast by the lights of the Christmas fir, are the only associations with that tree which could be in the least formidable to the young, for whom it was surrounded with much charming lore. In a Norse story, quoted by Thorpe, we have a very characteristic specimen of the genial faith which inhered in the weird mythology of our forefathers. The hill of the Hartz called Hubinchenstein, covered with holy firs, amidst which a pleasant village nestles, has a Norse and a post-Christian explanation of its existence; according to the former it was flung by a giant out of his shoe, as a grain of sand which hurt him, while the latter states that the mountain floated there during the Deluge. However, there are beautiful fir cones found there, which may be wrought into various ornaments. On one occasion the wife of a poor and sick miner of the neighborhood went out to gather cones and sell them as a last resource against the imminent starvation of her family. She met a little man with a long white beard in the forest, who told her where she could get the best cones. When she arrived at the point indicated the cones fell so thickly around that, being frightened, she ran away. Nevertheless, the cones had fallen into her basket, and this basket, as she went homeward, grew constantly heavier. Well it might: the cones turned out to be of pure silver. The next day she went again to the wood, and found the little man of the snowy beard again, who, laughing at her fright, told her he was the Gubich, or king of the dwarfs, and to the wealth which he had bestowed upon her he now added some plants, a decoction of which her husband drank and recovered health. The now wealthy miner preserved one of his silver cones, which, it is said, may be found in Grund to this day, with, no doubt, a kreutzer-loving guide to tell the story of its origin. The

Gubich with snow-white beard is a modification of Santa Claus, and in those regions cones are silvered over for the Christmas-tree. He brings them there from his crystal cavern, whose golden floor is "strewed with green fir branches."

The superstitions concerning the pine and the fir are especially found in the vicinity of the German mines; and it is remarkable that in California, whose gigantic pines were regarded with awe by the aborigines, quite similar notions have been known to crop up. The gold-miners of that region sometimes tip a cone with the first gold they find, and preserve, or perhaps wear, it as an ornament, which some say will bring luck. The effect of the hunger for gold which led so many to the American El Dorado might be well typified by the spells sometimes wrought on those who became the sport of the fir elves, as described in Grimm's "Elfin Grove" and Tieck's "Phantoms." Sometimes the firs and pines hurled down heavy cones upon the wayfarer and killed him. Dark deeds were sometimes associated with them. Under a fir Blanscandiz lures Genelun to break the oath of fealty; and under the pine Paladin conspires with Marsilia for Orlando's ruin. The spirits of the pine and fir were, however, usually friendly. The kindness of the old god who presides over the Christmas-tree, and is the saint of children, is sufficiently shown in the belief, common in Southern Germany, that branches of the fir laid on the foot of one's bed will keep away the nightmare, which, as is well understood in those regions, results from an invasion of witches anxious to use the sleeper as a horse. In Erzgebirge bunches of fir may be often seen hung up over barn doors to keep off certain field spirits, which will cut or steal grain wherever they can. In the Netherlands it is said that if on Christmas-eve you put a stick of fir on the fire, but take it off before it is quite burned up, and keep the remainder under the bed, the house will be safe from lightning for the year.

Allusion has already been made to the practice of the American Indians in burying their heroes at the root of a young MAPLE. Bernatz, in his "Scenes in Ethiopia," says that "maple-trees, under which the natives perform their religious rites, and offer sacrifices to their chief gods, Oglia and Akete, are considered holy." Dr. Hermann Masius mentions the reverence for the maple as very strong in medieval Germany. It was drawn into the court-yard of the king and wine poured on it. If the tree were felled, it was by one who must remove his hat, and say, on his knees, "Good Maple, give me of thy wood, and I will give thee of mine, when it grows in the wood."

The BLACK-THORN furnished the material from which divining-rods were made in Mecklenburg and Oldenburg. It is believed to cure various illnesses, especially, if gathered at Easter, erysipelas. The buckthorn, made into little crosses and stuck in manure, will, according to

a Bohemian superstition, keep one safe from all pranks of witches on their Walpurgis-night. In Suabia the missionaries declared that the thorn-crown of Christ was made from this tree, as in England and France they ascribed the same honor to the hawthorn, which on that account still bears in the latter country the name of *l'épine noble*. In Austria, on Good-Friday, it is common to find boys thrusting "thorn-apples" in the hair of little Jews, and it probably refers to Christ's crown of thorns. The same legend probably underlies the German story of "The Jew in the Thorn-bush." In England the popular reverence for the May-thorn was consecrated in the legend of the Glastonbury thorn, said to have blossomed out of Arimathea's staff, indicating so the spot where he should build Glastonbury Church. "At the very hour that Christ was born," wrote old Layton, "it will spring, burgeon, and bear flowers;" and so many still believe. The common name of the witch, *hag*, is the same as *haw*, the hawthorn being the *hedge*-thorn; this coincidence may not, however, be due to the magical craft of the witch, but only to the habit of those presumed to be such of sitting under the hedges. The sanctity of the white-thorn would seem to have come from Rome. Virgil (Eclogue 5) says that at the death of Daphnis the thistle and thorn sprang up:

"Pro molli viola, pro purpureo narcisso,
Carduus, et spinis surgit paliurus acutis."

This must have been the *ramnos* of Dioscorides, which, he says, was hung over doors to keep off enchantments. The same is said of Ovid's *spina alba* (our hawthorn). In Fasti (Book 9) Janus presents to the goddess Carna the white-thorn, to avert calamity from her household:

"Sic fatus, virgam quâ tristes pellere possit
A foribus noxas, hæc erat alba dedit."

BELLADONNA is esteemed in Bohemia to be a favorite plant of the devil, who watches it, but may be drawn from it on Walpurgis-night (when it has the power to make horses strong) by letting loose a black hen, after which he will run.* The name refers to an ancient belief that it is the form of a fatal enchantress. The famous apples of Sodom have been identified by Haselquest as of the same family, *Solanice*. (See Apoc., Book of Wisdom, x. 7.) Boughs of the PLUM, gathered on the same night, are placed over the windows and doors to keep away witches; and, in Austria, the same tree is planted to protect fields against mice. The CHESTNUT, in Russia, is held to be efficacious against backache and gout. In East Prussia there is a superstition concerning DOG-WOOD, that its sap, absorbed in a handkerchief on St. John's night, will fulfill all wishes.

Among the sacred trees of Germany the CHERRY must be included. To waltz on May-

* This superstition about the fondness of the devil for a black hen is also found in Niederbrackel, Holland.

day or St. John's Day, then lie naked under a cherry-tree and shake the dew on one's back, is in Brandenburg still the peasant's prescription for fever. If the Bohemian maiden is slandered she will sometimes go and stand under a cherry-tree, shake the dew from it on her head, then call for something to eat, but before eating give a portion to the cat and the dog. Coming marriage or other good fortune may be divined in Silesia by cherry switches gathered on St. Barbara's Day, soaked in water, and kept till Christmas, when their color and quantity of sap retained are narrowly examined. In other regions various maladies are cured by walking backward and eating the buds of the same tree. But it is not always a tree of good omen. In Brandenburg it is regarded as the sign that a child will die, if, during its illness, blossoms and ripe fruits are found on a cherry-tree. In East Prussia, it is said, one must on unlucky St. James's Day (July 25) especially avoid climbing this tree, as the danger of breaking one's neck will be imminent.

The PEAR was held sacred chiefly in France. We find comparatively few traces of superstitions connected with it in England or Germany, though it was a favorite fruit in the goddess Holla's garden. Dr. Masius speaks of an old pear-tree at Walserfield, which it was said would, when it again blossomed, proclaim the Day of Judgment.

The field spirits which figure so largely at the present day in the superstitions of the Russian peasantry linger in Germany in the notions concerning the grain, straw, etc., which were at an earlier period believed to be each under a special preternatural guardian. In Iceland the farmer guards the grass around his field lest the elves abiding in it invade his crops. In the word "cereal" we have the record of the faith in the relation of Ceres to the grain which made the temple of that goddess at Rome the tribune of the democracy—i. e., the farmers. The torches with which she searched for the lost seed (Proserpine), carried off the winter frost (Pluto), and raised it to its flower again, are still burning on the altars of our Catholics and Ritualists. Bertha (i. e., Berchta, the shining, from *πυρ*, fire) was the Ceres of the German mythology; and all such winds and clouds as affect the crops, but do not rise to the dignity of storms, were believed to be arranged by her. In the Odenwald, near Rodenstein, the ruined castle of the Wild Huntsman, there is a weird rock called the Wilde Weibchenstein, believed to be the haunt of a little woman who comes out when some one is late in harvesting, and cuts the corn, and binds it into sheaves behind the reapers with astonishing rapidity. This is Bertha again. She protected the grain so formidably that children were warned that they must not go into a field where it was growing for fear the wehr-wolf (whose howl they could sometimes hear in the wind) would seize them. On the contrary, in Schleswig one is deemed safe from the wehr-wolf in a corn-field. Three hand-

fuls of grain were solemnly given to every animal on Christmas night in Franconia; and in Eastern Prussia three grains of corn, each cut thrice through with a knife, were given to a cow about to calve. Twelfth-tide brooms were held to have great virtue against witchcraft. A broom made at that time, and laid on the threshold over which cattle are driven, would keep them from evil possessions the year round; and if the axe and broom be crossed on the same the cattle will surely find their way back. If a cow's udder is swollen it must be stroked three times with such a broom, in profound silence, and the broom then laid under its crib; then the cow will recover. The straw which was held sacred in Sweden as yule-straw was appropriated by Christianity. It was declared that when the Virgin Mary brought forth her babe she laid him on the straw of the stable where he was born. The *Galeum verum luteum* is called Our Lady's bed-straw, and has been painted by N. Poussin under the infant Jesus. In the more ignorant regions of Sweden the customs still prevail of scattering yule-straw in the fields to help their harvest, giving a little of it to the cattle to insure them against disease, putting some of it in the nests of domestic fowls, and even of making it into a bed on the floor for the whole family to sleep upon on Christmas night. To find two stems of straw crossed is unlucky.

The pantomime known as "Pippin" preserves a bit of folklore. A gnome conceives a passion for a miller's maid, whom he finds sleeping in an enchanted wood. He saves her from decapitation (on condition that she would become his wife) by so charming her spinning-wheel that it spun pure gold out of straw. Being beloved by a prince she breaks faith with the gnome, who, while she is on her way to the altar, carries her away to his enchanted castle, from which, however, she is rescued by the prince. The legend is another instance of the old belief that every yellow growth, of whatever shade, derived its tint from the gold in the earth.

The flower growing amidst corn, if the eyes are stroked with it, prevents sight from failing, according to an Austrian belief; and in Bohemia other cures are ascribed to it. It is esteemed good for serpent bites and fevers to take into the mouth the earliest shoots of the corn in spring. In the neighborhood of Oldenburg corn stalks are strewn about the house in which a corpse lies to prevent any further misfortune to the family. If one finds a double ear of corn in Voigtland he straightway puts it above the looking-glass as a security against lightning; and in the same country destiny is read in corn grains. If flowers from a corn-field be brought into the house the bread will become mouldy. In Jutland the *Polytrichum commune* is called Loki's oats, and when there is a shimmering motion in the air it is said, "Loki is sowing his oats." Loki (who survives with us as Luck) is the nearest approach to a devil to be found

in the Northern mythology, and is sometimes spoken of as sowing weeds among the good seed. (See Thorpe.) It is not impossible that the phrase "sowing one's wild oats" originated in this Norse superstition. The rhi-nanthus, or yellow-rattle, is called in Jutland Loki's purse. MILLET (which will not be eaten by birds if sown after sunset) was much used in ancient German festivals. The old dragon (lightning), which when he appeared fiery-red dropped gold somewhere on the ground, and when blue betokened plenty of grain, was said to be fed on millet in his earthly form (the serpent);* and so it was said that millet, eaten on the first day of the year, would make one rich. GRASS BLADES give second-sight, and the sod out of which grass grows is potent against witches.

The ONION, deemed in ancient Egypt a symbol of the universe, which was thought similarly made of concentric foldings, is in Bohemia used for fortune-telling. It is also hung up in rooms that it may draw to itself the maladies that would otherwise fall on the inmates. Cives, especially if eaten on Green-Thursday, protect against the evil-eye; and garlic fits one for labor. On the eve of a festival garlic is given, in Bohemia, to the house-dog, the cock, and the gander, to make them fearless.

The adoption of the LEEK as the national device of Wales has been frequently explained as resulting from its having the old Cymric colors, green and white; but this is very doubtful. An inscription on one of the pyramids shows that they were the food of the poor, and there is some reason for believing that the phrase "to eat the leek" is remotely connected with that fact. At Delphos it was ordered that the gardener who, on the day of Theoxenia, offered the largest leek of the species *gethyllis* to Leto, should receive a portion from the holy table; for Leto, when pregnant with Apollo, had longed for a leek.

It is remarkable that we find so little said in the old folklore about the FUNGI. Occasionally we find village children regarding mushrooms as fairy-stools, but it is difficult to trace them to any special associations. The astrol-ogers burned them for the cure of cattle, which were said to be particularly bewitched by the yellow mushroom which grows around trees. In England toad-stools, especially in regions where pixy-rings abound, are supposed to harbor evil beings, and are always destroyed when seen. Red mushrooms are regarded in Bohemia as diabolical, and it is a saying there that many mushrooms betoken a bad harvest and dear living. In Sweden the *Lichen caninus* is sought to cure miliary fever, said to be brought on by meeting elves.

* In Persia the heavenly serpent is the rainbow, and, from the character of the rainbow as a good omen, and that of the serpent as a guardian of treasures, may have been derived the saying that if one finds the end of a rainbow he will discover there a bag of gold.

In Russia it is still a general belief among the peasants that on St. John's night the FERN flowers, and, as the finder of the flower will get from it all that is said to come of the four-leaved shamrock in Ireland, I was assured at Moscow that it is not uncommon to find persons walking amidst ferns at midnight—the only hour when, as is supposed, the flower can be seen—at the sacred time of the year mentioned. The same superstition exists in Thuringia. On that night, as is said in Bohemia and the Tyrol, the fern seed shine like fiery gold. In early times fern seed were called "wish-seed," and one who held them would find hidden treasures, which, where the seed were scattered, would reveal themselves in veins of bluish flame in the earth. The sap of this flowering fern conferred eternal youth. In the Tyrol the *Osmunda regalia*, called "the blooming fern," is placed over the door for good luck. In Bohemia the traveler will take fern seed along for good hap, and feels himself especially safe from storms or sun-stroke. But the seeds which reveal treasures and procure all desires are not so easy to get. According to the Suabians they can only be got just before midnight at Christmas. They are under keeping of the devil (in Russia it is a serpent still), and one must prepare for the quest by refraining from church during Epiphany, and thinking as much as possible of Satan. The seeker takes his stand at a cross-road where a corpse has passed; that is the spot where ghosts and demons swarm on Christmas night, and they try to make each one who passes speak or laugh. Those who do either would, in the analogy of folklore, be changed to stones instead of finding the magical leaves; but now it is said the devil tears them to pieces. They who go on in silence will get the shining fern. On old St. John's night—(July 8, now "Kiliansnacht"), in Bohemia, one decorated with the "blooming fern" is said to become invisible. There one must lay a communion chalice-cloth under the fern, and collect the seed which will fall before sunrise. If one finds the cloth steeped in sap, dew, or rain-drops, from the plant, it has the same virtues. In Westphalia fern seed which have fallen unnoticed into one's shoes are potent. When one carries the fern which secures treasure he will be followed by adders, which guard the treasures. This seems to be the Lithuanian form of the superstition. The famous blasting-root (*sprengwurzel*, commonly called springwort) is probably the fern root. Pliny records the superstition concerning it nearly in the same form in which it is now found in Germany. If any one touches a lock with it it will yield at once. In Switzerland it is carried in the right pocket, to render the bearer invulnerable to dagger or bullet; and in the Hartz it is said to reveal treasures. One can not easily find it himself, but generally the woodpecker (according to Pliny that or the raven; in Switzerland, the hoopoe; in the Tyrol, the swallow) will bring it under the following circumstances: When the bird visits its nest the

nest must be stopped up with wood; the bird opens it by touching it with this root. Meantime a fire or red cloth must be placed near, which so frightens the bird that it lets the magical root fall. The root is believed to cure many diseases, and to protect from lightning. There is a species of fern called in some parts of Germany "Irrkraut," and if one walks over it he will be likely to lose his way and wander about, unless he changes some garment inside out, or his feet exchange their shoes, or until the following Sunday. It will be remembered that this is the old device for breaking the bewil-

dering spell of the pixy in Devonshire. It may be mentioned also that the pixy-rings of Cornwall, or circles of luxuriant grass, are called in Sweden *elf-dances*, or *älfexing*. In various parts of England there is a superstition that "all the ferns have one root." This is often said in Somersetshire, where there is also a saying that

"When furze is out of blossom
Kissing is out of fashion,"

the idea being, perhaps, that both are equally perennial.

ANNE FURNESS.

BY THE AUTHOR OF "MABEL'S PROGRESS," "AUNT MARGARET'S TROUBLE,"
"VERONICA," ETC.

CHAPTER VIII.

THE Reverend Edwin Arkwright lived in a small house in the oldest part of Horsingham. The street he lived in was narrow and winding: it was called Wood Street, and was perhaps the duller in the whole town—though that is a bold word. The houses in Wood Street varied considerably in size, but they were all old houses. The Arkwrights' residence was very old. It had lozenge-shaped little panes of glass in the windows; the ceilings were traversed by massive beams. Scarcely any two of the rooms were on the same level. You went up steps and down steps, apparently for no reason but that the builder had chosen that it should be so. There were inscrutable closets hidden away in the thickness of the walls; and the deep seats in the windows lifted up by means of a hinge, and revealed lockers which always made me think of a ship. One characteristic of that house was gloom. Let the sun shine as he would outside, within the little low-roofed parlor darkness always fought a good fight for supremacy. It lurked in corners, and brooded overhead among the oaken rafters. And by three o'clock in the afternoon, save perhaps for a few days in the full midsummer, it had invaded the whole room. Whoso wished to use his eyes in the parlor at that hour must remain close to the beetle-browed window, or have recourse to lamp or candle. There was, indeed, one roomy closet near the fire-place which never was illumined by the light of day. Mrs. Arkwright would grope in it, and dextrously select what she wanted by means of her sense of touch, aided sometimes by that of smell. For this was a store closet, and the children were invariably set sneezing whenever they approached their young noses to its spice-laden atmosphere. Once, and once only, I saw that mysterious receptacle partially revealed by the feeble flame of a rush-light. I could not help thinking of the famous dark cavern of Kentucky as I peeped into it. White, ghastly looking jars loomed

on the shelves, and seemed to *blink* when the rush-light's ray fell upon them, like creatures to whom dimness is natural. I could fancy that the drab-colored paper, in which various household stores were tied, had absolutely become paler from long residence in that atmosphere of total eclipse. And I certainly saw some agile little insects scudding hurriedly away from the unwelcome illumination.

The darkness was inherent in the structure of the house. But it had another characteristic, which was solely due to the energy of its mistress—it was inexpressibly (I had almost said insupportably) clean. There was something almost depressing in the specklessness of that house; it suggested such a chilling and unsympathizing superiority to human weakness! Poor Mrs. Arkwright, how she toiled and strove! Five children had to be fed and clothed and housed out of her husband's scanty pittance, eked out by such chance earnings as fell in his way. Five little helpless creatures were living and eating and wearing out their garments day by day; and two were dead. The father spoke of the departed ones sometimes as if their going had been in truth a blessing, though he had doubtless loved them well. But I am sure that the mother never ceased to regret those lost little claimants for food and care and tendance. Love that is shone on by sunny smiles may be a fair plant; but love that has been watered by tears is imperishable.

Mrs. Arkwright's children never squalled, her chimneys never smoked, her knives and platters were always bright and clean; and yet I fear that her husband did not always return to his hearth and home with the willingness that might have been expected from so affectionate and domestic a man as he was. In truth, there was a little familiar fiend who made a third at his board; who quenched the glow of the fire, and smirched the snowy cloth, and dropped a bitter flavor into the food. And the name of the fiend was Jealousy.

Mrs. Arkwright was not a jealous wife in

the ordinary acceptation of the term; but she was jealous of the attachment of every human being whom she cared for. She was jealous of her children, her friends, her servants. I believe she was jealous of the purring cat that rubbed its head against its master's legs. She must have been good-looking once, I fancied. She was not indeed old in years when I first knew her, but the providing of that daily bread, for which her five little ones were taught to pray, had planted many a furrow in her tawny face. She was very dark; black-browed, black-haired, black-eyed. Hers was an aspect that a foreigner would be apt to consider peculiarly un-English. But she came of a good old yeoman family, that had held the same land in our county from generation to generation for many centuries. I know not whether the familiar fiend I have spoken of had set his mark on her complexion, as well as her mind, but the truth is that she was yellow and bitter as a Seville orange.

I went to Wood Street one afternoon with my books, and arrived there too early for my lesson. This had happened before. I was driven into town by my father, and had to accommodate my hour of setting forth to his convenience; and on market days he sometimes came to Horsingham rather early. Mr. Arkwright had not yet come home, but I was ushered by the little maid-of-all-work into the parlor, and I sat down to wait. I thought at first that there was no one there; but becoming, after a minute or so, accustomed to the dimness, I perceived little Jane Arkwright, the youngest child, fastened into her wicker chair, which had served, I fancy, each of the three younger Arkwrights in succession; for things "wore" wonderfully in that household. Jane was a fair, gray-eyed creature, like her father. She was fastened, as I have said, into her chair, and a kind of ledge, forming a table, was placed in front of her. On this were ranged some dozen or so different shaped bits of wood, cut out of the soft sticks used for lighting fires, and with these she was "playing." Heaven knows what fancies her baby brain connected with those unpromising materials! But the little creature was as gravely interested as a chess-player over his game.

"Good-day, Jane," said I. Jane smiled faintly, and fixed her eyes upon me with an unwinking gaze. I kissed her, and began to talk to her in baby fashion, asking her what "those things" were; meaning thereby the bits of wood. Jane replied, with much composure, and a quiet putting aside of my nonsensical attempts to be amusing, "Bix." And then resumed her occupation of arranging and rearranging the "bricks" on the ledge of her chair.

"Ah," said Mrs. Arkwright, coming into the room shortly afterward, "you're a little early, Miss Furness; Mr. Arkwright is not come home yet." She glanced sharply at me as I knelt near little Jane. She always professed a dis-

like to her children being made "soft," as she phrased it; and, consequently, discouraged a too caressing manner in those about them. But I believe that her besetting failing was at the bottom of this; and that she grudged any scintillation of regard that went forth from her children's hearts to a stranger. Fortunately, little Jane's instinct was not to be deceived by any assumed hardness of manner. She turned on her mother a very different look from that with which she had regarded me, and held out her little arms to be taken. It was curious and pathetic to see Mrs. Arkwright's face change and soften as she lifted Jane and set the child on her knee.

"How good she is!" said I. "She was all alone here when I came in, and as quiet as a wee mouse."

"She is mostly alone all the morning."

"Poor little thing!"

"Do you think it such a misfortune to be alone? I would give any thing for half an hour to myself, sometimes. But Jane will soon have to go to school with her brother and sisters."

"To school! How old is she?"

"Turned three. Oh, you needn't look so astonished. Lizzie went to school before she was so old as this one. But then Lizzie was the eldest, and I had to get her out of the way for a few hours every day, because there were *two* babies younger than herself to be looked after."

Presently Mr. Arkwright returned, and we began our lesson. Mrs. Arkwright brought in her work-basket to the parlor, and sat sewing diligently. Hers was no dainty device in delicate wicker-work, lined with satin, and fitted with silver. Mrs. Arkwright's work-basket was strong, ugly, and well-worn; and her work on the present occasion was the dextrous insertion of a patch into a pair of cloth trousers of small dimensions, the property of Edwin Arkwright, Jun., commonly known as Teddy.

"You are absent, I think," said Mr. Arkwright, gently, after a patient explanation of the meaning of a passage in Schiller which I had entirely failed to follow. "Whither are your thoughts wandering?" he added, with a smile.

It was a question to which I did not at all contemplate giving him a true answer. My thoughts had been wandering with a light rhythmic motion to the accompaniment of a waltz tune; they had fluttered over garments of many colors, and flowers, odorless, indeed, but of cunning workmanship. Lastly, they had been contemplating an existence devoted to cleaning rooms, nursing babies, and mending trousers, as contrasted with such constituent elements of happiness as the dancing, dresses, and adornments aforesaid, and shuddering in every fibre of their butterfly wings at the picture. And yet at the very same moment there was that within me which sincerely

disdained the erection of selfish frivolity into an ideal of life. I suppose most persons have experienced similar contradictions.

I stammered out, "I—I beg your pardon, Mr. Arkwright. I am giving you a great deal of trouble."

He recommenced his explanation, and this time I followed it pretty well; but only by a strong exertion of will.

"I think," said Mr. Arkwright, closing the book at the end of my lesson, "that I must ask you to rewrite that translation. It is scarcely so well considered, or so carefully expressed, as usual."

There was a look of disappointment on his face which moved me greatly. I had often told myself how much to be compassionated the poor man was, and how glad I was to think that my lessons were not irksome to him, but that he took some pride and pleasure in my progress. And now—!

Mrs. Arkwright put in a word for me. Nothing made her more inclined to be merciful to any one than the perception that he or she had incurred her husband's displeasure. Not that she loved to oppose Mr. Arkwright's judgments, but that it lulled her wakeful jealousy, which the least word of praise from him was certain to irritate.

"Come, Edwin," said she, with a smile that made one wish she would smile oftener. "Don't be hard on Miss Furness. I think this is the first time that she has not done even better than you expected."

"I hope I was not very hard, Patty," said Mr. Arkwright. He was making my books into a packet, and fastening them together with a little leather strap, as he spoke. He had long, slender white hands, which looked as if they were neither strong nor dextrous, and which did not belie their appearance; for the strap slipped from his grasp, and down fell the books in various directions on to the floor.

"Oh, pray, let me do it!" I exclaimed, kneeling down to gather the scattered books. But before I could do so Mrs. Arkwright had picked them up, and had neatly and rapidly put them together in a parcel firmly fastened by the strap. "Oh, I am so much obliged to you, Mrs. Arkwright," I said. "How beautifully you have made the parcel. But I think I never saw such skillful hands as yours; they can do any thing."

"Practice makes perfect," replied Mrs. Arkwright, and checked a little sigh, as she resumed the patching of Teddy's trowsers.

"Miss Furness is quite right," said Mr. Arkwright, looking at his wife with a beaming face. "They *are* skillful hands. Dear, busy, helpful hands!" He clasped her brown fingers in his fair ones as he spoke, and for one instant, at all events, Mrs. Arkwright looked happy.

It was customary for Eliza to call for me at Wood Street on my lesson days, and to accompany me to my grandfather's. She was waiting for me now, and we went away together.

On turning from Wood Street into the main street of the town, we met Alice Kitchen coming from the market with a covered basket on her arm. She stopped to speak to us, and to exclaim—as she did every time she saw me, however short the interval might have been since our last meeting—

"Miss Anne!" Then changing the emphasis—"Miss Anne! How you do grow!"

"Do you find me much grown since last Monday, Alice?"

"Oh, but to think as I was not so old as you are when we first saw you, Miss Anne. And you such a little white-faced thing! Deary me!"

"Is your father quite well, Alice?"

"Thanks be, Miss Anne, he is nicely. We be in a bit of a worrit just now, for we're going to take a lodger this races."

"A lodger!" exclaimed Eliza. "Why, Alice Kitchen, *niver!*"

I think that Eliza conceived some peculiar solemnity of adjuration to be involved in the utterance of both Christian and surname. She always used the two when she meant to be impressive. And she meant to be impressive now. For let the reader consider that a lodger coming to Horsingham for the race-week must, in all probability, come for the purpose of attending the races. And the races and all connected with them were held in abhorrence by the sect to which Eliza and the Kitchens belonged. Their pastor—the blood-chilling preacher whose eloquence Eliza had once so singularly commended—was in the habit of planting himself under one of the great elms on the way to the course, and distributing hand-bills to all passers-by, calling upon them in exceedingly strong language, enforced by big black letters reeking from the press, to turn back while there was yet time, and flee from the yawning gulf of perdition; and, moreover, uttering other similar warnings in a loud voice. Therefore, it will be perceived that the announcement of a member of this gentleman's flock receiving a lodger during the race-week was calculated to startle and even scandalize his fellow-members.

But Alice was no whit abashed. Professing that she did not want to keep me standing in the High Street, "seeing as it was so thronged, being market-day," she turned and walked a little way with us through some by-streets, and she talked the whole time. I think that Horsingham folks—and, indeed, the natives of our country generally—have a pre-eminent gift of speech. They love—men and women, young and old—to "hold forth." The stream of words pours forth copiously, and they would rather make a long speech than a short one, upon any imaginable topic. Alice was certainly not grudgingly endowed with powers of talk. She stated her case and pleaded her cause at considerable length. Her arguments seemed to amount to this: that as it was clear people *would* come to the races; and, as the ungodly made a profit of their doing so, she saw no reason why

she also should not derive some advantage from the crowd of visitors. "Tisn't as though father and me, saying we wouldn't let, 'ud keep folk from coming, Miss Anne!" said she. "And there'll be that throng of strangers as niver was; as butchers' meat alone 'll cost a week's wage pretty well. We've furnished the little sitting-room up stairs quite genteel. And there's Mat's room empty now, as is the best bedroom i' the house." ("Trust him for that!" thought I.) "And so we've made up our minds to set a ticket i' the window. Father he was against setting the ticket. He thought it seemed like encouraging the races. But I say, 'No; if you want to let, you must make the folk know it.' Setting the ticket won't make nor mar the races as *I* can see. So father he came round at last."

"And what does Mr. Matthew say to it?" I asked.

"Oh, Mat, he's clean against it," answered Alice, coloring a little. "He holds fast by the wages of sin being death. But then, Miss Anne, you see he's well off enough. And I'm sure, if father and me got as much out of grandfather as Mat and his wife does— Well, that can't be cured, and must be endured." With that she bade us good-day, and turned to go back, having first invited Eliza to drink tea with her any Sabbath evening after chapel that she could get leave from Dr. Hewson to do so.

When I told grandfather what Alice Kitchen had said he looked vexed, and passed his fingers through his hair until it was more like a mane than ever. But he made no comment beyond muttering to himself, "Of course, of course. The old story! The usual thing!" He liked Alice. She had become quite a favorite at Mortlands. Since her brother's marriage she had become closer friends with Eliza than ever. And even Keturah, whose good opinion was not lightly to be had, approved of Alice's industry and good-humor; and especially of a certain blunt honesty which characterized her, and which contrasted oddly with the canting form of many of her utterances.

"And so these—ahem!—blessed races are to be more numerously attended than ever this year, are they?" said grandfather, thoughtfully nodding his head.

"So Alice seemed to think, grandfather."

"H'm!" (with a peculiar grunt of discontent).

"Horsingham people are quite rejoicing at the prospect. They say a night's lodging will go up to a fabulous price."

"Ay, ay! Spoiling the Egyptians is good fun enough." Then he added, in a lower tone, "But one doesn't find it so pleasant when one's only daughter happens to have cast in her lot for better for worse with one of the tribes of Pharaoh."

"He will be busy gathering in a plentiful harvest," observed Mrs. Abram, mysteriously.

"Pharaoh?"

"Satan!"

"Tut, Judith! There, there, I beg your pardon for startling you. The harvest men will reap on Horsingham race-course; men have sown there; and they plant a fresh crop every year. More's the pity!"

Grandfather withdrew to his study; and no sooner had he turned his back than Mrs. Abram bent forward to me with uplifted finger, and her eyes so wide open that the odd yellow specks in them gleamed very conspicuously, and huskily murmured, in her most inarticulate tones, "Ah, love, if he would but understand! But your dear grandfather never did think enough of the devil!"

CHAPTER IX.

ALICE KITCHEN's expectations were fulfilled. The races of that autumn were more numerously attended than any meeting that had taken place for many years. I remember that autumn well. I have reason to remember it. I remember mother's hesitation as to whether she should, or should not, be present on the race-course on the great "cup" day. And I remember how at last, despite grandfather's remonstrances, she resolved to go. I knew then as well as I know now—albeit, nothing was said between us to that effect—that mother went to the races and took me there, in the hope that our presence might keep father from the betting-ring, and prevent mischief.

It was a lovely bright day. The sky was clear, save for a silver gauzy mist on the horizon, that looked like a breath on a mirror. The course, I heard it said, would be in first-rate order. The person who said so was Dodd's successor, the undersized groom. His name was Flower, and I always thought a more inappropriate appellation could scarcely have belonged to him. Flower was no favorite with my mother. She discovered, a very few weeks after his arrival, that he had introduced the practice of card-playing into our kitchen, a thing unheard of there before. He was not always quite sober, although never too drunk to do his work. His manner was full of a suppressed insolence, and his tongue was, the other servants said, versed in the vilest ribaldry, to which he would give utterance on any occasion when the presence of his superiors did not restrain him. But neither these considerations, nor any others which could be presented to him, availed with my father to induce him to discharge Flower.

"My Lucy, darling," father would say, "can you tell me that the man has ever dared to be insolent or ill-behaved to you in word or look?"

"To me? No, George; but—"

"Or to Anne?"

"Why, no dear. Still I—"

"Or to me, or to any guest or friend we have? To be sure not! And he is a first-rate groom: quite first-rate. As to the servants'

morals, they will take care of themselves. Or, if not, I am sure that neither you nor I are able to take care of them. And I wonder that you should be growing puritanical. *You*, of all people—brought up as you have been!"

This was said as we were driving to the race-course; and I pondered on it a good deal. Father had given forth many such utterances lately, and they never failed to rouse my indignation. There was an implied assumption in them that, because grandfather did not profess to be bound within the narrow limits of any of the orthodox codes of behavior known to Horsingham, therefore he and his must necessarily and consistently grant the widest license, and the most placid toleration to all evil-doers and evil-doings. The High-Church people and the Low-Church people, the Methodists and the Papists, the Zion-chapelites and the Baptists, publicly condemned each other to perdition every seven days or so; but they were quite unanimous in detesting the principles of my grandfather, who was charitable to them all, and comprehended that there were good men to be found in every one of these denominations. If he would but have anathematized any one set *en masse*—if he would even have declared his conviction that they would *all* of them be lost, instead of humbly hoping they might most of them be saved, I really believe they would more readily have forgiven him. In short, it often occurred to me then, and has often occurred to me since, that poor Mrs. Abram had summed up the public grievance against grandfather when she said that he "never did think enough of the devil."

"You'll stay with us, George, won't you?" said my mother, when our carriage was got into its place in the line, and the horses had been taken out. "I get nervous in this crowd if you leave us by ourselves," she added, with a poor pretense of there being no other reason why she wished to keep him by her side.

"Stay with you? Of course!" father answered, testily. "You don't mean, I suppose, to pin me to the skirt of your gown? I shall be on the course, and quite within hail all day."

To see a bright tear come and tremble in mother's eye, and the color flush into her face and then fade, leaving her very pale, made a feeling of burning indignation rise in my breast against father; and the feeling was not quenched by my catching sight of Flower, who had heard what had passed, and was standing with his drab-gaitered legs apart—as bowed and fleshless they looked as the "wishing-bone" of a chicken that has been picked clean—and an insolent grin on his smooth, sharp-chinned visage.

Presently, as the course began to fill, I recognized one or two acquaintances. My father's cousins (children of that aunt who lived far away from us in the country, and with whom I have mentioned my parents staying on a visit), the Cudberrys, were there—one son and three daughters—occupying a very odd vehicle, which I well knew by sight. It was nearly square,

with four seats inside and a roof supported by poles, whence depended leather curtains, which were closed when it was cold or rainy, but which now were furled back, and fastened by straps and buckles. This vehicle ("the sociable," it was called by the Cudberrys) was driven by a man in a drab-colored livery coat of enormous size. It was long and wide and heavy. The collar of it nearly smothered him. The cuffs of it were so ample that his hands were entirely concealed. The skirt of it hung over his heels. It must have been made for a man of exceptionally vast proportions. Its present wearer was rather short, with a very wide, red face—like a face reflected in the bowl of a spoon, I fancied—and red hair, surmounted by a stiff, glazed hat. Him, also, I knew; he was Aunt Cudberry's principal servant. His accomplishments were exceedingly varied, and ranged from "pitching" a load of hay to decanting a bottle of port, whenever Uncle Cudberry could make up his mind to have one opened, which was not very often. The young Cudberrys, as they were called, although Sam Cudberry, the eldest, was turned forty, and his sisters followed close upon him, made a remarkable contrast with the rustic and old-world air of their carriage and their coachman. They were dressed in extravagant imitation of those works of art on which one may feast one's eyes in the shop-windows of tailors and dress-makers. I never saw any thing alive clothed quite in that manner save the young Cudberrys, although I have many a time, when I was a child, gazed admiringly upon certain waxen effigies at the door of a clothing warehouse in the High Street, kept by a Jewish tradesman, which came near to rivaling Sam Cudberry in general effect. His sisters, too, were marvels of attire. I counted so many shades of color in Matilda Cudberry's garments within a minute or so, that I gave it up in despair of enumerating them all. The three sisters were very small and very lean, and they wore so much clothing, and that of so conspicuous a kind, that they themselves seemed lost and extinguished under it. They always gave me the idea of *inhabiting* their clothes, if I may use such an expression, rather than wearing them. They did not love me, nor my mother, nor my father, though for him they felt, I fancied, a kind of compassion. I don't know why, and I believe they did not know why, either; and my grandfather they actually detested. Nevertheless, catching sight of us, they alighted from the sociable and came toward us—Sam and Matilda and Henrietta and Clementina.

"How do, cousin? How do, Mrs. Furness? How do, Anne?" said Sam.

He had a natural, broad, country accent, which would not in itself have offended my ears, albeit they were used to a nicety of pronunciation in my mother and grandfather very rare in Horsingham. But to hear Sam Cudberry, conscious and ashamed of his tendency to talk his native dialect—overlay it, and smother it, and change it into a mongrel speech, ugly, like

every thing forced and strained, and vulgar, like every thing affected—was a trying thing. To hear him and his sisters mince and mouth their words, and to see the physical contortions of lip and jaw which attended their efforts, was a really dreadfully trying thing. At least, it was so to me. Mother was older and gentler and more tolerant than I was, and she bore it sweetly. For myself, I sometimes longed to make hideous grimaces; to roar out a word at the full pitch of my lungs; to scream with impatience, when I heard, Tilly, or Henny, or Clemmy Cudberry converse; but the worst of it was, that the more genteel and fascinating was their mood, the more did they think it necessary to twist and torture their native language. It sometimes positively became a mere mopping and mowing; and they had all loud, high-pitched voices. They were very genteel on this race-day. Sam, in particular, was of superfine gentility; and smelled of hair-oil to a degree that would have been unbearable any where but in the open air.

"Holloa!" said my father, good-humoredly shaking hands with them all round. "This is something new, is it not? I don't remember ever to have seen you at the races before."

"Oh, dear, Cousin George," replied Tilly, "we must make a beginning. I told ma, and I told pa, that our nursery days were over, and that we *must* begin to do a little like the rest of the world. Society has claims, you know."

If a stentorian peacock could be endowed with speech, I think he would speak like Tilly Cudberry. She pronounced "Oh, dear, Cousin George," "A-o-oo, de-o-ah, Cousin Jaw-arge." But I do not intend attempting to convey to the reader's eyes the mode of speaking with which father's cousins regaled our ears. He must imagine it for himself—if he can.

"To be sure: must move with the times, you know, as I tell the governor," observed Sam, in corroboration of his sister.

It occurred to me that the "times" (in Horsingham at least) had now been moving in the direction of the race-course for a considerable period. But I did not say any thing.

"I suppose," said my father, with an almost imperceptible embarrassment, "that you're not going over yonder, Sam, eh?"

He pointed to the Grand Stand. The betting-ring was there too, as I instantly and painfully remembered.

"What! to the ring? No, thank ye, George, my boy! No, no; S. C., junior, knows a trick worth two of that. No, no, no; not if I am aware of it. One of us is enough. The family will be well represented, eh? Ha, ha, ha!"

I felt as if I could have struck the booby, as he stood beside the carriage with his broad brassy countenance expanded into a grin at his own exquisite humor. I do not pretend that the feeling was not very wrong and very foolish on my part, and I knew it to be so then. But although, alas! my conscience is far from clear of wrong and foolish impulses at this present writing, I had still less cool wisdom and

self-command at twenty; which, my observation leads me to conclude, is not an altogether unparalleled state of things.

I suppose I looked as angry as I felt, for Henrietta observed, spitefully, "What a color you've got, Anne!" and then the three sisters giggled in chorus.

"Had you not better get into the carriage?" said my father, speaking to Tilly, Henny, and Clemmy, collectively. "It is higher, and you will see the course better than from the sociable. You can mount on the box, Sam; and, as you are not going to the Grand Stand, you can remain and look after the ladies. Mrs. Furness was just saying that she did not like to be without a gentleman in this crowd."

Shall I ever forget mother's face when he hurried away across the course, muttering something about "expecting to see a friend," and "having made an appointment!" The wistful glance with which she followed his retreating figure as he made his way through the crowd, towering above most of the men there, and the piteous efforts she made immediately afterward to look smiling and indifferent under the sharp unsympathizing eyes of the Cudberrys, are as vivid to me now as they were at that moment.

"I wonder you let George bet, Mrs. Furness," said Tilly, who generally took the lead in right of her seniority.

Mother put the observation quietly aside, and made room on the seat next herself for one of the girls. We were five women in the carriage, and though it was a roomy barouche, hired for the occasion, we were more crowded than was comfortable, owing to our cousins' voluminous skirts. I had vacated my place beside mother in favor of Clementina, who was the quietest and least fidgety of the three sisters; but Tilly turned her out of it immediately, and took it herself.

"Oh, dear, no!" she said, in her most peacock-like tones, and spreading out her gown, so as almost to overwhelm my mother, like a flood; "Miss Cudberry, if *you* please." (She frequently spoke of herself as "Miss Cudberry.") "No, no, Clemmy; it would look peculiar to see *you* in the post of honor and Miss Cudberry in the carriage."

Clementina submitted very quietly to the superior claims of "Miss Cudberry." Not that she would have allowed her elder sister to tyrannize over her; but they had made a sort of code of laws in the family—or rather the laws had grown up slowly by prescription and precedent—and, among them, the social supremacy of Matilda was a leading article. It was odd to me to observe how undoubtingly they assumed that these rules and regulations were as well known to the outer world as within the narrow limits of their family circle, and with what surprise and resentment they regarded any breach of them by unconscious strangers. They had lived in a very secluded house, and in a very secluded manner, until

quite recently; and being the principal persons in their own village, were not prepared to find their greatness unrecognized elsewhere. I fear that I was partly responsible for the infliction on Horsingham society of the three Misses Cudberry; for from the date of the dancing-party at Sir Peter Bunny's, of which I have slightly made mention, they made high resolve to participate in similar gayeties, and pursued their object with very frightful energy. "It seems so ridiculous, you know," said Henny, who was perhaps the most spiteful, although not the most demonstrative of the three sisters, "so truly incongruous, that *you*, little Anne Furness, as we were calling you only the other day, should visit people we have never been introduced to! And go to a ball, too! We laughed so at home when we heard it."

I had been brought up in great reverence for the laws of hospitality; and I felt that, so far as such considerations were concerned, my father's carriage was the same as my father's house, and I therefore refrained from uttering a sharp retort that rose to my tongue. But if the reader supposes that I felt otherwise than indignant and contemptuous toward my cousin, he gives me credit for more gentleness and amiability than I ever possessed.

Meanwhile Tilly was talking at the full pitch of her voice to Flower, who stood at the carriage-door eying her with a cool insolence, of which, I think, she was wholly unconscious.

"Flowah, Flowah! Do go and see for our sociable! I can't think where it is! Our sociable, you know. Mr. Cudberry's sociable, of Woolling. We came with our man-servant. Our man-servant is called Daniel. Tell him to draw the sociable up in line with the other carriages directly, because we shall perhaps be going back to it, and if he delays we sha'n't get a good position. And, Flowah, tell him to go next a gentleman's carriage. I will *not* be next that donkey-cart. I know it's a donkey-cart, for I saw the donkey as we passed it on the road. Daniel his name is. Mr. Cudberry's man-servant, of Woolling."

"I know him, miss," responded Flower. And if he had said in plain words, "I know him; he is too ridiculous an object in his livery-coat to be mistaken for any body else," he could not have conveyed more distinctly (to my apprehension, at least) that that was his real meaning.

Tilly, however, continued to utter loud directions to be given to her "man-servant" in a screaming tone, which might have been designed—as perhaps it was—to attract the attention of the whole course to the fact that Mr. Cudberry of Woolling's sociable, in charge of Mr. Cudberry of Woolling's servant, was on the ground, until her attention was seized and her speech arrested by seeing me bow to Lady Bunny, whose carriage had but newly taken its place in the rank not far from us.

"The Bunnys?" she demanded, instantly fixing her eyes on them, with no more hesita-

tion than if they had been so many wax-work effigies, incapable of embarrassment.

"Hush!" I exclaimed, almost involuntarily. "Yes; that is Lady Bunny."

Almost as I spoke Sir Peter Bunny alighted from his carriage, and came toward us, accompanied by a gentleman. I knew the gentleman by sight. I knew his name, too. I had danced with him at the ball. He was an officer, whose regiment was quartered in a small town not far from Horsingham.

"Mrs. Furness," said Sir Peter, raising his hat, "may I have the honor of presenting to you my friend, Mr. Lacer? Ensign Gervase Lacer, of her Majesty's —th regiment of foot," added Sir Peter; and I felt unreasonably ashamed of his doing so, and wished he hadn't, and wondered if Mr. Lacer guessed why I colored—as I felt that I did.

My mother saluted the new-comers with her own sweet and unaffected grace. She remembered having had the pleasure of seeing Mr. Lacer at Sir Peter's house, she said, although he had not then been introduced to her. I could see what a favorable impression her manner and her beauty—for though paler and more anxious-looking than she used to be, she was still very beautiful—made on Mr. Lacer. And I perceived, or thought I perceived, that he was surprised as well as pleased to find me so superior in refinement to the bulk of Horsingham people. And I felt—again quite unreasonably—half vexed, half triumphant at so perceiving.

"Introduce me!" said Tilly, in a loud whisper, and nudging my mother with her elbow.

There was no help for it. "Sir Peter Bunny, I think you have met my husband's cousins?" said mother, gently. "Miss Cudberry"—"Of Woolling," prompted Tilly, parenthetically—"Miss Henrietta, and Miss Clementina Cudberry."

"Don't leave me out, Mrs. George!" called Sam, from his elevation on the box. Sir Peter and Mr. Lacer looked up, and Sam took his hat off with a flourish. Mr. Lacer's stare at him was, I felt, neither polite nor flattering; but Sam evidently conceived himself to have made a very favorable impression. The course was now becoming very crowded, and the hour fixed for the first race of the day was rapidly approaching. Sir Peter proposed to take me back with him to his wife's carriage. Barbara was there, he said, and Lady Bunny had charged him to get Mrs. Furness's permission for me to join their party. I hesitated, and looked at mother. "Go, my love," she said, "since Lady Bunny is kind enough to wish it." I took Sir Peter's arm, and went with him. Even now, when I think of it, I feel a stab of self-reproach. It was selfish, it was almost cruel, to leave mother alone with those hard, uncongenial women, to bear and conceal a thousand anxious thoughts about my father as best she could. Mother—God bless her!—forgave me then and there. Nay, I believe she would not have admitted there was any thing to forgive.

Her maternal love demanded the sacrifice of no wish, or caprice, or self-indulgence from me. But my conscience was not to be hoodwinked, and it made me uneasy at intervals all the day.

Mr. Lacer remained for a few minutes at the carriage-door speaking to my mother. And Sir Peter and I must have been quite a long way off when we heard Tilly Cudberry's voice screeching to Mr. Lacer, with great vivacity, "Do just be kind enough to try if you can find it. Flowah has disappeared! Mrs. George, where *can* Flowah be? Inquire for Mr. Cudberry of Woolling's sociable, Mr. Lace-ah! And for our man-servant, Daniel. Mr. Cudberry's man-servant, Daniel—of Woolling!"

CHAPTER X.

LADY BUNNY and Barbara received me very kindly. They had a handsome roving carriage, and a great hamper full of good things to eat and drink, and it was decidedly more comfortable to be with them than squeezed up as the fifth in a barouche, of which three other occupants were the Misses Cudberry.

Lady Bunny was a handsome, portly woman, with a slow, placid manner. She wore her hair—still of a clear brown color, untouched with gray—in a row of short, loose curls all round her head. This I remember thinking very odd and incongruous when I first saw her, I being then a little girl at school. But the impression soon wore off. And in no other particular, either of manner or dress, did Lady Bunny affect juvenility. Barbara was very like her mother. She had the same large light blue eyes, the same fair complexion and dimpled chin. She, too, wore her hair in a single row of short curls, and looked altogether like a small copy of Lady Bunny; for Barbara, though plump, was short, and built on a much less massive scale than her mother.

"I would have got Sir Peter to ask Mrs. Furness to favor us, my dear, but I see she has company," said Lady Bunny. She raised a large double eye-glass to her eyes as she spoke, and contemplated my cousins with her usual deliberate quietude.

"Those are my father's cousins, Lady Bunny, the Misses Cudberry."

"Of Woolling," added Mr. Lacer, who had by this time come up to the carriage. He gave me so comical a glance as he said the words that I could not refrain from smiling.

"Ah, sure!" said Lady Bunny. "And Mr. Furness, where is he, my dear?"

"I don't know—I—I—mean, I think he is over there."

"On the Grand Stand, my dear?"

"Perhaps. I am not sure. No, Lady Bunny, he is in the betting-ring, I think."

Lady Bunny said no more. But she raised her double eye-glass again, and looked this

time at my mother. And placid as Lady Bunny's face was, I could discern some traces of trouble and compassion on it as she did so.

"I think," said Mr. Lacer, "that I have had the pleasure of meeting Mr. Furness several times." He was leaning with folded arms on the carriage-door. He was on the side next me. The others were watching the clerk of the course, as he cantered up and down, scattering the crowd, and the general confusion of "clearing the course." And I think they did not hear what Mr. Lacer was saying. Indeed, I am almost certain that they did not, for he spoke in quite a low voice.

"Where have you met father?" I asked. I, too, spoke in a low voice, I am quite unable to say why. I am very sure that it was not because I feared being overheard.

"Oh, at—several places. Does he not go to the races at W—— sometimes?" naming our county town.

"He has been once or twice, I believe."

"I have never seen Mrs. Furness with him there."

"Mother never goes to the races at W——."

"Nor you?"

"No."

"You look, Miss Furness, almost as if you—"

"As if I what?"

"As if you disapproved of races. There was quite a severe expression on your face." Mr. Lacer laughed as he said it, but not rudely—only merrily, I thought; but the subject was one on which it was impossible for me to feel merry—mother's wistful face came too vividly into my mind. Mr. Lacer watched me attentively. I did not *see* that he did so, for I did not look at his face, but I felt it.

"They are going up to the starting-post," said he, looking at two or three bright-colored specks that were moving gently over the course at some distance. "Will you risk a pair of gloves on the event, Miss Furness? I will give you the field against Butterfly."

"Oh no, thank you! I never bet," said I, with what seemed, I dare say, ludicrous earnestness. He must have thought me the most unsophisticated of provincial school-girls, or the most affected. Mr. Lacer bowed and smiled, and then, as the race was just about to begin, he mounted on to the box, where Sir Peter was already seated.

This first race was by no means one of the important events of the day. When it was over the crowd poured over the course again, and the itinerant jugglers, mountebanks, musicians, and fortune-tellers began to ply their respective trades. I looked out anxiously over the moving mass of heads to try whether I could descry my father. I hoped that, now the race was over, he would rejoin mother. I knew how she would be longing to have him by her side again, away from that surging, roaring, horrible mass of men in the betting-ring. To me there seemed something infernal in their vehemence and excitement. Pleasure or amuse-

ment there was none within that inclosure: merely a hideous, reckless lust of money, that sparkled in their eyes, and flushed their eager faces, and gave a loud, brassy tone to their shouting voices. It was a pitiable and degrading spectacle, I thought, to see these human creatures selling their very souls on the hazard of Blue Jacket or Red Jacket, following every bound of the panting, straining horses with wolfish eyes, and saluting the victor with almost wolfish howls. It shocked and revolted me to know that my father was among this crew. And the bitter knowledge I had of mother's pain of mind did not dispose me to look leniently upon the scene. True, father had promised not to bet; but, alas! it was some time since I had felt that no reliance was to be placed on his word in that respect. Mother felt it, too: she had ceased to boast of her implicit trust in her husband's promise. In her love and fidelity to him—poor mother! *how* loving and how faithful a heart hers was—she forbore to utter a syllable of complaint even to me; but the subject of father's promise, and father's stanch adherence to his plighted word, was, by a tacit and instinctive understanding, entirely avoided between us.

Lady Bunny observed my wandering gaze. "Are you looking for any one, my dear?" she asked.

"I thought that perhaps father might be going back to our carriage now."

"Do you want Mr. Furness?" said Mr. Lacer, jumping down from the box. "Let me go and look for him: may I? I know him very well by sight."

"Oh, it isn't for myself, but I know mother will be—" I began, and then I stopped short, confusedly. He did not seem to notice my confusion; but I knew beyond doubt that he had noticed it, and that he instantly began laughing and talking with the others, in order that they might not observe my flushed face, and eyes in which tears were painfully brimming up, and only kept from falling by a strong effort, and I felt very grateful to him. Lady Bunny and Sir Peter were busily superintending the unpacking of a huge hamper. Barbara was exchanging nods and smiles with some friends on the opposite side of the course; but even if their attention had not been thus occupied, it would speedily have been distracted from me, even supposing they had been interested in observing my tell-tale face before, which was not likely, by the arrival of Tilly Cudberry, who advanced to the carriage-door with her peculiar, jerky little walk, leaning on her brother's arm. It was impossible for any being, unless it were a person afflicted (or blessed!) with total deafness, to ignore Tilly Cudberry's presence for many seconds.

"You abominable creature!" she exclaimed, shaking her finger at Mr. Lacer. The words were intended to be playful, but the voice in which they were uttered was so alarmingly suggestive of the peculiar tone of badinage known

generically as "Billingsgate," that Sir Peter Bunny and his wife looked up from the hamper quite scared, and their servant very nearly let fall a bottle of Champagne which he was in the act of unwiring.

"Meaning me, Miss Cudberry?" said Lacer, with a comical face of dismay.

"Oh, I dare say, you faithless wretch, you! It's no use putting on that innocent look—not one bit of use! Didn't you say you were going to find the sociable, and Daniel, our man-servant? And then you disappear like I don't know what, and leave us in despair! Perfect despair!"

I shall never forget the screech with which she uttered the last word. It rings in my ears, when I think of it, to this day.

Lady Bunny appeared quite bewildered. As to Barbara, she was choking herself with her pocket-handkerchief in order to prevent an explosion of laughter.

"Dear, dear, what is the matter?" said Lady Bunny, in a mildly reproving tone. Mr. Lacer explained that he had endeavored to find the "sociable" and the "man-servant," but had failed. He added that he would take the present opportunity of the interval between two races to make further search for them. Just as he was moving away he said to me, very quietly, "I shall tell Mr. Furness that your mother is without a cavalier, and get him to come back to the carriage." He evidently did not suppose that Mr. Cudberry would desert her as he has done. I thanked him by a silent gesture of the head. I admired his quickness, his self-possession, his good-natured consideration for mother. I had seen so little of the world that Mr. Lacer, with his easy, self-assured manner, which was not to be ruffled even by Tilly Cudberry, seemed to me a very superior being—one to be relied on, and believed in implicitly. Had he been loud, or coarse, or obtrusively complimentary, I should have shrunk from him with my old dainty shyness. But he was really kind, and full of tact, and he had already established, I scarcely knew how, a sort of confidential understanding with me on the subject of my father's besetting sin; and yet we had said no word to each other save such as I have laid before the reader. Still, my faith in Mr. Lacer's *savoir-faire*, great as it was, scarcely led me to hope that he would succeed in bringing father away from the neighborhood of the Grand Stand. I was, therefore, agreeably surprised to see him presently emerge from a knot of people gathered round a conjuror, and walk toward our carriage arm in arm with my father. I kept my eyes fixed on mother's figure, and although I could not, at that distance, discern her face distinctly, I saw the little joyful start of surprise she gave when father, whom she, sitting with her head turned toward the opposite direction, had not perceived approaching, touched her hand to attract her attention. And my heart was filled with tenderness and compassion for her as I saw it.

Meanwhile Miss Cudberry and Mr. Sam Cudberry had made acquaintance with Lady Bunny and Barbara, and were conversing with them after their own engaging fashion. Lady Bunny was the most hospitable creature in the world; and, although I could plainly see that these cousins of ours excited wonder and alarm in her breast, she could not allow them to stand by while the contents of the hamper were being consumed without inviting them to take a seat in her carriage and a share of the good things. The place in the carriage Tilly accepted with alacrity, and she did justice to the solid viands. But on being offered a glass of Champagne she protested, with a cry like that of a huntsman giving the view-hallo, that she never touched wine—neva! and, not content with simply declining, she made a face expressive of the utmost disgust, as though these troublesome people were endeavoring to thrust upon her something unspeakably nauseous. Whereat Lady Bunny's large blue eyes grew larger than ever.

Sam, however, was not under any such restraint as his sister, and he drank so much wine, and became so convivial, that I was quite miserable, dreading lest he should disgrace himself beyond forgiveness.

"Well, little missy!" said my cousin Tilly, playfully waving the leg-bone of a chicken at me previous to depositing it, cleanly picked, on her plate, "and how do *you* get on? We were so amused, Lady Bunny, to hear of Anne's being at a ball at your house!"

"Were you?" said Lady Bunny, simply. "Dear! Why?"

"Oh, my goodness, I don't know! But there is an absurdity in the idea to *us*, which I dare say you can hardly understand. Gracious!" Here followed a wild peal of laughter, in which nobody joined, for the excellent reason that none of us had a conception what had excited it. Presently she proceeded: "But Anne always was the funniest little frump of a thing. Little Frumpy we used to call her at home. We are dreadful quizes, you must know, Lady Bunny. It's quite a family trait." No one responding to this sally either, Tilly looked once more at me, and exclaiming, "Oh, you queer little creature!" went off into a fit of laughter behind her pocket-handkerchief.

Barbara Bunny here lost patience and blurted out, with school-girl abruptness, "Little! Why, Anne's quite tall: she's a head and shoulders taller than *you*, at any rate!"

Tilly changed the subject. "What a nice creature that Mr. Lacer is!" she said. "Such a military figure! He was quite delighted to make our acquaintance."

"Was he?" began Sir Peter, and then stopped and altered his phrase into "No doubt he was!"

"Oh, delighted! Woolling—our place is at Woolling—in fact, we are *of* Woolling: Cudberrys, of Woolling—is only five miles from where his regiment is stationed. You may fancy how he jumped at it when I said I was

sure Pa and Ma would be glad to see him, and that there would a knife and fork for him any time he liked to call. Because, as to society, gracious, Lady Bunny, I suppose there's *nothing* but tradesmen's families where he is quartered?"

Poor Lady Bunny colored a little, but quite coincided in Miss Cudberry's opinion, that association with "tradesmen's families" was not to be thought of. She was a good woman, and in most things a perfectly sincere one; but on the point of gentility she was weak. Sir Peter professed himself even more shocked and sympathetic for Mr. Lacer's forlorn position in being quartered amidst such abomination of desolation as was involved in having tradesmen's families for his sole society. And yet Sir Peter, who was an honest, well-principled man in the main, had stood behind a grocer's counter with linen sleeves on, in his father's shop, before he took to selling malt instead of sugar, and so made his fortune. These anomalies perplexed and vexed me greatly in those days.

Sam broke in with enthusiastic praises of "Lacer." Lacer was a top-sawyer; Lacer knew a thing or two; Lacer and he, he foresaw, would become great chums. He was more than half tipsy by this time, and was becoming so thoroughly odious, with his natural stupid coarseness peeping through the thin varnish of vulgar finery with which he had overlaid it, that even his sister began to think it possible that the Bunnys might have too much of him if he remained longer. Of herself she never conceived that any society could have too much. She therefore declared that she must return to her cousin George, and send Sam to find the sociable and Daniel; for it was getting late, and they should only remain for one more race, *the great race*. And with many voluble and vociferous adieus to the Bunnys, and holding out the encouraging hope that it would not be long before she paid them a visit, she seized her brother's arm and dragged him off.

"Your cousin's very—lively," observed Lady Bunny to me; "but a little—ahem!—a little sharp in her manners, isn't she?"

"I think she is very rude, Lady Bunny," said I, bluntly.

"Oh, come, come, come!" said Sir Peter, smiling, "don't be severe, Miss Anne; don't be severe." Then turning to his wife, he added, "A good old family, my lady. A well-known name. Cudberrys, of Woolling, have been on their own land from father to son for two centuries and a half."

I saw no more of Mr. Lacer that day until just as we were about to leave the course. I had observed, with almost as much surprise as thankfulness, that father remained in the carriage with mother during the rest of the day; and I therefore was prepared for the beaming face with which my darling mother greeted me when Sir Peter escorted me back to her. Mr. Lacer came up to say "good-by" as we were driving off.

"See you to-morrow, Lacer," said my father, so familiarly that I stared at him. But the other took it quite as a matter of course, and merely nodded.

"I didn't know, George dear," said mother, "that you had invited Mr. Lacer to Water-Eardley for to-morrow."

"No, I have not done so. I shall see him in—in Horsingham. All right, Flower, go on."

I noticed with much indignation that Flower, in touching his hat to Mr. Lacer as we drove away, bestowed on him a broad grin and a grimace that was almost like a wink. But I concluded that he had been drinking. The last sound which saluted our ears as our wheels left the turf of the race-course for the road, and which rose above all the mingled din of the crowd, was Tilly Cudberry's voice, screaming, "Do be so good as look for a sociable! Mr. Cudberry's sociable, of Woolling! And for a man-servant, answering to the name of Daniel" (as if he had been a dog), "Mr. Cudberry's man-servant, of Woolling!"

CHAPTER XI.

A WEEK OR so after that race-day I was sitting engaged with some studies for Mr. Arkwright in mother's little morning-room, when the door was opened, after a preliminary tap—a loud and aggressive kind of tap, which seemed not so much to ask admission as to demand it peremptorily—and Mrs. Matthew Kitchen walked into my presence. I do not think she had been to Water-Eardley more than twice since her marriage; and on each occasion she had come with a broad hint that she expected a present. The first time was when she announced to my mother that she was getting her baby-clothes ready, as she expected to be confined within a short time. That announcement induced mother to give her a handsome hood and a piece of fine linen. On the occasion of her second visit, Mrs. Kitchen brought her baby, and informed us that it was just going to be baptized in Zion Chapel, and that old Mr. Green, the child's great-grandfather, had behaved "very handsome" in the way of gifts to the infant. Father was present when this was said, and I saw him wrap a sovereign in a piece of paper and slip it into Mrs. Kitchen's hand, begging her to buy the little one some trifle with it. I had nothing to give; but if I had been mistress of a whole silversmith's shop full of christening gifts, I would not have bestowed one of them on Selina. I felt as if it would be a piece of hypocrisy on my part to do so, there being no emotion of kindness toward her in my heart.

"How do you do, Selina?" I said, looking up from my books in some surprise as she entered.

"I am very well and hearty—I'm thankful to the Lord," she answered.

And indeed she looked strong and thriving. She was buxom and bright-eyed as ever, but her countenance seemed to me to have grown harder without looking older. She had very handsome clothes on, and wore a gold watch fastened outside her waist-belt.

"It is a long time since we have seen any thing of you," said I, rather at a loss for conversation.

Selina seated herself in an arm-chair uninvited, and folded her hands on her lap before making answer. "Ah, so it is. I'm a busy woman. I have duties. My husband he is a busy man, and he expects me to do likeways."

"I suppose so. Every body has duties."

"Now, Miss Anne, don't you go to take offense because I spoke of my duties. You always was apt to take offense from a little thing. How's your mother?"

I explained to her that mother was not very well—was suffering from a nervous headache, and could not be disturbed. She received this news very coolly, having lost none of her old insensibility to other people's troubles, and then began to inquire for father, and grandfather, and Eliza, and Keturah, and, lastly, for Mrs. Abram. They were all well, I said shortly. Upon this she commenced favoring me with a kind of homily upon the "lukewarmness" of my family in general, and my grandfather in particular. She herself, she averred, had been "lukewarm" in former days—when she lived in a "lukewarm" family, in fact. And she delicately implied that, had she been prematurely cut off in that tepid condition, she considered that the guilt of it should in justice have been laid at our door. But now, Providence having specially interfered to "snatch her"—these were her words—she was happy to state that she was quite comfortable as to the future prospects of herself, her husband, and her little boy. Respecting the insignificant remainder of the human race, she confessed that she was *not* quite comfortable. Long before she was half-way through this discourse, I had signified to her that I was occupied, that I had some studies to prepare for the next day, and that if she had nothing to say but in that offensive strain, I should take leave to busy myself with my own concerns, and withdraw my attention from her altogether. But this made no difference to Selina. She talked on, and I sat with my eyes fixed on my book, but totally unable to fix my mind there too. I was burning with indignation, and I could not choose but hear the woman's ignorant folly, strongly spiced with malice. Why should she feel maliciously toward me and mine? I asked myself. She owed us nothing but gratitude. As the word shaped itself in my thoughts, it recalled to me Keturah's stern saying, that Mat Kitchen's "natural man" was a man that hated to be grateful. To any cool auditor—which I was far from being—I doubt not that Selina's tirade would have appeared exquisitely ludicrous. She had caught up certain phrases from the

Zion Chapel preacher, and certain phrases from her husband, and jumbled them all together with her own peculiar modes of speech. The incongruity between the fire and fury of some of these sayings, and the stolid calm with which Selina brought them out, was extraordinary.

When she had tired herself with talking, or when, more probably, she thought that for other reasons of her own it was time to bring her visit to an end, she ostentatiously turned her gold watch-face outward, and declared that she must be thinking of going. The efforts she made to see the face of the watch, and the difficulty she had in doing so, in consequence of the watch being securely fastened to her belt by means of a great gold hook, reminded me of my own old struggles with my pocket-handkerchief.

"Will you not have something to eat, Selina, before going back?" said I.

"Yes, I will," she answered, promptly. "I'll take a glass of beer and a bit of cold meat, or whatever they've got in the kitchen."

I rang the bell and gave the necessary orders. Before Selina left the room she held out her hand to me.

"No, thank you, Selina," said I, "I don't feel inclined to shake hands with you."

"Now that's your pride, you see," she retorted, shaking her head. She did not frown, or flush, or show the least discomposure. "You always was proud, from quite a little thing."

"It is not pride that makes me refuse to shake hands with you, Selina; or, at all events, it is no greater and no different kind of pride than I shall show to any of my acquaintance under similar circumstances. I think that you had no right to come here and speak to me as you have done. I think you did not mean what you said kindly, and I resent that."

"Ah!" said she, still perfectly unruffled, "that's the carnal nature, that is. You can't bear to hear the truth, you know. I ain't offended with you, Miss Anne; nor my husband won't be offended when I tell him. I might ha' been the same if Providence hadn't snatched me, only as I never had your temper, nor your pride, nor your height. You always was short-tempered, and proud, and high from a child. Remember me to your mother, will you?"

And with that Mrs. Matthew Kitchen rustled out of the room. I sat gazing at my book for some time after she had made her exit; I do not know for how long, but it seemed a long time; and I woke up suddenly to the consciousness that I had not understood one syllable of what my eyes had been resting on. I rose and put away my books and papers, intending to return to them later in the day, and went out into the garden. From the garden I wandered on into the river-side meadows, and walked as far as the present confines of our land. Then I turned, and was strolling slowly back toward the house, when I saw two figures emerging from the stable-yard. The stable-yard was a

part of our premises that I never visited now. I had sometimes done so in the days when Dodd reigned there. But since Flower's arrival I had never set foot within those precincts. Neither was father apt to visit his stables since the sale of his hunters. There was nothing there for him to take pride in. Nevertheless, one of the two figures emerging from the stable-yard was my father's. The other person I discerned, to my great surprise, to be that of Kitchen. Mat Kitchen, like his wife, was well clad. He wore shining new black broadcloth, and a shining new black hat. And his hair, and his whiskers, and his eyes were black and shining, to match his attire. But his pouting mouth and his short snub nose were as expressive as ever of sullen obstinacy, and contradicted the general sleekness of his aspect in a forbidding manner.

The two men did not see me at first. They were talking earnestly; or rather, my father was talking, and Matthew was listening. I heard the former say:

"I'm sure *you* could manage it for me; and as to risk—where's the risk? What risk can there possibly be? I have shown you enough to—"

Here Matthew interrupted him, saying, in his deep, growling voice, "It don't depend on me, Mr. Furness. Showing *me* and convincing *me* ain't the question. Grandfather Green is a close man. A religious man and a godly man he is, but close, Mr. Furness. Nor he ain't soft, ain't my grandfather. He looks after his percentage, Mr. Furness, in a way that at his years is surprising. And as to security—I never knew Grandfather Green wrong with his security. Sometimes it comes over me like as though it might be a special providence in his favor. For you do see the unescutest done in spite of all their worldly cunning, Mr. Furness. But Grandfather Green he has the wisdom of the serpent along with the guilelessness of the dove—in a script'ral sense—and I never knew him done yet, Mr. Furness."

At this point Mat Kitchen became aware of me, and, breaking off his speech to my father, said, "Good-day to you, miss," in the same sullen, growling way that he had been talking in all along.

"Where is Mrs. Kitchen, Anne?" asked father, in an odd, flustered manner. "I thought she went in to have a chat with you while her husband and I looked at the pony-chaise. Do you think that little matter can be managed, Matthew?"

"It may be patched up for a bit," returned Matthew. But I did not believe him to be speaking of the pony-chaise.

It was all so odd and disagreeable that I drew a long breath of relief when these people took their departure. They drove away in a high old-fashioned gig, drawn by a tall, bony, ancient horse. I recognized both gig and horse as belonging to Mr. Green, the coach-maker. I had often seen the old man driving about Horsingham in it.

"How smart Selina is," said I to my father, as we stood side by side at the gate, watching the retreating vehicle jolting along the road. "I suppose her husband is prospering very much."

"Hah! yes," murmured my father, absently.

"I never was fond of Selina, father, as you know. And I think her rise in the world has made her quite unbearable."

"Eh?" said father, sharply, turning full on me.

I told him of Selina's homily, and my refusal to shake hands with her. He flushed a dark red, as he did when he was very angry. For a minute or so he did not trust himself to speak. Then he began to scold me furiously. Why had I been such a fool as to care what the woman said? Why could I not have been civil, and held my tongue? Did I know what mischief I might have done by my cursed missish airs and pride?—had done, perhaps! For who could tell how Matthew would take it? This was what I learned at Mortlands! This was my grandfather's doing! Dr. Hewson was not content with flying in the face of all—father hesitated for a word here—of all established ordinances himself, but he must get *me* talked to, and lectured, and hectored by an ignorant, brazen hussy, who was my servant the other day.

I was greatly astonished to discover that, while my father so hotly upbraided me for not having been civil and friendly to Selina, he was at the same time violently angry with her for her impudence and presumption. I bore my scolding in silence, however, and after a while father cooled down. He walked away, stopped, hesitated, and came back to me as I still stood leaning on the gate. "Look here, Anne," he said, "the best thing for you to do will be to keep out of Selina's way whenever—if ever—she comes here again. You can do it quietly, without being markedly rude to her. I have a reason for not wishing to offend that sulky beast, Mat Kitchen, just now. I tell you that in confidence, Anne. Do you understand?"

"Yes, father."

"Give me a kiss, and let us say no more about it." He stooped his tall form to kiss my forehead. It seemed to me then a long, long time ago since I had been so small that father's stooping had to be supplemented by my standing on tip-toe in order to reach his lips. Now he had to bend but a little way, for I inherited his straight, upright figure, and was rather above the middle height of women.

I returned to the morning-room, but not to my interrupted studies. I could not fix my mind on them. Mother was still lying in her darkened chamber, a prey to a violent nervous headache, and the only thing that care and affection could do for her in these crises was to watch that she was undisturbed, and to leave her quite alone. So there I sat by myself, looking out on the gray autumn sky and the rotting leaves, and thinking—or rather dream-

ing—sadly enough, when there arrived by the Horsingham carrier a letter for me from my grandfather. The sight of his handwriting revived my spirits like a cordial. He had been wishing to come to Water-Eardley, he said, but had been, and still was, busy with a great many fever cases among poor families in a low part of the town. However, he hoped to see me at Mortlands soon. He had had pleasant news. Donald—I remembered Donald, of course—Donald Ayrle was coming to stay with him. It was to have been a mystery and a surprise; but he, grandfather, hated mysteries and surprises. He would tell me particulars when we met.

I have mentioned that my recollection of my old play-fellow, Donald, had been fading rapidly during the latter years of my school life. It had faded still more since then. But on this mention of him, and this unexpected prospect of seeing him again, I began to rub up the magical lamp of memory, and to summon the genii of the past.

I believe I had got as far in my recollection as our joint discovery of the North Pole, when the door was opened, and the parlor-maid announced my second visitor that day,

"Mr. Lacer."

MADAME MÈRE.

LOOKING out, on a golden morning, from the windows of a castle above the gardens of Genoa the Superb, one may see on the southern horizon the purple mountain summits of an island not more than a third larger than our little State of Delaware, rising from the bosom of the Mediterranean Sea. Imagination never created a wilder fairy-land. Along its eastern borders stretches a range of granite hills, whose loftier summits, clad in everlasting snows, tower skyward full eight thousand feet. Where they slope westward and melt into the marshes of the coast, uplands, covered with grand old forests, intervene; and in sweet, sheltered valleys are rudely cultivated fields and vineyards, with groves of fruitful orange, olive, date-palm, pomegranate, fig, and citron trees. No navigable streams flow out of the island, and not many large towns intrude upon the attention of the lover of nature in its wildness, grandeur, and beauty.

This island was the Cyrenus of the Greeks, and is the Corsica of our time. Ligurians, Etruscans, Romans, and Carthaginians, and people of various nationalities of modern Europe, have successively occupied it. For centuries the Tuscan tongue has uttered the thoughts of the people, and the Italian Church has satisfied their spiritual wants. A hundred years ago the French seized the island by honest force. Afterward the English acquired sovereignty over it by cunning and perfidy. For more than fifty years it has been a province of France. It has a history as romantic

as an Eastern tale. Its daughter, Madame Mère, has made it immortal in the story of the human race.

In Ajaccio, the capital of Corsica, is a spacious stone house, upon which travelers look with profound interest. In it dwelt, a century ago, a young married couple, named, respectively, Carlo and Letitia. No seer thought of uttering a prophecy of their special eminence in the affairs of the world. The husband was descended from an ancient Tuscan family of noble blood, whose root was in Rome in the Dark Ages—a family conspicuous in the savage wars between the Guelphs and the Ghibelines, which so long desolated some of the fairest portions of Italy; and also in letters of the era of the Medici. The wife was one of the line of the Counts of Colalto, an ancient family of Neapolitan Italy, whose first representative in Corsica was son-in-law of the Doge of Genoa. The husband, at their nuptials, was a youth of nineteen years; the wife was a maiden of sixteen years. He was handsome, wise, and accomplished; she was one of the most beautiful and fascinating of all the girls of Corsica. He had been carefully and severely educated at Pisa and Rome, and soon won the honorary degree of Doctor of Laws; she had been as carefully instructed at home and in a Corsican conventual school, in which moral and religious discipline was the paramount consideration. From earliest childhood *strength* was expressed in every feature of her character.

That pleasant home at Ajaccio was an Eden for the happy pair. But Satan, in the hideous features of war, disturbed it. For a season the energetic Pasquale Paoli, who had driven hostile Genoese from Corsica, had kept the island free from civil war and foreign invasion. He was the government, and sought to elevate the people. Out of anarchy he evolved order. He encouraged industry of every kind, established a public printing-press, and founded a university at Corté. He invited Rousseau to come from France and frame a republican constitution for Corsica; and so wide was his fame as a patriot, a soldier, and a statesman, that distinguished men from the Continent, and even from the British Islands, paid court to him. The young dwellers in the modest home in Ajaccio were his favorites in his hours of repose from public labors.

Again the Genoese, in fulfillment of a bargain with France, attempted to garrison the ports of Corsica. Paoli baffled them. The French king was enraged, and sent Marbœuf and Chauvelin, with many troops, to seize the island. Paoli sounded the clarion for recruits. Patriotic young men flocked in eager troops to his standard. Among them was Carlo, who forsook his law books and sachel, took position on Paoli's staff, and on every occasion showed himself worthy of his leader's confidence. The French were beaten back in several encounters, and would have been driven to their ships or into

the sea, had not the Count De Vaux landed on the island, early in 1769, with twenty-two thousand men, and overwhelmed Paoli with numbers and weight of metal.

When Ajaccio was threatened the people fled to the wild interior. Carlo met his darling Letitia and their baby boy on horseback, almost at the head of the fugitives. She was not unaccustomed to perilous rides, for she had frequently accompanied her husband in wild expeditions, when the French scouts, the previous year, were spreading over Corsica. In the dark recesses of the spurs of the great Monte Rotondo, whose hoary head is almost ten thousand feet above the waters of the sea, they found shelter. There Letitia suffered much from unaccustomed privations, for she was soon to be a mother again; but her brave heart never quailed before danger or pain. Self was merged in her husband and children.

The French were victorious every where. Paoli was compelled to fly from his beloved Corsica. Carlo accompanied him to Porto Vecchio, where he was tempted to embark with his leader for Leghorn. He would not leave his wife and child; so he returned to their retreat in the shadows of the great Monte Rotondo. The French were lenient when the prize was won. Carlo and his family were allowed to return to their home in Ajaccio; and Corsica, as a French province, was soon quiet and peaceful. In the local magistracy that was established by France for the government of Corsica Carlo became a prominent and influential member, for he was an eminent lawyer.

On a hot day at the middle of August, not long after the return to Ajaccio, Letitia, as usual, attended mass in the parish church. There she was suddenly taken ill, and was borne to her home, where, upon a couch covered with a piece of old tapestry, on which warlike scenes from the Iliad were depicted, she gave birth to her second son. Her first-born, whose nativity was at Corté a year and a half before, was named Joseph. To her second son she gave the name of Napoleon.

And so it was that Corsica became the birth-land of the great French Cæsar, for Carlo Bonaparte and Letitia Ramolini were his parents. They had loved and been betrothed when she was only fourteen years of age; but their families were active political antagonists, and the marriage was deferred for about two years, when the Paoli party, to which Carlo belonged, became absolute masters of Corsica, and active strife ceased. They were wedded in 1766 by the archbishop, and received the blessing of her parents at the nuptials.

Count Marbœuf, the conqueror, was made Governor of Corsica, and Carlo Bonaparte and his family were highest on his list of personal friends. Ten years after that conquest the Corsican nobles sent Carlo to Paris as their representative in the popular branch of the imperial government of France. Leaving Letitia in charge of their growing family, he took Joseph

and Napoleon with him. They crossed the sea to Leghorn and journeyed to Florence, where Carlo received from the Grand Duke, Leopold, a letter to his sister, Marie Antoinette, the Queen of France. She made Carlo a welcome guest at Versailles, when Napoleon, then ten years old, first looked upon that gorgeous palace of which he was afterward the master. Carlo left Joseph in a school at Autun, and through the influence of Governor Marbœuf he was allowed to place Napoleon in the Military Academy at Brienne, where the afterward eminent Pichegru was one of his instructors.

Six years later a heavy weight of misfortune fell upon Letitia. Carlo was attacked by the same disease which terminated the life of his most illustrious son at St. Helena thirty-six years afterward. He went alone to Montpellier, in France, for advice and remedies, and there he died, in 1785, under the hospitable roof of a girlhood companion of Letitia, the mother of the celebrated Marshal Junot.

When Carlo died Letitia was not thirty-five years of age, and had been the mother of thirteen children. Five sons and three daughters were yet living—a race of monarchs who occupied thrones and lost them during one of the most wonderful historical dramas, enacted in the space of ten years, the world has ever known. She saw them rise and fall while her tresses were yet dark, and the beauty of her youth yet bloomed on her cheeks and sparkled in her eyes. Her sons were Guiseppe, or Joseph, who was made King of Naples in 1806, and of Spain in 1808; Napoleon, who made himself Emperor of the French and disposer of thrones in 1805; Luciana, or Lucien, who alone refused a crown, but accepted a principality, with its title, from the Pope, in 1808; Luigi, or Louis, made King of Holland in 1806, and refused the crown of Spain in 1809; and Girolania, or Jerome, who was made King of Westphalia in 1807, when that province was erected into a kingdom. The daughters were Maria Anna Eliza, who was created sovereign of Tuscany, with the title of Grand Duchess, in 1808; Carlotta, afterward Marie Pauline, who, as wife of Prince Borghese, became the most illustrious Italian princess of her time; and Caroline Maria Annunciado, the wife of Murat, who became Queen of Naples in 1808.

The young widow of Ajaccio had no reason to dream, in wildest fancy, of the splendors that awaited herself and family. The latter were mostly little children; Jerome, the youngest, an infant in her arms. She was left with scanty means for their support and education. To these she devoted all her energies, with marvelous success. Strength, we have observed, was the prominent feature in her character, and this was displayed in the hour of need. Napoleon once said, "She had the head of a man on the shoulders of a woman.....Losses, privations, fatigue, had no effect upon her; she endured all, braved all." These came at times thick and fast. Joseph, ever kind and good,

helped his mother with all his might as he grew toward manhood; while Napoleon, a rather dull student in outward expression, was preparing, in the military school at Paris, for that wonderful career which enabled him, by imperial decree, to make sovereigns of his brothers and sisters, and to confer upon his mother, at the age of fifty years, the lofty title of Madame Mère, equivalent to that of Empress Mother, with an income of two hundred thousand dollars a year.

Often dark and weary was Letitia's journey up to that bright eminence. Yet light beamed kindly upon her path. She had the counsels and aid of Archdeacon Lucien Bonaparte, brother of her husband, and the Abbé Fesch, her half-brother, who was afterward a cardinal, and Napoleon's ambassador at Rome. The good archdeacon watched over Letitia and her children with parental tenderness and vigilance; while young Fesch, with equal zeal, did all in his power to promote their interests.

Napoleon, meanwhile, had completed his studies, entered the military service, fallen in love with a pretty maiden of Valence (where his regiment was stationed), with whom he had stolen interviews; and under the inspiration of the tender passion, after a visit to Mount Cenis, had conceived the idea of becoming an author and writing an account of his travels, after the manner of Sterne's "Sentimental Journey," then a popular style. Absence from the black eyes of Mademoiselle Calombier allowed his thoughts to take stronger form, and he began a history of Corsica, which the venerable Paoli, then an exile in London, approved. It glowed with intense democratic sentiments, then finding lodgment and nurture in the minds of many leading Frenchmen, who had been inoculated with the principles of the American Revolution; and his family (whom he visited at Ajaccio every year) fully sympathized with Lafayette, the Duke De Rochefoucauld, and others in the reform movement in France, which speedily kindled the awful fires of the French Revolution.

The Constituent Assembly of France, under the influence of Lafayette, allowed the Corsican exiles to return. Paoli went to Paris. He was introduced to the king, who created him a lieutenant-general, and made him military governor of Corsica. He was afterward invested with the civil title of President. As the revolution in France progressed, and its direction was taken by violent men from Lafayette and his associates, its sanguinary character shocked and disgusted Paoli. At the instigation of the British government, under which he had found an asylum for twenty years, he organized a rebellion against the then rulers of France. The French garrisons were finally expelled, when English troops took their places, and the British monarch was declared to be "King of Corsica." Poor Paoli, deceived and wronged, expected to be made Viceroy, but the office was given to an Englishman. By this perfidy Paoli was ruined.

The Bonapartes were against Paoli in the rebellious movement. They sagaciously perceived that France would be the winner, and they took sides with the strong. So, in the civil war that disturbed Corsica, the sons of Carlo were found in arms against his old friend and leader. They were powerful in Ajaccio, and the people there kept the tricolored flag of the French republicans floating over the town. Paoli determined to humble it. The three sons of Letitia were away at that critical moment. She took upon herself the direction of affairs. She sent messages to Joseph and Napoleon, and giving public notice that they would speedily appear in Ajaccio, she kept the partisans of Paoli quiet.

Napoleon, then acting provisionally as commander of a battalion of the National Guard, went to Corsica with a few troops in a frigate bearing commissioners of the revolutionary government. Meanwhile Paoli had taken possession of Ajaccio. Napoleon drove him out; but the partisans of the old patriot rallied, and the invader besieged him closely in a stronghold. He escaped, when Paoli resolved to drive the Bonapartes from the island.

Letitia perceived her danger, but knew not how to escape. The way was opened. At midnight she was awakened suddenly, and found her room filled with rough Corsican mountaineers. She supposed them to be followers of Paoli, and herself and children prisoners. The room was dimly lighted by a fire-torch that scarcely defined the features of the leader, who said, "Quick! make haste, Signora Letitia. Paoli's men are close upon us. We have no time to lose. Fly with us. We will defend you or perish!"

It was the voice of a friend who spoke—Guido Costa of Bastelica, one of the most populous villages of Corsica, that lay nestled at the foot of Monte d'Oro. One of the villagers had fallen in with a body of Paoli's followers, who told him that they were going to Ajaccio with orders to take the Bonapartes alive or dead. Costa heard of it. He aroused his friends, and to the number of three hundred they made a forced march and reached Ajaccio before Paoli's men.

The warning and departure occurred in the space of a few minutes. Letitia and her children were placed in the centre of the rescuing column; and all moved out of the town so silently that no sleeper was awakened, and the flight was not known until sunrise, when the fugitives were in the deepest recesses of the mountains, in sight of the sea. There they rested. From an eminence near by they could see Ajaccio. Toward noon dense columns of smoke were seen rising from its bosom. "That is your house that's burning, Signora," said one of the men. "Never mind," replied Letitia; "we will build it better hereafter. *Vive la France!*" But Letitia's house was not burned. It is there yet.

During two nights the fugitives journeyed in

the mountains. As they approached the port of Calvi, at dawn, a French frigate was seen in the harbor. It was a joyful apparition to the wanderers. The shore was soon reached; and there, with tears of profound gratitude in her eyes, Letitia bade adieu to the good Costa and his friends, and promised them a life-long remembrance of the services of himself and men. She had nothing else to offer. Nothing more was desired. The frigate was soon reached; and there the exiled mother found Joseph and Napoleon and the French commissioners. At noon the ship stood for Marseilles, where the Bonaparte family landed. It included Letitia's half-brother, the Abbé Fesch. They were in absolute destitution, and Letitia and her little children gratefully received rations of bread daily distributed to patriot refugees. Upon the scanty pay of Joseph and Napoleon as sub-alterns in military service they depended for all else.

Like other chief cities of France, Marseilles was then a seething caldron of politics. Lucien Bonaparte, though only a youth of eighteen, took an active part as an orator and partisan of the republicans. This fact promised to bring the greatest misfortunes upon his family at first, for the Bourbons were strong in Marseilles, and, as in other cities, were plotting rebellion against the central power of the Jacobins at Paris. The plots ripened into open revolt, in which Marseilles led. But the speedy reduction of Lyons, and the terrible punishment inflicted upon it, made the Bourbons pause in Marseilles, and great numbers of them fled for protection to Toulon, the last of the rebellious cities that held out. The Bonapartes were with the winning party, and were secure from personal harm in their humble home in the old town by the side of an ancient Roman wall. The abbé wisely laid aside his clerical dress and character; for it was as offensive to the Jacobins to harbor a priest as to give shelter to a Bourbon prince. He exchanged his crook for a halberd, and became military store-keeper in the army of General Montesquieu, who, in the autumn of 1793, swept over Savoy.

Although Napoleon was the second son, he was, by common consent, at this time regarded as the head of the family. His career soon vindicated his claim to the distinction. In the autumn of 1793 he was assigned a conspicuous part in the siege of Toulon, a city then held by the Spanish and English, and a place of refuge of a large number of royalists. Its possession by the French was very important. In the siege Napoleon's military genius blazed forth in amazing splendor, dazzling the veterans of the army, and lighting up for him that pathway to renown which he followed with quick steps. Finally he submitted to the council of war a plan of attack, which was accepted, and successfully carried out by him. The victory diffused joy throughout France, and Napoleon was recognized by the best officers of the army as the foremost military man of the age in promise.

"Reward this young man and promote him, for, should he be ungratefully treated, he will promote himself," wrote General Dugommier to the Committee of Safety; and in February, 1794, Napoleon, when in the twenty-fifth year of his age, was commissioned a brigadier-general. During the next four months he made the brilliant campaign against the Piedmontese troops.

The promotion of Napoleon promised better days for his mother. He provided a good home for her near his head-quarters, and the sunshine of prosperity and hope warmed it. But clouds soon gathered. The power of the Jacobins, which gave Napoleon promotion, was tottering to its fall. Robespierre tried to seduce the young general into the immediate service of his party as the successor of Henriot, in command of Paris, with large emoluments. Napoleon disapproved the Reign of Terror, and knew it could not be immortal. Indeed, the speedy passing away of its sceptre was clear to the vision of his sagacity, and he refused the bribe. "It is not so easy," he said to his brothers, "to save one's head in Paris as at St. Maximin. It is not yet time. There is no place for me so honorable as the army. We must have patience: I shall command Paris hereafter."

But Napoleon and his family were temporarily involved in the downfall of Robespierre. The general was arrested as the tyrant's partisan. Joseph fled to Geneva, and Lucien was imprisoned at Aix. Letitia was again plunged into the deepest poverty and distress, but she bore all without complaint.

Napoleon, who was released after a few days, vainly sought military employment. His ambition was boundless, but it had not yet made France its proposed centre of action. He was, in spirit, then, as ever afterward, a mere adventurer, seeking self-honor, and to gratify this, he proposed to offer his services to the Sultan of Turkey. His mother besought him to be patient, and to be true to France. "Never leave it," she said, "except in its service." She was ready to bear poverty for the sake of her children, and had such faith in the future that she continually spoke words of encouragement. Her faith was fortified. At about this time Joseph married the daughter of a wealthy banker of Marseilles, and he was enabled to place his mother and young family in a position of comparative opulence.

In the reorganization of government in France germs of civil war were planted. The Directory and the Convention that constituted the government were obnoxious to the people, and rebellion ensued. It was resolved to put down the populace of Paris by force of arms. Napoleon, who was as ready to fight against the people as for them, for despotism or against it, as his private interest might dictate, was employed to lead the troops of the Convention. And so he again entered the military service. From that time his star was in the ascendant.

His military genius was of the highest order, and was recognized as such by Carnot, at whose instance he was placed in command of the army of Italy early in 1796. His income was now ample, and he assigned a portion of it to his mother, who continued to reside in Marseilles. Of all her sons only Jerome, the youngest, was then with her as a dependent, Louis having entered the army at the age of seventeen, and Lucien was in the commissary department.

Letitia made her abode with Joseph, in Paris, in 1799. Lucien, who had married the daughter of an inn-keeper, was also living there. Napoleon was then engaged in his magnificent scheme of empire in the East, which contemplated the conquest of Egypt and the whole country eastward to the Indus, and the expulsion of the English from Hindostan. It was a splendid failure, and he suddenly returned, in time to engage in the political intrigues in Paris which resulted in the revolution of November, 1799, and his elevation to the position of absolute Dictator of France, with the specious title of First Consul.

That was a most trying period for Letitia—more trying than poverty and privation. She well knew the selfish ambition of her son, and saw nothing but hopeless ruin in his failure. During the roaring convulsions in Paris on the 9th of November her distress was greater than any she had experienced since leaving Corsica as an exile; but her courage and fortitude controlled her emotions. "She appeared calm," said the Duchess D'Abrantes, who was with Letitia when the billows of that revolution were subsiding, "though far from being easy; for her extreme paleness, and the convulsive movement she evinced whenever an unexpected noise met her ear, gave her features a ghastly air. In these movements she appeared to me truly like the mother of the Gracchi. She had three sons under the stroke of fate, one of whom would probably receive the blow, even if the others escaped. This she felt most forcibly. My mother and myself remained with her a part of that tantalizing day, and only quitted her on the restoration of her confidence by Lucien's messengers, who were frequently sent to calm her disquiet. The danger to which the Bonaparte family was exposed might have been even imminent on the night of the 9th or 10th. If the Directory and the Councils had triumphed, all Bonaparte's brothers would have followed him to the scaffold; and their friends and partisans would have been exiled, to say the least."

Napoleon was now next to the imperial dignity in power, but he was careful not to shock too soon the democratic ideas of the people by ostentatious display. His mother and family lived in great retirement, though provided with ample means. The beautiful young widow, Josephine Beauharnais, who had become the wife of Napoleon, was not a favorite with the mother-in-law. Letitia preferred the more quiet and simple manners of the wives of Jo-

seph and Lucien, for whom she felt a real affection; and when, in 1805, Napoleon was Emperor of the French, and a feud between him and Lucien caused the latter to make his residence in Rome, Letitia went with her exiled son. When the emperor upbraided her for her partiality, she said, "An unfortunate son will always be most dear to me."

Napoleon finally persuaded Letitia to return to Paris, and make her abode there in a style suitable for the mother of a reigning monarch. He settled upon her a pension of two hundred thousand dollars a year; gave her, by royal decree, the title of Madame Mère, the equivalent of Empress Mother, and assigned to her a palatial residence and a separate court. Even then she avoided all ostentatious display and vulgar aping of the old courts of Europe, to which the emperor was prone; and she refused to encourage that foolish extravagance in her household which Napoleon's example and wishes were calculated to foster. She was not avaricious, as her manifold deeds of charity daily attested; but she could not divest herself of a fear with which sad experience had impressed her, that reverses might come, when the savings made in a season of prosperity might be needed for the purchase of daily food. Her kindness of heart was as proverbial as her sagacity in detecting imposition of every kind. The deserving always found in her a friend; the undeserving seldom felt the good of her bounty. She was often the medium through which favors were asked of her illustrious son, and she was always gratified when they were granted.

Madame Mère watched with more anxiety than pride the audacity of Napoleon in interfering with the concerns of other nations, and especially in placing members of his family upon thrones to which he had no other claim of possession than the right which might gave. She observed with deepest sorrow the often unscrupulous and cruel acts and policy of that son, whose chief aim she knew to be self-aggrandizement; and in her inmost soul she harbored a firm conviction that retributive justice would one day punish him with its fearful penalties. While the world was dazzled with the glory of his deeds, her eyes saw clearly the dark motives which lurked in secret behind them. It was not a source of comfort to her to see her half-brother, the Abbé Fesch, whom she loved, made cardinal and imperial ambassador by the means employed. She was distressed when she saw Joseph, her first-born, obey the orders of his imperial brother, and mount the throne, first of Naples and then of Spain, which had been stolen by robber bands from quarreling guardians. She trembled when she saw the republic of Holland transmuted into a vassal kingdom, and her son Louis placed on the throne as an expected puppet in the hands of the emperor. And she was unhappy when she saw Jerome, her baby, a young man only twenty-three years of age, made monarch of Westphalia, a kingdom

created for the purpose by the ambitious Napoleon. Nor was she pleased to see her daughters made imperial princesses, and their husbands seated upon thrones by the imperial will alone.

In 1809 the empire was at its noontide glory. Nothing seemed wanting to fill the measure of Napoleon's ambition but an heir to perpetuate his dynasty. Josephine had failed to gratify his desires in that respect. So, sacrificing love, justice, humanity, and the marriage vow upon the red-hot altar of his unholy ambition, Napoleon divorced his wife by his own imperial decree, and married a scion of the house of Austria. It was one of the blackest crimes recorded in human history. His new wife bore him a son, but he never sat on a throne; and the Napoleon dynasty was revived thirty-seven years after the sceptre and crown were taken from the first emperor; not by his own descendant, but by a grandson of the discarded Josephine, who, if report speaks truly, has not a drop of Bonaparte blood in his veins.

This crime of Napoleon deeply stirred the righteous soul of Madame Mère. The new empress appeared to be good and amiable, and she learned to love her. That empress had revolted at the marriage when it was proposed to her, and said she considered herself "a victim devoted to the Minotaur." Madame Mère honored her for it. When the allies approached Paris, in 1814, the mother accompanied the young empress and her court to Blois. On that occasion she showed her usual forethought and prudence. She drew from the treasury the arrears of her allowance, and dismissed nearly all of her attendants.

By the treaty of Paris in 1814, which placed Louis XVIII. on the throne, Napoleon was allowed to take up his abode on the island of Elba, as its sovereign, with a revenue of over a million dollars; and Letitia was permitted to retain the title of Madame Mère, and receive an annuity of forty thousand dollars. Early in August of that year she followed her son to Elba, and on the 15th (his forty-fifth birthday) she presided at a ball given in honor of the anniversary. She fondly hoped for more quiet in that retreat than she had enjoyed for years, and that her son would not again seek the dizzy height from which he had fallen so gently. That dream was soon and suddenly dispelled. Napoleon's thirst for imperial power and universal dominion was as intense as ever. He fomented intrigues in Paris against King Louis; and ten months after he landed in Elba he left it, debarked at Cannes with an escort of a thousand of his old guard, and started for Paris. His confidence in the attachment of the French army to his person was justified by events. Nearly the whole standing army of France joined his cause. Louis fled. Europe was astounded by the unexpected apparition; and the Congress of sovereigns at Vienna, engaged in the nefarious business of disposing of the rights of nations for

their own advantage, broke up in alarm, with a cry to arms against the "terrible scourge of Europe." Napoleon remounted the throne and defied all Europe for a while. His sceptre departed from him forever at Waterloo, in June, 1815, and he was imprisoned for life on a rocky island in the South Atlantic Ocean.

Madame Mère could not be persuaded to go back to Paris with the emperor when he left Elba. She went to Rome and resided with her brother, Cardinal Fesch, in whose palace she had spacious and superb apartments. True to her saying, "An unfortunate son will always be most dear to me," when she heard of the disaster at Waterloo, and it was evident that the emperor had fallen to rise no more, she offered him the whole of her large fortune. And she would gladly have accompanied him, to cheer him in his exile on St. Helena, had she been permitted. "For me," said Napoleon to the Count Las Cases, while tears stood in his eyes, "she would, without a murmur, have doomed herself to live on black bread." And when Las Cases, on his return to Europe, told the story of Napoleon's situation to his mother, she said, "My whole fortune is at my son's disposal."

Madame Mère's continual solicitude for her exiled son was manifested on many occasions. In the autumn of 1818, when the allied sovereigns were assembled at Aix-la-Chapelle, she wrote an affecting appeal to them in his behalf. "Sires," she said, "I am a mother, and my son's life is dearer to me than my own. In the name of Him whose essence is goodness, and of whom your imperial and royal majesties are the image, I entreat you to put a period to his misery, and to restore him to liberty. For this I implore God, and I implore you, who are His vicegerents on earth. Reasons of state have their limits, and posterity, which gives immortality, adores, above all things, the generosity of conquerors." Her appeal was in vain. The sovereigns knew how undying was Napoleon's ambition, and how perfidious was his nature when under the influence of that ambition, and they feared and hated him.

Help for him was more easily rendered by his mother in 1819, when she heard that he was sick, that he would not suffer an English physician to come near him, and desired the company of a Roman Catholic priest. By permission of the Pope, a mission was sent to St. Helena, at her expense, consisting of Dr. Antommarchi, Father Bonavita, and Abbé Vignali. These remained until Napoleon's death in 1821.

Cardinal Fesch occupied the Palace Falconieri, in Rome, and there Madame Mère lived twenty-one years after her brief sojourn at Elba. She lived in splendor, but quietly and unostentatiously. She maintained a retirement congenial with her tastes, and entertained but few persons outside of her immediate family of descendants and her intimate friends. She was a devout daughter of the Italian Church, and was

ever ready to dispense its and her own large charities.

When she was eighty years of age Madame Mère retained strong marks of personal beauty, which Canova embodied in his fine bust of her; and her vivacity was sunshine in her household until the last days of her life. Loving hearts and hands were continually at her service, until, on the second day of February, 1836, when she was eighty-six years old, Letitia Bonaparte of Corsica—Madame Mère of the first French empire—the mother of the founder of the Napoleon dynasty, departed for the world of spirits.

Her tomb is at Rome; that of her husband is at St. Leu, once the estate of their son Lucien, near Paris.

THE FAUN OF PRAXITELES.

He does not see the Gladiator's pain,
Though hopeless at his feet for years
That unappealing agony has lain;
He never knew the need of tears—
Nor grief, nor fear, nor sigh,
Nor sorrow's shadow, ever came him nigh.

He leans against the woody trunk, and seems
(If such might be) a Grace at rest;
One foot on tip-toe poised, as if he deems
By dancing steps should earth be pressed;
In flexile fingers he
Folds lightly rustic pipes of Arcady.

Listening he stards, with lips apart, to track
A train of echoes that just now
Came swiftly floating from the woodlands back,
As he went fluting—and his brow
With happy wrinkles mars,
That never knew of Care the deeper scars.

He smiles at his own music, and at me,
Who can not meet his sunny eyes,
So innocent of that whose mystery
All our brief gladness underlies;
Of problems that perplex,
And restless Nemeses that haunt and vex.

The crowd of feverish nations past him press—
An eager, thought-o'erburdened throng—
For time is gold, and wealth is happiness,
And life is short, and art is long:
He does not see them—airs
Blow on him from another world than theirs.

In *theirs* the scheming despots rise and fall,
Still weaving nets for freemen's feet;
Disloyal spirits nobler hearts enthrall,
Love dies, Truth hides, and armies meet;
And Death's resistless dread
Forever threatens some beloved head.

In *his* world green leaves quiver, clovered banks
Allure the sunshine and the breeze,
And bright-eyed squirrels play their joyous pranks
Along the trunks of mossy trees,
And birds trill happy love
In swaying boughs the shade-flecked turf above.

I enter in with him; there Fancy sings
The notes that lull the weary brain;
There, bathed anew in Beauty's freshening springs,
The soul is panoplied from pain;
And from the enchanted wave
Comes, like Achilles, arrow-proof and brave.

Reluctant from that realm and him I part;
Though still the poet's sesame
To me its gates unlocks, the sculptor's art
Has of its portals lost the key:
No later-born could seize
The cunning chisel of Praxiteles.

But live its record thou! forever fair,
The Celebrated and the Praised,
As when such triumphs Sculpture still could dare;
When bright upon her altars blazed
A fire that has grown cold
Since in the Tripod Street thou stoodst of old.

ANTEROS.

BY THE AUTHOR OF "GUY LIVINGSTONE," "SWORD AND GOWN," "SANS MERCI,"
"BREAKING A BUTTERFLY," ETC.

CHAPTER XX.

THE Duke of Devorgoil was manifestly ill at ease, and sat plucking at the sable coverlet as though he would fain have hidden himself under its massive folds, and glancing to left and right nervously; but, shift as he would, he could no more evade the steady gray eyes than a patient can the gaze of the magnetizer. So he met them at last.

If a little formal, nothing could be more courteous than Ralph's salute, nothing more placable than his voice and manner.

"I am happy to have this opportunity of presenting your Grace to Lady Atherstone."

Seldom has any dignitary of Church or State been plunged in direr quandary than that in which the Lord Lieutenant of Loamshire found himself now. That first offense of *lèse-majesté*, recorded above, had never been mitigated by any after-homage on the part of the criminal. Whenever county business brought them in contact, Lord Atherstone did not evince the smallest inclination to defer to the other's wishes or opinions. Twice or thrice, when, on the occasion of a royal visit, an invitation was equivalent to a command, Ralph had partaken of a state banquet at Grandmanoir; but of his own free-will he never had darkened those august portals, nor had he once entreated their master to honor Templestowe with his presence.

Throughout all these years the Duke had nursed a sombre resentment, waiting and watching, not overpatiently, for an opportunity of slaking the same; and, besides private pique, he had public grounds for enmity. He did honestly believe that Lord Atherstone was a discredit to the order to which they both belonged, and therefore deserved in all possible ways to be discouraged and repressed; ay, and there was something more: Lupus Fitzrolland was far too sublime a personage to listen to gossip. To the ordinary *cancan* of society he lent no more attention than did the Olympians to the tittle-tattle of Troy. But he had chanced to pass through town soon after the Atherstone engagement was announced; and as he sat conning the papers in his solitary arm-chair at the sanctorium, certain scraps of club talk had floated past his ear, leaving him to infer that, if no grave scandal had attached to Lena Shaf-ton, she had at least been something imprudent in her time. Now, if he had been a rigid Puritan instead of a very indifferent Christian, the Duke could not have entertained a holier horror of any thing in the shape of coquetry. No facilities for flirtation were provided at any of his entertainments, either in town or country; and even on neutral ground couples indulging in the most innocent of such diversions

had been known to start guiltily under his austere gaze, and fly like timid hares to the cover of the conservatory or other fastness, whither the censor's eye could not follow. Was not the edifice of Lord Atherstone's social sins high and broad enough already, but that he must add thereto the very corner-stone, by bringing into the county a wife concerning whom the world's tongue had wagged lightly, if not accusingly?

All things considered, here, in absolute completeness, was the chance of retaliation for which he had waited so long. It was his bounden duty—so he had told himself at least a dozen times—no less as head of a family than as head of a county, to assert his own position, and make the Atherstones feel theirs. Yes, it should be shown so plainly that all who rode might read the lesson, that the house of Devorgoil had the privilege not only of choosing their acquaintance, but of dropping the same at their pleasure. Indeed, the Duke had rehearsed the whole scene to his entire satisfaction; how, when the criminals approached, he would look straight to his front, neither frowning nor smiling, but superbly serene, and implacably ignore their presence, so that they would be fain to pass on, clad in the garments of confusion, and a warning to future misdoers. As for his conduct being questioned—a Lord Lieutenant might possibly, not probably, be called to account by his sovereign, but, assuredly, by no other living creature.

The scheme was not ill laid; but, like many others framed both by men and mice, through a slight miscalculation it went "a-gley." The Duke had never reckoned on his enemy coming straight at him, and opening fire within point-blank range.

Had Hawley been told on the eve of Preston that on the morrow the clansmen would hurl themselves bare-breasted on the sabres of his dragoons, he would surely have laughed aloud. But what the result was we know; and these provoking surprises will go on happening till the end of time.

If, on the present occasion, the noble strategist avoided total rout, he escaped not sore discomfort; instead of the serene unconcern that he had intended it should wear, his countenance was full of irritated perplexity; there was more of nervousness than pomposity in the frequent clearing of his throat, and evidently something more than the right word in the right place was a-lacking. What he had proposed to say, or not to say, you know; what he said was this:

"I am—ahem—happy to—a—make Lady—er—Atherstone's ac—quaintance."

And, as he lifted his hat a bare inch from his brows, his hand shook painfully. He, also, was

being "executed" in the sight of all the people; but he could not, like brave old Bailly, have replied to a scoffer, "It is with the cold."

If the Baron had "presented" his wife, it would have sounded better; but even this poor salve to the ducal dignity was wanting. Nevertheless, there was now no possibility of drawing back; and henceforward, till fresh cause of offense arose, there must be outward amity, however hollow, betwixt Grandmanoir and Templestowe.

In such emergencies it is generally a woman who shows herself most calm and cruel. Lady Rachel, perhaps, was made of sterner stuff than her sire; for little encouragement could be drawn from her wiry salute, and not a word, courteous or uncourteous, escaped her lips, braced like a steel trap. But Lady Ursula—*bon brin de fille au fond* and a degenerate Fontenaye—nearly spoiled the effect of her sister's admirable behavior by nodding and smiling, and putting some ridiculous question as to Lady Atherstone's sporting taste. Lena had not betrayed the faintest embarrassment from first to last; but she did feel very grateful toward Lady Ursula just then, and her color rose a little as she replied "that this was almost her first essay; but that she fancied that she should grow very fond of hunting."

Jasper Knowsley had a shrewd tact of his own; and it was probably consideration for others besides his hounds, whose coats were beginning to stare under the north wind, that caused him to move off toward the covert without more delay. A glance from Ralph told his wife that the interview was over; and, after another interchange of formal salutes, the pair followed in the wake of the field.

Whether from this passage of arms—the expression is not much too strong—any of the parties concerned issued with the honors of war, is an open question; for, as to the Lord Lieutenant's intentions, or the causes that brought the same to naught, few of the spectators were deceived; and though many admired his nerve, the extorted courtesy did not greatly improve Lord Atherstone's social credit. Perhaps Mr. Chantrey, the horse-breaker, in his homely language, expressed pretty accurately the general opinion.

"The Dook, he meant to be nasty," quoth honest Will; "a blind man could see that with half an eye; but when it came to the push, he had to drop it. It's for all the world like this here black colt of mine. He's got plenty of temper, but no pluck to speak of; and if you just shake this here cutting whip at him, he'll drop his back and lob on like a sheep. The Dook, he's had a side-binder or two from the Baron in their time, I'll pound it. Old Ralph ain't by no means a pleasant sort to tackle."

It is time that we too should follow, for the rearmost hound has topped the covert-fence five minutes ago.

A promising draw, certainly. There is good

lying on the slope of the hill, and a perfect jungle under the alders down there in the hollow, filled, in days before drainage was known, by the ancient mere. Hares by dozens are stealing away, and rabbits by scores scuttling about already; and, if the air is not darkened with pheasants, as it would be within the park-fence of Grandmanoir, a whirl of wings ever and anon shows that there is no danger of the foxes being starved out of this strong-hold. The keeper—leaning against the gate-post yonder, with an air of moody resignation—d'you allow that he padded a brace, at least, yester morning? Moreover, the wind lies just right for the vale, trending away to the southward, till it seems to narrow to a point in the gray distance.

A few go into covert with the hounds; but the rides must be mere quagmires after the late rains; and the body of the field keep to the sounder ground above, while the first whip gets forward and ensconces himself in the bend of a high bull-finch, so that, unseen himself, he can peer through the upper branches over the open beyond. It is not a day when, even in covert, the scent is likely to lie well; while, at the best of times, Hazlemere takes a deal of working. And very patiently the Master does work it in his own quiet fashion, seldom speaking to, much less hurrying, his hounds; so that the field—no longer overshadowed by the awful Presence, for the ducal carriage keeps to the main road along the hill-crest—has leisure for courtesies or for chaff, as the case may be.

Arthur Corbett, visibly exulting at having stolen a march upon his fellows, presses up to salute Lady Atherstone, and lingers at her bridle-rein; and some half-dozen more are presented to Lena, including Mr. Swarbrick and the Devereuxs. Though Cissy has, to a certain extent, got her company manners on, her cordial welcome is by far the brightest gleam of social sunshine that has crossed Lady Atherstone's path since it led her Loamshireward. Ralph performs his part in these ceremonies creditably enough; but he is very chary of his word, and there is a grave, preoccupied look on his face such as Lena has not seen once since their marriage.

Suddenly, from the thickest of the covert below, comes a whimper, eager, yet not quite confident; but Jasper Knowsley still sits silent and statue-like in the middle ride; for, though Mariner is the very gem of this year's entry, he is apt to be a trifle too keen. The next minute comes a sharp, joyous yelp, about which there can be no mistake, and the Master smiles triumphantly (Mariner is the first produce of a famous cross) and cheers him with a will; then a deeper tongue chimes in, as Vigilant, whose speech is law, proclaims that youth may sometimes be right, though it speak before eld; and other notes swell into music—the music that, more than any other under heaven, maketh the ears that hear it to tingle.

Mr. Swarbrick, out on the hill-side, takes the time to a second from a machine something

larger than a traveling-clock; the which significant action causes some of the thrusting ones to creep forward, though Jem Spurrell, from his post of vantage, flings back his hand warningly; but, "Gently, pray, gently on the right," cries the mild Master, in the act of swatting through a miry pool; and, "That's right, spoil your own sport and be d—d to you!" roars his terrible Echo. Luckily the double-barreled remonstrance takes effect, and the culprits draw rein before harm is done. Soon the chorus within deepens to a crash; from the nook of the bull-finch comes a scream that could no more be printed than it could be set to notes, but which the hounds know as well as they do the Master's horn; and, without the ceremony of taking a run, Jem dives head-foremost into the black-thorn; Swinton Swarbrick, with a dig of his ponderous spurs, launches forth the bony brown, and lurches away over the meadow, like a rock let loose, for a pet gap, which he guesses is only lightly bushed up, followed by Arthur, the squire of dames, and some dozen more. Dick the Driver, who, ever since the find, has been fighting his savage till they both are all afoam, with a great gasp of relief goes hurling at the spot where the growers are thickest; Godfrey Colville—keener for a start than he ever was from Ranksborough—goes straight as a die at the place that he picked ten minutes ago; and Cissy Devereux, humoring Paladin's fidgety mouth like an artist, sails off in his wake happier than any crowned queen.

"Get forward to the gate, Edward" (this to his groom); "and keep quite close to me, Lena," says Lord Atherstone, his face lighting up at last.

Those who make for the same pass—some from awe of the Baron, more for the sake of the bonny bride—fear to press upon the pair till they are fairly through.

And so the curtain is up, and the play begun.

Unluckily, in many dramas, grave and gay, the interest is apt to decline steadily from the opening scene; and so it happened here. The first burst of a mile or so was quick enough to satisfy any body; but then the hounds got bothered in some sheep-foil, and the scent, out of covert, was so miserably cold, that they never picked up their ground or got upon good terms with their fox again. The Master of the L. H. was patient to a fault, and would "potter" on, as his detractors said, in almost hopeless pursuit, rather than try for a fresh one; but he was compelled to do this at last.

The second fox was a cowardly ringing brute; and when he did break, it was only to slink over the hill along a chain of spinnies that brought him to a "creep" through the park-pales of Grandmanoir; the day, too, was lowering instead of lightening; so Lady Atherstone assented willingly to her husband's suggestion, that they should turn homeward here.

The moody look had settled down on Ralph's face again, puzzling Lena not a little, and pro-

voking her to boot; for she herself felt in unusually good spirits. She had been present at several meets before, but had never seen a covert actually drawn, and the novelty of the sights and sounds had kept her thoroughly amused. Standard-bearer had carried her admirably, and they had negotiated two or three unavoidable fences without any difference of opinion; moreover, the L. H., as a rule, had agreeably surprised her. She liked the placid Master, who, busy as he was, had found time to be presented, exceedingly; Swinton Swarbrick, as a relic of the old Squire Weston days, was inimitable; Mrs. Devereux must be charming, and Mr. Corbett—well—he smiled a little too often and too blandly; but he was pleasant to look upon, and wonderfully amusing and well-bred for a provincial banker. The Grandmanoir party did not impress her favorably; but perhaps the Duke could not help being fidgety and formal, any more than Lady Rachel could help looking acid; and, though she was glad when the interview was over, the idea of an intentional slight had never crossed her mind, much less dwelt there. So, perhaps, there was the slightest shade of pique in her tone when she broke rather a long silence.

"It has been a very stupid morning for you, monseigneur. Indeed, I am half ashamed at having enjoyed it so much."

Ralph started from his reverie, and his brow cleared.

"You're quite wrong, my dear. It would have been a very stupid morning if I had not had you to look after, and—it's the honest truth—to admire. I don't know whether you or Standard-bearer can claim the most credit; but you deserve a good deal between you. The sport has been just about what I expected—much better than I expected, if you have been really amused."

"But something has gone wrong," she persisted. "I would give any reasonable sum to know your thoughts for the last ten minutes, unless they have been simply wandering."

"They have not wandered far," he answered, with his curt laugh; "I have been thinking of my own folly and blindness—a harder word than either might suit—which began when I first came to live in Loamshire, and have gone on ever since, from bad to worse. I had had crosses and disappointments, of course, but so have thousands who come out smooth and smiling. There was nothing to make one set one's bristles up, and keep all the world at bay. People did try to be civil when first I came home, I quite remember that; but all the forms and ceremonies bored me intensely, and—I showed it. There was another opening just after Philip's marriage, but I didn't take it, though Marian tried hard to persuade me. Of course I've made enemies by scores. They have never had a chance of hitting me before; but they have got one now, and I doubt if they will let it slip, that's what I've been thinking about, my dear."

Lena looked up, wondering. This was not

the first time she had heard of her husband's rough, unsocial ways; but as to the immediate cause which now moved him to repent them, she was still in the dark.

"Don't you overrate your unpopularity?" she said. "I thought every body seemed good-natured enough to-day."

Ralph's keen gray eyes dwelt on her as if he doubted whether she spoke in earnest.

"The Duke of Devorgoil, for instance? It would not have cost much trouble to have made a friend instead of a foe of that pompous old idiot. If I had not cut him short in a congratulation-speech, and if I had asked his opinion twice a year at Quarter Sessions, and lifted my hat an inch and a half higher whenever we met, he would have been civil enough, I dare say. Now he would have been any thing but civil three hours ago, if he had dared; but—it's a constitutional weakness, I've noticed it in him before—he always forgets what he's determined to say or do, as soon as any one not absolutely in his power fixes him with their eyes."

Lord Atherstone wished the words unsaid as he saw the hot Shafton blood mount to his fair wife's forehead; yet he only half guessed the cause of her emotion.

That she was vexed as well as surprised by this new aspect of things is quite true. The old Adam is apt to rise rebelliously within the meekest and wisest of men when they first recognize that the slight has been put upon them, especially if it be too late to resent it; and Lena, being neither meek, nor wise, nor masculine, felt the full force of the sting; but she felt something more. She felt it was quite possible that an ancient grudge and mortified vanity might not entirely account for the Duke of Devorgoil's demeanor; and that if the nerve had been equal to the will, it might have been plain to Loamshire that Ralph Atherstone's wife, as well as Ralph Atherstone, was henceforth to be numbered among those whom the Lord Lieutenant did *not* delight to honor.

When Lena Shafton was first warned that if she took not better heed the world would make free with her name, she had smiled defiantly. If Caryl Glynne kept his promise, and came to claim her, he could never taunt her with risks incurred for him; if he came not, the gossips might talk themselves hoarse for aught she cared. But after the early bitterness was past, and she had settled down into the weary waiting that ended as you wot of, she had, no doubt, more than once repented of her recklessness, though never so keenly as now. The better she understood her husband the more she looked up to and trusted him; and if it was as yet impossible to love, she found it already quite easy to honor and obey. It cut her now to the heart to see him taking all the blame to himself so simply and frankly, when perhaps not half of it was fairly his share; and for a second or two she was moved to abate the consequences of full confession. However, one glance at his face changed her purpose. Lena's courage could

not be measured by the ordinary standard of womankind; but this thing she dared not do. If her voice trembled a little when she made answer, it was not with anger.

"I had not an idea of this, or I would have prayed—so hard—to be spared the introduction. Is it absolutely impossible to breathe Loamshire air without the Duke's sanction?"

"Not at all impossible," Ralph answered, more cheerily. "I've tried the experiment, you know; and I can't say that my lungs have suffered; but if I can't amend my past errors, I ought to try to prevent you pain for them; and, on the whole, I think I acted rightly to-day. The Grandmanoir folks will probably keep up to civility-mark now, and that's all that's required of them. So I might have kept my own counsel, and not have spoilt your pleasure. I am half sorry I told you."

"You need not be," she said. "It's always best—so much best—to speak out."

"'Always best,' of a surety; but is it always so easy?"

Had that question been put to Mother Eve, she would perhaps have answered Nay, before her leafen kirtle was sere.

CHAPTER XXI.

So our first act ends; and before the curtain rises again you must suppose an interval of hard on a year. During this space there was some shifting of scenes and of dresses, but in the actors or the circumstances no material change.

On that Hazlemere day the Duke of Devorgoil had, however grudgingly, entered into tacit recognizance to keep the peace toward Templestowe; and he acted up to the letter of his engagement. He drove over with his daughters to call, on a bright, balmy afternoon, when the odds against finding any healthy human creature within doors were hardly calculable; and, after leaving a sheaf of cards, went his way with a sense of relief, not devoid of humiliation, such as may have been felt by the kings and kaisers of old time, who, for their people's sake, rather than their own, submitted to signal penance. Furthermore, after ascertaining by inquiry, careful, though circuitous, that the Atherstones were absent (they had gone up to town for a fortnight), he besought the honor of their company at one of his state banquets. The visit was returned in due course, and the invitation declined with due courtesy; and so, for the present, the matter ended, it being understood on both sides that, whensoever they met, all the ceremonies of distant acquaintanceship should be observed.

To a certain extent the county took its cue from the Lord Lieutenant. There was no overt case of avoidance; the Atherstones came in for their fair share of set dinner-parties, and neighbors showed themselves not averse to accept from them the like formal hospitality.

Ralph had quite broken through his rule of

seclusion, you will observe, and, if the effort was sometimes evident, played the host much better than might have been expected from his want of practice; but still an invisible barrier, almost resembling a line of quarantine, seemed drawn around Templestowe.

The first year of Lena's residence there was drawing to a close, and—setting Hubert Ashleigh aside, parish duties, according to his own account, kept him much at home—she could hardly claim intimacy with more than two families—the Devereuxs and the Corbetts. That willful Cissy was little accustomed to defer to authorities, spiritual or temporal, and was capable of quite as much audacity in her friends' quarrels as she displayed in her own; not that there was any quarrel here, but it is certain that, had an episcopal as well as a ducal ban been actually launched against the tenants of Templestowe, Mrs. Devereux would not have cultivated their acquaintance a whit less sedulously. Now, from the first, she was rather drawn toward Lady Atherstone; why, it would be difficult to say, for, though there were certain points of resemblance, their characters, essentially, were very different. Both were self-willed and fearless, even to recklessness; but in Lena there was an earnestness and strength of purpose, whether for evil or for good, that, luckily for her own happiness, Mrs. Devereux lacked. Admiration was a necessity of Cissy's existence; and she would have gone out into the highways to exact it from the passers-by, rather than be stinted of the tribute; while Lena simply accepted homage, neither showing herself careful to seek it nor especially grateful when it was rendered. It was not hard to guess that the one life would be full of gay *fabliaux*; but that in the other there had been, or would be found, a single grave story. Here, you were looking on a bright, shallow lakelet, apt to be stirred into mimic waves under the lightest breeze, but never likely to be fatal in its vagaries; there, on a deep, land-locked tarn, the recesses whereof had never yet been fully sounded, not easily to be moved from serenity, but possibly dangerous to the stoutest bark, if a gust should sweep down unawares through the one gorge giving access to the wind. However, in the present state of civilization, differences of character are not a much greater bar to friendship than differences of opinion; and so a kind of *camaraderie* was struck up between these two, and, on one pretext or another, they contrived to meet very frequently. Lord Atherstone, to speak truth, watched the growing intimacy with no great favor. It was not that he disliked Mrs. Devereux—indeed, personally, he rather admired her, and had often been amused by her ready repartees and audacious sallies; but, though he never listened to gossip, he knew that the petulant beauty had been more than lightly spoken of, and that there was little chance of her amending her ways; and altogether, if he had been allowed to select a companion for his wife, his choice would scarce-

ly have lighted here; but then came the question, Was there any choice? and Ralph rather shrank from the answer; at any rate, he neither by word nor deed attempted to check or thwart their arrangements. Once only, when Lena was regretting that Hunsden was so far from Templestowe, he smiled coldly; and she divined, rather more easily than if he had frowned, that here at least she need not reckon on conjugal sympathy.

As to the second intimacy, the expression ought to have been limited. Mrs. Corbett's family cares were so many and various that, if she performed her strict duty toward society in the visiting line, it was perhaps as much as could be expected of her. Moreover, her tastes were decidedly domestic. For some years past her husband had been wont to appear at all sorts of entertainments, both public and private, *en garçon*, and the arrangement seemed to suit both parties so perfectly that it was no wonder if people in general had come to look upon it as a most natural one. But Arthur Corbett was very often at Templestowe. Generally he had some excuse for his presence there.

Among Lord Atherstone's prejudices was an irrational dislike of the legal profession in all its branches; and for some time past divers agency matters, which usually pass through a solicitor's office, had been transacted by the Corbetts—an irregular way of doing business—but it worked well, notwithstanding. It was difficult to conceive these two men having a single idea in common; and Arthur's little weaknesses were precisely of the kind least likely to find indulgence in the eyes of the stern old *sabreur*; nevertheless, the Baron had a high opinion of the other's shrewdness and probity. Moreover, he really liked the sight of his genial face, and listened not unwillingly to his fluent prattle, especially as it always seemed to amuse Lena.

Lady Atherstone hunted pretty constantly up to the end of that season; and, whoever else might be in attendance, one special cavalier was safe to be found, whenever hounds were not running, not far from her bridle-rein; and this was more easily managed after her brother—carrying out his scheme of retrenchment—came down to Templestowe; for Miles speedily struck up a great friendship with the banker, finding it exceedingly pleasant, when the meet lay beyond Heslingford, to be carted over luxuriously from the town to the covert-side, and then to have one of the "little dinners" above mentioned to fall back upon—repasts infinitely preferable, in the hussar's opinion, to the fare at the cavalry barracks, where he was also made very welcome. Moreover, when they met in society Mr. Corbett generally contrived to spend a goodly portion of the evening in Lady Atherstone's immediate vicinity; but the most captious observer could not have detected in his manner the slightest approach to philandering; without being obsequious or constrained, it was always thoroughly deferential; neither did closer

acquaintance embolden him to transgress the outermost verge of familiarity. Lena could not be said actually to encourage these assiduities; it was not her way; but that they were agreeable to her was quite evident. Arthur Corbett certainly seemed to have the faculty of attracting and retaining her attention to an extent not attainable by any other cavalier, whether resident or quartered in Loamshire. Before the year was out "she had got used to him," as she confessed to Cissy Devereux. And in some women's mouths that expression means a good deal.

Early in that same spring Mrs. Shafton paid a long visit to Templestowe. With the state of things within doors she had every reason to be content. She had scarcely expected to find Lena so soon and so thoroughly domesticated. If there was no absolute sympathy between husband and wife, clearly there prevailed a comfortable harmony. The aspect of affairs abroad was hardly so satisfactory. Mrs. Shafton was too keen of wit not speedily to divine that her daughter's welcome in Loamshire had been none of the warmest. For many years past she had given up the luxury of self-delusion, and was wont to look annoyances of all kinds fairly in the face. Therefore, though rumors of Lord Atherstone's unpopularity had reached her ears, she never thought of imputing the coolness of the county solely to this cause; but, howsoever far her misgivings may have traveled, she kept them to herself; and after a few natural questions about the neighborhood, etc., had been answered, she forbore to press Lena on the subject; neither did the latter appear inclined to pursue it. Nevertheless, you may possibly guess what prompted Mrs. Shafton, a fortnight or so after her arrival, to inquire whether there was any probability of the Ashleighs soon appearing at Templestowe.

It was unlikely that Lena could have divined the train of her mother's thoughts. Nevertheless, she colored a little as she looked up from her embroidery.

"I hardly know, mother. Monseigneur has never alluded to the subject yet; and I am sure he would have done so if he had expected them soon."

Mrs. Shafton smiled pleasantly, as she had the knack of doing, even when her inner commings were grave.

"Perhaps he prefers that you should invite them. Men have odd scruples sometimes; and I fancy Lord Atherstone has more delicacy on certain points than the world gives him credit for. It would be only graceful if you were to suggest it, Lena. You liked what you saw of Lady Marian, didn't you?"

"Very much. One can't help being amused by her brisk, downright way, and quaint, original sayings; and I should think she must be honest. As for her husband—it would be almost treason, under this roof, to say exactly what I think of him; but I suppose an attractive couple is rather a rarity, and, I dare say,

Mr. Ashleigh will never care for much of my society. Perhaps you are right, too, mother; and I wish I had spoken to monseigneur about it sooner. I'll do so this very day."

Lady Atherstone felt much more penitent an hour later, when she saw her husband's face light up with satisfaction at her first words. The matter must have been on his mind for some time past, or the broaching of it would not have so pleased him.

"It's very kindly thought of, my dear," he said—"kindly for me as well as for the children. Marian and I have always been great friends, you know; and I'm sure you will find her improve on acquaintance; she's such a cheery creature, though a little sharp at times. As for Philip, to do him justice, he's never much in any body's way; he's always too much occupied with his politics and his ailments; though I believe both are about equally imaginary. Would you mind writing yourself to Marian? This address will find her."

"It's just what I should have wished to do," Lena answered. And her letter went by that day's post.

Whether Lady Marian felt specially grateful for the invitation may be doubted; but that she was ready to accept it is certain. Had there been no deeper motive for her so doing, a natural curiosity to see how things progressed at Templestowe under the new *régime* would have prevented her hesitating.

After Lord Atherstone's marriage the Ashleighs had paid two or three visits, and then taken up their quarters at a West End hotel. The prices there were not extravagant; nevertheless, the thrifty couple had not yet felt such a steady draw on their purse-strings. It so chanced that a fortnight's bill lay on the breakfast-table, side by side with Lena's note; and Philip grumbled sorely over the items. Perhaps it was this that made him listen so readily to his wife's suggestion, that he had really worked hard enough to earn a holiday; and that, though the House had a good deal of business on hand before the Easter recess, it might possibly be scrambled through somehow in his absence. So that same afternoon he paired off with another honorable invalid, whose ailments were not quite so visionary as his own, and the end of the week found the Ashleighs once more at Templestowe.

The meeting was sufficiently cordial on all sides, and Marian quite justified her father-in-law's prediction that she would improve on acquaintance. Her manner toward the family party already assembled there could scarcely have been improved upon; she seemed to settle into her new position without an effort, and never put on those airs of ceremony or deference to recent authority by which some women, under like circumstances, contrive to evince their sense of injury. She was courteous with Mrs. Shafton, pleasantly confidential with Lena, and so good-natured to Miles, that the dragoon, who in polite society was any thing but bold,

under her encouragement waxed sometimes quite talkative. Lord Atherstone, watching her narrowly, could not detect the faintest change in her bearing toward himself; so he, at least, was thoroughly satisfied. Philip, too—by dint of how much private tuition will never be known—behaved himself, on the whole, very creditably. He was punctiliously, almost nervously, polite to Lena; at proper intervals addressed a commonplace remark to Mrs. Shafton; and, if he sometimes started and shivered at Miles's sudden entrance, as though a gust of cold air had swept in, he contrived to keep his dislike of that boisterous person within decent bounds, and cursed him only to Marian *sub sigillo*.

Without personal experience in the matter, you may conceive that the path of a step-mother—especially of a young step-mother—is beset by snares and pitfalls; so that even Philip should have failed to catch her tripping, says not a little for Lena's tact and training.

Though all went on so smoothly in the family circle, Loamshire, as a rule, was provokingly slow to believe in the domestic happiness at Templestowe. Both at home and abroad the Ashleighs seemed to be on the best possible terms with their step-mother; and perhaps neither husband nor wife led their friends to believe they were dissembling with dutiful intent; but somehow, after their visit was ended, people who knew her well began to talk of "poor Lady Marian" (those who knew her very slightly, of course, said, "Poor *dear* Lady Marian," looking mysteriously compassionate the while), and the prejudice against the Atherstones was not materially abated.

It was Ralph himself who proposed that they should spend part of the season in town; and they had no reason to complain of their reception there. If Lena's early imprudences were not altogether buried, society, at least, could afford to ignore them, now that she was sheltered under a blameless name. The Baron's old comrades—several of whom had taken family honors years ago—were very ready to welcome him in his new character. Miss Bellingham was one of the earliest to bring a peace-offering, and was as affectionate, in her formal way, as if she had never had cause to complain of her niece; Lady Montfort, another relative, who once had found it convenient to forget that any Shafton blood ran in her veins, offered to be the bride's sponsor at St. James's; and few cared to meddle with those under the protection of this potent and warlike dame, whose tongue was a two-edged sword, and who, from the impregnable fortress of her virtue, shot out arrows like hail at whoso presumed to flout her pen-nant.

One circumstance, perhaps, smoothed the way for Lena. Even such as were gifted with disagreeably tenacious memories could not amuse themselves with watching how she would bear herself toward Caryl Glynn. Some months ago he had departed on a long yachting tour,

and since then only vague rumors concerning him and his fellow-wanderers had come home.

Was Lena glad of this absence? Assuredly she tried to persuade herself that she was so; and if occasionally things around her looked strangely flat and dull, like a picture out of which the colors have faded, she had strength of mind enough then not to admit, even to herself, that there was any special cause.

Altogether their sojourn in town was decidedly a success; yet perhaps neither the husband nor the wife was very sorry when the time came for their moving northward. The grouse-disease was rather prevalent that season; so Lord Atherstone gave his Scotch moor a jubilee; but they made a long stay at Kirk-fell, and the weeks spent there were certainly the happiest that Ralph had known since his marriage. That the welcome was of the warmest it is needless to say; and there was delight in the very contrast of his present security, with the doubts and hesitations of last year. He never entered the cozy drawing-room without remembering how he had paused on the threshold to watch a tall white figure and a graceful head bowed over the flowers, and his first glimpse of a proud beautiful face, and his first pressure of a soft slender hand—all his own now—his own, as he believed, forever. It was pleasant to listen, out on the hill, to the banter of his jovial comrades, and to see them afterward vying with each other in rendering their honest homage to his queen, and pleasant to watch the complacent self-congratulation of the host; for General Percy evidently attributed all that had happened since to his own diplomacy and foresight. Lena, too, was happy in a quiet fashion. The complete rest did her quite as much good as the bracing air; and she half regretted the other engagements which at last called them away from Kirkfell.

However, in one way or another, the autumn passed quickly and uneventfully, till the fall of the leaf brought the Atherstones home again once more.

LITERARY FORGERIES.

I.

I HAVE not cared to occupy myself with the autographs of M. Chasles, since every one has learned the whole story; but, even before the fraud was unveiled, I have shunned any allusion to the subject. I was not anxious to push at a gate which appeared to me open and swinging both ways. There is great risk of passing for a dupe in treating seriously of certain things. In my opinion, the hypothesis of M. Chasles raised a prejudice sufficient to excuse every man charged with the examination. To what purpose study the pieces, or compare the characters and the dates? The system of the learned astronomer fails in the very enunciation: his theory was false, because it contradicted the rules of probability—because it was absurd. What! here are thousands of letters, written

by a great number of persons, all bearing more or less directly upon a so-called scientific discovery of Pascal, and of all this nothing had transpired elsewhere! The writings of Pascal already known bore no trace of it; the works and manuscripts of Galileo, of Newton, etc., were equally silent on the subject! The proofs of the pretended discovery are all found here, in this collection, and are found only here! Not one tie to bind the fact to other facts already established, to other documents, to other indications! This was a new chapter to add to scientific history, supported, it is true, by innumerable pieces; but, like these pieces themselves, left isolated, without any point of connection, suspended in the air. I repeat it: under such conditions there should have been no examination: the mere statement of the question sufficed to settle it; the honor of the critic himself commanded him to forbear. For such as are but slightly versed in historical studies, the story of M. Chasles's manuscripts can have no other interest than the demonstration of the extremes possible to a forger's boldness and a mathematician's credulity. I am wrong: the story shows, above all, how little the studies prevalent in France develop the critical faculty, when we have seen so many fine minds—indeed, a whole academy—gravely occupied, during eighteen months, with the work of the most daring, but certainly also the most commonplace, cheat who has ever fabricated autographs.

Perhaps it might be worth the trouble to write a history of false autographs; it would be a separate branch, and not the least curious, of the story of literary frauds. The false autograph should not be confounded with the supposititious book; an imposition which consists in passing off a work under the name of a person who is not its author is much more easy, and, consequently, much more frequent, than one which pretends to make us see and touch the very manuscript of the writer whose name it has borrowed. There are thousands of supposititious books. They have existed in all ages—among the Hebrews, the Greeks, and the Romans. There are writings falsely attributed to Homer and to Virgil, to Plato and to Cicero, to Solomon and to St. Paul. There have even been fabricated spurious letters of Jesus Christ; and, it may be said in passing, the great wonder is that M. Chasles's provider did not go to that length. But, I repeat, the false autograph is something much more difficult, and therefore much more rare, than the false book. Besides the invention of ideas and facts, the observance of probability, and the imitation of style, it is necessary to reproduce the material conditions of an original manuscript, the ink and paper of that period, the handwriting of the supposed author—difficulties which can be surmounted only by care and patience, which can never be surmounted wholly, but which seem to have a singular fascination for certain crafty and dishonest natures.

A history of false autographs would have the advantage of proving decisively in how narrow a circle these inventors move. Let them have ever so much imagination, the task is always nearly the same—to forge letters or books of known persons, and to invent handwritings. Besides, forgers can hardly avoid repetition, and the knowledge of old frauds may serve to place the public on guard against new ones. Annius of Viterbo pretended to have discovered Sanchoniathon long before M. De Wagenfeld. Joseph Vella showed Arabic manuscripts from St. Sophia, as Simonides has shown us Greek manuscripts from Mount Athos; Ireland was encouraged by Chatterton's success; Vrain Lucas, or those who employed him, saw the way clear, no doubt, in view of the good fortune achieved by the letters attributed to Marie Antoinette.

In the absence of this history of false autographs—which I commend to the learned as a book worth writing—it has occurred to me to record here some of the most memorable frauds of this kind. It will be, if you like, a specimen of the general history that I would gladly see written, of two or three chapters of which it will be composed.

False autographs, in each country, are naturally conformed to the taste of that country. In Germany the forger writes in Greek or Latin; in France he fabricates correspondence and memoirs; in England he easily becomes a poet—he invents Shakspeare, Shelley, Byron. Here is audacity, at least! Let us begin with these poetical impostors.

England counts many forgers of the sort just mentioned. From this number I select four: Chatterton, the most celebrated; Psalmanazar, the most inventive; Ireland, the most impudent; and Mr. Byron, the most adroit.

Every one knows Chatterton. His precocity, the success of his literary frauds, and his sufferings, all unite to render him conspicuous. He is the only literary impostor whose works have a real value, an interest independent of the name under which they appear. Chatterton has left verses, written at the age of eleven, which already display grace and melody. He was but sixteen when he produced those so-called poems of Rowley which deceived so many excellent judges, and which still hold a place in English literature. It was at nineteen, finally, that he put an end to his life, after having suffered the torments of hunger, and, more bitter yet, the agonies of disappointed ambition. The character of Chatterton was one made up of contradictions—greedy of renown, yet seeking to conceal himself behind a borrowed name; susceptible of domestic affection, yet an adventurer; jealous of his independence, yet the slave of booksellers; endowed with the cleverness of a consummate impostor, yet possessed by an eccentricity bordering on madness. To complete the paradox, he had received a very imperfect education, and even knew nothing of Latin, yet he devoted himself to learned and

antiquarian works. His passion was to deceive the literary public; he had not the vanity of the poet who aspires to celebrity, but the more subtle vanity of the pseudonym, who would make at once admirers and dupes. His invention, his quickness, and his skill were extraordinary. From the old stores of pretended manuscripts of the monk Rowley, Chatterton drew successively, not only the drama of "Ella," ballads, eclogues, and those poems which, as I have just said, form to-day part of the English literature, but even genealogies, coats of arms, an imaginary description of the ancient churches of Bristol, with plans and draughts, a catalogue, not less visionary, of ancient painters and sculptors, an account of the inauguration of a bridge over the Avon in the thirteenth century, and a fragment of a sermon upon the divinity of the Holy Ghost. All this in a style very passably imitated from that of the fifteenth century, traced on parchment with an artificial ink, and in Gothic characters. To-day the fraud seems to us rather awkwardly managed; at the end of the eighteenth century it made many dupes. The works of Rowley have been the subject of an immense controversy, which was not finished in sixty years. Strange! the manuscripts of the false monk will not bear the least paleographic investigation; the language is no more like old English than our own *Clotilde de Surville* is like the French of the time of Charles VII.; yet, with all this, there is no denying the superiority of Rowley's poetry to all that Chatterton subsequently published under his own name, or that was found after his death; so that even to this day we find ourselves confronted by that literary problem—a writer who has shown infinitely more grace and talent in imitations than in his own language; who, in an obsolete dialect, has left admirable fragments, but who dropped to mediocrity in the moment when he returned to the common English of his own time.

Psalmanazar died in 1763, some years before Chatterton. In some respects he was yet more remarkable; with less genius, doubtless, without even talent or real literary aptitude, he displayed a fertility of invention hardly to be surpassed. Psalmanazar, to speak correctly, was not a fabricator of autographs; he was more and less than that—the inventor of a language, of a chirography—what do I say?—of a nation. But his life was yet more wonderful than his inventions. It is all a romance. This romance he has written; we possess his autobiography, yet we do not know his name! Out of regard for his family he has sought to conceal it, and he has carried his secret with him: we shall never know who he was, nor even whence he was. It is supposed, however, that he was born in the south of France, in Languedoc or Provence. His family was poor, his father established at a distance, in Germany. George had been brought up with the Jesuits, then with the Dominicans; having finished his theological course, he was received as preceptor in several

families. But he had indolent and adventurous tastes. He was not slow to adopt the rôle of religious impostor, no doubt in order to profit by his theological studies. We find him borrowing, begging, traversing Provence, on his way to Rome; repairing to Germany; playing the part sometimes of a converted Huguenot, sometimes of an Irish student, or, again, of a pilgrim. He ran many risks, came near being shot as a spy, fell into the depths of misery, and beheld himself covered with sores and vermin. From adventure to adventure, from knavery to knavery, George arrived at the grand fraud of his life. Finding himself in a Protestant country, he could remain neither pilgrim nor Catholic: he gave himself out as a Japanese from the island of Formosa, taken to Europe, he said, by Dutch merchants. Formosa was very little known; the young impostor recalled, as well as possible, such accounts of Japan as he had heard among the Jesuits; then, upon this slight canvas, he began to embroider a whole world of fancy. He fabricated a so-called language of Formosa, an alphabet for writing it, a grammar to explain the rules. He made a new division of the year into twenty months. He invented a new religion, with a book of prayers, and went so far as to worship the rising and setting sun, with all sorts of forms and mummeries. Finally, he accustomed himself to eat raw meat. The idea of doubting the veracity of a man who ate raw meat, and who wrote fluently in characters which no one knew! Meanwhile Psalmanazar (such was the name he had adopted on becoming Japanese, and which he retained to the end of his life) had met another rogue, who conceived the plan of profiting by him. This person, named Innes, was chaplain of a Scotch regiment then in garrison at Sluis, in Holland. It was here that Psalmanazar made his acquaintance, and that they became intimate. It is probable that Innes at first had been himself deceived by the false Japanese, and it is certain that he soon discovered the fraud; however, he did not abandon his designs on that account. Innes took up Psalmanazar, taught him English, carried him to England, showed him to the Bishop of London, baptized him with much ceremony, and, altogether, managed so well that he ended by obtaining from the bishop, as a reward for services rendered to religion, a living in the county of Essex. Psalmanazar, under such patronage, could not fail to develop his happy gifts and ingenious knaveries. He hastened to translate the English catechism into the Formosian language, and had the pleasure of beholding the Bishop of London accord a gracious reception to this work. It was submitted to *savans*, who saw in it nothing out of the way. To whom could it occur to suspect a young man of twenty of so colossal an imposture? Not that there were not, here and there, weak points in the system of the Formosian. It is impossible to be forewarned of every thing: he had forgotten to give names to the letters of his alphabet, which caused him some embarrassment.

He had believed that the Japanese wrote from right to left, like other Oriental nations, which furnished another argument against him. He had asserted, rather carelessly, that the inhabitants of Formosa sacrificed eighteen thousand male infants every year; and when it was represented to him that, at this rate, the island would long before have been depopulated, he had no other answer than an obstinate perseverance in his declaration: he had early formed the resolution never to retract. Psalmanazar, however, understood what he owed to the public, and he crowned all his frauds by a new and gigantic one, "An Historical and Geographical Description of the Island of Formosa, with an Explanation of the Religion, Customs, and Manners of the Inhabitants. By George Psalmanazar, a Native of that Island." The work appeared at London, in the English language, in 1704, and was soon translated into French and German. In the French it passed through three or four editions. It was adorned by the famous alphabet, a map of the island, plates representing divinities of the country, costumes, religious ceremonies, edifices, and vessels!

The work rendered warmer than ever the discussions among the *savans* which had been called forth by the first inventions of the author, all the more that this time the quarrel was complicated by all sorts of rivalries between the Protestants and the Catholics, the philosophers and the orthodox. On the whole, the relation was considered authentic, and during the entire eighteenth century it continued to be quoted by many as an authority. Walckenaer cites a "Universal Library of Travels" which, in 1808, borrowed almost all of this description of Formosa.

We are not yet at the end of the surprises reserved for us by Psalmanazar. Once baptized, he studied at Oxford, took orders, and became almoner of a regiment. So slipped away a dozen years. All at once he experienced a deep and decided change. At thirty-two this warped nature redeemed itself. I know not what hidden reaction raised up the vagrant again, what shock forced him out of vanity and idleness. The squalid adventurer became the model of modest virtue, the audacious forger the pattern of conscientious scholarship. Psalmanazar became a devout Christian, and it must be confessed that no convert ever did greater honor to his conversion. No intolerance nor dogmatism; nothing but humility, love of work, desire of obscurity, and, above all, a profound repentance for the impostures in which he had indulged. Indeed, he earnestly wished to make some honorable amends. He took occasion to introduce, in a treatise upon Geography, a rectification on the subject of his former description of Formosa. When his adventures were spoken of, he turned the conversation, or was silent. Finally, these tacit disavowals proved insufficient, and he wrote a confession, designed for publication after his death.

Walckenaer has well remarked the contrast offered by the two halves of our adventurer's existence. "His life," says he, "was divided into two parts, which hardly seem as if they could belong to the same person. In the last portion of his life, and during a half-century, he made himself endeared by his piety and his virtue; he was conspicuous for works as solid as important, and he enjoyed universal esteem and well-merited consideration. In the first part of his existence, after having received an uncommon education, he fell, successively and voluntarily, to the very lowest ranks of society; he crawled in the vilest pursuits; covered with the rags of poverty, and wasted by the leprosy of utter wretchedness, he appears to us under a hideous and disgusting aspect; and his baseness and hypocrisy make us condemn him as unworthy of the pity which he inspires." So true it is that human nature is large enough, or pliant enough, to lend itself to all kinds of contradictions.

Psalmanazar lived a long time. He devoted himself to erudition, knew Hebrew pretty well, and gained his bread by working for the publishers. We owe to him a good part of a compilation, formerly celebrated, the great "Universal History." Dr. Johnson, who knew him well at that time, and who belonged to the same club, more than once renders witness to the uprightness and sincerity of the ancient adventurer. He was, Johnson told Boswell, one of the men for whom he entertained the greatest respect. Psalmanazar must have had an admirable constitution, for, after having suffered a long time from every sort of misery and privation, we find him, in his old age, working from seven in the morning to seven at night, and taking, without inconvenience, considerable doses of laudanum. He died in 1763, at the age of eighty-three. His memoirs were published the following year by a lady, "his worthy and pious friend," whom he had appointed his legatee and testamentary executrix. It is the history of his life, a general confession of his offenses, a book curious, sincere, and which a grain of talent, a spice of deviltry, might have made an incomparable tale of adventures. But the author is too sincerely converted for that; he is too preachy, too snuffling—in a word, he is tiresome.

Ireland, in one sense, was even more audacious than Psalmanazar: the former invented a country which no one knew, the latter passed off his own poetry under the name of a writer whom every one had read. And that writer? The greatest, perhaps, of all who have ever held a pen! Ireland manufactured Shakspeare. Let us add that Ireland had no talent, and that he made fewer dupes.

William Henry Ireland was born in London about 1776. His father, Samuel Ireland, engraved in *aquatint*, and published illustrated travels; this father was at the same time an amateur of old books and prints, a species of antiquary, interested particularly in whatever

concerned Shakspeare, on the watch for documents and autographs. The son, evidently, early learned to ride the paternal hobby. A journey to Stratford-on-Avon, the birth-place of Shakspeare, which he made with his father, doubtless completed the work of turning all his thoughts toward the great dramatist and his forgotten or ruined works. What happiness for young Ireland if it should happen to him to find some lines of that precious writing—a poem, or—who knows?—a drama! But, finding nothing, why should he not make a pretense of having found something? Why not imitate the example of Chatterton? Why not give his father the joy of pressing at last to his heart a fragment of the writing of the great poet? Without counting the pleasure of circulating his own verses under such a name, of agitating the whole republic of letters, of duping the learned.

It seems that William Ireland began by deceiving his father, but it is difficult to believe that the latter did not later become the accomplice of his son. However that may be, the young man was only nineteen when he executed one of the boldest projects that ever came into the head of an impostor. It was reported, all at once, that Samuel Ireland, the engraver of Norfolk Street, was displaying manuscripts, some of which were by Shakspeare's own hand, while others concerned his life and his person. He got them from his son, who, he said, had found them among some old papers in the country seat of a neighboring gentleman. As for the name of this gentleman, the Irelands were not at liberty to make it known. Among the documents in question had been found a will, and from this will contentions might arise; briefly, the public must content itself with a knowledge of the manuscripts, without showing itself too exacting on the question of their source. Exactly the same pretense as that of poor M. Chasles!

The pieces produced were at first few in number: received with transports of joy by the literary world, they were not slow to multiply. There were books which had belonged to Shakspeare, with marginal notes by his own hand; contracts and receipts; letters from Queen Elizabeth, from Lord Southampton, and various other persons; some verses addressed to Anne Hathaway—afterward his wife—to which Shakspeare had fastened a lock of his own hair. Then appeared a "Profession of Faith," extremely edifying, and whole passages of "Hamlet" and "King Lear," with different readings from the known text. Finally, luck not turning against him, William Ireland risked the grand move, and produced an entire play. The subject was borrowed from the history of the ancient British kings, and was called "Vortigern and Rowena." All these relics were exhibited by Samuel Ireland; it can be imagined the house was never empty; whoever would, might see with his eyes, and touch with his hand, these sacred remains of the past. Boswell, Dr. Johnson's biographer, thanked God

in contemplating them. Parr and Wharton fell upon their knees before the poet's pious "Profession of Faith." Malone, the editor of Shakspeare, and Kemble the actor, were the only ones, it is said, who entertained doubts from the first moment. The pleasure of making dupes, however, was not the only profit derived by young Ireland from the fraud. He sold, at a very high price, the books and other objects belonging to the poet; he published, at one hundred francs a copy, a volume of facsimiles, which found purchasers; finally, Sheridan bought, for a large sum, the play of "Vortigern," for the Drury Lane Theatre, and placed it in rehearsal.

William Ireland had reached that dangerous moment when the false document, forced to appear in broad daylight, meets many unexpected objections. There was now an accessible test, upon which Malone published an exhaustive criticism. Then came the representation of "Vortigern," the second of April, 1796. There was a crowd. At the door of the theatre were distributed advertisements for and against the authenticity of the piece. The public verdict speedily settled the question. After having indifferently supported the tedium of the first two acts, the audience interrupted the play with a storm of hisses. The mine was suddenly exploded; the forger was obliged to disappear and to remain concealed for some time. His father exculpated himself as best he could. As for the dupes, some sought to cover their retreat, while others swore by all the gods that they had always suspected something.

The story does not end here. If William Ireland had imitated Chatterton in writing poems in the archaic style, he imitated Psalmanazar in publicly avowing the fraud of which he had been guilty. Only the false Japanese asked pardon for his crime of God and of men, while the false Shakspeare appeared to have taken a certain pleasure in mocking the public. Ireland, in his account published toward the end of 1796, sought to exonerate his father. He had had, he said, but a single confidant, a young man named Talbot, who had surprised him one day in the very act of forgery, and who, therefore, became necessarily a sharer of the secret. Ireland, however, gave proof of skill and energy. Like all who have followed the same business, he procured paper by tearing out the blank leaves of old books. He was careful to soil them afterward, particularly on the edges, in order to give them an ancient air. The ink that he used was a composition which turned brown when exposed to the fire. The strings that tied his manuscripts were drawn from old tapestries. He had altered an ancient engraving, bought by chance, into a pretended portrait of Shakspeare in the character of Shylock. Unhappily for him, he had but a very imperfect acquaintance with the handwriting of the poet, and none whatever with that of Elizabeth or

Lord Southampton, so that he could not even attempt to imitate them.

The confessions of Ireland, by cutting short all uncertainty, only irritated the more those whom he had deceived. His career was over. He could not remain in England. He went to France, where he lived a long time. There he reappeared during the Hundred Days, at which period Napoleon, for what services I know not, gave him the Cross. He published, in 1822, a

rather curious work upon this epoch and the second Restoration. He passed his life in writing for the booksellers. He has left a history of the county of Kent, several romances, and a poem, none of the slightest value. The author has had precisely that strange fate of being himself the most mediocre of writers, yet of passing off some of his verses under the name of the greatest of poets. He died in 1835.

Editor's Easy Chair.

THERE have been two topics of universal interest during the summer, the heat and the war. But, despite the African fervor, the latter was the absorbing topic. There was never a more unexpected war. Indeed, the great cloud appeared, discharged itself so suddenly and with such fury, that it may be quite spent before this Magazine is issued. The Peace Society has not been heard from recently. That general disarming of the great powers, of which there was such vigorous suggestion a little while since, has not yet taken place; and the millennium of swords beaten into plow-shares seems still remote. Yet it is not a great many years since the Easy Chair was speculating with a friend, as they strolled through the busy streets, upon the aspect of a great city during a war. So prolonged and profound had been our own peace that a state of war had become half fabulous, and they pleased themselves with fancying the alarm, the lassitude, the paralysis, which must by turns affect a city during war. Soon enough they saw the spectacle which they had fancied. And every town and every village and every quiet valley among inland hills all over the land saw the same spectacle. And every where even now, when the last gun was long since fired and the last soldier has long ago become a citizen again, the country still shows and feels what war is.

This is the reason that the news of the war in Europe was received here with such unanimous deprecation and sense of horror. The sanguinary ordeal has been stripped of all romance. It is no longer, as it seemed to us when we used to read of the wonderful campaigns of Napoleon Bonaparte, "a great drama;" it is merely a cruel and causeless tragedy. In summer days of leisure a young Easy Chair, for instance, read of Lodi, of Marengo, of Austerlitz, of Waterloo, of the ghastly Russian expedition, as it read of Diomedes and Pandarus, of Hector and Achilles, upon the plain of Troy. The awful carnage, the inexpressible suffering in the field, the unimaginable sorrow in countless homes, seemed as unreal and remote as the personal grief in Lydia when Cyrus conquered Cræsus. But every Easy Chair reads the newspapers describing the present war of another Bonaparte with eyes touched by the magic of experience. It is romance no longer. It is crime.

Yet if any one is inclined hopelessly to suppose that history is an eternal circle, that we merely seem to advance, and that civilization is but a finer form of barbarism, let him be com-

forted by observing a few significant facts that distinguish this war. The war indeed is itself a fact, and most deplorable. It is, as Mr. Gladstone called it at the Lord Mayor's dinner in London, "a quarrel the most mournful and miserable ever witnessed by mankind." It is, also, as Mr. Gladstone did not say, because he was speaking in the name of a neutral and neighboring government, a war springing from the pride of one man. It is almost literally a war without excuse and without object. It is, therefore, as wanton and wicked a war as could be imagined.

But the quicker conscience of civilization is to be seen in nothing more plainly than in the instant and universal recognition of that fact, in its emphatic statement by the English prime minister, and by the vehement protest of the moral public opinion of the world. That sentiment now distinctly demands that there shall be no war without extreme and inevitable cause. It denounced Louis Napoleon with unsparing severity as a malefactor. The attempts to justify him, or to insist that the sympathy of the world should be neutral between Prussia and France, were absurdly futile. It was an invitation to stultification, to oblivion of any difference between right and wrong. It was an airy exhortation to believe that the anguish of thousands and thousands of loving hearts was nothing to us because they were French and Prussian hearts, and that the tortures of the wounded and dying upon bloody fields need not affect us, because they were foreign fields over the sea. The universal and indignant protest against the war, and the overpowering condemnation of its author, were the declaration that there can no longer be a neutrality of the public heart or conscience, and that any man who invokes war to avenge his mortified vanity or his personal grief shall share the condemnation of the forger and the murderer. The development of such a sentiment and its powerful expression are largely due to the political changes which society is rapidly undergoing, which reverse the theories and practices of the warlike ages, and assert the essential value and equality of men. As the people come into power, wars will be waged only from dire necessity. Not that republics have not been as bellicose as other governments, but that by the conditions of our modern republics intelligence is so developed that the moral protest will be a constantly increasing force.

The better state of things is also seen, despite the fact of the war, in the constant attempt of

the guilty government to justify itself before the world. It is an attempt which not only shows the vivid consciousness of the existence of a public moral tribunal, but also of the weight of its opinion. The Duke of Grammont, the French foreign minister, said that the tone of the English newspapers deeply irritated France. That they deeply irritated the Emperor is very probable. They vexed his uncle also. But his uncle had a short and easy way with such dissenters. Sir Samuel Romilly said that Louis the Fourteenth was never so independent of public opinion as Napoleon Bonaparte. He prohibited all English newspapers; and one of his courtiers in 1800 told an English nobleman that, if the English press was not silenced in its censure of Napoleon, there must be war to the death. Cobbett was mentioned by name by Napoleon as an editor who must be punished. Poor Dr. Addington, the predecessor of Mr. Gladstone, remonstrated with the newspapers, but he could not punish them, as the great Napoleon did, for a difference of opinion. The nephew is irritated, but he does not threaten nor haughtily demand peremptory punishment of misbelievers. Like a criminal at the bar, he proceeds to justify. He tries to defend himself. One of the New York papers said that it was likely to be a war of documents as well as of Chassepots and needle-guns. Documents are official proofs. Their production is an evidence of an uneasy consciousness of the kind of tribunal which sits in permanence upon the war.

Then also the amelioration of war is seen in the attitude of both combatants toward neutrals. The old rule was that every thing must give place to the war. Neutrals had such rights only as the belligerents chose to concede. But the Congress of Paris, in 1856, showed the increasing influence of neutral interests and the deepening conviction that war must be regarded as a horrible alternative, whose direful consequences should spread as little as possible beyond the belligerents. The doctrine that free ships make free goods is a sign that peace and not war is coming to be regarded as the normal state of the civilized world. But at the very beginning of this war, the very first act of Prussia, against whom the fury of France was to be hurled, was a declaration that all merchant vessels, including those of France, should be secure upon the sea. This is a step in the humanity of war beyond that taken by any nation. In 1856, at the Congress of Paris, we had offered to take it in company with the other great powers. Prussia, on the eve of a tremendous war, takes it alone. It is asserted, indeed, that, having a long coast and a small navy, it was her interest to do it, hoping that France would do the same. The Easy Chair is not of those who suppose that Bismarck expected any such action from France. He knew the force of the French navy, and he knew that the French government in so crucial a war would not surrender a single advantage. He undoubtedly expected that France would demand the letter of the bond of 1856, as she did. She consented, accordingly, that free ships should make free goods, but, unlike her magnanimous antagonist, refused to allow the Prussian flag to protect any thing.

Why then did Bismarck pursue such a policy? To secure a moral advantage. And a moral ad-

vantage was possible only because of that better public opinion in regard to war of which we have been speaking, and which is thus acknowledged to exist, and to be worth propitiating by the most astute of living statesmen. With the same consciousness and purpose he published to the world the fact of the overture from France to absorb Belgium. There was a great deal of contempt in the indignation with which this announcement was received, because it seemed a kind of travesty of the old Napoleonic policy by the inadequate heir of a famous name. The time has so wholly passed in which it is permitted to a king or an emperor to lay such plots, that there was also a certain incredulity in the wonder with which it was heard. And if the design itself showed, upon the part of the chief plotter, an indifference to the public opinion of which we have been speaking, the result and his subsequent conduct serve all the more forcibly to prove the existence, and character, and power of that opinion.

The very circumstances, therefore, which are irresistibly conspicuous about the war show the presence and force of a feeling which will hasten the work of the Peace Society. Surely it is a sentiment which every honest man and woman will strive to deepen and strengthen. When governments feel it to be necessary to deprecate the judgment of the world upon their armed contests, such contests will become fewer and fewer. As war becomes more humane, also, it tends to disappear. There is, indeed, another theory which declares that, the more ferocious warfare is, the sooner it will be ended. If wells are poisoned, and bullets are made explosive, and the ocean is ravaged, and wounds and suffering are aggravated, and the horrors of death are multiplied, says this theory, nations will be more wary of undertaking wars. The reply is simple and conclusive. Civilization repudiates such a policy, barbarism pursues it. But among civilized nations wars not only diminish, but they are more sharply denounced; while the normal condition of savages is war. To adopt the barbarous policy—and its adoption has been gravely urged in recent discussions upon maritime war and neutral rights—would, of course, be to barbarize all nations that resorted to it. But is war likely to disappear in the degree that the world relapses into barbarism?

No, no; an age in which Florence Nightingale goes, a humanizing influence, with the British army to the Crimea—an age in which thousands of Florence Nightingales are organized into a Sanitary Commission, which tenderly follows the American army, like a good genius attending a hero—is not an age which fosters war, but which diligently plants the palm of peace. Mournful and miserable, indeed, is the struggle which, as we write, begins to shake Europe, and which sickens every heart in America, that only too freshly recalls six years ago. Remembering ourselves, we know what France and Prussia—the France and Prussia of the people—feel to-day. What consolation there is, is for the assaulted Prussians, to whom no alternative was left. The King of Prussia said, with truth, "I am compelled to draw the sword to ward off a wanton attack." And how curiously must a thoughtful Frenchman wonder whether the genius of his race forbids the hope that the people

of France will ever firmly and intelligently direct their own destiny!

"THE elephant now goes round, goes round;
The band begins to play;
The little boys under the monkeys' cage
Had better get out of the way!"

The Easy Chair can not properly ask the highly respected reader whether he has lately been to a country circus, because a circus is cosmopolitan, and Mr. Merryman, who, far up in some retired valley of the Green Mountains, runs into the ring and says, "Here I am!" ran into the same ring, with the same humorous ejaculation, in the great city, only a month ago. But when you reflect that he said the same thing last evening and this afternoon, and will say it again this evening and to-morrow afternoon, you will admire the unflagging zeal with which he works at his profession. However, that is not the thing to think of when we go to the circus. And by all means let us go in the country if we can, because a city audience is callous with constant dissipation, while in the country there is always a large part of the audience which is wholly inexperienced in the enjoyment. And the size of the audience, the unexpected crowd, in the country, suggests also the monotony of the life there, which every body is delighted to invade with any excitement.

The premonitory symptoms of the circus break out upon the village fences in the form of huge placards, conveying a temptation which is both appalling and irresistible. It is at once evident that the utmost ferocity in the wild beasts may be expected. The rhinoceros is a terrible creature. His horn, which is a yard long, glistens horribly in the sun while he tears through the jungles of the tent at an incalculable speed. As for the elephant, his huge legs, trunk, ears, and tail are all flying in different directions as he rolls a brace of royal Bengal tigers over and over, who frightfully gnash their teeth and glare upon Behemoth with a savageness that curdles the village blood in its veins. The African lion in his native wilds is consuming three villagers and other men at one meal, and the polar bear lies under the ample shade of the glacier receiving a friendly visit from walruses and seals. If you can turn your eyes from these delightful horrors, there is the celebrated highly-trained animal, Napoleon, the horse that waltzes to slow music. And here is Mademoiselle Éclair flying, and gracefully kissing her hand to applauding worlds as she flies, through several miles of papered hoops. And the modern Hercules simultaneously catches 500-pounders, with a smile, upon the nape of his neck and each elbow. *La Petite Elise*, aged five years, flutters in the most angelic manner, with tiny flags in her hands, over floating draperies. All is delight and grace and happiness, skill, ferocity, and surprise, in the premonitory symptoms.

The young villager studies these great bills with inexpressible awe and expectation. He saw them last year, perhaps, and probably the year before. He has proved the quality of their veracity. He knows whether the rhinoceros really does plow up the elephant's belly, and the elephant's flying leaps has he not seen? But who knows not the magic of a play-bill? Yes, and of a dinner-bill? The first blue-bird in

spring does not more surely foretell a summer that shall not be than the bill of fare in the dingiest cellar smelling of beer insinuates the delicate vision of a dinner beyond Delmonico. Then is there not the Grand Entree of the whole company? the band, comfortably sitting in Cleopatra's barge, playing lively tunes with an overpowering proportion of bass drum? the dusky, dusty elephants, slowly following, flapping their huge ears like punkahs, and stoically restraining that promised tendency of legs, trunk, and tail to fly abroad? and the camels, Bactrian and other, come lounging along; and the boys instantly lose themselves in a learned labyrinth of debate whether it is the camel that has two humps and the dromedary one. Then roll in solemn silence all the red vans, in which we know, with feelings not to be described, that zebras and gnus, and leopards and jaguars, and lions and tigers, are passing, although invisible. If there is a hoarse growl, a sullen rumble, a snarl, a scratch— Oh joy! that in these cages is something that doth live!

What a procession it is! And when does it move, and by what roads? What if, driving by a lonely way for pleasure upon one of the burning afternoons of this summer, you had suddenly come upon camels and elephants plodding heavily along! You would not have been surprised, for you are a philosopher, and evidently our zone has lost its balance, and the tropics have marked us for their own; but what would your horse have said? There was a lemonade merchant at the circus—for we are going gradually thither—who said mysteriously, as he chipped the ice, "Long before the sun's first ray We are off and far away!" Does that help the matter? Suppose that you are passing your vacation at a farm-house, and are awakened at dawn, not by the proud challenge of chanticleer, but by the roar of the king of beasts under your bowery window! "Suppose, my beloved brethren," said the deacon at the prayer-meeting, to the thoughtless world's people who had come in to scoff—"suppose, my beloved brethren, that you should wake up to-morrow morning and find yourselves dead, what would you say then?" One dweller near the springs of Dove, by which the circuses pass to the neighboring town, has a convenient theory of the souring of milk. If it comes upon the table in that state, he says, "Succus at Dove to-night."

"How do you know?"

"Milk's sour."

"How does that prove it?"

"Cows can't stand the noise. When the succus goes by, and the animals snarl, it curdles the milk in the bag. 'Least s'pose so. Can't 'count for it no other way."

The tent is stretched in a large field, and there are other tents adjacent—moons, as it were, to the great planet. Flags wave gayly from the tops of poles. There is a long line of vans and a tent of horses. What a peaceful encampment! How much pleasanter to see than those summer camps upon the Rhine! Here is the tent of the "Grand Opera Troupe and Ethiopian Minstrels," with a prodigious picture. In one corner of the picture a dandy, of a kind never seen upon earth, is bowing to a New York lady of the extremest fashion—a combination of chignon, panier, and high heels; a clown sprawls upon the ground;

and in the other corner a Lydia Thompson appalls Sam Slick with a tremendous demonstration of the cancan. It is all extravagance and bright paint; but the humor lies altogether, like Cap'n Cuttle's, in the application. And here is the tent of the giant, Major Goliath, illustrated by a full-length portrait. It must, indeed, be fully as long as the Major, representing that gallant officer as about twenty-five feet high. We ordinary people are depicted as reaching halfway from the Major's ankles to his knees. But human nature is avenged by Miss Fairy Mite, who is to be seen in the same tent, and who, judging from her portrait, also generously exposed gratis, is apparently of the proportions of a grasshopper. Miss Ada Chubley, the far-famed fat girl, completes the trio of attractions in this department—admission only twenty-five cents.

The circus ticket-seller sits in a red van upon wheels, and sells the tickets through the open back. That of itself is something. It has a picnic air. It sets the refrain humming again, "Long before the sun's first ray We are off and far away." It makes the circus seem a merry-go-round. But the ticket-seller, somehow, is not merry, nor in any degree suggestive of merriment and festivity. He sits in his shirt-sleeves, and has taken off his cravat and collar, and sells tickets with a weary, mechanical air, which is wholly inexplicable to the youngest visitor of the party, who has different associations with a circus. And the men at the door of the tent, who take the tickets as we pass in, do not seem in the least degree excited. The older of the younger members observes that they are as indifferent to the pleasure of which they are a part as a confectioner's boy to candy. The eyes of the younger sparkle as we deliver the tickets.

Well, here it is again, as the clown says; the old familiar smell. One whiff, and we are all children once more. It is a mingling of tanyard and stable and menagerie; but it is unmistakable. And all around the ring is a rising bank of eager spectators. It is midsummer, and it is not a sombre audience. The women and children are in light dresses; the men in drilling coats, and often in shirt-sleeves. Every body has a small palm-leaf fan, and there is a half-dizzy flutter in the aspect of the audience. But such eager attention! We walk slowly along, and there are no seats. People upon the lower benches only wish that we would get out of the way, and not hide the view. Down go the younger members upon the grass at the edge of the ring, and the elders squeeze in somewhere modestly, and immediately wish that the next comers would get out of the way and not hide the view. And there is the same old ring, and the same old clown, and the same old double-checked slowly-cantering horse; and there is the same old Mr. Merryman. "My sweet-heart says—I have a sweet-heart," and we are all delighted at the droll fellow's humor—"my sweet-heart says, 'You'd better not keep your cap on 'fore folks.' And she snakes it off—so!" 'Tis irresistible.

That funny fellow must have been doing that very thing, and saying those very words, ever since the siege of Troy. And he seems never to have said it before. It is a happy inspiration. And so it is, when, in that same old gay round

voice, he says to the solemn ring-master, who snaps his whip in a highly stately manner:

"Do you know what my gal says?"

"No, Sir; I don't know what the person whom you call your 'gal' says."

"She says—" and the wit follows the ring-master steadily around the pole.

"Well, Sir, *what* does she say?" demands the ring-master with dignified urgency.

"Wouldn't you like to know!"

"Come, Sir, none of your freedom with me;" and he feigns a snap with his whip at the clown's leg, who feigns a pain, and catches up his leg and hops comically after his leader.

"Well, my gal says, says she—"

"Very well, Sir, what?"

"Shoo, fly, don't bodder me!"

We all laugh again, not immoderately, but pleasantly; while one delighted auditor behind us enjoys every sally and every intended sally. Nor can the funny man exclaim, "I say!" but the friend behind snickers and shouts, and is evidently having his full money's worth. When Mr. Merryman sings his song, lamenting, with appropriate expressions of face, that "Sally's gone away," the delight of our friend is uncontrollable. Laughing is not enough. He nudges all his neighbors with his elbows. He slaps his knees, and he whispers, utterly overcome, "Wa'al, I never see nuthin' to beat that." He takes good wholesome pleasure in every thing that is said or done; but his eyes cling with pathetic fondness to Merryman; and when that gay fellow retires toward the curtain, and, turning, says, "Ladies and gentlemen, the song of 'Sally's Gone Away,' and twenty other new songs that you haven't seen in any other book, are to be had in a little volume which will be offered to you, price ten cents: sold for the benefit of a poor orphan boy; and I'm the chap," slapping his fat sides—it is too much for our appreciative neighbor, who merely pants "Oh! oh!" in utter exhaustion of delight, unable to laugh longer.

Meanwhile Mademoiselle Éclair has bounded into the ring and waves her hand, and smiles the most arid and mechanical of smiles, and is lifted to her horse and kneels and stands and puts out her arm in the most wearisome way, poor thing! and smiles more of that arid smile, and then sits quietly sideways upon the steed, while the attendants bring in long tubs, exaggerated specimens of those in which ice-cream forms are carried about. The attendants stand upon the tubs and hold up the hoops covered with tissue-paper, and up springs Mademoiselle Éclair upon the back of her steed, which begins to canter, and Mademoiselle first goes under the hoops, to get a good start, and then, with an intent, doubtful, half-frightened air, she gives a jump, and happily the tissue-paper breaks and the rider comes safely through. But if her feet caught, or the steed lost his gait, how she would come down, poor thing! and how all of us who are gaping at her would shout and laugh!

"The elephant now goes round, goes round;

The band begins to play;

The little boys under the monkeys' cage

Had better get out of the way!"

We are all sitting gasping as well as gaping. It is three o'clock of one of the most torrid days, and we are packed upon the narrow board seats under the canvas roof. All the women and

most of the men are fanning, and to the right of us and to the left of us it is one volley of "whew!" "whew!" The men ease their necks in their sticky collars; but we none of us take our eyes off the ring. If we had never seen a man or a horse before we could not stare more steadfastly. Young mothers with screaming and belligerent babies—babies who sprawl and kick and splutter and grow red—merely rise, if they are on the lower seat, and move slowly up and down before the audience, their eyes fixed and their souls intent upon the Acrobatic Brethren, one of whom, at the top of the tent, is now holding the other by his teeth, while the other makes himself horizontal high up over our heads, and goes spinning round in a wholly dizzy and bewildering manner. The staring young mothers promenade slowly and stare steadily, totally regardless of the frantic burdens in their arms. It is a noise and a struggle to which they are well used. They are plainly young mothers without what are called nerves, and who do not credit any body else with them. The Easy Chair tries vainly to accommodate its feet upon the seat before it, lest it drop ignominiously through. But a staring elderly lady, sedulously fanning, and resolved to have value for every penny of the entrance-money, moves this way and that to enjoy a perfect view, and on each side encounters a foot of the Easy Chair. She turns round and surveys the offender, who looks blandly unconscious, and vainly endeavors to adjust the relations of things, but succeeds only in infringing upon the similar rights of others.

These little incidents make it warmer, which is needless; and while they are occurring, and Mr. Merryman is making ludicrous remarks, we are all unable to hear, because of an extraordinary voice, which says something unintelligible and monotonous in a singsong staccato tone. Listening closely, we can hear "Each and every one should secure a copy of the song-book; price ten cents! ten cents for the book. While away an hour every evening; each and every one." And so on from the beginning. This is a constant accompaniment of the performance. The seller of song-books passes, and is succeeded by a boy, copiously beaded with perspiration, carrying a metal tray holding tumblers of iced lemonade. He is evidently a graduate of the same school of elocution. "Each and every one should have a tumbler of iced lemonade; keep you cool for the whole of the afternoon and part of the evening. How many did you say, Sir?" All delivered in the same hard, stilted, measured, absurdly solemn tone. The lemonade boy drips by; and then—"Each and every one should have a fan, to keep yourself cool!" The whole performance is like one of the highly gilt volumes that you find upon hotel tables, which have an air of being books; but every other page is a circular, and it is not a book, but an advertisement. Presently the ring-master himself stops and says: "At the close of the entertainment the grand opera troupe and minstrels will give a concert in the adjacent tent. You will please to take notice that it is by females only. Tickets will be offered to the audience, to save them trouble in procuring them afterward at the ticket-office. Each and every one can secure tickets for the grand opera troupe without leaving their

seats. Price twenty-five cents! But our own performance is not more than half through." Which is a melancholy departure from the truth, as events prove.

"The elephant now goes round, goes round;
The band begins to play;
The little boys under the monkeys' cage
Had better get out of the way!"

"I didn't care a cent to come to the succus, but the children wanted to see the wild beasts," says one broad-waisted and round-backed matron, steadily fanning, to another. But, truthward, the remark is at least suspicious, for nobody loses less of the spectacle. She watches with delight Signor Caoutchouchi, the India rubber man, whose shins, neck, and calves appear to be interchangeable, and who, as the elder of the younger members remarks, is equally at home upside down or inside out. Mrs. Broadwaist may not care a cent for the succus, but she is deeply interested in *La Petite Elise*, who stands upon her papa's shoulder upon the gentle canterer, and waves her little arms and kisses her little hands, and bounds out amidst our hearty applause. Presently the elephant himself appears, flapping those dusky ears, and the little boys who have front seats upon the ground close to the ring suddenly retire with a serious, preoccupied air; not as if they were obeying any exterior suggestion, but an inward monitor. The huge beast treads over the Saracenic gentleman in a dirty turban, who carries a cowhide; and he limps around the ring upon three legs, and he poises himself upon one of the inverted ice-cream freezers, wheezing and roaring to a degree which is evidently coincident with renewed warnings of the boys' inward monitor, for they withdraw still further.

And so must we all, loudly informed that the concert by the grand opera troupe is about to begin—tickets for sale at the door. But we prefer to pass around and look at the animals, although the authorities immediately warn us to leave, as it is necessary to close the tent in order to prepare for the evening performance. The noscerous is a dreadful disappointment to the younger member, who had expected to behold the unicorn of Scripture, and to see an agile animal with a long ivory rapier upon his nose, "rearing up" for a grapple with an equally lively lion. The heavy, hulking beast with a swelling upon his proboscis—for no horn is visible—is far from satisfactory. We are shuffled out with the crowd, and emerge upon a contest of attractions.

One man in front of the concert tent declares that "each and every one should hear this unparalleled concert. Such a musical attraction is seldom offered. Only twenty-five cents." Opposite, and very near, is the tent of Major Goliath and Miss Fairy Mite. A stentor bawls the hidden charms of that canvas in masterly style: "Ten thousand dollars offered for the equal of this *lusus naturæ*. I give you my word of honor, ladies and gentlemen, that I have never seen his equal for intelligence and learning. The fat girl is alone worth the price of a ticket. Affable as he is tall, ladies, and a universal favorite. Ten thousand dollars offered for the equal of this *lusus naturæ*." The amount was spouted out in such a prodigious voice that it made as much noise as if it had been half a million, and it seemed to make us all richer to hear such

enormous sums so lavishly and loudly mentioned. But the lemonade merchants were not less sonorous: "Step up, ladies and gentlemen. We are not selling now; we are giving it away! Ice lemonade only five cents a glass! A ruinous rate! Each and every one should take a glass of ice lemonade. 'Twill keep them cool all the afternoon and part of the evening. With sugar, lemons, and plenty of ice, We make you a drink that's uncommonly nice. Five cents! Five cents a glass! Sheer ruin! Step up, ladies and gentlemen!"

Every body was going. Only those stragglers for whom the tent of the succus has a resistless attraction still hovered about. Mrs. Broad-waist, who came only because the children wanted to see the wild beasts, went last and lingeringly. It was the same old circus. Nothing was changed. Will any thing ever be changed? Will they always have the trained horse doing exactly the same things, and the elephant likewise? Will there be always the *Mademoiselle Éclair* jumping through the hoops, and the *Petite Elise* doing what her great-grand-mother in the same business did at her age? Will the drunken fellow in the seedy clothes always come tumbling into the ring from the outside, and must he always have been to school with Mr. Merryman, who betrays him into sprawling in the dust? Shall all the world advance, science, art, civilization itself, and the succus stand still? One thing only was new; Monsieur Éclair rode around the ring sitting in a chair upon his horse's back and fanning himself. And to call that new is probably only to betray how long it is since the Easy Chair had heard the stirring words:

"The elephant now goes round, goes round;
The band begins to play;
The little boys under the monkeys' cage
Had better get out of the way!"

A SAD letter of M. Prévost-Paradol to a friend in France, in which the minister speaks despondingly of his position, has been published since his death. It is the letter of a man entirely ill at ease. He would have renounced politics, but it was impossible. He ought to be in the Chamber of Deputies, but he could not afford "to devote forty or fifty thousand francs to an election." To come to America was to allow the course of events in France to be determined, and to fit himself for affairs. It is, indeed, a melan-

choly letter, and has been made the occasion of some melancholy comments upon the penalties of public life, as illustrated from some conspicuous careers among ourselves.

Undoubtedly the three most noted American men of the last generation died disappointed men. Webster, Clay, and Calhoun are sorrowful names to mention. What inducement, cries the critic, has a man to serve his country? See what abuse was hurled at Washington, at Lincoln! Contemplate the ex-Presidents! Who would serve a public which forever proves itself ungrateful!

But is it ungrateful to Washington? Is it ungrateful to Franklin? Is it ungrateful to any of the famous fathers? When a man complains or feels that he has served his country for naught, what does he mean? That he has not helped his country? That it is not stronger, wiser, better for his services? No; he means something very different. He means that he has not received the reward that he wished.

If the careers of the three Senators of the last generation are melancholy to contemplate, why are they so? Is it because they served the country according to their powers and perceptions, or because they are felt to be personally disappointed men? The truth is plain. If a man serves his country that he may be personally honored, his disappointment will sour himself and his friends. But we must understand what honor is. Would Webster, or Clay, or Calhoun be more honored or regarded if they had been President? Would they have been more famous? What is the reward of public life? Is it noble fame and public gratitude, or an office? Would John Bright's political career, his public service, be without reward if he had never been called into the cabinet, if he should never be made prime minister?

Webster, Clay, and Calhoun gave their lives and talents to public life, and were rewarded with great fame and all but the highest office. If they were disappointed, the moral is not that republics are ungrateful, but that the personal ambition of public men is inordinate. The testimony of Mr. Greeley has been given upon this subject in a little speech. He says: "I wish to give my testimony as that of one nearly sixty years of age, and who for forty years has been actively engaged in political strife, and that without holding office or attaining wealth or position; that I feel that my career has been a satisfactory one."

Editor's Literary Record.

POETRY.

IT is curious how, in the cycles of time, literature returns to its starting-point. The oldest books of the world are its sacred books. The philosophy of China, the poetry of India, the legends of our own North American aborigines, the mythology of Greece and Rome, and last, though not least, the entire literature of the Hebrews, their history, philosophy, poetry, and romance, are religious. It would, indeed, almost seem as though nothing else had power of permanent life. And now we have come back, having traveled a long journey meanwhile, to an

era which again produces nothing but religious literature. The modern romance, in its best form, is a parable. The modern history is not only philosophy, but religious philosophy, teaching by example. Modern philosophy is never really content to deal with any less problems than those which concern the infinite. And no poems really stir the heart of the age deeply that do not have in them somewhat of reflected light from the other world. The poetry of Rossetti and of Swinburne only ruffles the surface. The poetry of Wordsworth, of Tennyson, and of Whittier is needed to sound the depths of the soul. Nobody

ever suspected Timothy Titcomb of being a *great* poet, but his "Bitter-Sweet" and his "Kathrina" attained an unexampled popularity, chiefly because they discussed, in the realm of feeling and imagination, problems in soul-experience that can not be solved by the analyses of the intellect. *The Modern Job*, by HENRY PETERSON (H. Peterson and Co.), is a genuinely modern poem in that it is written by one who appreciates this spirit of the age. It is characteristically a religious—we might almost say that it is a theological—poem. It follows, in the outline of the story, curiously close to its Hebrew original. The story opens with a picture of Job in his prosperity, "perfect and upright, and one that feared God and eschewed evil." But affliction soon overtakes him. Drought, rust, and barrenness blast his fields; his flocks and herds die; his wealth withers to dust and ashes; his wife and children fall a prey to the spotted fever; and, finally, the boils that afflicted his prototype break out all over him. Comforters—Job's comforters—come, in the persons of two clergymen, to console him, by declaring his afflictions to be a divine judgment for his sins. And finally, caught up into heaven, he talks not with God, but with God's vicegerent, Michael, whose interpretation of the mystery of life closes the book. Job's wife alone is wanting, and her place is very well supplied by an impish dwarf, Judas. But here the similarity ends. That mystery of suffering which Jehovah declares to the Hebrew Job to be inexplicable, Michael explains to the modern Job:

"God rules the earth, but rules it through his powers,
As he rules all the planets and the suns."

Michael is lord and ruler of the earth. But he is neither omnipotent nor omniscient. He can never tell what the result of any course of action will be, since men are free agents, and he can never be sure what they will do. He does the best he can. But he makes some bad blunders, and causes immense mischief, by his ignorance or his inability to cope with Satan and his tremendous agencies. This is the moral and meaning of the whole poem. As a work of poetic art, it is a remarkable book. The characters of Job and Judas are strongly marked, and the devil is, if the reader will excuse the expression, an admirable devil. But as an explanation of the mystery of sin and suffering, it is a lamentable failure. The moral of the ancient Job is better than that of the modern one. The theology of the Hebrews is better than that of the Hindoos. It is better to bow before the throne of an all-seeing and all-mighty God whose love we trust, though his ways are past our finding out, than before a Michael who means well but is quite incompetent to manage the estate which has been intrusted to him. We have so little respect for overseers, and agents, and middlemen, and subordinate officials of all sorts, in terrestrial affairs, that we should be very loth to accept any theology which transfers them to the kingdom of heaven.

TRAVELS.

WILLIAM H. DALL's treatise on *Alaska and its Resources* (Lee and Shepard) has been on our table for some time awaiting our attention. Alaska is a pleasant topic to think and read

about with the thermometer at 102° in the shade; but a ponderous volume of over six hundred pages is rather formidable reading for the dog-days, and we have not made so rapid progress in it as we could have wished. It is to be added that Mr. Dall's book is not one to be judged of by a glance at the title-page and the table of contents, nor can the cream of its rich pages be taken off by any skimming process. It is really, what the American press does not often furnish us, a genuinely original contribution to our stock of knowledge, and is likely to prove rather a permanent than a popular addition to the American literature of travel. In 1864 the plan was devised of constructing an international telegraph from San Francisco, by the way of Behring Strait, to Siberia and Russia. An expedition of observation was started in 1865 to explore the Yukon territory, the direction of which, by the death of its original commander, fell into the hands of Lieutenant Dall. Before their explorations were completed the completion of the laying of the Atlantic cable superseded the necessity of any further prosecution of their work, and in August, 1867, the Western Union Telegraph Company abandoned the hopeless enterprise, which had already cost nearly three million of dollars, and recalled the expedition. Lieutenant Dall's scientific enthusiasm was aroused, and he resolved to remain and prosecute his researches for himself, which he actually did for a year, entirely alone. During his two years of absence he did not receive a single letter from home, so complete was his isolation. The result of his observations and explorations is a valuable addition to the cabinet of the Smithsonian Institute, and the volume before us, which is part journal, part narrative, part description, part scientific analysis. The style is vivacious and entertaining; the descriptions, both of nature and of Russian and Inuit life, that of a careful observer. It is a perfect cyclopedia of information concerning Alaska. It opens up to the average reader a land hitherto almost wholly unknown. Its chief defect is its size. The author assumes a degree of interest on the part of the American reader in that land of Indians and Oranians, to use his own word, which the American public are far from feeling. We wish, for our own comfort in reading and for the largest usefulness of the book itself, that its author had made it one-half the size. The illustrations are very fair in execution, and the map is an admirable one.

It is just possible that some of our readers never heard of Musardu. They may even be oblivious of "the populous and thriving towns of Zolu, Zow-Zow, Salaghee, Fissahbue, and Bokkasaw." They may even be ignorant of Ziggah Porrah Zue, with its "vast and noisy market." Nay, it would not be surprising if the whole territory of the Western Mandingoes may be an unknown land to them. For their benefit we will say that it is a territory lying just east of Liberia. We have read with more than usual interest the plain, simple, and unostentatious story by BENJAMIN ANDERSON of his *Journey to Musardu*, the capital of the Mandingoes, and the difficulties with which he had to cope, and the dangers he had to face and overcome. The narrative is a straightforward,

manly one, without any attempt at display, and gives the reader a glimpse of life in the interior of Africa, which it is more agreeable to get by the eyes of another tourist than by one's own. Mr. Anderson, let us add, is a pure-blooded negro, and his narrative is printed and published under the auspices of the Smithsonian Institute.

We may, perhaps, classify among books of travel Mr. KINGSTON's reminiscences of Artemus Ward, very well entitled *The Genial Showman* (Harper and Brothers), for he was a very genial showman indeed, and this gossip volume is a very genial book. Not, certainly, a remarkable addition to the literature of biography, but a very pleasant and readable series of sketches, from which you may extract, without difficulty, many a pleasant laugh, and some little, though not very valuable or useful, information concerning American shows and the private life of American showmen.

SCIENCE AND ART.

To say that a book is French is, in some styles of literature, no less than in fashions and millinery, its best recommendation. Such a book is FIGUIER's *Primitive Man* (D. Appleton and Co.). From the frontispiece to the concluding exclamation point it is French all over. The lively, piquant style is French; the accurate but not heavy scholarship is French; and the numerous plates are the same that were used in the original French edition. Only the version is English. We are learning very fast that no people excel our Gallican neighbors in the facility with which they bring the results of dry research directly before the people, so that even children can learn the sciences while at play. A book on this subject was wanted. Sir J. Lubbock's work is not quite popular enough in its style—in fact, Sir John is himself too much of a scholar in this department to take kindly to the creation of popular effects. He has not that combination of faculties that makes the dashing Professor Huxley so popular with both the *savans* and the lecture-going and newspaper-reading public. Figuiet is a Frenchman, and probably has no more faith than most of his countrymen in Revelation; but he knows that on such a subject the prejudices of his countrywomen must be consulted, and he is as soundly orthodox as the Pope of Rome. "Man descended from a monkey? Cousin-german to a gorilla? Profane doctrine! Besides, here are some scientific arguments against it. To be sure, I must make man from twenty to one hundred thousand years in existence, but the Bible doesn't deny it; and are not M. l'Abbé This-one and Mr. Bishop T'other-one among the leading advocates of this prolonged antiquity?" And so this most pious of the sciences, commended by the most pious of prelates, is piously introduced to the pious French people. And yet, with its somewhat unnecessary disclaimer of irreligion, we do like the book. Every one ought to know something about archæology, and here we have it in a compact, readable form. The ages of stone, of bronze, and of iron; the dolmens and cromlechs; the caves and tombs and lake dwellings; cracked thigh-bones of mammoths, and oyster-shells from Danish kitchen-middens; hatchets and arrow-heads and

fishhooks; and even combs and hair-pins and necklaces; here they are all described, and not only so, but pictured out on almost every page. These smaller pictures are of very great value. They are accurate and indispensable to the reader. But we can not say as much for the astonishing full-page engravings on which the designer has been allowed to indulge a most extraordinary imagination. Life must have been poetry in those days, if we can trust these pictures of the "noble savage." Look at that "Family in the Stone Age." The skin is untanned by exposure. The mother, nursing her child, with her half-grown children around her, has as delicate, girlish, and refined a face and figure as you would any where find. The father, posted in a striking attitude, and gazing out on the ocean, is a veritable Hercules in physical development, and belongs to the highest Greek style of feature. We would suggest one caution to those who read this book. Remember that the geology of man, this study of pre-historic times, is a science yet in its infancy. Its conclusions are not yet to be fully trusted when they do more than describe the bare relics which have been discovered. When they divide the ante-historic period into defined stone, bronze, and iron ages, or when they attempt to prove from the Neanderthal skull what was the mental development of primitive man, or when they would say whether the human remains of Europe indicate an antiquity of five thousand or of five hundred thousand years, they are treading on slippery ground. On such questions the best authorities are at sword's-points. So long as Vogt and Quatrefages differ on these matters we will wait till the fight is out, and meanwhile content ourselves with looking at Figuiet's figures, or, it may be, import a little of his French enthusiasm for the investigation of some of our American antiquities.

Dr. T. S. VERDI, in his book on *Maternity* (J. B. Ford and Co.), has treated a very delicate subject with great delicacy. His book fairly deserves the description of its title-page, "A Popular Treatise for Young Wives and Mothers." For a long while a false sensitiveness veiled all the various physiological questions connected with maternity in an obscurity which was only less injurious to the morals than to the health. Women were allowed to grow up and to enter the marriage state in utter ignorance of those truths which, above all things, it concerned them to understand. Such books as were written on the subject were of a character to intensify the popular dislike and suspicion of all medical literature bearing upon it. We welcome cordially the improvement indicated in public sentiment by such works as this of Dr. Verdi. To be ignorant in this matter is a crime, a crime not only against one's self, but against humanity and the state. Every young wife and mother, nay, every woman, should, through some such treatise, acquaint herself with her own constitution, the laws of her own being, and the dangers which threaten both her and her offspring. Among the various volumes of this kind which the last two or three years have produced we give a high place to that of Dr. Verdi. It is more distinctively medical than some others. It belongs to the homeopathic school, and the remedies it prescribes are homeopathic remedies. But apart from this considera-

tion—a recommendation to some of our readers, and a radical defect in the eyes of others—it is admirable in its exposition of the principles of physiology, in its interpretation of the laws of hygiene, and in the eminent good sense of its practical directions, not only to the invalid, but to the as yet strong and well.

Charles Scribner and Co. add to their excellent library of "Illustrated Wonders" a volume on the *Wonders of Architecture*. To those who are familiar with foreign guide-books there will be no new revelations on the subject in the illustrations of this volume, which do not do the theme justice. The book itself gives a very excellent, though a necessarily brief, sketch of the different styles and schools of architecture, and is a very convenient and readable compend.

RELIGIOUS AND PHILOSOPHICAL.

ALL that patient research can do to illustrate the life and labors of St. Paul by elaborate learning, Conybeare and Howson have done so perfectly that their work is of necessity without a rival, and deserves to be without an imitator. Dr. BARNES, therefore, in his *Scenes and Incidents in the Life of the Apostle Paul* (Ziegler, M'Curdy, and Co.), does wisely to refrain altogether from entering the field which they have cultivated so satisfactorily. But if the work of Conybeare and Howson is perfect of its kind, it does by no means exhaust the life of the great Apostle. It is as an author that Paul has been most influential on the destinies of mankind. A work which should seize and portray, in modern and uneclesiastical language, the spirit and tenor of the Apostle's teachings, which should do for the letters of Paul what "Ecce Homo" has done for the words of Christ, could not fail to render an essential service to humanity and the cause of truth. Scarcely less would be the service which one would render who, seizing the salient facts in Paul's life, should exhibit the truths which he taught by his example, who should elucidate his life and character not by a profusion of learning, as Conybeare and Howson have done, but by an appreciation of his character and its significance, interpreting Paul's life as, for example, Bayne has interpreted the life of Howard. It is the latter office which, if we judge aright, Dr. Barnes has undertaken to fulfill. "The work," he tells us, "is founded on the principle that the nature of true religion is fairly illustrated in the lives of its friends; and that *more* can be learned of its nature from the example of those whose lives are conformed to its requirements than from a creed or a mere abstract statement of its doctrines." Our chief criticism upon his execution of the plan is that his book is too dogmatic; the story is burdened with too heavy a moral. As the fashion of preachers is, a very large conclusion is drawn from a very small text, a very extensive but rather thin fabric out of a very small cocoon. In short, the book is too much like a volume of sermons, and leaves on our mind the suspicion that the crude material may have been a series of parochial sermons or lectures on the life of Paul; that Dr. Barnes has simply tapped his ministerial barrel at the demand of the publishers; and that, as they are shrewd publishers, and are aware that sermons are not a popular form of literature, he has, at their solicitation, cast them

in a slightly—very slightly—different form. His arguments, too, though it would be heresy to impugn them, will be more satisfactory to the faithful than to the skeptical; they are flavored a little with that characteristic which belongs pre-eminently to the preacher whose misfortune it is to have ordinarily no adversary to answer him and expose his weak points. The rationalist, for example, will ask Dr. Barnes, who argues for the supernatural character of Paul's conversion, how he explains the conversions of Constantine and Loyola; and why he admits the visions of the Jewish any more than of the Roman or of the Spanish saint. We do not say there is no difference, but we do say that in a discussion of this event it devolved on Dr. Barnes to point out that difference. To the arguments with which he presses upon the modern Athenians the importance of pushing their investigations into the realm of religious truth, the disciples of Comte and Herbert Spencer will reply by asserting the incompetence of the human faculties to deal with spiritual truth, and will find in his pages no response to their position. And the Arminian will hardly agree that the Lord's declaration to Paul on shipboard, "there shall be no loss of any man's life among you," amounts to a demonstration of particular and personal election. In short, as a book of "evidences" this volume does not compare with the same author's lectures on the "Evidences of Christianity," nor does it constitute, as the preface partially promises it shall, "an argument of great force" in favor of the Christian religion. It is rather a book of pleasant and profitable reading to those whose faith is unshaken; and will be of greater service to instruct and nurture the believer than to strengthen the doubting or convince and convert the skeptical. The book is handsomely printed on slightly tinted paper, and we recognize in it a sign of improvement in subscription books. The full-page pictures are very fair, but the small wood-cuts are a positive blemish. They are either very badly cut, or, what appears more probable, printed from very old and well-worn plates.

DESPITE the author's disavowal in his preface, the public at large will be very apt to accept Professor NOAH PORTER's treatise on *American Colleges and the American Public* (C. C. Chatfield and Co., New Haven) as an exposition and defense of the principles of education maintained at Yale College. The book is written by a leading professor in that honored institution. It was originally contributed, in a series of articles, to the literary and theological organ of New Haven, *The New Englander*. It is dedicated to President Woolsey. It is printed in the office of the *College Courant*. It comes to us with the imprint of a New Haven publisher. And it maintains and defends from the attacks of educational iconoclasts, and the emendations and alterations proposed by educational reformers, the "old landmarks" which Yale still continues to maintain despite the seductive examples of Cornell University and Harvard College. Professor Porter does, indeed, admit, rather reluctantly, the fallibility of college faculties, and the possibility of reforms in detail, even in Yale College itself. But the reforms he suggests are incidental and not very important; reforms in conduct and spirit rather than in

any fundamental principles of education. His strength is laid out in opposing radical alterations. His book may be defined as a plea for conservatism. He argues for the maintenance of classical studies, for the superiority of the dead over the modern languages and over science as a means of development, for the continuance of enforced recitations, for the perpetuity of the dormitory system, against the substitution of lectures for text-books, against the secularization of the college, and against the transfer of its guardianship from a close corporation to the ever-changing body of its alumni; in a word, for the American College very nearly as it is, without either the addition of any considerable graftings from English or German soil, or any pruning of imagined excrescences, and old and, as some modern educators would have us believe, dead limbs—effete and now blossomless and fruitless growths of the past. Dr. Porter is thoroughly at home in his subject, writes *con amore*, and has produced the very best plea for conservatism in education that we have ever met with. Still, it is this and nothing more. It is a defense, a resolute and able defense, of the educational system of the past against the attacks of a not too reverential present. We applaud the spirit which leads this knight-errant of scholastic institutions in general, and of Yale College in particular, to set his lance against the falsely so-called utilitarianism which would substitute what the Germans call the "bread-and-butter" sciences for the liberal studies—book-keeping for Virgil and Homer, and mechanics for moral philosophy; but we could wish he had been able to get out of the atmosphere of New Haven, to look on a larger world than Yale, to perceive the true meaning and spirit of American civilization, and to see what are its educational wants, and what yet will be its educational provisions. For while it is true that *man* is more than American, and that no system of education ought to be merely national, any more than it should be sectarian, while one of the very objects of scholarship is to break down local and national prejudices, and naturalize men from all nations as from all sects in the one great republic of letters, while it is true that in the kingdom of literature, as in the kingdom of heaven, men come from the north and the south, from the east and the west, and sit down together, yet it is no less true that the traditional instruments and methods of the Middle Ages are not the best which the resources of the nineteenth century can afford, and that some greater modifications in the present too narrow system of schooling are required by the spirit of the age, and by the enlarged domain of knowledge, than Dr. Porter recognizes in the one short chapter which he devotes to a discussion of some proposed remedies of acknowledged evils in the present college system.

Rocks and Shoals (American Unitarian Association) is the title of a small volume of sermons by Rev. GEORGE H. HEFORTH, pastor of the Church of the Messiah, in New York. Mr. Heforth is a student of real life. He is more successful in describing the "rocks and shoals" of the great city than he is in pointing out the way to escape them. His style is free, fresh, and unconventional. But there is nothing of the ser-

mon about these lectures except the text, and nothing whatever of that moral power over the heart and life which is the first condition of truly and permanently successful preaching. They are the sermons of a popular but not powerful preacher.—Characteristically unlike them are the lectures of JAMES FREEMAN CLARKE—*Steps to Belief* (American Unitarian Association). Nominally a Unitarian, Mr. Clarke is one of those men of whom the age is prolific, who are too broad-minded to *belong* to any school, though too sensible to dissociate themselves wholly from all schools. He is a Unitarian as Mr. Beecher is a Congregationalist, Father Hecker a Roman Catholic, and as Robertson was an Episcopalian. He delights to deal with the intellectual religious problems of his time. Careless of the theology of the past, seizing the theological problems of the present, his book is an admirable presentation, not of orthodox religion, nor yet of Unitarian religion, but of the Christian religion in its largest and broadest sense, as an experience of love toward God and man, and of faith in Christ and the Holy Spirit as against the cheerless and senseless philosophies of atheism and deism on the one hand, and the bondage of Romanism on the other. It is an admirable book, though it is to be read with the remembrance that it is, after all, written from the Unitarian stand-point. Certainly the evangelical school will not accept Mr. Clarke's conception of the divinity of Christ as a basis of reconciliation between themselves and their Socinian antagonists.

NOVELS.

It has often been said that there is nothing in American life from which romance can be made, and that it is, therefore, a barren field. The truth is, however, that all life has the elements from which romance can be made; only the chemistry by which it is to be extracted must be learned. It is much easier to find romance in European life, because one has had there so many predecessors, and the processes by which the romantic element is extracted are all fixed and formulated. What we want is not the element of romance, but the genius to find it. The variety in American life is so great that it is full of fallow fields for the novelist. If *The New Timothy* (Harper and Brothers), by W. M. BAKER, does not introduce to us a new Dickens, it does bring us a writer who has studied, in a painstaking way, the Southwestern life, and who has drawn it with no little artistic skill, and with a truthfulness to the life that is a perpetual wonder to us. The book is evidently not without its didactic purpose. It is a sharp criticism on some orthodox developments from an orthodox stand-point. Mr. Wall, the hero, the New Timothy, is a young minister not without serious faults, but who yet struggles upward into better life. But the story is a portrait gallery throughout; and some of the characters, the beautiful, fat, indolent Miss Mills, the heiress; Mrs. General Likens, Mr. Merkes, Mr. Long, not to name others, are not simply individuals, but rise to the dignity of types, and show that Mr. Baker must rank not only as a copyist of nature, but as a writer of no little creative power, able to generalize his characters so that they stand in the reader's mind as individuals, but still as file-leaders of classes of whom he knows a long line in his own acquaint-

ance. We can not but admire the strict and almost rigid exactness of Mr. Baker's portraiture. It is the best mistake a novelist can make in the beginning of his career to paint life too closely. But we are glad to note a growing freedom in our author's delineations, not less truthfulness, but more liberty.

MR. JOHN ESTEN COOKE has been actuated by a very commendable spirit in writing the *Heir of Gaymount* (Van Evrie, Horton, and Co.)—viz., a desire to teach the F. F. V.'s the value of hard work. He has evidently studied the agricultural books and papers to good advantage, and makes a romance out of cabbages and corn and grape-vines such as only the believers in the five-acres-enough style of literature will be able to credit. Certainly since the era of the Arabian Nights such farming was never known as that of Edmund Cartaret. However, spite of its inherent absurdity, the story is entertaining reading, and will do to while away an hour in the cars or on the veranda after dinner. It is a story to be read when you want no temptation to mental excitement or mental activity of any sort; to be read to-day and forgotten to-morrow.—Mrs. OLIPHANT frankly discloses the secret of the interest of her last novel by its title, *John: A Love-Story* (Harper and Brothers). There is nothing strikingly original in the characters, and the plot is simple and natural enough. But the story has a peculiar charm to it, nevertheless—that which belongs to the story of true love, which it is al-

ways difficult to tell truly and simply, as it is told here.—JULIA KAVANAGH might have entitled her last novel, *Silvia* (D. Appleton and Co.), a love-story, too; for though there are some side issues—a forged will, a thrice-attempted assassination, a conflagration, and an embezzlement—the interest of the story all centres about Silvia and Charles Meredith. Indeed, they and Mrs. Groom are the only real characters. It is only when they are on the stage we read with much interest. We do not wonder that Mr. Lovell is perpetually bored. How can it be otherwise when he spends his days in the tiresome society at Lady John's? The first half of the book is charming. Then it grows wearisome. It would be twice as good if it were half as long.—*True to Herself* (Harper and Brothers), by F. W. ROBINSON, is not, on the other hand, exactly a love-story, though, of course, there is a fair admixture of love in it. Minnie Garth is true to herself because she is true to her father, the father she had been taught to fear and almost hate; and the story of her life is the story of her seeking and finding and coming to love him, despite many obstacles and many misadventures. The whole plan of the story is somewhat novel, and the incidents are not borrowed from those of any predecessor. On the whole, we are inclined to regard Mr. Robinson as the best of our second-class novelists, decidedly the superior of Anthony Trollope, though less popular; and this novel is fully equal to his previous work.

Editor's Scientific Record.

KOERTLING'S METHOD OF RELIEF PRINTING.

A GLASS plate is coated with a non-transparent varnish, and the desired figures are drawn on it with a needle, the dark parts being entirely removed. The glass is then bound to a zinc plate, coated with a layer of asphaltum varnish, and the whole exposed for a length of time to the sunlight, after which the zinc plate is washed with oil of turpentine. The light passing through the scratched lines on the glass plate renders the asphaltum directly subjacent insoluble in turpentine, and the corresponding portion of the zinc remains coated, while the rest is laid bare. The plate is then etched in the usual manner, leaving the figure in relief, and capable of being printed from like a wood-cut, when properly mounted.

WHITE-LEAD.

An eminent German practical chemist has lately had his attention called to the defects of white-lead prepared by the so-called English method, especially to the comparatively slight covering property which it possesses. As some of our readers are aware, this method consists in calcining lead in a reverberatory furnace with one per cent. of its weight of sugar of lead dissolved in water, and placing the mixture in horizontal troughs communicating with each other and closed above. A current of carbonic acid gas is conducted through the troughs, obtained usually by burning coke. A sufficient pressure is produced by the bellows of the furnace in which the coke is burned to force the gas through cool-

ing tubes into the mixture, which is continually stirred during the introduction of the carbonic acid. This process, however, according to careful experiment, is not sufficient to produce a soft white lead, of a suitable coating quality, as the product is found to contain too much hydrated oxide of lead. On this account the suggestion was made—with an excellent practical result—to use two and a half per cent. of neutral acetate of lead, dissolved in water, to one hundred parts of the oxide of lead, to which a slight quantity of vinegar is to be added. By acting upon this suggestion, it was found that the process of the fabrication of lead was greatly accelerated, and that a very much better article was produced, having an extraordinary coating power.

BEST COLORS FOR SIGNAL LIGHTS.

Experiments lately prosecuted, as to the shades of color recognizable most easily and at the greatest distances, have resulted in proving that bright yellow has the advantage in this respect; and that next to this comes blue. Violet, green, and red are said to be less easily recognizable than any other. In the construction of signals, therefore, whether designed to be used by night or day, it would be well to bear this practical suggestion in mind.

COLD PERIOD IN EUROPE.

The scientific journals of Europe have much to say of a remarkable period of cold which occurred during the first half of February of the

present year, and which reached its greatest intensity in the southern steppes of Russia, as on similar occasions, in January, 1848, and January, 1850. The occurrence of this period of cold is believed to have been occasioned by the fact that a very violent polar current was hindered by an opposing equatorial current from extending southward, and changed to a clear, cold east wind. This current then extended in an immense breadth over Europe, gradually wearing itself out by meeting the warm currents from the Atlantic. An appreciable length of time was of course required for the extension of this storm of cold toward the west, and its progress was readily determined by means of the electric telegraph, its entire duration occupying about fourteen days. The temperature indicated varied in different places. Thus, at Stettin it was at about zero of Fahrenheit; at Ratisbon it was -10° ; at Moscow, $+3^{\circ}$; at Constantinople, $+22^{\circ}$; at Paris, $+20^{\circ}$; and at other places varying in a similar manner.

COPYING OLD WRITINGS.

Press copies of old letters or manuscript can be taken, it is said, by pressing the pages on the dampened paper in the usual way, and then applying the vapor of ammonia. Although no result may appear to follow the first operation, we are assured that after the second the letters will appear distinctly on the dampened blotting-paper. Another method consists in dampening the manuscript with a solution of sugar, honey, or mucilaginous matter, and then applying as heretofore. In this case the sugar is put on the paper, instead of being mixed previously in the ink, as is done in one form or other with ordinary copying inks.

We have already made allusion to the method of M. Carré, by which satisfactory copies can be taken of letters and other manuscript some considerable time, even years, after having been written. This, in brief, is accomplished by wetting unsized copying paper with a solution of one part of hydrochloric, or muriatic acid, and twelve of water, instead of plain water; and, after laying this on the manuscript, subjecting the whole to pressure with the ordinary copying press. This method has also lately been used to test the antiquity of certain writing, since, when the manuscript is thirty years old, only an illegible copy can be made. On the other hand, writing less than ten years old disappears entirely after immersion of some hours or days in the same solution, while that thirty years old and more continues legible after fifteen days' maceration. In taking a press copy of writing by Carré's method any acid absorbed by the paper can be neutralized by exposing it for a few seconds above a dish containing aqua ammonia.

CLOSING CRACKS IN STOVES.

It may be convenient to know a ready method of closing up cracks, which are not uncommon, in cast iron stoves; and we are assured that the following recipe is a reliable one. Good wood ashes are to be sifted through a fine sieve, to which is added the same quantity of clay, finely pulverized, together with a little salt. The mixture is to be moistened with water enough to make a paste, and the crack of the stove filled with it. This cement does not peel off or break

away, and assumes an extreme degree of hardness after being heated. The stove must be cool when the application is made. The same substance may be used in setting in the plates of a stove, or in fitting stove-pipes, serving to render all the joints perfectly tight.

THE HEATON PROCESS OF MANUFACTURING STEEL.

Although this process, invented by Mr. John Heaton, the proprietor of Langley Mills, near Nottingham, has now been in use by him for a year or two, yet, as we are not aware that any establishment has yet been started in the United States for its employment, it may interest some of our readers to learn something about it. It is essentially a direct method of producing steel chemically that bids fair to be of the very first importance, and almost to revolutionize that branch of industry. This, to express it in the fewest words, consists in pouring melted iron upon nitrate of soda in a cupola furnace, by means of which the oxygen developed from the nitrate combines with all the impurities—carbon, silicon, phosphorus, sulphur, etc.—which disappear, leaving the iron in the form of a crude steel, to be used in that form, or to be converted by a subsequent process into cast steel. The details of the process are as follows:

Cast iron of *any* quality (and this constitutes the chief advantage of the new process) is melted in a common iron cupola furnace, and a known quantity—from half a ton to a ton—is tapped out into an ordinary crane ladle, which is swung round to the side of the converter. This is a tall cylinder of boiler-plate iron, open at the bottom, and with a space between it and the floor. There is a fire-brick lining to the converter, and a conical covering, out of which an iron funnel opens into the atmosphere. In the bottom are placed a number of short cylindrical pots, lined with brick and fire-clay. Into the bottom of one of these pots is placed a given weight of crude nitrate of soda, the surface of which is leveled, and covered with a circular, perforated plate of thick cast iron. At the side of the cylinder is a hopper, covered by a loosely hinged flap of boiler-plate. This is raised, and the ladleful of cast iron is poured into the converter, descending upon the top of the perforated plate, which becomes gradually heated, and a reaction soon commences in the nitrate, resulting in the development of brown nitrous fumes, followed by blackish-gray and whitish fumes mixed with steam. In five or six minutes deflagration ensues, with a roaring noise, and the escape of a brilliant yellow flame from the top of the chimney, this lasting for a minute and a half, and then subsiding. The converter is then detached from the chimney, and the contents of the pot emptied on the iron pavement of the foundry, consisting of crude steel and of slag. The steel is in a pasty state, and the slag fluid, the cast iron plate melted up with the general mass.

The crude steel thus made is then broken up, and again heated on a balling furnace; afterward rolled or forged into suitable shapes. The material in this form is called "steel iron," and has qualities fully equal, for most purposes, to the Lowmoor iron. It welds perfectly, is neither "hot-short" nor "cold-short," and forges well at both a low red and clear yellow heat. To

convert this again into cast steel, the cakes, after squeezing in the shingling hammer, are broken up and put into ordinary clay melting pots holding about 60 lbs. each. To 100 lbs. of the metal are added $2\frac{1}{2}$ or 3 lbs. of spiegeleisen, or its equivalent of oxide of manganese and charcoal, and the whole fused and cast into ingots. It is now cast steel, and from it bars can be produced in the usual way, fit for any required purpose.

Various reports have been published upon the iron and steel produced by the Heaton process, all of them unanimous in its praise. Mr. Robert Mallet pronounces it in strict accordance with theory, and that it can be conducted safely and economically on any scale, yielding results of greatest value, competing with any other known process. First-class wrought iron and steel can be produced from inferior brands of pig-iron, abounding in phosphorus and sulphur, to which no other method is applicable. Mr. Mallet's report concludes with the words: "Heaton's process constitutes, both with respect to economy of production and utilization of inferior pig-iron, one of those metallurgic advances which leave their mark indelibly on great national industries."

CONNECTION OF METEOROLOGICAL CONDITIONS AND DISEASE.

The result of an investigation into the variation in the rate of mortality with changes in the character of the season establishes quite conclusively the fact, that the influence of meteorological causes in producing fluctuations in the rate of mortality is much greater than any other recognized agent; and that the class of diseases most affected by meteorological changes is the so-called zymotic. It is also stated that the relative increase in the number of fatal cases of disease at different ages, in unfavorable seasons, is greatest between the ages of twenty-five and seventy-five, and among classes most exposed to the vicissitudes of the weather.

FOSSIL MAMMALS IN CHINA.

The occurrence of some interesting species of extinct mammalia in China has recently been announced in connection with a collection lately brought to England by Mr. Swinhoe, the well-known naturalist and explorer of Eastern Asia, most of the specimens having been obtained by him in apothecaries' shops at Shanghai, where they seem to have been preserved as articles of the materia medica. These consist principally of two new species of elephant; a new hyena, a new tapir, a new rhinoceros, and a species of *Chalicotherium*. The geological age of these fossils is referred to the upper pliocene, or the post-pliocene, with the exception of the *Chalicotherium*, which belongs to the miocene period.

THE FOSSIL PEDIGREE OF THE HORSE.

Much interest has been excited by the lecture delivered by Professor Huxley before the Geological Society of London, having special reference to the geological age of the horse, and the successive forms of its supposed development from a primitive ancestry, as exhibited in strata of successive periods of deposition. This was made the subject of a special lecture by the learned professor at the Royal Institution, entitled "The Pedigree of the Horse," in which the ar-

guments for the view in question were presented in a popular form. Premising his adherence to the views of Mr. Darwin in regard to the evolution of species of animals from their predecessors, he stated that the case in question was one of extreme strength, and able to resist any amount of criticism. After showing that the horse of the present day differs from ordinary quadrupeds in having one instead of two or more bones in each of the fore-arms or front limbs, and in each of the hind-legs, and that it has lost some of the toes of the average quadruped, and really walks on the tip of the nail of the middle toe of each foot, its teeth also being arranged in layers of hard and soft substances, so as to give a rough, grinding surface, like that of a millstone—he stated that the remains of the horse so constituted are found in abundance during the later geological periods of both Europe and America, and exhibit no marked change in structure until the upper miocene period is reached. In this period a second form, called the *Hipparion*, is discovered, similar to the horse, but with two more toes, one on each side above the hoof of each foot, and likewise tipped with a small hoof; while the teeth, although still resembling those of the horse, are more like those of the ordinary hoofed mammal. Going still farther back in geological time, we find in the lower miocene deposits an animal called the *Anchitherium*, having the supplementary toes, and their hoofs, more developed and lower down. Its teeth also have still less of the special structure of those of the horse, while the skull is more like that of other ungulates. Thus the farther the horse is traced back in time, the nearer does it approach to the average quadruped in the matters of skeleton, feet, and teeth. He submitted that it was impossible to get evidence more complete than this, of its kind, of the origin and pedigree of the horse.

GENERAL CONSTITUENTS OF METEORITES.

According to Rammelsburg, the essential constituents of meteorites, which are always present in every different class of these bodies, are nickel, iron, phosphorus, sulphides of the metals, oxides, silicates, free silicic acid, and, in rare instances, carbon and combinations of carbon.

IMPROVED ENVELOPES.

One of those very simple improvements in the construction of a long-known article has recently been announced in England, in regard to the gumming of envelopes, consisting in applying the mucilage to the lower part of the envelope instead of the flap. On moistening the edge of the flap, as usual, and pressing it down upon the gummed surface below, a very thorough adhesion takes place, without the objection of getting the taste of the gum in the mouth, or removing a part of it by the tongue.

PERUVIAN MAIZE.

Among the agricultural products of Peru is a kind of Indian corn, called Carogua. This is of remarkable size, attaining an elevation of ten feet or more, and with a grain an inch in length. It grows at a great height upon the mountains, and thrives in a poor soil. The yield of the corn is said to be 60 per cent. additional to that of the ordinary kinds, and of forage 90 per cent. Ex-

periments recently made in France show it to be well adapted to the mountainous portions of that country, and it would doubtless do equally well in the United States.

TREE OF RAPID GROWTH.

Experiments have recently been made in Algiers with a very remarkable species of Australian acacia (the *Lophantha*), and to its adaptability to the reclaiming of arid deserts by covering them in a very short time with a dense forest growth. Seeds sown at Hyeres, in France, in May, reached a height of over ten feet, and a circumference at the base of nearly seven inches, by November. The lateral branches stretched out nearly five feet, and the whole tree was of a beautiful pyramidal shape.

HYDRAULIC MORTAR.

An easy way of making hydraulic mortar out of ordinary lime consists in adding to burned lime as much water as it will take up without becoming pasty, and allowing it to stand in heaps for eight days, and swell up. It is then passed through a wire sieve with meshes about the fifteenth of an inch in diameter, for the purpose of separating the hard particles. The residuum of preceding siftings that have been exposed to water or moist air are to be rubbed up and added to the mass, the whole to be well mixed together and then piled up in heaps, protected from rain, till needed. It may be preserved thus for years, ready for use at any moment.

ALBERTYPE PRINTING.

This method of printing directly from the photographic negative, invented by Albert, of Munich, a year or two ago, is probably familiar to many of our readers, but as some additional details of manipulation have lately been announced, it may be of interest to many to have some account of the entire process. For this purpose a glass plate, about five-eighths of an inch thick, is coated with the following solution: Filtered water, 300 parts; white of egg, 150 parts; gelatine, 15 parts; bichromate of potash, 8 parts.

The plate thus covered is to be dried, a black cloth laid behind it, and exposed two hours to the light. It is then covered with a mixture of gelatine and bichromate of potash, in the proportion of gelatine, 200 parts; bichromate of potash, 100 parts; and water, 1800 parts. When this coating is dried the plate is printed upon by means of a negative, the rays of light falling perpendicularly. After a sufficient exposure the plate is washed and then printed from, like a lithographic stone—that is, a fatty ink applied by means of a roller, and then a print taken off, under a lithographic press. The theory of the process is as follows: The photographed surface of the plate is washed with cold water, not to take off any portion of the gelatine, but only to remove the chrome salt and to moisten the gelatine. The portions of the layer that have been the most exposed to the light, and corresponding to the deepest shades, are entirely insoluble, and do not take up the water. The less illuminated portions take up some water, not being entirely insoluble; but the higher lights, or the portions of the plate not exposed at all, absorb the water.

The lower plate thus prepared is treated just like a lithographic stone. When the ink passes over it the color sticks to the dark shades, in a less degree to half lights, and not at all to the entirely light portion, on account of its coating of moisture. One peculiarity of the impressions thus obtained consists in the fact that lights and shades are not presented in a continuous tone, as in an ordinary lithograph, but in a fine granulation, which is the result of the manner in which the gelatine absorbs or repels the water. Sometimes this granulation is undistinguishable without a lens, but it can always be detected on close examination. It is said that a thousand impressions have been taken from a single plate, although this is perhaps questionable.

PREPARATION FOR SOFTENING LEATHER.

An oil has lately been introduced into commerce in Germany which answers an excellent purpose in softening stiffened leather, and rendering it almost as pliable as when new. This preparation, it is said, consists of a mixture of sixteen parts of oleic acid, two parts of alcohol of 90 per cent., and one part concentrated sulphuric acid. The oleic ether formed is poured off, it being a thin, brownish oil. It is separated from the free sulphuric acid and the alcohol by shaking it up in warm water and decanting it. On mixing this oleic ether with an equal weight of fish oil, and adding, for the purpose of concealing the smell, from a quarter to half an ounce of nitro-benzole to the pound, a preparation will be obtained which experiment has shown to possess all the qualifications required for the purpose.

LUMINOUS FLAMES AND SOUND.

Among the curiosities of physical science is the well-known fact that luminous flames are very sensitive to sound, exhibiting different phenomena under different circumstances. An ingenious savant proposes to turn this to practical account, and for this purpose has devised an apparatus, consisting of two upright copper rods, one of which, at its upper extremity, has a metal band attached at a right angle, and consisting of thin layers of gold, silver, and platinum, welded together. When exposed to heat the bands expand unequally and bend to one side, thereby coming into contact with a platinum point which is attached to the other bar, so as to stand at about four-tenths of an inch from the bands. Both ends are connected with the poles of a small electrical battery, in the circuit of which an electrical bell is introduced, in a distant part of the room, and which sounds whenever the circuit is closed. A flame is now brought to about ten inches from the metal band, and on removing to a distance of ten or fifteen yards from the flame, and whistling, the flame answers immediately, by becoming shorter and broader. In this way it comes into contiguity with the metal band, and this, curving to one side as it is heated by the flame, touches the platinum point, closes the current, and we hear the distant bell sound each time in answer to the whistle. In a similar manner, the cry of a child in its cradle by night may be carried to the room of its parents; and, by a somewhat similar arrangement, a thief attempting to open a door with a key, can sound a distant alarm.

bell, if he makes the least noise. It is even possible to arrange an apparatus resembling this, by means of which, in a fog or by night, the approach of a boat or vessel can be detected at a great distance, by the sounding of a bell in the captain's cabin.

ELECTRIC LIGHT IN PHOTOGRAPHY.

Among the most interesting communications made before the American National Academy of Sciences, at its last meeting, at Washington, in April, was one by Dr. Woodward, of the Army Medical Museum, in regard to the use of the electric light in photography. Occupied for many years in the preparation of photographic negatives of microscopic objects, the author experienced great inconvenience from the difficulty of working at times when the sun did not shine sufficiently for his purposes; and, after trying various kinds of artificial illumination, he finally came to the conclusion that the electric light, under some circumstances, was to be preferred even to the sun itself, since photographs could be taken at any time of day or night, and after a much shorter exposure than to the sunlight. The magnesium light was found to have some advantages, especially when the object was not to be magnified more than one thousand times; but for average work, especially under very high powers, the electric light was found to surpass all its rivals.

The apparatus used was a Duboseq's lamp, kept going by a battery of fifty small Grove's elements. Seven and a half pounds of strong commercial nitric acid, with three of sulphuric, diluted with ten times the quantity of water, were sufficient to charge the battery and keep up a continuous light for three or four hours, during which time from twelve to thirty or more photographs could be produced, the number varying with the character of the subject and the amount of preparation required. Dr. Woodward states that for a negative of one thousand diameters, about thirty seconds are sufficient for some objects, while for others about three minutes were required. This light was found to be perfectly adapted for producing photographs of the soft tissues with any power under a thousand diameters.

REMOVAL OF PHOSPHORUS FROM IRON ORES.

It is said that iron ores containing phosphates can be purified by treatment, first, with sulphuric acid, and a subsequent washing with water. In some cases, instead of the sulphuric acid, some other oxygen combinations of sulphur are employed. Ores which contain sulphurets and carbonates should be roasted before the treatment just referred to.

SIRUP OF HYDRATE OF CHLORAL.

A German preparation for a sirup of hydrate of chloral is made in the proportion of ten grains of the hydrate of chloral, eighty-five of the sirup of sugar, and five of rectified alcohol, to be digested at a gentle heat, and put away for use. This sirup can be prepared in advance, and keeps without change for a considerable time. If prepared for immediate use the addition of alcohol is superfluous. The peculiar taste of hydrate of chloral can be corrected by chloro-

form; one drop of chloroform to one hundred and twenty or one hundred and fifty grains of hydrate of chloral being enough to disguise its taste completely.

FLIGHT OF WINGED ANIMALS.

In course of an elaborate memoir, published by the Linnæan Society of London, Dr. Pettigrew, of Edinburgh, proves conclusively, by a large number of dissections and experiments, that the motion of the wing of a flying animal, whether bat, bird, or insect, is actually that of a screw—and, indeed, a reciprocating screw—a figure of 8 track being described during the oscillations of the wing, similar, in some respects, to that described by an oar in sculling.

FLIGHT OF AN INSECT.

This is true of the vibrating wing when the bodies are artificially fixed; but when at liberty, and flying at a high horizontal speed, a figure of 8 is actually converted into a wave track, since the wings are carried forward by the body, and are never permitted to complete more than a single curve of the 8.

FLIGHT OF A BIRD.

These announcements have lately been confirmed in a curious manner by Professor Marey, of the College of France, in Paris. This gentleman, well known in connection with experiments in the use of the sphymograph, has actually caused the wing of a bird or insect in motion to register its own movements in the following manner: A cylinder revolving at a given speed is enveloped by a sheet of thin paper, smeared with lampblack, and to this the tip of the rapidly vibrating wing of the insect is applied in such a manner as to cause it to brush out its track on the blackened paper. A similar result is obtained from the bird by fixing a registering apparatus to the wing and causing the bird to fly in a chamber. In this case the register is connected with the cylinder by means of delicate wires, and the registry is effected by means of electricity. In both cases a figure of 8 and the wave movement originally described by Dr. Pettigrew are faithfully reproduced.

The lectures of Professor Marey, as published in the *Revue des Cours Scientifiques*, are illustrated by numerous diagrams, showing the nature of the movement of the wing, and will, it is understood, be transmitted and published in this country before long.

BEST MODE OF APPLYING CORALLINE.

On dissolving a given quantity of coralline in a boiling hot solution of one part of sirup of

water-glass and four of water, a paint of the most beautiful rose and the most brilliant carmine-red will be obtained. This solution has been applied with great effect to the coloring of white woods containing very little tannin, such as fir, white pine, linden, etc., which afterward can be lacquered and polished. It is also used for wall paper and other materials, for coloring pictures, by basket-makers, and for lead pencils and artificial flowers it also renders good service. The solution must be used within a day or two after preparation, as it decomposes and loses its efficiency.

INFLUENCE OF OZONE ON NITRO-GLYCERINE, ETC.

According to recent experiments, the presence of a small percentage of ozone produces spontaneous explosion of nitro-glycerine, dynamite, iodide of nitrogen, chloride of nitrogen, and other similar compounds. Gunpowder prepared with picrate of potash is also slightly decomposed under similar circumstances, while ordinary gunpowder is affected in the course of some weeks. The explosion of picrate of potash in the establishment of Fontaine, in Paris, some time ago, which caused a number of deaths, and was for a time so inexplicable, is now asserted to have been produced by atmospheric ozone; and some otherwise unintelligible explosions of gun-cotton have, it is suggested, been produced in a similar manner.

OXYGENATED BREAD.

An article of diet termed oxygenated bread has of late been introduced into England, and found considerable favor. For its preparation the bread is placed under an air-pump, and the carbonic acid gas and atmospheric air exhausted, and then oxygen admitted in sufficient quantity to fill the pores of the bread. An inconvenience attending its use is its tendency to become mouldy very rapidly. This can be obviated by avoiding the use of yeast, or by placing a paper saturated with a solution of carbonic acid on the top of the box in which the bread is preserved, this scarcely affecting the taste of the bread. A single mouthful of oxygenated bread is said to remove the want of appetite, and to induce an agreeable sensation in the epigastrium in dyspeptic attacks. In the case of gastric disturbances arising from nervous depression, incomplete assimilation, or scrofulous affections, it is said that the use of this bread produces a very sensible improvement in the course of one or two weeks.

DOMESTICATION OF THE REINDEER IN THE REINDEER PERIOD.

An interesting question has lately been raised as to whether the ox, horse, and reindeer were domesticated during the so-called reindeer period. Bretmeyer is inclined to take the affirmative, against most other paleontologists. Vogt is very decidedly opposed to the idea; and especially on account of the entire absence of the dog. He says that any one who has seen a herd of tamed reindeer will readily understand that their use without dogs, especially trained for the purpose of keeping them in order, is entirely impossible. The reindeer is so stupid and incapable of training, and his return to a wild condition takes

place so readily, that man alone, without the assistance of the dog, can not look after him. He therefore considers that the training of the dog must have preceded that of the reindeer; and, since no bones of the dog are found among the remains of the reindeer period, we must conclude that the reindeer bones of that epoch belonged exclusively to wild animals that were killed from time to time, as needed for food.

CLEANING PRINTED SHEETS.

A method recommended by a foreign contemporary for cleaning printed matter and engravings consists in fastening the sheets to a board by broad-headed tacks, and washing it with clean water, to which a slight percentage of carbonate of ammonia has been added. This process must be conducted very carefully with a soft brush. The paper is then to be rinsed off with water, and the operation repeated on the back side as soon as it is dried. It is then to be moistened with water acidulated with pure wine vinegar, and again washed with water, to which a little chloride of lime has been added. Finally, it is washed off again and dried in the air by sunlight. In this way it becomes extremely white without any injury to the impression. Some valuable engravings have, it is said, been completely restored by this method.

LABELS FOR OUTDOOR PLANTS.

A convenient method of preparing outdoor labels for plants, capable of resisting any weather, consists in first cutting them out of smooth paste-board, and writing upon them whatever may be desired in ordinary ink. When this is dry they are immersed in linseed-oil, or, what is still better, linseed-oil varnish, until they are completely permeated by the liquid; after which they are hung in the open air upon threads to dry. They become like iron, and resist wet for a long time, and are more durable than slips of metal.

WHITENING LINEN.

According to a French writer, crystallized carbonate of soda, although so great a favorite with the washerwomen, is a declared foe to linen, since, notwithstanding its cleansing power, it attacks the fibre, and after a time makes it so rotten as to cause it to tear, almost at the touch. An improvement on this substance, it is said, consists in the employment of a solution in the proportion of two pounds of soap to twenty-five quarts of warm water, to which are to be added one table-spoonful of essence of turpentine and three spoonfuls of ammonia. The mixture is to be stirred by the help of a little broom, and the linen immersed in it for several hours, the tub being completely covered. The articles are then to be washed in the ordinary way, rinsed in tepid water, and then blued, if this is necessary. The same solution can be used twice over by heating again and adding half the amount given of essence of turpentine and ammonia.

It is claimed that this process is accompanied by great economy of time, labor, and fuel, and that the linen experiences little or no injury, appearing finally in a condition of irreproachable whiteness. The ammonia, it is said, does not exert any corrosive effect upon the fibre, since it evaporates immediately; and the odor of the turpentine entirely disappears in drying.

Editor's Historical Record.

UNITED STATES.

OUR Record closes on the 25th of August. It necessarily consists mainly of a summary of the military operations in Europe.

The North Carolina election, on the 3d of August, resulted in a Democratic victory, the conservatives electing five out of seven delegates to Congress, and securing also a large majority in each House of the State Legislature.

Mr. Frelinghuysen has formally declined the appointment of Minister to England.

Admiral David G. Farragut died at Portsmouth, New Hampshire, on the 14th of August, in the seventieth year of his age.

EUROPE.

When we closed our last Record the French Emperor had arrived at Metz, assuming the position of commander-in-chief of the French army. His forces were then stationed as follows: In the vicinity of the Rhine, and in the advance, were three corps: the First, under Marshal M'Mahon, at Strasbourg; the Fifth, under General De Failly, at Bitche, northwest from Strasbourg, and a little north of west from Weissenburg; and the Seventh, under General Douay, at Belfort, some distance south of Strasbourg. Four corps were stationed in a direct line eastward from Paris: at Chalons, the Sixth Corps, under Marshal Canrobert; at Metz, the Third and Eighth, under Marshal Bazaine and General Bourbaki; and at St. Avold, the Second Corps, under General Frossard. North of Metz, at Thionville, was the Fourth Corps, under General Count Ladmirault. The Emperor's plan of campaign evidently contemplated an advance across the Rhine. In his address to his soldiers, on assuming the command, the Emperor said: "The war which now commences will be long and hardly contested, for its theatre will be places hedged with obstacles and thick with fortresses; but nothing is beyond the persevering efforts of the soldiers of Africa, Italy, and Mexico. You will prove once more what the French army is able to accomplish, animated by a sentiment of duty, maintained by discipline, influenced by love of country. Whatever road we may take across our frontiers we will find upon it glorious traces of our fathers, and we will show ourselves worthy of them."

The Prussians were meanwhile concentrating their forces on the east of the Rhine, and it soon became evident that they had it in their power to bring into the field immediately a much larger army than the French. The South German States promptly declared their adherence to the Prussian cause. The conscription embraced all between 20 and 32 years of age. It was announced that 950,000 men were at the disposal of Prussia, of whom nearly 700,000 were ready to take the field. The popular war enthusiasm in Germany seemed more profound, and likely to be more permanently sustained, than in France. After the declaration of war was made by France the King of Prussia left Ems for Berlin. On July 31, with General Moltke, the most able of German strategists, and Count Von Bismarck, his Prime Minister, he set out for Mayence, the Prussian head-quarters, where he arrived on the

3d. The Prussian forces were then concentrated in the triangle formed by the Rhine, the Moselle, and the Saar rivers.

The French army assumed the offensive, but only for a single day. It crossed the frontier August 2, and captured Saarbrück, a position of little importance, and held by a small Prussian force. This was on the French left. The next day the Prussians, under the Crown Prince, Frederick William, attacked the French right-centre at Weissenburg, which was held by General Douay's division of M'Mahon's corps. The position was carried, 800 French prisoners were taken, and General Douay was killed. From that action the French were put on the defensive. Edmond About, writing after the event, says: "Having declared war, we let the Prussians begin it. True, neither party was ready, yet the French lost twenty days in useless marching and countermarching. They were surprised at Weissenburg by an enemy whom there were no videttes to watch, no skirmishers to meet, and no settled plan to repel." The Crown Prince again attacked M'Mahon at Wörth, on the 6th, and with marked success, capturing 4000 prisoners and 30 guns. The same day the French left, under General Frossard, was attacked, and compelled to retire. M'Mahon, on the right, had for a time been cut off from the main army. The French centre remained firm at Metz, where were three corps that had not been under fire.

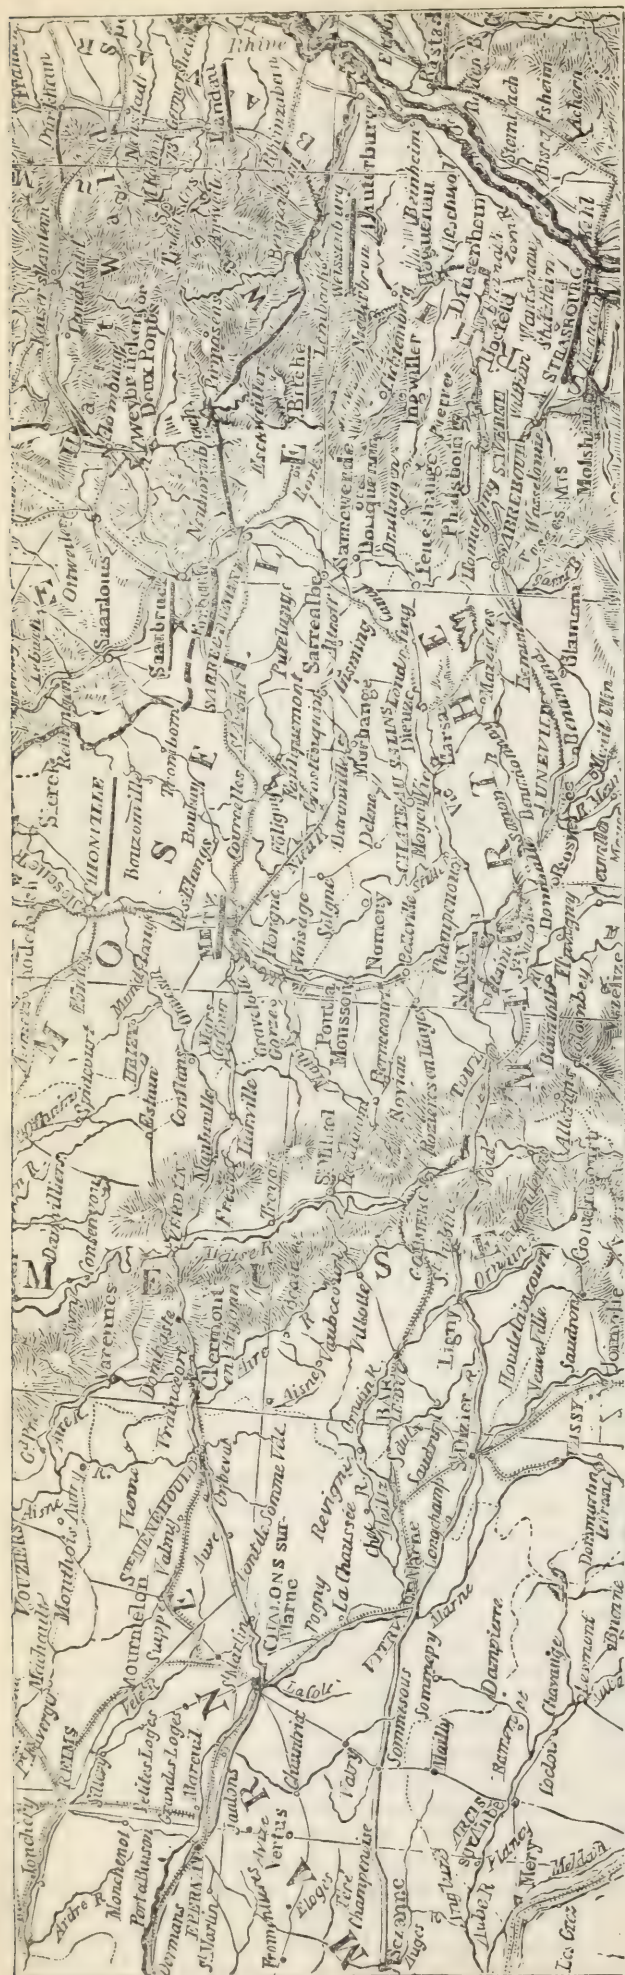

On the receipt of the Emperor's telegram, acknowledging a defeat, there was great consternation in Paris, and that city was declared in a state of siege, though the enemy was over 200 miles away. The Empress issued a proclamation appealing to the patriotism of the people.

M'Mahon, after his defeat, fell back on Saverne, having reinforced the garrison at Strasbourg, which by his retreat had been left uncovered. On the 8th the Prussians menaced Metz and occupied St. Avold; M'Mahon's retreat was continued to Nancy, and the Emperor was reported to be at Chalons.

The Prussians had thus compelled the French army to swing back its entire centre and right around Metz into the interior of France.

On the 9th the Corps Législatif met, and, by a large majority, carried an order against the then existing ministry.

After M'Mahon's and Frossard's defeat, Marshal Bazaine was made commander-in-chief of the French army. The revulsion in Paris had given power to the Orleanist faction, and we soon find General Trochu a major-general of the army, taking the place of Lebœuf, and General Changarnier holding a prominent position on the Emperor's staff.—On the 10th, in the Corps Législatif, a measure was carried conscripting all unmarried men from the age of twenty-five to thirty-five. General Count Palikao announced the new ministry as follows: *Minister of War*, Count Palikao; *Minister of Foreign Affairs*, De la Tour d'Auvergne; *Minister of the Interior*, Henri Chevreau; *Minister of Justice*, M. Grandperret; *Minister of the Marine*, De Genouilly; *Minister of Finances*, Pierre Magne; *Minister of Public Works*, Jerome David; *Minister of Public Instruction*, Jules Brame; *Minister of Commerce*,

THE SEAT OF WAR IN EUROPE.

Clement Duvernois; *President of the Council of State*, Busson Billaut.

On the 14th the Prussians occupied Nancy, evacuated by the French the day before. The united armies of Frederick Charles and General Steinmetz—the right and centre of the Prussian army—had their head-quarters at Herny, on a direct line with Saarbrück, and within twenty miles of Metz.—In the Corps Législatif a proposition made by Jules Favre for a Committee of Defense received only from fifty to sixty votes.—Count Palikao issued an address to the troops blaming them for firing too rapidly. At Weissenburg, he said, they used more ammunition in one day than the Prussians did in three.

On the 14th M'Mahon was at Toul, the Emperor at Verdun, and the main body of the French army, which had been concentrating for some days at Metz, was attempting to move westward from the Moselle toward the Meuse, *i. e.*, toward Verdun, in order to keep up its communication with M'Mahon. This was Sunday. When half of the French army had crossed over to the left bank of the Moselle the Prussians made an attack, which appears to have been a surprise, as Napoleon, in his dispatch, says: "Our advance guard had no knowledge of the presence of any force of the enemy." The Emperor, however, claimed that after four hours' fighting the Prussians were repulsed with great loss. On the other hand, the King of Prussia claimed a victory for his army.

From this point until the time of closing our Record there have been several engagements fought between Metz and Verdun, the object of the Prussians evidently having been to keep the main body of the French army at Metz, while the Crown Prince, with an army numbering from 150,000 to 200,000, should advance toward Paris.—On the 15th the Prussians lost, it is reported, 40,000. In regard to the battles which followed each other day after day, from the 14th to the 21st, we only know this, that they were very severe. The French, though repeatedly driven back to Metz, it is reported, finally, on the 23d, succeeded in advancing northward from Metz toward Montmédy. A later telegram, however, throws doubt upon this statement, and indicates that Bazaine was, on the 24th, still held at Metz. It is very doubtful whether, even in this case, the Crown Prince would venture to advance upon Paris. M'Mahon, having broken up the encampment at Chalons, was prepared to oppose an army of 170,000 against any force moving upon Paris.

The French government has asked for a loan of 1,000,000,000 francs. The books were opened on the 22d, and before night 680,000,000 francs were subscribed. The French declare that peace is impossible as long as a Prussian soldier treads French soil.

Editor's Drawer.

A GENTLEMAN just returned from an extended Western tour reports to the Drawer, as in duty bound, the following as having occurred in one of the thriftiest towns in Minnesota:

A young lawyer, clever, but slightly irregular, having married a bright, sensible, plucky young woman, promised faithfully to abandon all sinful ways, and be very good. The new wife kept her fond husband pretty well in hand, and for months every thing was lovely. But meeting, in an unlucky hour, certain old cronies from a neighboring town, whom he had not seen since his nuptials, he yielded to importunities, and joined them in "just one little tear." The "tear" was vigorous and prolonged, lasting until ever-so-many o'clock, when, being in a condition of conceded fuddlement, he was led home by one of the troop, who, after posing him safely on his door-steps, rang the bell, and retreated somewhat deviously to the opposite side of the street, to see if it would be answered. Promptly the "porte" was "ouverted," and the fond spouse, who had waited up for her truant, beheld him in all his toddiness.

"Why, Walter, is this you?"

"Yes, mydear."

"What in the world has kept you so?"

"Been out on littleturnwithboys, my d-d-arling."

"Why, Walter, you are intoxicated!"

"Y-y-es, dear, I estimatethat'sso."

"What on earth made you get so drunk? And why—oh, *why*, do you come home to me in this dreadful state?"

"Because, my darling, *all th'other places 'r' shut up!*"

OUR Fifteenth Amendment friend is progressing. He begins to study, and is ambitious to learn. Recently, in one of the schools taught by a young lady, a colored brother whispered to his teacher, and said: "Miss, won't you please give me a Bible lesson; for they call on me to preach sometimes, and *I'm mighty tight upon the words!*"

TALKING with a friend a few days since, while fishing at Pelham Bridge, we were told the following anecdote, hitherto unpublished, in connection with the late Archbishop Hughes: He had been rather overworked, and for recuperation had gone to Long Branch. There he found two or three gentlemen with whom he was on terms of personal intimacy, who saw that what the bishop required was quiet, pleasant diversion. They therefore proposed a row out to the "fishing-banks," and a day's fishing. Next morning, having secured the services of the leading fisherman at the Branch, they were rowed out. The morning being somewhat foggy, the bishop enveloped himself in a cloak. Just as they were coming to the right place for anchoring the boatman saw bearing down for the same spot a steamboat, which so annoyed him that he commenced to swear quite freely. One of the gentlemen quietly nudged him, and glanced at the bishop. But the fisherman "didn't take," and "ripped out" again awfully. "Sh!—sh!"

quietly whispered the gentleman, giving him another nudge, and a significant and deprecatory glance at the bishop, whereat the old fellow paused, and, leaning over, asked, in a whisper, "*Is the old man pious?*" The answer was a nod, and he ceased blaspheming. The good bishop would occasionally, with great point, narrate this little incident.

For the following we are indebted to an English friend:

When Mr. John Stuart Mill was returned to Parliament for Westminster, an immense crowd gathered in Covent Garden to hear the announcement of the state of the poll in the afternoon. Close by were handsome equipages crowded with ladies, some of whom were well known to fame. Later in the day, after the mob was tired of waiting, a short, stout man, with a bushy head of (say) tawny hair, suddenly showed his head above the rostrum, and shunted out an arm, semaphore fashion, as if to bespeak the ears of the friends, Romans, and countrymen present. Loud cheering and clapping, and cries of "*That's Mills! That's him! Don't you see?*" But a very stout man, who wore a blue apron and smelled of fish, hissed fiercely. "What are yer hissin' for?" inquired a pugnacious friend of Mr. "Mills." "Hissin'!" said the fisherman; "why, he says a man as has only eighteen bob a week, like me, ought to be lugged up if he has more than three children!" This concrete version, or rather perversion, of Mr. Mill's doctrine would startle both him and the shade of Sismondi, whose teaching he invokes. But, whatever the limit (Sismondi says *two*), it might well have puzzled all the Mills, Malthuses, Ricardos, and Sismondis that ever lived to hear the impromptu comment of a free-spoken, elderly dame who supported the fisherman. "How," said she, with infinite contempt, "can you tell they *won't all three of 'em be twins?*"

IN one of the western towns of this State resided some years since a somewhat noted character, called "The Major." When the local savings-bank suspended payment, and hundreds of depositors lost their little all, the Major, perhaps unjustly, was more bitterly accused of malfeasance, as one of its directors and largest stockholders, than any one else; and he was seriously advised by his friends not to show himself on the street until the public indignation had somewhat abated, lest personal injury should be inflicted upon him. But the Major was ever careless of personal consequences; and so, on the Monday following the report of the collapse, he sauntered down toward the post-office with his usual nonchalant mien. He immediately found himself pursued by half a dozen clamorous people, including an irate Irishwoman. All of them accosted him with reproaches and threats; but the Celt, with all the volubility of her race, heaped the most furious reproaches upon him.

"There he goes, the ould thafe!" she cried. "Come back here, ye ould spalpeen, and give me back the bread ye've taken from the mouths of me childer!"

The object of these attacks, not at all discomposed, faced about, and coaxingly said:

"Now, really, my good people, you mustn't blame me about this sad affair of the savings-bank. I hadn't any thing to do with it. I was as much surprised and grieved as any of you to learn it; and, after all, you simple creatures! you don't seem to realize half the truth of this wretched business. There's a great deal more about it than the mere loss of your money, I can tell you."

The serious tone and solemn countenance of the speaker hushed the noise of his accusers, and one of them inquired, in a more respectful voice, what he meant.

"The miserable institution," burst forth the Major, swelling with mock anger, "*it broke on Sunday! Just think of it! a bank breaking itself and the Sabbath all at once! Enormous!*"

He turned and walked rapidly away under cover of this astounding announcement, and was out of reach before it occurred to his pursuers that one of the Major's clever artifices had been played upon them.

A GEORGIA friend, who has laughed over some of the very extra-judicial decisions of learned judges that have found their way into the Drawer, sends the following as having actually occurred in one of the cities of that State:

Our friend is full of the dignity of his office, and entirely convinced that the affairs of the country would come to a full stop but for his efforts. Not long since a man was brought before him on a warrant for vagrancy. A plainer case could not be presented, and as the evidence was given in, the young lawyer who was defending him thought it hopeless. On arising to sum up, while badgering his head what to say, he happened to notice that his client was tolerably well dressed, and called the attention of the Court to that fact, claiming that no man who wore "good clothes" could properly be considered a vagrant, a vagrant being a ragged, dirty vagabond. Observing that the Court made a memorandum of "good clothes," he had the good sense to sit down. After the prosecution had concluded, the judge, with his rich brogue, said: "The Caart having intintively haard the ividence and the remarks av counsil, is of the opinion that, inasmuch as the prisoner wears good clothes, he can not properly be considered a vagrant; *but*, as he has not shown to the satisfaction of the Caart how he obtained thim clothes, I shall bind him over for *simple larceny!*"

He was so bound over, and the papers are on record in the county clerk's office.

NOTHING like grammar! Better go without a cow than go without that. There are numberless "professors" who go "tramp, tramp, tramp, my boys!" around the country, peddling a weak article, by which in "twenty days" they guarantee to set a man thoroughly up in the English language. An instance in point comes from Greenville, Alabama, where a "professor" had labored with the youth of that people, and taught them to dote on grammar according to "Morris's" system. During one of the lectures the sentence, "Mary milks the cow," was given out to be parsed. Each word had been parsed save one, which fell to Bob L——, a sixteen-year-old,

near the foot of the class, who commenced thus: "Cow is a noun, feminine gender, singular number, third person, and *stands for Mary.*" "Stands for Mary!" said the excited professor. "How do you make that out?" "Because," answered the noble pupil, "if the cow didn't stand for Mary, *how ecull Mary milk her?*"

A SCOTCH gentleman, who has recently taken a run through the South, says that the only negro song he heard that had a vindictive turn about it was one dating from an early day in the conflict, and was said to have been first sung by an old negro prophethess at a jubilee meeting of emancipated slaves near Washington. It run thus:

"If de debble do not catch
Jeff Davis, dat Confederate wratch,
And roast and frigazee dat rebbel,
What is de use of any debble?"

THAT the newly imported serving-woman reads the papers is fairly deducible from a remark she made in the parlor of her master's house a day or two since. While clearing up that apartment she became discouraged at the profusion of articles with which the room was filled, and exclaimed, "Och! an' sure things is layin' round wholesale and *advertail!*"

SPEAKING the other day of the different forms of burial-service used by different religious bodies, a gentleman remarked that the briefest one he had ever heard was that used by a Scotch deacon, the clergyman being absent. When the hearse reached the grave the solemnities began and concluded as follows: "Tak' him oot." "Put him in." "Cover him up."

And then they all "gang'd bock again."

WE fear that *some* of the merchants whose stores are located on the City Hall Park sidewalks are not governed by that fine moral sense that should animate the conscientious dickerer; for, under date of July 14, from Colusa, California, we have the following statement:

When I was walking around the Park, opposite the Astor, I saw a decrepit pea-nut merchant sitting over his basket, awaiting customers. I made a purchase and sauntered on, opening and eating them as I walked. I found that for every good nut there were a dozen bad ones; so, turning back, I accosted the vendor, and told him that the nuts he sold me were bad. That enterprising trader, with perfect frankness, replied: "I know it. *I didn't ask you to buy 'em, did I?*" He had "the law on his side," and I walked over to the Astor.

MR. DAVID MACRAE, a Scotch gentleman, has just published in Edinburgh a book about "The Americans at Home," which contains several anecdotes of that singular people. When he was at Mobile he was desirous of seeing Captain Semmes, of *Alabama* notoriety, and asked the clerk of the hotel if he knew where the captain lived. No, he didn't.

"What paper does he edit?"

"No paper," said the clerk. "He *did* edit a paper once, but he gave that up."

"What is he doing now?"

"God knows," said the clerk.

"I reckon they'll be able to tell you at the *Tribune* office," said a tall gentleman who was lounging against the rails.

Away to the *Tribune* office Mr. Macrae went, made his way up to the editor's room, but was taken aback by the following intimation on the door:

POSITIVELY NO ADMITTANCE

Until after Two o'Clock,

EXCEPT TO WHIP THE EDITORS.

After some little trouble, but without whipping any Southron, he found Captain Semmes, and had a talk with him. The talk didn't amount to much.

ILLSBOROUGH, Missouri, where the commissariat seems to be irregularly organized, contributes (in an envelope indorsed "literary biz") the following:

A gentleman was passing through here recently, when he came upon a youth of apparently seventeen summers, who was furiously scratching at the side of a gravelly hill.

"What are you after, my friend?" inquired the stranger.

"After a ground-hog I saw run in this hole."

"Why, you don't expect to get him in that way?"

"Git him! Bound to git him! We're out of meat!"

TALK about things that are "slow!" Could any thing be more leisurely than the following, from a correspondent at Martinsville, Virginia?

"In this region you will find every few miles turb mills for grinding corn, nearly all of which (through ignorance) are very 'slow.' Nell — had the honor of being the presiding genius over one of the slowest of turbs. Having started his mill one morning, he proceeded to get his breakfast, but had not been long seated at table when his dog set up a furious barking in the direction of the mill. Thinking the animal had treed a 'possum, he hurried to the spot, and found that the dog had eaten the meal up, and was *barking at the spout for more!*"

The freemen of Rushford, Minnesota, celebrated with becoming ceremonial the late anniversary of the "glorious Fourth." As a part of the proceedings the following "sentiment" was offered from the stand, and is supposed to express the general tendency of Western thought respecting the *Sixteenth* Amendment:

"The woman of the coming time!"

Shall man to vote app'nt her?

Well, yes or no; your bottom dime,

He'll do as *she's* a min' ter!

We know she "*will*," or else she "*won't*"—

'Twill be the same as now;

And if she does, or if she don't—

God bless her, *any how!*

A CORRESPONDENT at Paris furnishes the following neat saying of a lady to the eminent philosopher and doubter, M. Ernest Renan, who, by-the-way, rarely shows himself in the Parisian *salons*, but who on this occasion was present at a reception given by one of the ministers. He was there presented to Madame G——, who paid him some rather sarcastic compliments about his learned writings. "Sir," she said, "I am sure

that there is among the Apostles one whom you will not have failed to treat as a brother and colleague."

"And who is that, madame?" asked M. Renan.

"St. Thomas," was the reply.

THE members of a church in one of the very rural towns of Illinois recently procured a small cottage organ to aid the vocal services. This was quite acceptable to most of the congregation; but one good brother was opposed to it. On the Sunday evening following its introduction he was called on, as usual, to close the meeting with prayer. Raising his head, he replied, "Call on the *mersheen*; if it can sing, it can pray. Call on the *mersheen*."

THAT was very neat of a good old gentleman on his friend, as they were cracking jokes at each other:

"Did you ever see me when I had taken more than you thought I could carry?"

"No, indeed; I can not say that I have," was the reply; "but I have seen you when I thought you had better have gone twice after it."

GRIEF and business have seldom been more thoroughly mixed than in the following obituary advertisement. The residence of the defunct we omit, and the name we have changed, therefore it will not worrit his friends:

"Othniel Sitgreaves, we are sorry to stait, has decesed. He departed this last Mundy. He went 4th without any struggle, and sich is life. He kept a nice store, which his wife now waits on. His virchews was numerous, and his wife inherits them. We are happy to stait that he never cheeted, speshully in the wate of mak-erel, wich was always nice and smelt sweat, and his survivin' wife is the same way. We niver new him to put sand in his suger, though he had a big sand-bar in front of his house; nor water his lickers, tho the Ohio river past his door. Piece tu his remanes. He leves 1 wife, 9 children, 1 kow, 4 hoses, a growcer's and other quadroopeds to mourn his loss. But in the langwidge of the poit, his loss is thare eturnal gane."

DR. SHELTON MACKENZIE, in his entertaining "Life of Dickens," has the following hit by Dickens at Thackeray, as to the originality of the latter's witty reply to Mr. Angus B. Reach, when the latter told him that his name should be pronounced *Ree-ack*—Thackeray asking him, as he passed a peach, "Mr. *Ree-ack*, will you take a *pee-ack*?" Dickens (it was at a dinner-party) asked Thackeray, "*Did you say that?*" "Certainly." "And think it original?" "Of course. Perhaps *you* said it?" "No," replied Dickens, with a merry twinkle of the eye; "but I was at Lord John Russell's the other day, and having to wait for him a few minutes, took up a book, which happened to be one of the volumes of Tom Moore's 'Diary.' There I read, under date of 1826, I think, that Luttrell, the wit, dining next a gentleman whose father invented the small napkins, or *serviettes*, used after dinner to put finger-glasses or wine-glasses upon, addressed him as '*Mr. Doyley*,' and was informed, rather angrily, that the real name was Deh'-Oyley, with a long rest between the elided preposition 'D' (or

de) and the rest of the word. 'Very well,' said Luttrell, in his blandest manner, pointing to a neighboring dumpling on the table. 'May I trouble you, Mr. D'Oyley, for a little of that d'—umpling?' So," added Dickens, turning triumphantly to Thackeray, "*your* joke is at least thirty years old."

DOES seem to us that, at this present writing, there are at the various eligible street corners, church fronts, and under good shading around the parks and squares, a larger number of strong, first-class blind beggars than were ever before seen in New York. Begging has become as much a fine art with us as ever it was in the Old World. Each respectable beggar has his particular stand or district, inside the metes and bounds of which no other respectable beggar intrudes. And a good business they make of it. The which is merely prefatory to the introduction of a little dialogue between two Dublin professors of indigence:

"Good-morning to ye, Mrs. Fogarty" (reaches a snuff-box to offer a pinch).

"Thin good-morrow kindly, Judy; I hope I see you well this mornin'."

"So, Mrs. Fogarty, you married your daughter?"

"I did—praise be to goodness!"

"Did she get a good match?"

"Faix, thin, it's herself that did! She got blind Darby Driscoll, on the Dyke, that makes more than any o' thim beggars in Cork."

"I'm delighted to hear it, Mrs. Fogarty. Did you give her any fortune, Mrs. Fogarty?"

"Any fortune, is it! Ah, thin now, Judy, is it insultin' me you'd be? Sure you know in your heart that a child of mine was never married widout it. Didn't I give her the best side of Patherick Street, which, if *well begged*, is worth seven and sixpence sterling a week?"

THERE was once an itinerant preacher in West Tennessee, who, possessing considerable natural eloquence, had become possessed of the idea that he was also an extraordinary biblical scholar. Under this delusion he would very frequently, at the close of his sermons, ask any member of his congregation who might have a "knotty text" to unravel, to announce it, and he would explain it at once, however it may have troubled "less distinguished divines." On one of these occasions, no one presuming to propound a text, he was about to sit down, when a chap "back by the door" announced that he had a Bible matter of great "concern," which he desired to be enlightened upon. The preacher, quite animatedly, professed his willingness and ability, and the congregation was in great excitement. "What I want to know," said the outsider, "is, whether Job's turkey was a hen or gobbler?" The expounder looked confused, and the congregation tittered, as the questioner capped the climax by exclaiming, in a loud voice, "*I fotched him down on the fust question!*" From that time the question-asking was abandoned.

SPEAKING of morality, how tersely and strongly put is the following, from one of Robertson's sermons, a volume of which has recently been published by the Harpers:

"Every profession has its conventional moral-

ity, current nowhere else. That which is permitted by the peculiar standard of truth acknowledged at the bar is falsehood among plain men; that which would be reckoned in the army purity and tenderness would be elsewhere licentiousness and cruelty. There is a parliamentary honor quite distinct from honor between man and man. Trade has its honesty, which, rightly named, is fraud. And in all these cases the temptation is to live content with the standard of a man's own profession or society."

A LEGAL brother in Maine, somewhat noted for his avarice and smallness generally, while engaged recently in the trial of a cause, was beaten on a technical point by the counsel opposed. This exasperated the old gentleman, who accused his young adversary of sharp practice. The young gentleman quickly retorted: "The court and the bar will readily recognize the fact that *small objects* can be picked up only on *sharp points*." The court and bar recognized.

RATHER a matter-of-fact treasurer of a Boston railroad corporation was he who, on being told on the day of the reception of the tidings of the death of Dickens, by the president, that "the death of Charles Dickens would be a serious loss to us all," replied: "Charles Dickens! There is no such name as that of any one that works for this corporation."

It will be remembered that the President, accompanied by several members of his cabinet and other government officials, attended the funeral obsequies of General Thomas at Troy. While *en route*, the train to which their car was attached came to a halt at one of the stations upon the Hudson River Railroad, where a large concourse of people, in anticipation of the arrival of the distinguished party, had assembled around the dépôt, all manifesting a lively anxiety to behold the Chief Magistrate of the nation. At the proper time the whistle sounded, the train approached, and before the wheels ceased revolving the crowd rushed round the train in every direction, until they discovered the carriage of the excursionists, which they invested on every side, peering through the doors and windows, and eagerly scrutinizing every face in sight, as well as all persons who came out; but, to their intense disappointment, they could not find the President; neither did he seem disposed to gratify their curiosity by coming out and exhibiting himself. Just before the train was about to depart, and as they were on the point of giving up the search, General Parker, Commissioner of Indian Affairs, came out upon the front platform, and remained there for a moment. Now the general, although an educated and polished gentleman, has a physiognomy and complexion which bear unmistakable attestation to his aboriginal lineage. No sooner did he make his appearance than one of the spectators, who professed to be well acquainted with General Grant, and who had been designated to point him out to the assembled tyros, gave a very significant wink and nod to the crowd, at the same time eagerly exclaiming, in a low tone of voice, "That's him, boys! that's him!" Thereupon all looked with deep and respectful interest upon the man they took to be the renowned hero, and various com-

ments were hazarded in regard to his personal appearance, his military bearing, etc., etc., all of which were of the most just and complimentary character. Only one individual manifested any doubt about the identity of the person before them, and this man, it appeared, had served under General Grant in the early part of the war. He, after walking several times past the Commissioner, and giving him a most scrutinizing examination, at length turned to the assembly, remarking: "Wa'al, now, I'll just tell you fellers what it is. If that's General Grant, the ole man's got confoundedly sun-burnt since he went to Washington, sartin sure!"

THERE has just been published in Paris a book entitled, "Private Recollections of Prince De Talleyrand," which contains several anecdotes of that clever and witty diplomatist hitherto unpublished:

Cambacérès said to Prince De Talleyrand: "A great many epigrams have been written against Count Siéyès, but they are groundless. I have heard him speak very often in our assemblies, and he has always shown himself to be a very profound man." Prince De Talleyrand replied: "Profound is not the proper word to apply to him. You should say hollow—very hollow."

When Prince De Talleyrand returned from a mission to Berlin, other German courts, and St. Petersburg, Napoleon asked, "Well, what do they say about me in the northern courts?" Prince De Talleyrand replied, "Sire, some think you are a god, others a demon; but I met nobody who thought you a man."

One morning, after the campaign of Dresden, Napoleon observed Prince De Talleyrand at his levée, and bade him remain, as he wished to talk privately with him. After the company had gone, he went up to Talleyrand and bawled: "What have you come here for? To show me your ingratitude? You give the public to believe that you belong to a party in opposition. You think, I dare say, that were I to die you would be President of the Council of Regency. Now, mark my words. Were I so much as dangerously ill, the first thing I should do would be to have you shot." Prince De Talleyrand, with the grace and quiet of a courtier who had just received new favors, bowed low and respectfully as he replied: "I did not require, Sire, such a warning to address most fervent prayers to Heaven to vouchsafe health and long life to your Majesty."

One of Napoleon's favorite ironical expressions was, "And what will the Faubourg Saint Germain say?" He was always secretly irritated by the disdain and opposition of the old nobles, and was especially annoyed by the disdain and opposition shown to him by Countess De Narbonne, the mother of Count Louis de Narbonne, one of his aids-de-camp. After the battle of Austerlitz (when, moreover, he had literally showered favors on Count Louis de Narbonne) he hoped that he had fairly won the mother's heart, although she was one of the oldest and most obstinate adherents of the House of Bourbon, to which she was attached by personal affection. Soon after the battle of Austerlitz Napoleon abruptly turned on Count Louis de Narbonne, and asked, "Does your mother love me now?" Count De Narbonne

was too embarrassed to reply. Prince De Talleyrand exclaimed, "Sire, Madame De Narbonne has not yet got further than admiration."

Now that the oyster has resumed his pleasant position at table, let us tell the following of Thackeray: When a dish of large-sized "Saddle-Rocks" was set for the first time before him, he gazed at them for several moments, and then asked what he was to do with them.

"Eat them, of course."

"Oh! eat them," said Thackeray, as if a new light had dawned upon him; adding, after a pause, "Well, here goes!"

When he had swallowed one, his friend asked him how he felt after it.

"*I feel*," said he, "*as if I had swallowed a baby!*"

DURING the late "difficulty" Southern soldiers were quite as fond of joking each other as they were of doing that same at our expense. This from a "Nof Ca'lina" friend, who is proud of his "tar and turpentine" State:

A North Carolina regiment, marching by a camp occupied by troops from Virginia, one of the latter asked, banteringly,

"Say, got any tar left?"

"No; General Lee has used it all up, putting it in the trenches here."

"Ah! What's that for?"

"To make the Virginians stick to their posts."

WHEN FIRST SHE CALLED ME "NED."

When first I saw those beaming eyes,
When first she answered "Mr. Brown,"
Ah, how I felt my poor heart rise
And fall beneath my silken gown!

I was a country curate then;
My income—it was scarce a jot;
How could I hope that such a gem
Would brighten a poor preacher's cot?

And yet, whene'er we met, she smiled—
I never saw her pout or frown;
And still my heart beat high and wild
Whene'er she answered, "Mr. Brown."

The laughing spring to summer turned,
And autumn brought its golden fruit,
And stronger still my love it burned,
But all my eloquence was mute.

One day we walked along the shade
Of green boughs, waving overhead;
Then, half in sport, and half afraid,
She archly smiled and called me "Ned."

Oh, how it thrilled my very frame,
And joy, like lightning, through me sped,
When first she dropped the formal name
Of "Mr. Brown," and called me "Ned!"

Then, then true rapture played her part—
No words *my* rapture could define;
I pressed her to my throbbing heart,
Kissed her warm cheek, and called her "mine."

PROBABLY no man laughs more heartily at the jokes perpetrated on him, especially those that occurred during the war, than General Butler. That one of a Southern person who, seeing placarded on the fences and gutters of New Orleans, "Buy your shirts at Moody's," supposed it not merely to be an order to that effect from head-quarters, but that General Butler was actually a partner in the concern! A joke, somewhat similar, is told of General D——, who was jocosely said to have a *penchant* for rebel furniture. Being seriously ill on one occasion, an

officer asked the surgeon in attendance what the matter was. "Only a heavy meal of furniture," said the surgeon; "but I have got him to throw up a bureau and a rocking-chair, and I think he will get round."

SOME years ago there resided in one of the principal towns of Maine a butcher, who, though illiterate, was not without wit. During one of his diurnal rounds with his cart he stopped at Judge B——'s, who asked, "What have you to-day, Thomas?"

"Mutton, Judge."

"How much a pound?"

"Two cents and a half. Have some?"

"Two cents and a half a pound!" replied the judge, in affected astonishment. "I'll live on faith before I'll pay two cents and a half a pound for mutton!"

The butcher-man paused a moment, and, holding out his hand, replied, "Judge, you'll have to *diet on repentance* some time before you can *live upon faith*!"

As an illustration of the progress of education in Connecticut, we introduce this:

N——, 1866.

MY DEAR SIR, I want to in form you that I am a boy of moral good caracter and would be wishfull to stud the interest of my employers and would gow to your office if you would give me a chance to gow to a forin contry so as I would have any sort of Pay I am prety well sienced in lerning and is be tween 17 and 18 years of age and I can gave a good recomdation please answer this and let me know your respect full friend

JOHN —

A boy so well "siened in lerning" should at once come to this metropolis, where that sort of thing is so promptly and remuneratively recognized.

ONE who signs himself "yours fraternally," in Alabama, sends the following as a specimen of the hand-bill of that region:

strayed!

STRAYED frOm me at town, one white, black, and red speckled cow. If any person should see her about here, I will thank him If he will notify me at town. She is one of the old stock, and will have one calf in abent two weeks.

A BRIGHT young lady of Indiana, on hearing of the approaching marriage of a friend, sat down and dashed off the following, to "rid her mind of the consciousness of neglected duty:"

"MY DEAR —: I hear you and — will soon be joined by the holy bonds of matrimony, and ere you have quite passed into his hands I wish to give you a few words of advice. Be kind to him, for he is one that must be treated tenderly, or fade away. Love him much, for he is worthy of all trust, honor, and love. And when you stand to be united, be ever ready with your own strong arm; in the excitement of the scene he may exhaust his sensitive nature, and, unless you lend him your aid, he may faint away. Treat him carefully. Make the fires for him. Saw his wood for him. Work for him. Walk for him. Kill yourself for him. Then, if on your death-bed he thanks you, humbly accept his thanks, and depart in peace!"

Admirable woman!

FROM Jordan, New York, where the public highway is in a notoriously and proverbially unsatisfactory condition for purposes of locomotion, a legal friend sends the following:

Some little time since I was employed, on be-

half of the complainant, to prosecute a prisoner for stealing, and during the trial undertook to impeach the testimony of one of the leading witnesses for the culprit. To do so I called, among others, Tom R——, who at home was considered by his neighbors to be a "knowledgable man," well posted in the law. On being placed in the stand he assumed a grave demeanor, which led the audience to believe that his testimony on so important a question would be received by Court and jury as conclusive. Judge of the surprise and merriment of his hearers, and the consternation of myself, when, in answer to my question, "What is the character of the witness for truth and veracity in the community where he resides?" he replied, with the utmost gravity: "Bad for truth, but *good* for veracity!"

An expression of hilarity lighted up the general countenance; then we *all* laughed.

THERE lived, in 1844, in — County, Ohio, a man who had just been elected Justice of the Peace, upon whom called, one fine morning, a couple to be married. The new justice asked for a little time to prepare for the case; consulted "Swan's Treatise," but could not find the ceremony laid down, and not liking to lose the job, turned round and said, "S——, hold up your right hand, and with your left take the hand of the lady," which being done, the justice continued: "You do solemnly swear that you will take the woman you hold by the hand to be your lawful and wedded wife, and do by her as other people does under like circumstances, so help you God!" As there was no book to kiss, he did the next best thing, and "swapped gum" (as they say in Iowa) with the ber-ide.

A CORRESPONDENT in Western New York mentions a certain grave-yard in his bailiwick which seems to abound in curious conceits in *memoriam*. We append two specimens. The first is an epitaph which, after reciting the virtues of the deceased through a dozen lines, concludes with an injunction to her friends and relatives:

"Like Nancy live, like Nancy die."

Another stone, erected over the remains of an old gentleman by his sons, bears the brief but touching inscription:

"Our Father—ANCHORED."

A thoughtless friend has suggested to our correspondent that to complete the idea and render it harmonious, a cenotaphic tablet should be placed next it, and exhibit the status of the widow of the deceased, as follows:

"Our Mother—AFLOAT."

JUDGE CHASE, of Vermont, was a man of excellent sense, and withal a great stickler for the dignity of courts. A case of very trifling importance, having well-nigh run the gauntlet of legal adjudication, came up at length to the highest court in the State. The counsel for the plaintiff was opening with the usual apologies for a frivolous suit, when the subject-matter, "to wit, *one turkey*, of great value," etc., catching the ear of the judge, he called out, "Mr. Clerk, strike that case from the docket. *The Supreme Court of the State of Vermont does not sit here to determine the ownership of a turkey!*"

THE HUGUENOTS.

BERNARD PALISSY.

THE barbaric dream of chivalry proved singularly attractive to the imaginative people of France. The strength and glory of the nation were wasted in endless wars. The same impulse that leads the Comanche to butcher the Sioux, or the King of the Guinea Coast to burn the villages of his neighbors, drove the French kings and nobles to fierce inroads upon Germany and a constant rivalry with Spain. Glory was only to be won upon the battle-field; he who fought was a noble; the honest laborer was his inferior and his slave. To murder, to waste, and to destroy, were the proper employments of kings and princes; while the church of Rome aroused anew the worst elements of human nature by preaching a series of ruthless

crusades and by its example of a general persecution.¹

Chivalry, the offspring of barbarism and superstition, culminated in the person of Francis I. By historians Francis is usually called gallant, but his gallantry consisted only in an intense selfishness and an utter moral corruption.² He was the scourge of France, the de-

¹ De Felice, *Hist. Protestants in France*. D'Aubigné, *Reformation in Europe*, book 2, c. x. Martin, *Hist. Fran.*, ix. See Gassier, *Historie de la Chevalerie Française*, i. 277, for the cruel traits of chivalry; so, too, i. 360, for the origin of constables and marshals.

² For this period Smiles, the Huguenots, and White, *Massacre of St. Bartholomew*, may be consulted with advantage. Capefigue, *François 1^{er}*, enlarges on cet esprit chevaleresque, etc., i. p. 209.

stroyer of his people; and if, in this respect, he was no worse than his contemporaries Charles V., Henry VIII., and the popes of Rome, he was more guilty, because more highly endowed. Nature had been singularly bountiful to the chief of the house of Valois. His form was tall and graceful; his mind had been fed upon romance and song. He was a poet, the author of sweet and plaintive verses; a hero longing to renew the exploits of Amadis and Charlemagne; the friend of Leonardo da Vinci, the patron of Clement Marot.¹ Yet, with all these softening impulses and tastes, Francis lived the life of a savage. At home in his splendid palace, the Louvre, he was plunged in the coarse pleasures of a profligate court; abroad he rushed like a madman from battle-field to battle-field, never happy unless surrounded by carnage. Under the rule of its chivalric king France knew every woe of which nations are capable. Whole districts were desolated by the tax-gatherer, the conscription, the invasion of the enemy, the hand of persecution. Famine, disease, poverty, bloodshed, were the gifts of Francis to his people; and while the king and his mistresses were borne in pomp from banquet to banquet beneath canopies of velvet seamed with gold, the mothers of Languedoc saw their children die of hunger in once prosperous towns, and the holy men and women of Merindol were butchered by thousands to soothe the venal bigotry of their master.² It is sometimes said that the crimes of kings and popes, like Leo X., Henry VIII., and Francis, are to be palliated by the general barbarism of their age; it might be easily shown that they were usually the most vicious and corrupt of their contemporaries. In France were thousands of wise, pure, honorable, and gifted men, well fitted to rule a nation, who saw with shame and horror the cruelties and the vices of the unhappy Francis and his persecuting court.

In the dawn of this disastrous reign the Huguenots first appear. They were the direct offspring of the Bible.³ As the sacred volume, multiplied by the printing presses of Germany, first made its way into France, it was received as a new revelation. Before Luther had published his theses it is said that there were Protestants at Paris, and wherever the Bible came it was certain to found a church. But it was chiefly among the men of labor and of thought that its teachings were ever welcome. Labor, flying from the decaying cities of Italy and the disturbed dominions of Charles V., had found a new home in many of the towns of France; accomplished workmen in silk and linen, iron or clay, had stimulated the prosperity of Lyons and Tours, Saintes and Meaux; painters, sculptors, architects, and poets had sprung up amidst

the barbarism of chivalry; Paris was as renowned for its painters as for its goldsmiths; and the College of France spread liberal learning among the ambitious students of the day. To the cultivated artisan and the classical scholar the gross corruptions of the church, and the open vices of monks and priests, were singularly odious; for the one had learned the charm of virtue by practicing a regular life, the other by a study of Socrates and Cicero. When, therefore, the Bible, in its modern translation, was laid before the people, a wonderful religious revolution swept over France. Nearly the whole working-class became Protestants.¹ The great manufacturing towns were converted at once from Romanism to the faith of St. Paul. Almost every eminent artisan or inventor was a Huguenot. Stephen, the famous printer, Palissy, the chief of potters, the first French sculptor, Goujon, the great surgeon Paré, and a throng of their renowned companions, shrank from the mass as idolatrous, and lived by the precepts of the Bible.² The professors of the College of France and the ablest of living scholars adopted the principles of reform. The impulse spread to nobles and princes. The house of Bourbon and of Navarre were nearly all Huguenots. Marguerite, the sister of Francis, became the chief support of the reformers, and the king himself seemed for a moment touched and softened by the sacred language of inspiration. The Bible ruled over the rejoicing French. Of the wonderful power of this wide reform it is impossible to speak without enthusiasm. Swiftly there spread over the manufacturing towns of France a reign of saintly purity. Men once more shrank from vice and clung to virtue. The gross habits of the Middle Ages were thrown aside; the taverns and theatres were deserted, the morris-dancers and jongleurs no longer amused; the rude dissipation of the peasantry, the licentious fêtes of priests and nobles, awakened only disgust; but in every village prayer-meetings were held, and the Bible was studied by throngs of eager students, who, for the first time, were now enabled to listen to the voice of inspiration.

The reformation began, it is said, at Meaux, a small manufacturing town on the borders of Flanders, which had learned from its Flemish neighbor industry and independence.³ Its people had been coarse and rude, its priests vicious, indolent, and dull, and the little town had found its chief recreation in drunkenness and barbarous license. Its inhabitants were wool-carders, fullers, cloth-makers, and mechan-

MASSACRE OF THE INHABITANTS OF MÉRINDOL.

ics, living by the product of their daily labor, and grasping eagerly at every uncultivated pleasure. Jacques Lefèvre, the translator of the Bible into French, a man of nearly seventy, and the young and brilliant Farel,¹ his faithful associate, preached to the working-men of Meaux and distributed among them copies of the gospels. At once the mass was deserted, the priest contemned, and eager throngs listened to the daring missionaries who ventured to unfold the long-forgotten truth.² A swift and graceful transformation passed over the busy town. No profane word was any longer

¹ Said Farel: Je viens prouver la vérité de mes doctrines, et je le ferai au peril de ma vie. See *Histoire Genève*, par A. Shoarel, ii. p. 89.

² See Felice, p. 19.

uttered, no ribaldry nor coarse jests were heard. Drunkenness and disorder disappeared; vice hid in the monastery or the cloister; in every factory the gospels were read as a message from above, and the voice of prayer and thanksgiving mingled with the clamor of the shuttle and the clash of the anvil. The rude and boisterous artisans were converted into refined and gentle believers, ever seeking for the pure and the true; and the sudden impulse toward a higher life awakened at Meaux by the teachings of Farel and Lefèvre stirred, like an electric shock, every portion of diseased and decaying France. A moment of regeneration seemed near, a season of wonderful advance.

At a later period Palissy, the potter, has left a pleasing account of a similar transformation.

In the busy town of Saintes, where he was pursuing with incredible toil and self-denial one of the chief secrets of his art, Palissy became the founder of a church. Too poor to purchase a copy of the Bible, he learned its contents by heart, and every Sunday morning exhorted or instructed nine or ten of his fellow-townsmen who assembled in secret to hear the Word of God. The little congregation soon grew in numbers.¹ For some time they met at midnight, and hid from persecution. At length the purity of their lives and the earnestness of their faith won the respect of the people of Saintes; a pastor was procured; the people crowded to the Protestant assembly; a revival spread over the town, and a sudden reform in morals made Saintes a haven of rest and peace. Coarse plays and dances, extravagance in dress and license in living, scandal, quarrels, and lawsuits, says Palissy, had almost wholly passed away. Instead of profane language and idle jesting were heard only psalms, prayers, and spiritual songs.² The religion ruled over the happy town, and even the priests and monks, stirred by the general impulse, began to pray and preach with honest fervor, and to emulate the purity of the zealous reformers. A gentle harmony prevailed between the rival churches; for the moment the evil passions of men were charmed into repose. Then, adds Palissy, might be seen, on Sundays, bands of work-people walking cheerfully in the meadows, groves, and fields, singing spiritual songs together, or reading to one another from the sacred volumes; young girls and maidens chanting hymns beneath the pleasant shade; boys, with their teachers, full of a steadfast purpose to live a noble life. The very countenances of the people, he asserts, were changed; the coarse lines of sensuality had been swept away, and from every face shone only benevolence and truth.

The picture of the reformed village, drawn by the honest pen of the gentle artisan, reads like an idyllic dream amidst the dreadful story of the reign of the chivalric Francis; it seems scarcely more probable than Livy's narrative of the golden age of Numa, or Homer's legend of the gentle Phæaciens. Yet it was no doubt true. In many towns and cities of martial France similar scenes were witnessed. More than two thousand churches sprang up in the apparently ungenial soil. The early Huguenots were noted for their austere virtues, their truthfulness, their love of peace. They lived together, a happy brotherhood, joined in a common faith, a similar purity of life. Men trusted the word of a Huguenot when the oath of the Catholic noble awakened only distrust. They brought honesty into commerce, and the domestic virtues into every home. They softened their enemies by a tolerant patience; they strove to convert rather than to destroy;

their brilliant leaders, adorned by rare talents and eminent virtues, attracted the admiration of the age; and it seemed possible that the tide of reform might sweep unchecked over France, subdue by its gentleness the hostility of the Gallican church, and restrain, with a mighty force, the barbarous instincts of the feudal princes and the impulsive king.

But France was not permitted to reform itself. It was the slave of an Italian master and of a throng of Italian priests. From their distant thrones a series of cruel and vicious popes awoke the fires of discord in the progressive nation, denounced the gentle Huguenots as the enemies of Heaven, and demanded their extirpation.¹ The French priests, roused to madness by the intrigues of Rome, began the fatal labor of persecution; the uncultivated nobles and the immoral court yielded to the fierce anathemas of the Italian potentate; robbers and assassins were let loose upon the peaceful congregations of reformers; the horrors inflicted by the popish inquisitors awoke retaliation, and the dawning hope of France was forever lost in the unexampled terrors of its religious wars.

The pope gave the signal for a perpetual St. Bartholomew's; Francis obeyed, perhaps reluctantly, the Italian priest; a general crusade began against all those flourishing Protestant communities where sanctified labor had lately born Hesperian fruit. In 1525 Clement VII. sanctioned or created the French Inquisition, endowing it with "apostolical authority" to try and condemn heretics. A series of royal edicts followed, enjoining the public officials to extirpate the reformers; and in every part of France it became the favorite pastime for the idle and the dissolute to plunder the houses of the Huguenots, burn their factories, desolate their homes by dreadful atrocities, and bind them with malevolent exultation to the stake.² At the command, by the instigation of Clement, Paul, Julius, Pius, the successors of St. Peter, every Romanist in France was made an assassin, every faithful adherent of the pope was enjoined to rob or murder an unoffending neighbor.³ The era of reform, which had lately seemed so near, vanished before the malevolent interference of the Italians; the commands of Rome checked the advancing tide of civilization. Bands of plunderers, blasphemers, ravishers, murderers obeyed the Holy Father and sprang upon the Protestant communities. No

¹ The Romish church has always advocated the extirpation of heresy, where it can be accomplished with safety to itself. De Castro, *De Justa Hæret. Punitione*, 1547, 119. *Jure divino obligantur eos extirpare, si absque majori incommodo possint. So fides illis data servanda non sit.*

² D'Aubigné, *Ref. in Europe*, i. 552-557. Francis was hired by the clergy to extirpate the Huguenots. See J. Simon, *La Liberté de Conscience*, p. 123 *et seq.*, for the cruelties of the king.

³ *Relations des Ambassadeurs Vénitiens*, Doc. Ined. Hist. France, i. p. 520. Fu introdotta questa peste in Francia, etc. It was a horrible poison the Catholics wished to expel.

² Smiles, p. 39-42.

more were heard the chant of holy songs on Sundays in the pleasant groves; no longer fair young girls made sacred music in the forest; no more the manly youth planned lives of generous purpose. The austere, benevolent Huguenot was cut down at his forge or his shuttle; his wife and children became the victims of the papal soldiers; every village rang with blasphemy and the jests of demons; every enormity was perpetrated in obedience to the orders of the pope.

Palissy has described, with simple truthfulness, the effects of the papal interference upon his once prosperous church at Saintes. The town had been invaded by a band of papal persecutors. The very thought of those evil days, he exclaims, fills my mind with horror.

To avoid the spectacle of the robberies, murders, and various crimes perpetrated in the town, he concealed himself for two months in his own house. During all this long period the work of persecution went on, until all the reformed had fled from the hapless neighborhood. It seemed to Palissy as if Satan had broken loose and raging demons had suddenly taken possession of Saintes. Where lately had been heard only psalms and spiritual songs and exhortations to a holy life, now echoed on every side abominable language, dissolute ballads, profanity, and execrations. Led by their priests, "a band of imps," he says, issued from a neighboring castle, entered the town with drawn swords, and shouted, "Where are the heretics? we will cut their throats at once." They rushed from house to house, robbing and murdering; they uttered blasphemies against both God and man.¹ Palissy himself soon after escaped to Paris. Here he was employed for many years by Catherine de Medicis and her children; was at last sent to the Bastille for heresy, and by dying in prison escaped the stake. His narrative of the events at Saintes, of the horrors of the papal persecution, may be accepted as an accurate picture of what happened in every Protestant village or town in France by the direct command of the pope at Rome.

There now began a remarkable contest between the Romish church and the Bible—between the printers and the popes.² For many centuries the Scriptures had been hidden in a dead language, guarded by the anathemas of the priests from the public eye, and so costly in manuscript form as to be accessible only to the wealthy. A Bible cost as much as a landed estate; the greatest universities, the richest monasteries, could scarcely purchase a single copy. Its language and its doctrines had long been forgotten by the people, and in their place the intellect of the Middle Ages had been fed upon extravagant legends and monkish visions,

the fancies of idle priests, the fables of the unscrupulous. The wonders worked by a favorite image, the virtues of a relic, the dreams of a dull abbot or a fanatical monk, had supplanted the modest teachings of Peter and the narrative of Luke. Men saw before them only the imposing fabric of the church of Rome, claiming supremacy over the conscience and the reason, pardoning sins, determining doctrines, and had long ceased to remember that there was a Redeemer, a Bible, even a God. A practical atheism followed. The pope was often a skeptic, except as to his own right to rule; the church and the monasteries teemed with the vices depicted by Rabelais and Erasmus. Then in the close of the fifteenth century a flood of light was poured upon mankind. The new art of printing sprang into sudden maturity, and great numbers of Bibles were scattered among the people. They were sought for with an avidity, studied with an eagerness, received with an undoubting faith such as no later age has witnessed; arrayed in the charm of entrancing novelty, the simple story of the gospels and the noble morals of the epistles, translated for the first time into the common dialects, descended as if newly written by the pen of angels upon the minds of men.

Every honest intellect was at once struck with the strange discrepancy between the teaching of the sacred volume and that of the church of Rome.¹ No religion, indeed, seemed less consistent with itself than that of medieval Romanism. The Mohammedan of the fifteenth century still clung with tenacity to the minute requirements of the Koran; the Jew obeyed in every particular the injunctions of the Decalogue; the Greeks and Romans had suffered few alterations in the rituals of Jupiter and Diana. But it was found upon the slightest inspection that there was no authority for the Romish innovations in any portion of the Scriptures. There was no purgatory, no mass, no papal supremacy, no monasteries, no relics working miracles, no images, no indulgences to be found in the book that contained the teachings of Christ and his Apostles. The inference was at once every where drawn that the theories of the Roman church were founded upon imposture; and when, at the same time, the shameless lives of its priests and popes were brought before the public eye by satirists and preachers, its gross corruption was believed to be the necessary result of its want of truthfulness; its cruelty and violence seemed the offspring of its unhallowed sensuality and pride. The Bible alone could now satisfy the active intellect of France; the Bible awoke anew the simple church of the apostolic age.

To the Bible the popes at once declared a

¹ Smiles, 44, 45.

² *Relat. Ven. Amb.*, Doc. Ined., ii. 139. Corroero thinks the heresies might have been repressed if Francis had been more active. Yet it was during this period that Montaigne was writing his essay upon "Cruelty," and teaching wisdom from history.

¹ To the sellers of indulgences the New Testament was particularly odious. It stopped their trade. So Lyndesay's pardoner or indulgence-seller exclaims:

I give to the devill with gude intent
This unsell, wickit New Testament,
With thame that it translaitit.

Satyre of the Three Estates.

deathless hostility. To read the Scriptures was in their eyes the grossest of crimes; for they confessed by their acts that he who read must cease to be a Romanist.¹ Not murder, robbery, nor any other offense was punished with such dreadful severity.² The tongues of the gentle criminals were usually cut out; they were racked until their limbs parted; they were then forced to mount a cart, and were jolted over rough streets in agony to the stake. Here they were burned amidst the jeers of the priests and the populace. Yet the Bible sustained them in their hour of trial, and they died ever with hymns of exultation. Great wars were undertaken to drive the sacred volume from schools and colleges. The Inquisition was invested with new terrors, and was forced upon France and Holland by papal armies. The Jesuits were every where distinguished by their hatred for the Bible. In the Netherlands they led the persecutions of Alva and Philip II.; they rejoiced with a dreadful joy when Antwerp, Bruges, and Ghent, the fairest cities of the working-men, were reduced to pauperism and ruin by the Spanish arms; for the Bible had perished with its defenders. "There are above forty thousand Protestants in this town," wrote Sir Thomas Gresham from Antwerp in 1666, "which will die rather than that the Word of God shall be put to silence." A few years later their heroic resolution had been fulfilled; they had nearly all perished by famine, disease, and the sword of Alva.

To burn Bibles was the favorite employment of zealous Catholics. Wherever they were found the heretical volumes were destroyed by active inquisitors, and thousands of Bibles and Testaments perished in every part of France. Yet the fertile press soon renewed the abundant fruit, and the skillful printers of Germany and Switzerland poured forth an incessant stream of French, Dutch, and English Bibles, besides an infinite number of tracts and treatises by eminent reformers. The demand for these books could never be sufficiently supplied. At Nuremberg, Mentz, and Strasbourg there was an eager struggle for Luther's smallest pamphlets. Of his catechism one hundred thousand were sold. The sheets of his tracts, often wet from the press, were hidden under the purchasers' cloaks and passed from shop to shop. The most hated and the most feared of all the agents of reform, in this remarkable period, by priest and pope, was the humble colporteur or Bible-seller. Laden with his little pack of Bibles, Testaments, and Protestant treatises, the godly merchant made his way from Antwerp or Geneva into the heart of France, and beneath the hot summer sun or in the snows of winter pursued with patient toil his

dangerous traffic.¹ He knew that if detected he must die; he felt that the keen eyes of inquisitors and priests were every where watching for his coming. Yet, often disguised as a peddler of ribbons and trinkets, he made his way into the castles of the nobles or the homes of the working-men, and cautiously exposed his forbidden wares. They were bought with eagerness, and read by noble and peasant. But not seldom the daring missionary was discovered and punished; his little stock of Bibles was dragged forth and burned by rejoicing priests, and the humble Bible-seller was himself sacrificed, in fearful tortures, to the dreadful deity at Rome.

Between the printers and the popes the war now began that has never ceased. The clank of the printing-press had to the ears of the Italian priesthood an ominous sound. "We must destroy printing," said an English vicar, "or it will destroy us." The Sorbonne of Paris denounced the printers in 1534, and burned twenty of them within six months, and one woman. A printer of the Rue Saint Jacques was condemned for publishing Luther's works; a bookseller was burned for having sold them. At last the Sorbonne, the council of the papal faction, in 1535, obtained a decree from the king for the total suppression of printing.²

Robert Stephen was one of the most eminent printers and scholars of the age. From his accurate press at Paris had issued Latin Bibles and Testaments of singular excellence and beauty. But he was a Huguenot, and even the favor and protection of the king and the court could not shield him from the rage of the Sorbonne. It was discovered that in the notes to his Latin Bible of 1545 he had introduced heretical doctrines. He was prosecuted by the Faculty of Theology, and fled from France to escape the stake. His contemporary, the poet, printer, and scholar, Dolet, was burned for atheism in 1546. Yet the bold printers in Protestant Geneva, Germany, and the Low Countries defied the rage of popes and inquisitors, and still poured forth an increasing tide of Protestant tracts and Bibles. The press waged a ruthless war upon the antichrist at Rome. It founded the republic of Holland, the central fount of modern freedom; it reformed England and the North. It filled the common schools with Bibles and instructed nations in the humanizing lessons of history. From age to age it has never ceased to inflict deadly wounds upon the papacy; until at length even Italy and Spain have been rescued from the grasp of the Inquisition and the Jes-

¹ Said Paul IV.: A heretic never repents; it is an evil for which there is no remedy but fire.

² Said Montaigne, *Essay on Cruelty*: I live in a time abounding in examples of this vice; we see nothing in ancient histories more extreme than what we meet with every day.

¹ De Felice, p. 73. Reading the Bible to a congregation unauthorized by law is still a criminal offense in France, or was so in 1857. See M. Jules Simon's *La Liberté de Conscience*, p. 27. His treatise may be read with instruction.

² A. F. Didot, *Paris Guide*. C'est ainsi, says Didot, a good authority, que traitait l'imprimerie celui qu'on à volu surnommer le *Père*, ou le *Restaurateur des Lettres*, p. 296. The French are slowly discovering the absurdity of their received histories.

uits, and have proclaimed the freedom of the press. In the city of Rome alone, under the tyranny of an infallible pope, the printer lies chained at the mercy of his ancient adversary; from the dominions of Pius IX. the Protestant Bible, the source of modern civilization, is excluded by penalties scarcely less severe than those imposed by Pius V. And as once more the Italian priests prepare to renew their warfare against the printing-press and the Bible in the cities of free America, they will encounter, though with new arts and new arms, their successful adversary of the Old World. The printer once more defies the pope. He points to the ashes of his martyrs, scattered in the waters of the Seine or the Scheldt in the sixteenth century; to the prisons of Bologna or of Rome, so lately filled with the dying advocates of a free press in the nineteenth; to the crimes of Pius IX., no less than those of Pius V., as his gage of battle.¹

More than thirty years of ceaseless persecution, filled with scenes of horror, of flourishing seats of industry sacked and blighted, of holy men and women martyred with incredible sufferings, of dreadful atrocities perpetrated in every town and village by the emissaries of the popes, had passed over the patient Huguenots before they resolved to take up arms in self-defense. Their gentle pastors, with persistent magnanimity, inculcated theories of non-resistance. Calvin himself, rigid and severe, still urged upon them obedience to their merciless kings. He was content to meet the savage barbarism of the Inquisition with spiritual arms. From his strong-hold at Geneva he organized his Bible societies, and poured an incessant stream of reformed literature over every part of France. He cheered the martyrs with austere exhortations; his Bible-sellers were seen in every secluded path and by-way, stealing with fearless faith from congregation to congregation; his presses at Geneva were never idle; his "Institutes" were scattered widely over his native land. During this period of suffering the Huguenots continued to increase in numbers. Yet their congregations were often forced to meet in caves and forests, and to chant in subdued tones their sacred songs, lest their persecutors might break in upon them with fire and sword. Often the pious assembly was discovered in its most secret retreat, and men, women, and children were massacred by hordes of priests and brigands.

At Meaux, the birth-place of reform, fourteen persons were burned alive in the market-place. In the south of France two Protestant towns, Cabrières and Merindol, were razed to the ground—every house was destroyed, and the unoffending people were murdered in the streets.

Four or five hundred women and children, who had taken refuge in a church, were butchered at once; twenty-five women, who had hidden in a cave, were smothered by a fire kindled at its entrance by the papal legate. At Paris, on the night of September 4, 1537, a congregation of Protestants was gathered in secret at a private house in the suburbs.¹ Many of them were refined and pious men and women from the cultivated classes of society; some were noble and connected with the court. But, united by a common piety, they celebrated the communion and listened to the exhortations of a faithful pastor.² They were startled by the cry, outside the door, of "Death to the Lutherans!" A wild mob of papists surrounded the house and besieged all night the terrified women, who were guarded alone by the swords of the gentlemen who attended them. In the morning the police arrested the whole Huguenot congregation and dragged them through the streets to the filthy dungeons of the Châtelet, where they had neither room to lie or sit down. By the strict law their lives were forfeited; they were offered pardon if they would go to mass. But not one consented. A long and terrible imprisonment passed away before they were brought to trial. Among the captives, the fate of Philippa de Lunz—a refined and high-bred woman, only twenty-two years old, a widow, possessed of wealth and influence—is singularly illustrative of the papal theories. She was examined, and refused to recant. She was next led out for execution. In the gay city of Paris, in September, 1558, a throng of papists assembled around a pile of fagots in the Place Maubert, dancing, singing, and calling for the victims. The king, it is said, looked on from a distance; the courtiers were not far off; the priests were no doubt all present. At length a cart drove into the square, on which were seen Philippa and two Huguenot companions. Their tongues had already been cut out. But Philippa had laid aside her widow's weeds, and was dressed in her best attire. For she said, on leaving prison, "Why should not I rejoice? I am going to meet my husband."

She witnessed the horrible convulsions of her two friends as they expired amidst the flames. She was lost in fervent prayer. The executioners roughly seized her, tore off her outer dress, and held her, with her head downward, in the fire. Her feet had already been burned off. She was then strangled, and her great soul escaped to heaven.³

Several others of the prisoners were executed. But their fate now awakened the attention of Europe. Calvin wrote to the survivors a letter of encouragement; at his entreaty the princes of Germany interceded for them; the younger

¹ The present pope began his reign by promising a free press and liberal reforms to his people. He violated all his promises; and there is no existing government that has shown such excessive severity to its political opponents as that of Pius IX. See *Facts and Figures from Italy, and Italy in Transition*.

¹ White, *Massacre of St. Bartholomew*, p. 40-43.

² The Huguenots fled from Paris in great numbers. The streets resounded with the cry of the ban proclaimed against them. J. Simon, *La Liberté de Conscience*, p. 131.

³ White, *Massacre of St. Bartholomew*, p. 43.

CATHERINE DE MEDICIS.

prisoners were carried to monasteries, from whence they were afterward allowed to escape; others were pardoned upon making an apparent recantation; and it is possible that even the French king and court were satisfied with the woes already inflicted upon the pious congregation of Paris. But the pope was enraged at the lenity shown to the Huguenots, and denounced the faint trace of toleration on the part of the king. He complained, he remonstrated. He was discontented because every prisoner had not been hung with his head downward in the flames and strangled, like Philippa de Lunz.¹

I have sketched the fate of the Protestants of Paris, as an illustration of the Roman doctrine of employing force in preserving religious unity. The popes and the Italian priests still defend that theory of persecution by which Philippa de Lunz was strangled; by which every country of Europe has been filled with woe; by which, if honestly accepted, every devout Roman Catholic might be converted into an assassin.²

Silenced and overpowered, their congregations broken up, their pastors driven from France, the Huguenots still expressed their religious impulses by a singular expedient. Music came to their aid. Clement Marot translated

the Psalms of David into French verse, and soon the inspired songs of the Jewish king were chanted in every city of the realm. They resounded in plaintive melodies from the caves and forests where the Huguenots still ventured to assemble; they made their way into the palace and the castle; and Francis, Henry II., Catherine de Medicis, and Henry of Navarre, had each a favorite psalm. Catherine, with some propriety, selected "O Lord, rebuke me not;" Diana of Poitiers, the mistress of Henry II., delighted in the *De Profundis*. The Huguenots sang the psalms as a substitute for divine worship; and often, as throngs of Parisians were walking on summer evenings in the pleasure-grounds of Pré aux Clercs, some daring reformer would strike the key-note of a psalm of Marot, and the strain, caught up by innumerable voices, would swell over the gay assemblage. The King and Queen of Navarre often went to the fashionable walk to hear the singing. But the priests at length procured an edict forbidding the

practice, and the voice of sacred melody was finally hushed in the horrors of St. Bartholomew.

King Francis, the chivalric, died of his own excesses; his son, Henry II., succeeded, the husband of Catherine de Medicis. He was even more vicious and cruel than his father; he persecuted with Italian severity; he died amidst the thanksgivings of the Huguenots, pierced by the lance of a rival knight, at a magnificent tourney. His death made way for the rule of his widow, Catherine de Medicis, and their three miserable sons. Nor can one reflect without a shudder of disgust upon that wretched group of depraved men and more monstrous women, into whose hands now fell the destiny of the Huguenots and of fair and progressive France. Touched by the genial impulse of reform, filled with a brilliant generation of poets, scholars, accomplished artisans, and gifted statesmen, such as the world has seldom known, the unhappy realm was checked in the moment of its advance by the follies and the crimes of Catherine, the popes, and the Guises. Rome ruled at Paris, and in the peaceful and holy communities described by Palissy and Beza was soon aroused a dreadful discord that ended in their destruction. The workman fled from his forge or his loom to die upon the battle-field; the scholar, the musician, and the poet carried the fruits of his genius to foreign lands; the Italian prelate, with malevolent touch, blighted the dawning civilization of France.¹

¹ Laurent, *Le Catholicisme et la Religion de l'avenir*, Paris, 1869, p. 577 *et seq.*, shows that the Holy Office is still defended by the Romish bishops.

² The Syllabus still asserts that heresy must be repressed by force. The infallible pope still wields the sword of persecution.

¹ A Romish view of the persecution of the Huguenots

Catherine de Medicis led the revelries, the fashions, and the politics of the age. Her youth had been singularly unfortunate.¹ No friendly voice, no fond or tender counsels, had awakened in her cold heart a trace of filial or maternal love. Her father, Lorenzo de Medicis, had deserved by his vices the miseries he endured; her mother was no less unhappy; and Catherine, the descendant of the wealthiest mercantile house in Europe, was born penniless and a child of evil omen. It was foretold of her at her birth that she would bring destruction to the city where she was born; the townspeople of Florence would have exposed the infant in a basket to the balls of their enemies. But she was preserved alive, was shut up in a convent, and in the school of Macchiavelli and of Rome learned dissimulation and self-control. Her uncle became pope, and Francis I., anxious to win the support of Clement, married his son Henry to the portionless orphan, then a girl of fourteen. But misfortune still followed the child of evil omen. The pope, her uncle, soon died; Francis reaped no benefit from the hasty marriage; and Catherine came into the family of Valois only to be neglected by her husband for Diana of Poitiers, and to be contemned by her regal relatives as the penniless descendant of a race of merchants.

For many years she lived powerless and obscure, the nominal wife of a depraved king.² Yet she was singularly beautiful. Her brilliant complexion, her large and lustrous eyes, the inheritance of the Medicean family, her graceful form, her hand and arm that no painter nor sculptor could imitate, were set off by manners so soft and engaging as to win the esteem even of her foes. Few left her presence without being charmed by that graceful courtesy which had descended to her from Lorenzo the Magnificent; few could believe that her placid countenance concealed the passions, the resentments, the unsparing malice of the most ambitious of women. From Lorenzo Catherine had inherited, too, a love for exterior beauty in dress or form; a taste for lavish elegance. She shone at tourneys, and glittered in stately processions. From him, perhaps, came that passion for political intrigue that seemed the only vigorous impulse of her placid nature, and for which at times she became a murderess, reveling in the spectacle of her bleeding victims, or meditated and prepared the corruption, the degradation, or the death of her own sons.

By some ardent Roman Catholic writers Catherine is adorned with all saintly virtues as the guardian and defender of the church; by most historians she is looked upon as an in-

comprehensible mystery.¹ Not even her contemporaries could penetrate that chill and icy heart, where no maternal nor friendly affections ever dwelt, where pity and compassion never came, which was dead to the sufferings of others, and even to her own, and discover the secret springs that guided her erratic policy of vacillation and crime. Yet it is possible that the true mystery lay in her boundless superstition. For the common modes of belief she had nothing but skepticism. She toyed with the Huguenots; she was not afraid to cajole or defy the Catholics and the pope. But before the sorcerer or the fortune-teller all her narrow intellect was bowed in abject submission.² Her credulity was, perhaps, the cause of her impassive cruelty. She obeyed implicitly the decrees of the stars; she consulted with awe the famous seer of Salon, Nostrodamus, whose name and writings are still cherished by the lovers of curious mysteries, and whose rude oracles were freely purchased by the noble and the great of his superstitious age. She wore a mystic amulet or chain that still exists; she kept around her astrologers and alchemists, and possibly believed that in all her cruelties and crimes she was governed by an overruling fate. It is probable that a secret insanity clouded the active mind of the French Medea. Yet at the age of thirty-nine Catherine held in her unsteady hand the destiny of France.

By her side had grown up into rare beauty and equal dissimulation and pride a woman scarcely less mysterious than herself. The character of Mary, Queen of Scots, is still the subject of animated debate. She was the wife of Francis II., Catherine's eldest son, now King of France.³ He was a feeble, mindless boy of sixteen, but the acute and brilliant Mary was a year or two older, full of graces and accomplishments, of ambition and pride. In the splendid dawn of her mournful career Mary was rightful Queen of France and Scotland, and the popish claimant of the crown of England. She seemed the most powerful and prosperous of living women, and in the petulance of youthful pride was accustomed to taunt her mother-in-law, Catherine, whom she hated, with being the daughter of a race of Florentine shop-keepers. The two acute and heartless women struggled for power; but the contest was soon ended by the death of Francis and the reluctant retreat of Mary from the palaces and revels of Catholic France to the barren wilds of her northern kingdom.

At the head of the violent faction of the Catholics stood the ambitious family of the Guises. The feeble kings, and even the aspiring Catherine, were forced to submit to the impetuous and overbearing policy of these devoted adherents of the papacy. It was the favorite aim of the Guises to exterminate the Hu-

DUKE HENRY DE GUISE.

guenots, and to lay at the feet of the Roman pontiff France purified by a general massacre of his foes. Yet the power of the Guises was only of recent origin. Their father, Duke Claude, had come up to the French court an impoverished adventurer, and had died leaving enormous wealth, the fruit of a corrupt but successful career. His family of six sons were the inheritors of his fortune and power. His daughter was the mother of Mary of Scotland. His eldest son, Duke Francis, ruled over the family, the court, and the king; the second, Charles, Cardinal of Lorraine, had engrossed innumerable benefices, and was almost the pope of France; his rare eloquence and vigorous intellect were employed with fatal effect in the cause of persecution; his sonorous voice had chanted at the Council of Trent a perpetual anathema against heresy. The two Guises, Duke Francis and the cardinal, were called by their contemporaries "the butchers;"¹ nothing stirred their savage breasts with such real joy as the spectacle of Huguenots dying by torture. It was the custom of the cardinal, after a stately dinner at his regal palace, to show his guests a fair array of martyrs executed for their entertainment, or sometimes to hang up a tall and stalwart reformer in the banquetting chamber itself. Such monsters as the Guises, Catherine, or her children have never been produced in any form of Christianity except the Roman Catho-

¹ White, *Massacre of St. Bartholomew*, p. 85. The Duchess of Guise nearly fainted at one of these exhibitions.

lic, and are the necessary result of the Romish doctrine of force.

As if in happy contrast to Catherine and Mary, two women of singular piety and decorum ruled over the chiefs of the Huguenots. Jeanne d'Albret, Queen of Navarre and mother of Henry IV., governed her little kingdom with masculine vigor, expelled the priests and the mass, corresponded with Calvin, and scoffed at the malice of the pope.¹ To Jeanne the Huguenots owed their best counsels and their final success; for she educated her son in the valleys of the Pyrenees to bear toil and hunger, to feed on the coarsest food, to play barefoot and bareheaded with the children of the villages, and to prepare himself by early deprivations for the duties of camp and court. Henry descended from his native mountains robust, tall, strong in mind and will, tender-hearted and benevolent, the direct opposite of the three malicious and degraded kings, his predecessors, who had been moulded by the corrupting hand of their mother, Catherine de Medicis. Another pure and courageous woman, Charlotte de Laval, wife of the great

Coligny, inspired the most eminent of the Huguenots with her own heroic zeal. She urged, she implored her husband to take up arms in defense of reform; and when Coligny pointed out to her, with wise and tender words, the dangers and sufferings that must fall upon them both if he yielded to her advice, she nobly promised to bear all without a murmur. The Huguenot mothers, in fact, in this hour of danger, seemed to emulate the heroism of Jeanne d'Albret and the wife of Coligny, and bade their husbands and their sons go forth to battle, followed by their blessings and their prayers.

Yet the Huguenots were fearfully outnumbered. They formed scarcely a twentieth part of the population of France. Paris, the chief city of the realm, was intensely Catholic. The court and the Guises held in their power the capital and the government of the nation. Calvin and the Protestant pastors urged submission upon the persecuted Huguenots, and it was with sincere reluctance that Coligny and the chiefs of his party raised at last the standard of a religious warfare. A terrible atrocity suddenly aroused them to action.² On Sunday, March 1, 1562, the bells rung for service in the little town of Vassy, in Champagne, and a con-

¹ De Felice, p. 14. Jeanne introduced into Bearn a puritanic austerity. She was learned, bold, severe, the most eminent woman of her age.

gregation of twelve hundred Huguenots had gathered in a large barn to celebrate their simple worship. Duke Francis of Guise rode into the village at the head of a party of soldiers on his way to Paris.¹ The peal of the Huguenot bells enraged the fanatical chief, and after dinner he led out his soldiers to disturb or destroy the peaceful worshipers. They broke into the barn; the Huguenots, unarmed, threw stones at the intruders, and one struck the Duke on the cheek. He gave orders for a general massacre of the Protestants; men, women, and children were cut down or shot by the merciless assassins; few escaped unharmed from the dreadful scene; the duke, covered with the blood of innocence, rode on in triumph to Paris. He was received in the most Catholic city as the avenger of the church. Surrounded by a body-guard of twelve hundred gentlemen (?) on horseback, he entered the city by the St. Denis gate amidst the applause of a vast throng of citizens; the streets rang with songs and ballads composed in his honor; he was from this time the consecrated leader of the papal party; and the priests and bishops from every pulpit celebrated that "noble lord" who had instigated and guided the massacre of the heretics at Vassy. A year later the duke lay on his dying bed, his ambition stilled forever, his furious rage quenched in the last agonies; and in the varying accounts of his dying hours it is at least certain that there rose up before him the picture of the pious congregation he had so ruthlessly destroyed—a memory of the wickedest of all his evil deeds.

At the news from Vassy the Huguenots rose in arms, and for ten years all France was filled with civil discord; the factories were closed, the seats of industry sank into decay, and the vigor of the nation was wasted in a useless warfare; the Duke of Guise, fierce, ambitious, full of physical and mental power, fell, in the opening of the contest which he had begun, by the hand of an assassin. His death was charged upon Coligny, who denied the accusation, but scarcely condemned the act. The war raged with new violence, and the Huguenots repaid, with dreadful retaliations, the savage deeds of their foes; frequent truces were made, the nation sighed for peace, and even Catherine herself would have consented to grant toleration to reform, would have aided in giving harmony and prosperity to France. But the pope and the Italian faction still ruled in the divided na-

THE CARDINAL OF LORRAINE.

tion, and saw without a sentiment of pity or regret the horrors they had occasioned, the fierce passions they had aroused, the holy impulses they had stifled forever. They called incessantly for the total extermination of the Huguenots; they lamented every truce as impious, denounced every effort toward conciliation; they inculcated a merciless cruelty, an undying hatred. Paul IV., maddened with strong wine and the insanity of a corrupt old age, had instigated the latest persecutions that led to the civil wars of France.² His successors, Pius IV. and V., fanned the fires of strife, and called incessantly for blood; they aimed the assassin's dagger, or roused the evil passions of devout Catholics, by insisting upon the duty of repressing heresy by force; nor can there be found in history, except, perhaps, among their own predecessors, three sovereigns who have so increased the sum of human misery—three potentates, in any age, who have less deserved the name of Christians.

The teachings of the popes and the violence of the Catholic faction led to the massacre of St. Bartholomew.³ Catherine de Medicis, weary of incessant civil war, guided, perhaps, by her malignant star, had resolved to gratify

¹ For the massacre at Vassy, see Martin, *Hist. France*, x. p. 110. Les gens du duc commencèrent à insulter les Huguenots.

² Pius V. to Catherine, April 13, 1569, urged the complete extirpation of the Huguenots. He pressed Charles IX., March 28, 1569, to destroy them. Yet to Platina, *Vitæ Pont.*, this barbarian is a model of piety, p. 390.

JEANNE D'ALBRET.

the court of Rome, the Guises, and the Parisians by a total extermination of all those eminent and generous chiefs who had so long defied the armies of their Catholic foes. Within her dark, inscrutable breast had been matured a plot of singular efficacy for drawing into her toils the leaders of the Huguenots, and the lessons she had learned in the school of Machiavelli were exemplified with matchless power. It is impossible, indeed, to believe that St. Bartholomew was not premeditated;¹ it seems certain that a rumor of the approaching horror had filled the extreme faction of the Catholics with secret joy. A hollow pacification had been arranged; Catherine proposed to Jeanne d'Albret and the Huguenot chiefs to complete the union of the two parties by marrying her daughter Marguerite with young Henry of Navarre; Catherine's son, Charles IX., consented to the match, and pressed it in spite of the opposition of the pope, and in the summer of 1572 the ominous wedding was celebrated at Paris with rare pomp and boundless ostentation.

Young Henry of Navarre, at nineteen, frank, generous, a Huguenot in faith if not in practice, was brought up by his mother, Jeanne, Queen of Navarre, to be married to the daughter of her bitterest foe, and to mingle with a society and a court whose profligacy and corruption she

had ever shrunk from with disdain. It would have been well for the austere queen had she still repelled the advances of her rival. But Jeanne seems to have yielded to the arts of Catherine, and to have believed that some trace of womanly tenderness lingered in the breast of the new Medea. She consented, for the sake of the oppressed Huguenots, to suffer her son to marry the child of the house of Valois, and ventured to come up to Paris, the citadel of her foes. Her death soon followed. Whether premature age filled with sorrows and doubts had weighed her down, sudden disease, or secret poison, the annalists of the period could not determine, but among the Huguenots, shocked at the suddenness of their loss, arose a dark suspicion that their favorite queen had died by the Italian arts of Catherine. It was said that the mother of the expected bride had poisoned the mother of the bridegroom by presenting her with a pair of perfumed gloves, prepared with a deadly powder; it was believed that the austere and spotless Queen of Navarre had been lured into the circean circle of the French court

to be made way with the more securely. Yet Jeanne d'Albret died, as she had lived, a stern reformer, an example; and a warning. The corrupt ladies of Catherine's court, who visited her in her last hours, saw with wonder that the courageous queen needed none of the customary ceremonies of the papal church. She asked only the prayers of the Huguenot pastors and the simple rites of the apostolic faith.¹

Meantime Paris was filled with a throng of the bravest and noblest of the reformers, who had been lured into the centre of their foes.² Coligny, loyal, and trusting the word of his king, rode boldly into the fatal snare. Wise and faithful friends had warned him of his imprudence; a devoted peasant woman clung to his horse's rein and begged him not to trust to the deceivers; but no entreaties nor warnings could shake his resolution. He was followed by his companions in arms, the heroes of many a brilliant contest. But it was noticed that as the Huguenots entered the city no cheer of reconciliation arose from the bigoted citizens; that the streets were filled with menacing throngs; that every eye was averted in hatred and gloom.³ Henry of Navarre and his cousin, the Prince of Condé, came to Paris in the first days of August, and were lodged in the palace

² Sully, Mem., i. p. 21-30.

³ Most modern writers have abandoned the theory of premeditation; but the proof is strong on the other side. See an able and learned article in the *North British Review*, St. Bartholomew, October, 1869; and Martin, Hist. de France, x. 553.

The Catholic writers deny premeditation, on the testimony of Anjou, Marguerite, and Tavannes. See De Sauclières, p. 236. But Sorbon, the king's confessor, proclaims it; so Capilupi, Salviati, and Michiel.

of the Louvre. Coligny and his followers occupied an inn or hotel on the street of Bresse; the king, Charles IX., Catherine, and the young Duke of Guise, received their victims with eager civility, and Charles welcomed Coligny almost as a father. The city rang with revelry; the young princes, Henry, Condé, the Dukes of Anjou and Alençon, and Charles IX., joined with ardor in the revels and sports; and Catherine, surrounded by a corrupt train of beautiful women, inspired the dreadful hilarity.

Paris, in the sixteenth century, possessed few of those attractions that have made it in the nineteenth the most magnificent of cities.¹ It was renowned chiefly for its narrow and filthy streets, unpaved or lighted, the perpetual haunt of fever or plague; for its sordid and often starving population; and for the fierce superstition of its monks and priests. Several grand hotels of the nobility, each a well-garrisoned fortress, arose amidst its meaner dwellings; the new palace of the Louvre, lately built by Francis I., was the residence of the court;² but the Tuileries was unfinished, and the Palais Royal did not yet exist; and high walls, pierced by lofty gates, shut in the medieval city from the free air of the surrounding plains.³ Yet in the hot summer of 1572 its streets were filled with brilliant throngs come up to witness the marriage of Henry and Marguerite, of the Protestant and the Catholic, and every eye was fixed with curiosity and expectation upon the preparations for the splendid ceremony. Henry, the generous son of the mountains, was already renowned for his courage and his manly vigor; Marguerite was known only as the child of the corrupt Catherine. Her life had been passed in ceaseless terror under the iron sway of her mother, the enmity of her brother of Anjou, and the doubtful favor of Charles. Yet she had wit and talent, a pleasing manner, a graceful person, a natural duplicity encouraged by her early training; and few of the virtues of her namesake, the elder and purer Marguerite, had descended to her luckless grandniece. But the young pair were still in the bloom of youth when all Paris attended their nuptials.

The wedding was celebrated on the 18th of August, beneath a pavilion richly adorned, in front of the church of Notre Dame. It was performed with neither Protestant nor Catholic rites.⁴ Henry, attended by the king, Charles IX., and the two royal dukes, all dressed alike

ADMIRAL COLIGNY.

in yellow satin, covered with precious stones, and followed by a long array of princes and nobles, attired in various colors, ascended the platform; the king led in his sister, who was robed in violet velvet, embroidered with the lilies of France and glittering with pearls and diamonds. Catherine de Medicis followed, surrounded by a fair, frail circle of maids of honor. A bright summer sun shone on the gay pageant and gleamed over the towers of Notre Dame. The ceremony was performed by the Cardinal Bourbon; but no sooner was it ended than the bride left her husband to witness mass in the cathedral, while Henry turned sternly away from the unscriptural rite. In the evening a grand entertainment was given in the Louvre; maskers and royal and noble revelers filled its wide saloons, and for several days afterward Paris was a scene of strange merriment, and of feasts and tourneys, upon which the wiser Huguenots looked with grave disdain.¹

But the dreadful day was near when the secret purpose of the wild revels was to be perfectly fulfilled. The week which had opened with the wedding-feast and the carousal was to close in more than funereal gloom. Charles and Catherine had constantly assured the pope that the marriage was only designed to insure the destruction of the Huguenots. Orders were sent to the governor of Lyons to allow no couriers to pass on to Rome until the 24th of Au-

CHARLES IX.

gust; it was intended that the news of the wedding and the massacre should reach the Holy Father at the same moment.¹ The Huguenots, unconscious of danger, still remained in Paris. On Friday, the 22d, they were startled from their security by the first deed of crime. Coligny was shot at by order of the young Duke of Guise, and was borne back to his inn wounded, though not mortally, amidst the rage of his companions and the secret joy of his foes. In the hot days of August, amidst the noisome streets of Paris, the admiral lay on his sick-bed, surrounded by his bravest followers in arms. He was surprised by a visit from the king, who came to express his sympathy for his suffering friend—his rage at his treacherous foe. But with him came also Catherine, who wept over the wounded Coligny, and the Duke of Anjou, apparently equally grieved, but who were only spies upon the impulsive king. They feared that the wise and good Coligny might succeed in awakening the better element in the nature of the unhappy Charles.

From this moment a gloom settled upon the crowded city, and its Catholic people, no doubt, felt that the hour of vengeance drew near.² On Saturday, the 23d, the Huguenots could scarcely go into the streets without danger. They gathered around the bedside of Coligny, or in the chamber of Henry of Navarre, but seem nev-

er to have thought of escape. They breathed out threats against the assassin, Guise; yet they still trusted to the professions of Catherine and the word of the king. Nor does Charles seem to have been altogether resolute in his horrible design. He wavered, he trembled, he was weary of bloodshed. His feeble, imperfect intellect seems still to have turned to his friend Coligny for support, and Catherine saw with secret rage that some traits of humanity and softness still lingered in the breast she had striven to make as cold and malevolent as her own.¹

The August night of the 23d sank down over Paris, and upon its narrow streets and gloomy lanes a strange stillness rested. The citizens awaited in silence the signal for the massacre of the Huguenots and the perfect fulfillment of the constant injunctions from Rome. Every Catholic, every Parisian, knew that the popes had never ceased to inculcate a general destruction of the heretics. The king's body-guard had been stationed under arms in the city; the citizens were provided with weap-

ons at the public cost; the houses of the Huguenots were marked to guide the murderers to their doors; the Catholic assassins were enjoined to wear a white cross to distinguish them from their victims. But while all was still without, in a retired chamber of the Louvre a scene of human passion and wickedness was exhibited such as can scarcely be paralleled in history. A mother was urging her half-insane son to an unequaled deed of crime. Charles hesitated to give the final order. Soon after midnight Catherine had risen, perhaps from sleep, and gone to the king's chamber. She found Charles irresolute, and excited by a terrible mental struggle. He was probably insane. At one moment he cried out that he would call upon the Huguenots to protect his life; at another he overwhelmed with reproaches his brother Anjou, whom he hated and feared, and who had now entered the room. The other members of the guilty council—Guise, Nevers, and their associates—followed and gathered around the king. He still paced the room with rapid steps, incapable of decision. But Catherine, roused to a fierce rage, her voice filled with sinister meaning, told Charles that it was too late to recede, and that the order must be given. The king,² still scarcely twenty-two years old, accustomed from infancy to tremble before his mother's glance, his mind enfeebled by dissipation and

ASSASSINATION OF COLIGNY.

crime, conscious that if he disobeyed that menacing tone his own life was not safe, and that Catherine might remove him by her secret arts to place her favorite Anjou on his throne,¹ in a sudden access of terror or of frenzy, gave the fatal command. From this moment all that was gentle in his nature died forever, and he became the chief promoter of the general massacre, the active instrument in the hands of unsparing Rome.

Guise at once went swiftly from the room to begin the labor of death by the murder of Coligny.² The clash of his horse's hoofs resounded

in the still Sabbath morning as he led a party of soldiers to the admiral's quarters. Catherine, Charles, and the other conspirators, terrified at what they had done, kept closely together, and gathered at a window overlooking the Tennis Court. "We were smitten," says Anjou, "with terror and foreboding." Catherine, it is said, even sent to recall Guise; but he replied, "It is too late." Coligny had been stabbed in his bed-chamber, and his body thrown out of the window into the court below. Many Huguenots perished with him. The death of the chief of the reformers roused the conspirators to new energy, and Catherine gave orders that

Sully, *Mem.*, i. 25. They cut off Coligny's head, and brought it to Catherine.

the signal for the general massacre should be given before the appointed hour. The clock of the church of St. Germain l'Auxerrois sounded over silent Paris.¹ Its ominous peal awoke an awful clamor, such as the earth had never witnessed before. A clang of bells responded from every tower and belfry, the adherents of the pope seized their arms, rushed to the houses of the Huguenots, and murdered every inmate, from the sleeping infant to the gray-haired grandsire and the helpless maid. The city had been suddenly illuminated, and from every Catholic house the blaze of torches lighted up the labor of death. Beneath their rays were seen women unsexed, and children endowed with an unnatural malice, torturing and treating with strange malignity the dying and the dead. It is impossible, indeed, to narrate the details of this awful event, over which Catholic kings and priests rejoiced, and for which the infallible pope at Rome gave public thanks to God.

Within the palace of the Louvre itself, where a few days before every saloon had rung with festivity, and where mask and dance and throngs of gallant knights and maidens had greeted the nuptials of Henry and Marguerite, now echoed the groans of the dying Huguenots, and the shrieks of the terrified queen.² In the evening Marguerite had been driven by her enraged mother from her presence and from the arms of her sister Claude, who would have detained her, and was forced to go trembling to the apartment of her husband, lest her absence might excite suspicion. She lay awake all night, filled with a sense of impending danger; she pretends that she knew nothing of the approaching event. Henry's rooms were filled with his companions in arms, who passed the night in uttering vain threats against the Guises, and planning projects of revenge. Toward morning they all went out in company with the king; and Marguerite, weary with watching, sank into a brief slumber. She was aroused by a loud cry without of "Navarre! Navarre!" and a knocking at the door.³ It was thrown open, a man wounded and bleeding, pursued by four soldiers, rushed into the room, and threw his arms around the queen. He clung to her, begging for life. She screamed in her terror; the captain of the guard came in and drove off the soldiers, and the wounded Huguenot was allowed to hide himself in her closet. Marguerite fled hastily across the halls of the Louvre to her sister's room, and, as she passed amidst the scene that had so lately rung with the masks and revels of her wedding night, she saw another Huguenot pierced by the spear of his pursuer, and heard the clamor of the general massacre. Faint and trembling,

she went to her mother and the king, threw herself at their feet, and begged the lives of two of her husband's retainers.

Meantime, when Henry of Navarre had left his room in the morning, he had been arrested, and carried to the king's chamber; but of the throng of Huguenots who had attended him in the night only a few escaped. Each man, as he passed out into the court, between two lines of Swiss guards, was stabbed without mercy. Two hundred of the noblest and purest reformers of France lay piled in a huge heap before the windows of the Louvre; Charles IX., Catherine, and her infamous train of maids of honor, inspected and derided them as they lay dead. All through that fearful Sabbath day, the feast of St. Bartholomew, and for two succeeding days, the murders went on; the whole city was in arms; every hat or cap was marked with a white cross, and every Catholic was converted into an assassin.² Charles, a raging lunatic, rode through the streets laughing and jesting over the fallen; the streets were filled with corpses; the Seine was turned to blood; many Catholics grew rich by the plunder of the Huguenots; and it was believed that the king and his brother, Anjou, shared the spoils of opulent merchants and skillful goldsmiths. The papal nuncio, Salviati, overjoyed at the spectacle, wrote to the pope that nothing was to be seen in the streets but white crosses, producing a fine effect; he did not see the heaps of dead, nor the scenes of inexpiable crime. Charles IX. shot at the flying Huguenots from his bedroom window. The rage of the murderers was chiefly turned against women and infants.² One man threw two little children into the Seine from a basket; another infant was dragged through the streets by a cord tied around its neck by a throng of Catholic children; a babe smiled in the face of the man who had seized it, and played with his beard, but the monster stabbed the child, and, with an oath, threw it into the Seine.

For three days the massacre continued with excessive atrocities; a month later Huguenots were still being murdered in Paris. It is computed that several thousand persons perished in that city alone. In every part of the kingdom, by orders of the king, an effort was made to exterminate the Huguenots; and Lyons, Orleans, Bordeaux, and all the provincial towns ran with blood. Four thousand reformers are said to have been killed in Lyons. At Bordeaux, Auger, the most eloquent of the Jesuit preachers, employed all his powers in urging on the work of slaughter. "Who," he cried, "executed the divine judgments at Paris? The angel of the Lord. And who will execute them in Bordeaux? The angel of the Lord, however man may try to resist him!" The

STREETS OF PARIS ON ST. BARTHOLOMEW'S DAY.

number of the slain throughout France has been variously estimated at from ten to one hundred thousand. History has no parallel to offer to this religious massacre even in its most barbarous periods.

The pope, Gregory XIII., received the news of the fate of the Huguenots with unbounded joy.¹ The wish of his heart had been gratified, and Charles IX. was now his favorite son. Rome rang with rejoicings. The guns of the castle of St. Angelo gave forth a joyous salute; the bells rang from every tower; bon-fires blazed throughout the night; and Gregory, attended by his cardinals and priests, led the magnificent procession to the church of St.

Louis, where the Cardinal of Lorraine, the brother of the Duke of Guise, chanted a *Te Deum*. The cry of the dying host in France was gentle harmony to the court of Rome. A medal was struck to commemorate the glorious massacre; a picture, which still exists in the Vatican, was painted by Vasari, representing the chief events of St. Bartholomew. The pope, eager to show his gratitude to Charles for his dutiful conduct, sent him the golden rose; and from the pulpits of Rome eloquent preachers celebrated Charles, Catherine, and the Guises as the new founders of the papal church.¹

¹ Le Tocsin, p. 76. Louant Dieu qu'à son advenement à la papauté une si bonne et heureuse nouvelles s'était présentée.

¹ It was the working-men who had chiefly suffered by the massacre. At Meaux une grand nombre d'artisans suffered. The murders were joined with general robbery. See Alberi, Vita Cat. Med., p. 147.

But from every Protestant land one cry of reproach and detestation arose against those royal murderers and assassins who had covered with infamy their country, and even their age. The intelligent were affrighted at a barbarity that seemed worthy only of an Attila or an Alaric; the humane and the good looked upon the massacre in France as something portentous and almost incredible. Clothed in mourning, with every eye averted in gloom and aversion, the English court and its Protestant queen received the French ambassador, La Mothe Fénelon, after the intelligence of the fatal event; and the envoy himself, touched with shame, confessed that he blushed for his country. The mild Emperor of Germany, Maximilian II., lamented that his son-in-law, Charles IX., had incurred such an overwhelming load of guilt. The Protestant powers of the North joined in the general condemnation. Philip II., of Spain, alone laughed aloud—for the only time, it is said—when he heard how well Catherine had performed her task. Yet Catherine herself soon found that her bloody deed was only injurious to herself. She hated the Guises, she feared Philip II., she despised the pope, but to them alone could she now look for support and countenance. New dangers thickened around her. The Huguenots, enraged at the massacre, rose once more in arms; the sympathy of England encouraged the revolt; Catherine endeavored to excuse or explain her share in the massacre, and discovered that she had committed a great crime in vain.¹

But upon the feeble intellect of her unhappy son the effect of the dreadful deed he had witnessed and directed was fatal. The fierce excitement had scarcely passed away when his health began to decline. His mind was torn by remorse and terror; his conscience never slept. Around him in the air he heard strange noises like the voices of the dying Huguenots. The ghosts of the murdered stood by his bedside; his room seemed suffused with blood. His nurse, who had reared him when an infant, was a Huguenot, and now watched over him as he was dying. "Oh, nurse," he cried to her, amidst sobs and tears, "what shall I do? I am lost! I am lost!" She tried to soothe him with the hope that repentance and a Saviour's righteousness might save his guilty soul. Catherine came to him soon after with the good news of the capture of one of her enemies. "Madame," he said, "such things concern me no longer; I am dying." He received the last rites of the Roman church, and died soon after. Catherine's favorite son, the Duke of Anjou, for whom she had plotted and schemed with incessant labors, now became king, and it was believed that the miserable Charles had been carried off by poison administered by his mother.

Catherine died, her son was assassinated, her

guilty race faded from the earth, and Henry of Navarre became King of France. In 1598 the Edict of Nantes gave peace to the Huguenots, and once more a period of progress and reform opened upon the prosperous realm. In the opening of the seventeenth century there was still hope for France. Vigorous, energetic, active, intellectual, the Huguenot element in the nation began rapidly to sweep away the barbarism of the age. The reformers were everywhere active. They inculcated industry, and soon in every part of France grew up flourishing manufactures and a valuable trade.¹ The moral vigor of the people was renewed; honesty, purity, and mental culture supplanted the barren dreams of chivalry and the corruption and indolence of the Catholic rule. Great Protestant churches were erected, in which immense congregations listened to their accomplished preachers and heard lessons of virtue and self-restraint. To be as "honest as a Huguenot" was a common proverb. To be industrious, frugal, generous, sincere, was discovered to be far better than to be a Condé or a Montmorency. The period of progress continued long after the death of Henry IV., and even Richelieu, who crushed the Huguenots forever as a political party, never sought to extirpate them wholly. In the dawn of the reign of Louis XIV. the nation still advanced under the influence of Huguenot principles, and the most eminent men of the age belonged to the party of reform. The wise Colbert was a Huguenot;² the poets, orators, and authors of the day reflected the vigor of the new movement; the Protestant schools and colleges inspired with new life the fading intellect of France.³

Then once more the tyrannical hand of Rome was stretched forth to crush the rising impulse of reform. But it was now the disciples of Loyola and Lainez that aroused the last great persecution of the Huguenots. Louis XIV., in the latter period of his reign, guided by the counsels of the Chancellor Le Tellier and the Jesuit Père La Chaise, resolved to win the favor of heaven by a complete destruction of the heretics. Madame De Maintenon, herself once a Huguenot, confirmed the malevolence of the king, and grew rich by the plunder of the reformers. Slowly the cloud of ruin gathered around all those fair and prosperous communities that had sprung up under the influence of the new faith. The Huguenots foresaw with hopeless alarm their own final destruction. They held in their hands the commerce, manufactures, and the wealth of the nation; but they were comparatively few in numbers, and had no longer any hope of resistance. Their churches were torn down; their printing-presses were silenced; they were forbidden to sing

¹ Alberi, p. 382. She makes Charles IX. declare that it was a political conspiracy that produced the massacre; to Philip II. she wrote on the 29th of August, thanking God for his mercy.

psalms on land or water; were only allowed to bury their dead at night or at daybreak, and were oppressed by all the malicious devices of the Jesuit fathers. Yet they submitted patiently, and still hoped to soften the rage of their enemies by holy lives and Christian charity. Stricken by a mortal disease, Chancellor Le Tellier, from his bed of death, prayed the king to revoke the Edict of Nantes, and extirpate the Huguenots.¹ He died rejoicing that he had once more awakened the fires of persecution. Louis XIV. obeyed the commands of the Jesuits, and repealed (1685) the edict of toleration that had alone given hope to France. A wide scene of horror spread over the flourishing realm. Every Huguenot dwelling was invaded by fierce dragoons,² the missionaries of the persecuting king; the wealth and rich products of the industrious reformers were snatched from them by the indolent and envious Catholics; the manufactories were deserted, flourishing cities sank into ruin, and such crimes were perpetrated by the savage soldiers of Louis as can only be paralleled in the various persecutions instigated by the popes of Rome. Yet the king and his courtiers found only a cruel joy in the sufferings of the people. Even literature, the faded product of the corrupt age, celebrated Louis as the destroyer of heresy; and the infamous band of gifted preachers who adorn and disgrace this period of human woe united in adoring the wisdom of their master and the piety of the Jesuits. Bossuet, with rare eloquence and singular inhumanity, triumphed in the horrors of persecution; Massillon repeated the praises of the pitiless Louis; Fléchier, the pride of the Romish pulpit, exulted in the dreadful massacres; Bourdaloue was sent to preach in the bleeding and desolate provinces, and obeyed without remonstrance; and the whole Catholic priesthood were implicated in the fearful crimes of that fatal period.³ The wise, the good, the gentle Huguenots became the prey of the vile, the cruel, and the proud.

Nothing is more remarkable in history than the constant hostility the church of Rome has always shown toward the working-classes—the fatal result of Catholic influence upon industry and thrift. Ghent, Bruges, and Antwerp, under the rule of Alva and the Jesuits,⁴ saw their commerce and manufactures sink forever, and

their laboring-classes fly to Amsterdam and Leyden. Spain and Italy, under the destructive activity of the popes and the Inquisition, were soon reduced from the highest prosperity to a low rank in commerce and trade. Swarms of monks and nuns took the place of honest laborers, and industry was extirpated to maintain the corrupted church. It was only when England ceased to be Catholic that it began to lead the world in letters and in energy; it was when Germany had thrown off the papal rule that it produced a Goethe or a Schiller, and in the present day the traveler is every where struck by a remarkable dissimilarity. In Catholic Ireland all is sloth and decay, empty pride and idle superstition. In Protestant Ireland all is life, energy, and progress. A Catholic canton of Switzerland is always noted for its degraded laboring-class, their indolence and vice. The Protestant cantons abound in all the traits of advance. The Romagna and the papal states, so long as they remained under the rule of the popes, were the centres of sloth, improvidence, and crime, and brigands ruled over desolate fields that might have glowed with abundant harvests. In France, under Louis XIV., the whole energy of the Jesuits and the king was directed to the ruin of the laboring-classes, and their vigorous efforts were followed by a signal success. Seldom has so dreadful a revulsion fallen upon the industrial population of any nation. It was as if the factories of Lowell or Manchester were suddenly closed, and half their population murdered or sent into exile; as if every Protestant were driven from New York, and every warehouse plundered in Boston. Hundreds of factories were destroyed, many villages were deserted, many large towns half depopulated, and great districts of the richest land in France became once more a wilderness.¹ At Tours, of forty thousand persons employed in the silk manufacture scarcely four thousand remained; the population of Nantes was reduced one-half; it is estimated² that one hundred thousand persons perished in Languedoc alone, one-tenth of them by fire, strangulation, or the rack! Such was the victory of the faith over which Massillon, Bossuet, and Bourdaloue broke forth into loud applause; for which they celebrated the miserable king, with whose vices they were perfectly familiar, as the restorer of the church. "Let our acclamations ascend to heaven," said Bossuet, "let us greet this new Constantine, this exterminator of the heretics, and say, 'King of Heaven, preserve the king of earth.'" "At the first blow dealt by the great Louis," cried Massillon over the general massacre, "heresy falls, disappears, and bears its malice and its bitterness to foreign lands."³

Rome and the pope, too, were eloquent in,

³ I have abridged the eloquence of the two inhuman preachers. *La Liberté de Conscience*, J. Simon, p. 186, ventures to mention their disgrace.

congratulation over the ruin of the working-classes of France. *Te Deums* were sung; processions moved from shrine to shrine; the Pope addressed a letter to Louis filled with his praises.¹ The whole Romish church rejoiced in the slaughter of the heretics. Public thanksgivings were offered at Paris; medals were struck to commemorate the fortunate event; a brazen statue was erected to Louis on the Hôtel de Ville, with a brief Latin inscription, "To the asserter of the dignity of kings and of the church." During the Revolution it was taken down and converted into cannon, to be aimed against the throne and the priesthood.

There now occurred in the course of their annals that wonderful spectacle of heroism and devotion, the flight of the Huguenots from France.² The pure, the wise, the good, the noble, the wealthy or the poor, animated by a common resolution to preserve their faith at the cost of all they held dear, resolved to abandon their native land and throw themselves upon the charity of strangers. From every part of France, in mournful processions, in secret, by night, in strange disguises, and in fearful sufferings and dangers, a vast throng of men, women, children, made their way to the frontiers. No severity could restrain them; no offers of emolument or favors could induce them to accept the Romish creed. Louis and his priestly advisers dispatched the fierce dragoons in pursuit of the fugitives, and filled the galleys and the prisons with their helpless captives. The unparalleled enormities inflicted upon the flying Huguenots can scarcely be described in history.³ Yet still the wonderful flight went on. Powerful nobles, the owners of great estates, left their ancestral homes, and through a thousand dangers escaped impoverished to Germany and Switzerland. Fair and gentle women, accustomed to the ease and luxury of the château and the city, stole forth disguised, often in the midst of winter, and thought themselves happy if, clambering over the snow-clad hills, and wandering through the wild forest of Ardennes, they could at last reach, with broken health and exhausted resources, a shelter in the free cities of Holland. Two young ladies of Bergerac, disguised as boys, set out on the perilous journey. It was winter; yet they plunged bravely into the forest of Ardennes, on foot, and with wonderful constancy pressed on beneath the dripping trees, along the woodland roads, oppressed by hunger, cold, privation; and for thirty leagues joyfully pursued their dangerous way. Their constancy never wavered; they were sustained by the hope of approaching freedom. But the guards seized them as they approached the frontier

and threw them into prison. Their sex was discovered; they were tried, condemned, and shut up for the remainder of their lives in the Convent of the Repentants at Paris.

The lord of Castelfranc, near Rochelle, with his wife and family, set out in an open boat to escape to England. He was overtaken. Three of his sons and three of his daughters were sent as slaves to the Caribbean Islands; three other daughters were held some time in confinement, and were then allowed to escape to Geneva. The slaves were finally liberated, and the family was afterward reunited in England. The two Misses Raboteau, who lived near Rochelle, refused to become converts to Romanism, and were then offered the alternative of marrying two Roman Catholics or being shut up for life in a convent.¹ They resolved to fly. Their uncle was a wine-merchant, and promised to aid them to escape. He inclosed each young lady in a large cask, and thus conveyed them on board one of his ships. They reached Dublin in safety, married, and several eminent and gifted Englishmen trace their origin to the brave fugitives.

Geneva, the city of Calvin, showed unbounded generosity to the distressed Huguenots, and from its narrow resources contributed large sums to maintain the hapless strangers. The Catholics looked upon it with singular aversion. The inhuman saint, Francis de Sales, had in vain called out for its destruction. "All the enterprises," he exclaimed, "undertaken against the Holy See and the Catholic prince have their beginning at Geneva."² To destroy Geneva, he thought, would dissipate heresy. But Holland, Prussia, and at length England, were scarcely less active, and in every part of Protestant Europe the industrious Huguenots planted the germs of prosperity and reform. Huguenots filled the army with which William of Orange invaded England; they fought in the armies of Marlborough, and aided in bringing to shame the last days of their persecutor, Louis. They wandered to America, and founded prosperous settlements in New York and South Carolina.

A Protestant seigneur, Dumont de Bostaquet, has described the sufferings of a noble Huguenot family in the reign of Louis XIV. His ancestral château stood amidst the richest fields of Normandy.³ Around it on all sides spread out the wide and splendid domain of his ancient race. The château was adorned with costly hangings and the rarest furniture; its pleasure-grounds and gardens sloped gradually away and were lost in a girdle of woodlands. His plate was of great value; his stable filled with horses of unrivaled speed; his gilded coach, attended by outriders and musketeers,

was conspicuous at the gatherings of the provincial nobility of Normandy.

For thirty years the life of the Protestant lord had glided on in opulence and ease; a family of sons and daughters had grown up around him, gifted, intelligent, refined; and his stately château was often the scene of masks and gay carousals. It does not seem that the Huguenot chiefs were marked by any puritanic austerity. The family at Bostaquet were fond of merry entertainments and Christmas revels; the hunting-horn often sounded through their broad domains; and young ladies, queens of the chase, gave the last blow to the panting stag. The château resounded with mirth and gallantry, with music, dance, and song; and the Protestants mingled without distinction with their Roman Catholic neighbors.

At length, in 1687, the storm of persecution broke over the quiet scenes of Normandy; a line of dragoons surrounded the Protestant district; each avenue of escape was closed; and the alternative was offered to every heretic of recantation or imprisonment, and perhaps death. The dragoons committed the most horrible atrocities; the Huguenot châteaux were sacked and burned; the noblest families were often treated with barbarous indignities until they accepted the Romish faith. Bostaquet at first yielded to the powerful temptation. He looked, perhaps, on his wife and happy children; on his fair estate he had so loved to enlarge; on his pleasure-grounds and gardens, planted under his care; on the scenes of his youth and his ancestral home; and obeyed the commands of the persecutors. For the first time in the château of Bostaquet the priest and the Jesuit ruled unrestrained, and the unhappy family were even compelled to attend mass.¹ But conscience awoke; the saddened countenances of the seigneur and his sons and daughters showed their abhorrence of the feigned conversion; and parents and children watched eagerly for the happy moment when, abandoning their costly home and their ancestral lands, they might escape, impoverished exiles, to England.

One fair summer day from the ancient château set out a band of pilgrims, on whom rested the radiance of a perfect faith. At the head went the Seigneur Bostaquet; his mother, eighty years old, rode by his side, and was the most ardent of all the pious company; his sons and daughters of various ages followed; many friends and fugitives joined the cavalcade as they made their way to the sea-coast. The evening was charming; the moon shone bright and full; the emigrants moved on cheerfully in the cool night-air, and rejoiced at the prospect of the sea. The old lady of eighty, with her daughters and her grandchildren, sat on the shingle of the beach watching beneath the

moonlight for the ship that was to carry her away forever from her native land.

A loud outcry arose, and a band of robbers, or coast-guards, attacked the unprotected Huguenots. Bostaquet and his friends seized their pistols, and drove off their assailants. But they soon came back; Bostaquet was wounded, and was forced to abandon his family and ride for life toward the frontier. Accompanied by a friend he made his way over the hostile country, often aided, however, by generous Catholics; crossed mountains, woods, and rivers, and reached at length the shelter of friendly Holland. The ladies on the beach were seized by the coast-guard and shut up in convents, from whence they afterward escaped to England. Bostaquet's large estates were confiscated; his servants sent to the galleys; his family ruined; but he distinguished himself as an officer in the army of William III., and lived prosperously for many years in Ireland.

A yet more dreadful fate than loss of home and country awaited those unlucky Huguenots who were arrested in their efforts to escape.¹ They were condemned at once to the galleys. The French galleys were vessels usually a hundred and fifty feet long and forty wide. They were employed to guard the coasts, and sometimes to attack English cruisers that approached the shore. Along each side of the galley ran a bench or seat, to which the slaves were fastened by an iron chain around one leg, and of sufficient length to allow them to sleep on the deck beneath. Here they remained night and day, exposed to the torrid heat or the winter's cold, half fed, and urged on by blows and imprecations in the painful task of pulling the heavy oars. In these floating dungeons, surrounded by convicts and criminals of the deepest guilt, the pure and gentle Huguenots sometimes continued for ten or twenty years, chained to the bench, or often died of exposure and the enemy's shot, and were flung ignominiously into the sea. Old men of seventy years or boys of fifteen or sixteen soon yielded to the fearful toil; but others, more vigorous and mature, endured long years of torture, and were at last released at the instance of the Protestant powers. The captains of the galleys usually treated their galley-slaves with barbarous severity. They scourged their bare backs to make them row with speed; they threw them on the deck and had them beaten for trivial faults. Emaciated, faint, and feeble, the poor slave often sank beneath the blows and died, happy to escape from the intolerable torments inflicted by the stately and gracious Louis.

But the most unsparing of their tormentors was usually the chaplain or priest of the galley.² He was almost always a Jesuit. The disciples of Loyola were thought peculiarly fitted for this unattractive task. It seems to have been the duty of the chaplain to see that the Huguenots

¹ The Jesuits were always the leaders in all the worst persecutions. *Mémoires d'un Protestant condamné aux Galères*, p. 3. Les Jesuites et les prêtres—ces impitoyables et acharnés persecuteurs.

¹ De Felice, p. 337.

² *Les Forçats pour la Foi*, par A. Coquerel Fils, Paris, 1866.

were not spared in any one of their sufferings, and to strive to induce them to recant by incessant cruelty and blows.¹ Yet such was the wonderful constancy of these faithful martyrs that they chose rather all the pains of their sad condition than to accept an idolatrous mass. With one word of recantation they were offered a release from all their sufferings; with one feigned submission they might have been free. No promises moved them from their resolution; no artful insinuations could deceive them into insincerity. "You must know," said Father Garcin, a priest, to the maimed and bleeding Marteilhe, who has left an account of his imprisonment—"you must perceive that the church has no share in this matter. You are punished for disobedience to the king." "But suppose," he replied, "we wish for time to reflect, could we not be set free?" "By no means," said the priest; "you shall never leave the galleys until you recant." And he ordered their torments to be redoubled. It was the church that instigated the barbarity of the king.²

In the galleys might be seen for many years a sacred company of the purest, the most refined, and the most intelligent of the French. The men who might have saved and reformed the nation were chained, in horrible torture, amidst robbers and assassins. Marolles, once counselor to the king, by the express order of Louis, was secured by a heavy chain around his neck, and compiled his "Discourse on Providence" while fastened to the oar.³ Huber, father of three illustrious sons, was also a galley-slave. The Baron De Caumont, at the age of seventy, labored with the rest. But few ministers of the reformed faith were found among the number, since, if captured, they were usually put to death. More than a thousand Huguenots appear on the lists of galley-slaves, and it is believed that the real number has never been told. At length, in 1713, at the solicitation of Queen Anne, the sad remnant of the saintly band were set free from their tortures, and came, maimed and feeble, to Geneva. That noble and ever-honored city received the miserable exiles with fond congratulations and overflowing bounty. The magistrates, the clergy, and a large part of the population came out from the gates and welcomed the galley-slaves as they approached the walls; they were covered with honors and glad felicitations; and every citizen took to his arms some one of the band of martyrs and bore him proudly and fondly to the comfort and luxury of his Protestant home.

With the flight of the Huguenots a general decay settled upon France, and in the last days of the persecuting Louis his vain, aspiring nature was borne down by a thousand humiliations. No Protestant Turenne any more led

on the French armies to victory; no Huguenot Colbert saved, by careful economy, the resources of the nation. The best soldiers of France were fighting in the ranks of Marlborough and Eugene; its rarest scholars—a Descartes, a Bayle, a Jurieu—spoke through the printing-presses of Leyden or Amsterdam; its artisans had fled to England, Holland, and America; its people were chiefly beggars.¹ All over France, under the Catholic rule, men, women, children fed on roots and grasses, and browsed with the beasts of the field. Paris became one vast alms-house, and it is estimated that, at the breaking out of the Revolution, two hundred thousand paupers claimed charity from the hands of the king. The Jesuits alone flourished in the decaying nation, and ruled with dreadful tyranny over churches and schools, the prisons and the galleys. Literature died out; the mental despotism of the church gave rise at last to Voltaire, Rousseau, and the Encyclopedists; the Jesuits were overthrown by the indignation of the age; but their fall came too late to save from an unexampled convulsion that society which they had subjected only to corrupt.²

Under the rule of the Jesuits (1700-1764) the Huguenots who remained in France are still supposed to have numbered nearly a million. But they were no longer that bold and vigorous race who, in the sixteenth century, had nearly purified the nation. The Jesuits watched them with restless vigilance.³ They were forced to hide their opinions in cautious silence, to study the Scriptures at the peril of death. Yet they still maintained their church organization in secret, and elders, deacons, and evangelists still held their yearly meetings in lonely places, sheltered by the forest or the cave. The religious services of the Huguenots were held with equal difficulty and danger. Driven from the cities and public places, the devoted people would wander to the utter solitude of some unfrequented woods, or gather in great throngs beneath a fissure in the rock. Sometimes at night they assembled on the seashore, or climbed among inaccessible hills, where no hostile eye could follow.⁴ The Huguenots were noted among the Catholics for their love of solitary places, and their sect was called the "Church in the Desert." Here, in the heart of rocks and wilds, they ventured once more to chant the psalms of Marot, and heard the plaintive eloquence of their persecuted preachers with fond and eager attention. Yet often the Jesuits pursued them to their retreats with malignant eyes, and broke in upon them in the midst of their supplications.⁵ It was the favorite occupation of the active dis-

¹ Mémoires d'un Protestant condamné aux Galères, n. 362. The missionaries or disciples of St. Vincent de Paul seem to have been equally cruel with the Jesuits.

⁵ Martin, Hist. Fran., xviii. p. 21. Sometimes the Huguenots turned upon their persecutors and killed a Jesuit.

ciples of Loyola to follow the church to its home in the desert, and bring to justice the bold criminals who still refused to worship at the shrine of Mary; they were still resolved to extirpate every trace of heresy in France. Eighteen Huguenot pastors were executed or burned in the reign of Louis XV.; their dying voices were often hushed in a loud beating of drums. The galleys and the prisons were still filled with reformers; some perished, forgotten, in lonely dungeons; some died in chains or torture. The Jesuits, who knew the power of books and of the press, strove to destroy every trace of Protestant literature or libraries; they would have read throughout all France only history as sanctioned by the popes, or morals as treated by the casuists; a decree was issued (1727) ordering all "new converts" to give up their Protestant books; in every town and village of France bonfires were fed with Bibles and Testaments, or other "pernicious" treatises;¹ the reformed libraries were wholly destroyed, and the Huguenots, once the most learned of their contemporaries, sank low in mental culture. The French intellect was fed on the brilliant sophisms of Rousseau, the sharp diatribes of Voltaire, the historical fables of Bossuet and the Jesuit fathers.

One of the last and most remarkable of the scenes of Romish tyranny in France was the tragedy of Jean Calas. In the holy city of Toulouse, in the year 1761, still lingered a few heretics, distinguished for their peaceful lives and spotless morals. Yet to their Catholic neighbors they were ever objects of suspicion and dislike. Toulouse, indeed, had long been renowned for its rancorous bigotry. It was called the holy city because in one of its crypts might be seen the skeletons of seven of the Apostles, and in its bosom the cruel Saint Dominic had first conceived or applied the machinery of his holy inquisition. The spirit of Dominic ruled over the people, and Toulouse had been hallowed, in the eyes of popes and Jesuits, by several massacres of the Huguenots seldom equaled in savage cruelty. In 1562 a Protestant funeral procession was passing timidly through its streets; it was assailed by an angry throng of Catholics; a general slaughter of the heretics followed, and three thousand men, women, and children were torn to pieces by their Romish neighbors. The pope, Pius IV., applauded the holy act; an annual fête was instituted in honor of the signal victory; and every year, until 1762, a magnificent spectacle, attended by the blessings and the indulgences of successive popes, kept alive the rage of bigotry and inspired the thirst for blood.²

Jean Calas, a quiet Protestant merchant, lived (1761) among this dangerous population.³

He was sixty-three years old, respected for his honesty and his modest character; with his wife, six children, and one maid-servant, a Catholic, he lived over his shop, which stood on one of the best streets of the city. He had four sons and two daughters, and the eldest of his sons, Marc-Antoine, the cause of the ruin of his family, was now about twenty-six. He was a moody, indolent, and unhappy young man, who had sought admission to the bar, and been rejected because he was a heretic. He had sunk into melancholy in consequence, and had apparently meditated upon suicide. Yet in October, 1761, no shadow of gloom rested on the innocent family. It was evening. The shop was closed and barred; a visitor came in, and the Huguenot family gathered round their modest supper-table and passed the evening in cheerful conversation. Meantime the elder son, Marc-Antoine, left the table to go below. "Are you cold, monsieur?" said the servant to him. "No," he answered; "I am burning with heat." He passed on and went down stairs. About ten o'clock the younger son, Pierre, went to conduct their visitor to the door, and found his brother suspended by a cord, and quite dead. He had hung himself.

The father, stricken with grief, took the body of his son in his arms; a physician was called, who could do nothing; an irreparable woe had fallen on the gentle household; the mother wept over her first-born.¹ But common sorrows were not to suffice for the fated family, and a dreadful bigotry was to make their names renowned over Europe and in history. A curious crowd gathered around the barred door of the shop, and a suspicion arose among the Catholics that the Calas family had put their son to death to prevent him from abjuring his faith. The wild fancy grew into a certainty; the throng broke into the shop; the father, mother, the son, and the servant, were arrested and shut up in a close confinement; the church, the government, and the people of Toulouse assumed their guilt; and the dead Marc-Antoine, a Protestant and a suicide, was buried in solemn pomp as a martyr, attended by all the clergy of the city, followed by a vast and splendid procession, and covered with all the honors and blessings of the Roman church.

All Toulouse, now mad with religious hatred, called for the punishment of the Calas family.² It was asserted that all Protestants were assassins; that they made away invariably with their children, if necessary, to prevent their conversion to the Romish faith. It was believed that the whole Calas family had been engaged in the murder of Marc-Antoine; that father, mother, his brothers, and even the sisters, had united in the secret immolation. Jean Calas, after a long process, was tried and convicted. But no evidence of any value had been produced against him, and his own clear proofs of his innocence

¹ Smiles, p. 342 and note.

² *Histoire de Toulouse*, Aldéguier, iv. 315.

³ Jean Calas, et sa Famille, Paris, 1858, par Athanase Coquerel Fils. M. Coquerel has done valuable service to the cause of historical truth by his various monographs from the Huguenot annals.

² *Hist. de Toulouse*, iv. 307. Tout ce que pouvait être dit à la charge de la famille Protestant, etc.

were excluded by a fanatical court. The maid-servant, a Catholic, who could have shown that he was absent from the room where the fatal event occurred, was never suffered to be examined. Calas appealed to the Parliament of Toulouse; the church ruled over the highest tribunal, and Calas was sentenced to a horrible death. He died on the rack, still declaring his innocence. "Wretch," cried one of his persecutors to him as he lay in torture, "you have but a moment to live. Confess the truth." Calas, unable to speak, made a sign of refusal, and the executioner drew the cord around his neck.

But all Europe soon rang with the barbarous deed.¹ Voltaire took up the cause of the Calas family; friends at court aided in reversing the judgment of the fanatics of Toulouse; in vain the whole Roman church assumed the defense of the murderers of Calas, or Dillon, the Irish Archbishop of Toulouse, showered indulgences and honors on the guilty counselors; public opinion for the first time in France condemned persecution, and the corrupt church trembled before it. Rose Calas, the widow, the bereaved mother, the most unfortunate of women, went up to Paris, and was received with sympathetic attention by the court and the king; a new trial was ordered; the innocence of the Calas family was shown by conclusive proof; the judgment was reversed, and a late justice was done to the unhappy Huguenots. Yet the Catholic church, confident in its infallibility, never abandoned its belief in the guilt of its victims, and its falsified manuals of history will continue to assert that Marc-Antoine Calas was a martyr for the faith as long as the papacy endures.

The Revolution soon followed, and the example of persecution which the clergy of France had exhibited for so many ages was now retorted upon them with signal vigor. The scaffolds ran red with the blood of the priests. The galleys and the prisons, once crowded with Huguenots, were now filled with their persecutors. Chained to the bench and toiling at the oar, the Roman Catholic clergy experienced all those woes their church had so freely inflicted on the gentle heretics. A general emigration of priests and nobles took place. France lost, for a time, a large proportion of its people; yet it is impossible not to be struck with the unimportant effect of this later emigration compared with that wide scene of disaster and national decay that followed the flight of the Huguenots. When the gay nobles and the corrupt clergy crossed the frontiers no flourishing manufacturing cities fell into decay; no fertile districts returned to their native wildness; no intellectual dullness or moral decline succeeded a period of unwonted progress. It is probable, it is certain, that the destruction of a single centre of industry and trade by the intrigues of the Jesuits under Louis XIV.—the exile of its pi-

ous artisans and their well-trained families—was more injurious to France than the expulsion of all its nobility and the fall of its monarchy and its church. In the one case it lost a centre of moral advance; in the other only the sources of religious and political decay.

Under Napoleon the Huguenots experienced the toleration of a despot; at the Restoration they became nominally free. They were no longer forced to worship in caves and deserts. The last massacre and persecution occurred at Nîmes in 1815.¹ But the Catholic powers of France and the popes of Rome have never ceased to oppress by ingenious devices the rising intellect of the reformers. The Bourbons strove to suppress the dissidents;² even Louis Philippe was forced, in obedience to the Romish supremacy, to deny equal rights to his Protestant subjects. And in our own day³ a cloud of danger still hangs over the future of the Huguenots. France once more, as in the days of Louis XIV., has fallen under the control of the Jesuits.⁴ Slowly the society of Loyola has spread like a miasma over the land it so often desolated. The schools and colleges have been transferred to Jesuit teachers; the Protestant teachers are persecuted and trampled down. The Gallican church has abandoned its feeble show of independence, and is the strong defender of the persecuting faction at Rome; the politics of France are, perhaps, controlled by the chief of the order of the Jesuits. A strange mental darkness is settling upon the nation, and in most of the French schools and colleges it is openly taught that Louis XIV. was a magnanimous king; that the persecution of the Huguenots was a righteous act; that, as the Jesuit Auger declared, or Bossuet and Massillon implied, it was "the angel of the Lord" that presided at the massacre of St. Bartholomew and directed the horrors of the dragonnades.⁵

The Huguenots, therefore, are still in peril in their native land; their ancient foes, the Jesuits, rule over the church, and are plotting their destruction. An infallible pope sits on

¹ De Felice, p. 478.

² De Felice.

³ J. Simon, *La Liberté de Conscience*, p. 217, shows that as late as 1850 Protestant meetings were suppressed, Protestant schools broken up by unjust laws. It is doubtful if things have improved since then.

⁴ M. Athanase Coquerel thinks a new persecution impossible in France (*Les Forçats*, p. 142); yet he suggests a doubt (p. 143). If, as M. Jules Simon tells us, it is a criminal act to read the Bible to an assembly without permission from the government (see *La Liberté de la Conscience*, p. 217), or to establish and maintain a Protestant school in a Catholic neighborhood, the Huguenots can scarcely be thought secure (see p. 218, note).

⁵ The history authorized by the French government and the Romish church misrepresents all the leading facts in the religious wars. The massacre of Vassy appears as a quarrel between the two religions; the Duke of Guise is full of benevolence and honor! See *Simple Récits d'Histoire de France* (1870), the state history for secondary schools, p. 141. The massacre of St. Bartholomew is made to seem *un coup à l'Italienne*; the horrors of the reign of Louis XIV. are not mentioned.

¹ De Felice, p. 428. Rochette and three companions were executed at Toulouse the same year.

the throne of St. Peter, who proclaims, as the direct revelation from heaven, the persecuting doctrines of Pius IV. and Pius V.;¹ who has himself filled the dungeons of Rome and Bologna with the advocates of the Bible and of a free press. It is possible that France may prove the last battle-ground between the Jesuit and the reformer, the Bible and the pope. It is certain that in such a struggle the printing-press will not be silent; that the printer will still defy his natural foes; that the public sentiment of the age will rise in defense of truth and honesty; and that the lessons of history

will dissipate forever the lingering delusions of chivalry and of the Middle Ages.¹

We have thus imperfectly reviewed the sad but instructive story of the Huguenots. The tale of heroism is always one of woe. Yet the impulse toward reform begun at Meaux by Farel and Lefèvre has never been lost, and the energy and the sufferings of their disciples have every where aided the progress of mankind. It would not be difficult to trace the beneficent influence of Huguenot ideas in the prosperity of England, Holland, America, or France.

¹ In a somewhat extensive work, by Professor Laurent, of Ghent, *Le Catholicisme et la Religion de l'avenir*, may be found a clear statement of the medieval tendencies of Rome. The pope still threatens persecution, defies governments, annuls their acts, and only waits for an opportunity to destroy all his foes. See p. 362, 411, 568, etc.

¹ At the congress of the Roman Catholic bishops of Germany, France, Belgium, and England, at Malines, in 1863, Archbishop Deschamps excused the massacre of St. Bartholomew, and defended persecution. No Roman Catholic dares denounce the Inquisition, or to relate true history. He is obliged to repeat the feeble ideas that flow from the diseased intellect of the Romish Propaganda. See Laurent, *Catholicisme*, p. 574, and book xi., on Traditional Religion.

MY BABES IN THE WOOD.

I KNOW a story, fairer, dimmer, sadder,
 Than any story painted in your books.
 You are so glad? It will not make you gladder;
 Yet listen, with your pretty restless looks.

"Is it a Fairy Story?" Well, half fairy—
 At least it dates far back as fairies do,
 And seems to me as beautiful and airy;
 Yet half, perhaps the fairy half, is true.

You had a baby sister and a brother,
 Two very dainty people, rosy white,
 Sweeter than all things else except each other!
 Older yet younger—gone from human sight!

And I, who loved them, and shall love them ever,
 And think with yearning tears how each light hand
 Crept toward bright bloom and berries—I shall never
 Know how I lost them. Do you understand?

Poor slightly golden heads! I think I missed them
 First in some dreamy, piteous, doubtful way;
 But when and where with lingering lips I kissed them,
 My gradual parting, I can never say.

Sometimes I fancy that they may have perished
 In shadowy quiet of wet rocks and moss,
 Near paths whose very pebbles I have cherished,
 For their small sakes, since my most bitter loss.

I fancy, too, that they were softly covered
 By robins, out of apple flowers they knew,
 Whose nursing wings in far home sunshine hovered,
 Before the timid world had dropped the dew.

Their names were—what yours are. At this you wonder.
 Their pictures are—your own, as you have seen;
 And my bird-buried darlings, hidden under
 Lost leaves—why, it is your dead Selves I mean!

THE CAVE OF BELLAMAR.

ASCENT TO THE CAVE.

THE Cave of Bellamar, although discovered but a few years since, already enjoys a world-wide reputation. At the present day no visitor to Cuba fails to repair to that wondrous subterranean palace, unrivaled, perhaps, in the grandeur of its stalactitic masses and the exquisite detail of its sparry decorations. Easy of access from Havana by railway, and commodiously and safely prepared for the reception of visitors, it fully repays one for a day's absence from the busy scenes of the capital.

About a mile from the bridge of Bailen, on the south side of the city of Matanzas, there is a group of pretty villas designated by the name of Bellamar—a favorite place of resort in the hot season for sea-bathing. Not far from these is the famous cavern, which borrows its name from this picturesque hamlet. At a short distance beyond Bellamar you turn your back upon the foamy beach, and, following a tortuous road of reddish earth, thickly strewn with fragments of calcareous rock, you ascend a steep and rug-

ged hill, on the summit of which is the entrance to the cave.

On the 17th of April, 1861, some laborers were at work on this hill extracting limestone for a kiln, which still stands on the premises. One of these laborers, in forcing a crow-bar into the interstices of the loose rock, suddenly felt it slip through his hands and disappear, as if by magic, into the earth. Upon examination it was discovered that the crow-bar had slid through a fissure into a sort of well-like cavity. This natural well was very deep and dark. In a few days the opening made by the crow-bar was widened sufficiently to admit the body of a man. It needed no little boldness to venture into the yawning abyss of this cavity at the end of a rope. Mr. Santos Parga, owner of the premises, having been informed of the mysterious disappearance of the crow-bar, upon gazing down into this opening, surmised that the most valuable portion of his property was not on his lands, but under them. Being a man of nerve and intrepidity, he resolved to unravel for himself the secrets of this remarkable cavern. Upon being lowered through the perilous aperture he found himself, torch in hand, descending into a vast and magnificent temple, whose pillars were of glittering crystal, and whose lofty dome was formed of fantastic arches that sparkled as if coated with frosted silver.

Parga was not able to explore his wonderful subterranean domain very far, owing to the dangers which threatened him at every step. There were deep gullies which he could not cross, and steep precipices down which it would have been madness to attempt a descent. It was not without considerable labor that he, with a few companions, succeeded after several days in penetrating into some of the main avenues.

At present the visitor finds every thing very conveniently arranged for the descent. A comfortable pavilion has been constructed over the entrance, rendered accessible by the improvement of the roads to vehicles from the city.

Led by a guide, who provides us with a lantern or a torch made of long wax-candles twisted together, we descend by a stairway into the cave. This stairway is furnished with a hand-rail, and is supported by an artificial wall. We descend some twenty or thirty steps to an eminence within, around which a railing has been placed that we may safely approach the verge of the precipice, and gaze into the frightful abyss below. Here also we may divest ourselves of such extra articles of clothing as might interfere with our transit through the galleries, or render our subterranean sojourn uncomfortable in consequence of the excessive heat, which, in some portions of the cave, is almost intolerable.

From this elevated natural terrace we obtain our first grand view of the interior. It is like standing in the gallery of a temple. This first hall is about five hundred feet in length, with an average width of two hundred, and an elevation from the abyss to the dome of about one

hundred. A number of large lamps have been so placed that the whole interior can be taken in at a glance. At the farthest extremity of this chamber are two dark spots. These are the entrances to two of the principal avenues, which, after continuing for some distance, intersect each other, so that we can pass out of the main hall at one of the dark spots and return into it by the other. At the apex of this irregular V another avenue starts, which penetrates still deeper into the earth, altering the V into a Y, the base of which is nearly a mile from the entrance under the pavilion. The general course of these avenues is east. Starting also from the main hall is another principal avenue, running south for a distance of three miles, according to the measurement made by Mr. Santos Parga. A third avenue penetrates under the hill in a westerly direction for a distance of a mile, diverging also from the main hall, or "Gothic Temple," as it is named.

As we step upon the terrace the first object that strikes us is one calculated to make an impression not soon to be forgotten. It is a cluster of tall stalagmites standing directly in the centre of the chamber. We do not need the hint from the guide to the effect that this is called the "Guardian of the Temple;" we see that at once for ourselves. It is the colossal statue of a warrior seated upon a sort of Gothic throne; in his right hand he holds uplifted a tall, keen lance; his left arm is bent, and rests upon his thigh; his head is slightly turned, as if toward the opening by which we have just entered; he stares us in the face, and, as the yellow and unnatural light of the lamps flickers about his vague features, we can easily imagine that we feel the fixed and freezing glare of his stony eyes. We are forcibly reminded of some tale of enchantment read in our childhood, and we can not divest ourselves of the singular fascination which this weird and supernatural figure exercises over us. Our curiosity compels us to seek a nearer view of this stern, motionless, eternal sentinel, placed there by nature to watch over the hidden treasures of this shadowy domain. Accordingly we descend into the dark gulf at our feet, along a zigzag path cut in the gravelly and crystallized soil of the terrace, and approach the spot where we but a moment since saw the giant form of the warrior-gnome. Alas! we seek for it in vain; it is nowhere to be seen, having melted away as though at another touch of the enchanter's wand. What we behold in its place is but a confused heap of broken stalagmites, without any discoverable shape or meaning. The delusion is complete.

From the foot of the terrace we look up at the lofty dome overhead, incrustated with sparkling crystallizations which dazzle us, and gaze down from the little bridge on which we stand, and which spans a deep and perilous ravine, into the darkness. We can not escape a sort of vague terror. Indeed, we feel here as trespassers upon a forbidden precinct; and as if

THE GUARDIAN OF THE TEMPLE.

there were a fifth element—darkness—which we have rashly entered.

Among the pillars of the temple, which look as if they were sustaining the weight of the lofty arches, there is one remarkable for its huge proportions; it is called the "Mantle of Columbus," owing to the deep flutings in its surface, which bear some resemblance to the drooping folds of a mantle. Here the stalactites and the stalagmites, the former growing downward and the latter upward, have met and formed one solid mass of crystallization about sixty feet in height and twenty feet in thickness, as white as snow and as transparent as alabaster. As we wander through the grotesque aisles of this gorgeous cathedral every thing around us sparkles with brilliant coruscations that dazzle the eye.

Whatever advantage, as to extent, other caves may possess over Bellamar, surely none in the world can surpass its wondrous wealth of rare and exquisitely beautiful crystallizations. Nature seems to have exhausted her fancy in producing these myriads of quaint forms and curious combinations. The stalac-

tites are singularly capricious and beautiful. From the gigantic "Mantle of Columbus" to the newly formed delicate tubes and cones, scarcely an inch in length, there exists every intermediate variety of size. Some are flat and transparent, and will vibrate when struck, with a sound as clear and melodious as a silver bell. Others are tube-like, hollow, twisted, or curved, sometimes branching like coral, at others hanging like hooks, or darting sharply upward. According to the accidents of their position, they assume at times entirely different forms. Now they are frozen dribblets along the yellow surface of the rock; again they have worked themselves into grotesque fringes, or are scalloped into delicate frills; now they are like glittering serpents flashing wildly in the torch-light; then the rock is coated as if with a heavy frost; and again, the shapes take the form of crucibles, of cornucopiæ, or of flowers tinged with delicate colors and resembling dahlias and roses.

In the complex web which they form it is difficult at times to separate the stalactites from the stalagmites. The latter form, in some

places, rich curtains of the whitest and most quaintly patterned lace; they hang like the rich drapery of silken robes; or, like motionless cascades of glittering diamonds, they extend, wave after wave, and fold after fold, from the ceiling to the floor. Sometimes they assume the most grotesque forms and resemblances; here and there we see them about the floor like devotees kneeling before fantastic idols, in silent and eternal adoration; again they seem like weary travelers stretched out to rest at noon on the cool grass by the wayside; or, perhaps again, like plumed and naked savages gathered in dread circles around the council fire to plot the war-path, or to plan the chase.

And all this is accomplished simply by the combination of water with lime! A feeble stream of water permeates the limestone above, and filters through it, carrying along some minute particles of lime in solution. As this water drops from the roof of the cave, or dribbles along the surface of its walls, it leaves behind it these calcareous particles, which, in the form of carbonate of lime, harden and are crystallized, forming a thousand capricious figures. If the drops fall from the roof, the form is generally that of a pendent tube, or elongated cone, terminating in a keen point, to which every additional drop from above naturally runs. Each drop remains there suspended for a moment, contributing its infinitesimal quota of lime toward the lengthening of the stalactite downward; it then falls to the ground, carrying with it the residue of the lime, which is there

CAPRICIOUS FORMS OF CRYSTALS.

deposited and crystallizes, contributing to the growth of the stalagmite upward. Thus every drop tends to increase the two formations.

If the dribble of water, however, flows along the surface of a rock, then it leaves the lime behind it to mark its devious path in the form of delicate tracery and fringes. If the quantity of water is large, then the cascades and curtains and snow-drifts are formed. The roof of the cave, its walls, and its floor, are thus all, at the same time, being ornamented through the agency above described. Considering the extreme slowness of the process, how many ages it must have required to agglomerate gigantic

STALAGMITES.

masses of crystallization like that called the "Mantle of Columbus!" And yet this, necessarily, is not so old as the cave itself.

Caves such as Bellamar are to be met with on a smaller scale in all the calcareous formations on the island, where natural bridges, tunnels, and subterranean rivers are likewise found. The origin of the Cave of Bellamar may be due to volcanic action; but it is more probably owing to the gradual erosion of yielding strata by the action of water. The wonderful tunnel bored by the Cuzco River, in the eastern part of the island, might suggest the origin of a cave like this of Bellamar. The Cuzco is an insignificant and shallow stream, which, however, in the rainy season, becomes a powerful torrent. A lofty ridge barred the course of its ancient channel, and through the heart of this ridge it has carved a tunnel large enough to admit of the passage of huge trunks of palms and eriodendrons. After disappearing at the base of the hill, several hundred feet below the crest, it does not appear again until it comes out at the other side of the ridge, a distance of nearly three miles. Any volcanic action tending to alter the level or bed of the stream might divert its waters into a different channel; the former one would be soon covered with a dense vegetation, and all distinct traces of it be lost. The tunnel, or cavern, itself probably disturbed from its original horizontal position, would remain to puzzle future geologists.

The Cave of Bellamar, however, has no known communication with the upper air except by means of the artificial entrance broken through the thin crust which roofs over the principal hall, or "Gothic Temple," and its avenues, as far as explored, have all a downward grade, sinking to the depth of four hundred feet below the surface of the hill.

Passing the "Guardian of the Temple," we will visit what is called the "Altar." It stands in a spacious niche at the other side of the chamber, and facing the "Mantle of Columbus." It is a rude imitation of an altar, around which one may imagine that he can discover the forms of sculptured images, animals, and flowers.

We next follow the guide into the low subterranean passages, entering at the dark spot on the left, into what is called the "Avenue of the Fountain." This avenue is about half a mile in length, and presents at every step objects curious and beautiful; here you have on one side fantastic arabesques sculptured in relief on the dusky walls, quaint Gothic friezes and cornices, and Norman pillars; on the other side is a miniature polar scene, with its icebergs and piled snow-drifts and icicles; beyond we stop to notice the exquisite embroidery on a cambric robe, or the delicate tracery on a half-drawn curtain; then we come to a portion of the passage which, as it narrows, becomes so low that we must stoop to avoid the long stalactites which hang from the roof; then we creep carefully along the brink of some deep gullies and ravines which look like new-

THE EMBROIDERED PETTICOAT.

dug graves, where all is sepulchral and dark and dismal. Suddenly we find the passage has widened into a beautiful chamber, radiant with crystallizations, which make it seem as if we had passed from the night into the day.

Here is the fountain or spring from which the avenue takes its name. It wells up near the middle of the passage. It is a clear and sparkling fountain, gurgling in a polished vase of sculptured alabaster.

We are now at the apex of the V. On our left is a dark and irregular opening. This is the entrance into the passage through which, by-and-by, as we return, we shall again enter the "Gothic Temple." Picking our way cautiously among the débris of fractured stalagmites, we soon reach a gloomy archway and recess called the "Devil's Gorge." Any lugubrious vaticinations suggested by this name, however, are rapidly dispelled by the sight of a monster church organ, with its pipes quite symmetrically and elegantly arranged, and its row of ivory keys, which seem only to need the touch of some enchanted hand to fill those dark corridors, those gloomy depths, and lofty vaults, with the swelling and sonorous strains of a solemn music not meant to be listened to by mortal ears.

Not far from the organ there is another object which carries us pleasantly back to the familiar world of irrepressible realities: it is a rare and beautiful stalagmite, broad, smooth, thin, and very transparent, with perpendicular folds and plaits, and tastefully embroidered along the base with rich and graceful patterns. This is called the "Embroidered Petticoat." In order to show the embroidery to advantage, a light is placed behind it, when the exceeding transparency of the stalagmite sets off the denser lines of the patterns to greater advantage. Beside this memento of the upper world there is, just beyond, an elegant sofa, covered with white damask, with its curiously wrought back of silver and of ivory, and its rich and glossy cushions, which, though not so soft as they

MOUTH OF THE HIDDEN GALLERY.

look, yet silently invite the beholder to the dreamy luxury of an Oriental siesta. This luxury, however, we must endeavor to forego, because there yet remains a great deal to be seen, and the guides, who are all day long breathing this cavernous atmosphere, and are constantly being taught how much has been successfully accomplished by the restless and persevering labor of ages, will not fail to remind us that to them also, in this dark world of subterranean speculation, "time is money."

So we take another lingering look at the wonders of the "Devil's Gorge," and, with a parting sigh for the damask sofa, we again follow the guide, and plunge still deeper into the cavern in search of other wonders.

After continuing along the avenue for a short distance we come to a contracted and rugged passage, where we have to stoop low to avoid a savage-looking boar's head, with keen and desperate tusks, that menace us from the low roof, and immediately beyond we suddenly find ourselves in one of the most beautiful chambers of the cave. It is called the "Chamber of the Benediction," because it has been rendered historical that here a certain Catholic bishop, who had come to visit the cave, was so enchanted with the beauties he beheld, that, in the exuberance of his pious admiration for the wonders of the created world, he blessed and consecrated the Cave of Bellamar.

This splendid hall is nearly forty feet from the floor to the roof; it is somewhat more than that in length, and has a breadth varying from

twenty to twenty-five feet. The extreme beauty of its crystallizations, with their spotless whiteness and brilliancy, its graceful columns, and the smooth and even floor, all render it a favorite spot with visitors.

On the right, as we enter, there is a running spring which overflows into a shallow basin, whose pure waters are seen to glisten among numberless stalagmites. This shallow basin is in a low recess under a massive frieze-work, highly ornamented, and the receding portions of which are seen beautifully reflected on the tranquil surface. Upon approaching the spring we stoop and look into the recess, and perceive that there is at the back of it a dark opening, through which comes the streamlet like a silver thread. That dark aperture is the mouth of an extensive passage, which has been explored for the distance of nearly a mile by Mr. Parga and two others. When at that distance from the mouth a jet of water from the roof extinguished their only remaining taper. They attempted to light some matches with which they had provided themselves, but these had been rendered useless by the dampness, and one after another failed until only one was left. This was their last hope. They felt it would be impossible, in the dark, to retrace their steps through the labyrinth of narrow and tortuous passages, and the dangerous places they had passed. They groped about, feeling with their hands for a dry spot on the surface of the rocks. The last match was finally tried; it flickered for an instant, and went out! The situation

of the explorers was now very critical. Weary as they were—for they had been wandering all day through those intricate passages—they were now compelled to creep on their hands and knees, the sharp stalagmites tearing their clothing and lacerating their limbs. At moments they would sit down to rest themselves, exhausted and despairing, in this horrible darkness. It was midnight, and they seemed to be no nearer to the mouth of the passage than they had been in the afternoon, when their light was extinguished. A frightful death was staring them in the face. Hour after hour passed away, and as they groped about those dark passages, which brought back to their ears only the useless echoes of their own voices, the perils of their situation became every moment more and more apparent, and its terrors increased as hope grew less.

At last, toward morning, one of them thought he heard the echoes of other voices. They listened with breathless anxiety; a calmness and silence as profound as that of the grave seemed to mock their hopes.

Suddenly there came, faint and distant, the reverberation of a voice. They replied, and it answered them again. They pushed on toward this voice, groping in the darkness. The two voices sought each other. Soon a distant glimmer, like that of a faint star, shone in the distance. It came nearer and nearer.

The wife of Mr. Parga, alarmed at his long absence, had persuaded some friends to go into the cave in search of him. They were in this way rescued from a fearful doom.

This basin, with its crystal waters and its cool atmosphere, has a delightful effect upon the mind of the visitor. But the guide's narrative is not calculated to produce an equally agreeable result. We are never entirely at our ease when underground. The close, hot air of these caves suffocates us; the silent darkness ahead is horrible; the brain reels; there is at moments an irrepressible longing for the upper air; the voices of our companions sound weird and unnatural, and the red glare of the tapers has something demoniacal in it. We are startled at every slight noise behind us; a sort of vague terror haunts us lest the lights may go out, or may not last until we regain the entrance; or the ponderous dome give way, and, blocking up the narrow aperture which is our only means of exit, may consign us to the frightful doom of being buried alive in this natural sepulchre!

Near the spring is a beautiful piece of crystallization called the "Mantle of the Virgin." The crystals which adorn it are of extraordinary size and brilliancy. It looks like a mantle of white satin, embroidered with silver thread, and ornamented with diamonds and pearls.

The vaulted roof of this beautiful chamber is hung, in some parts, with innumerable stalactites of all shapes and sizes, the most of them presenting the appearance of alabaster lamps hung from the ceiling. As the guide waves his torch over his head, each one of these lamps

DON COSME'S LAMP.

dash forth a thousand brilliant coruscations in blended rays of azure, gold, and crimson. They are fairy lanterns, each lit with the blaze of a burning diamond. Among these stalactites there is one deserving of special notice. We reach it by passing through a narrow and irregular passage called the "London Tunnel." This stalactite is an exquisite specimen of subterranean workmanship. It has been named "Don Cosme's Lamp," from the fact that a Havanese gentleman of that name offered to pay a thousand dollars for it, provided he was allowed to carry it home with him entire. It is a yard and a half in length, quite broad at the top where it is joined to the roof, and terminates below in a keen point. It is a perfect specimen of its kind, and is covered with brilliant crystallizations, and fancifully decorated with the most delicate filigree work, tinted with violet and pale gold. The myriads of minute branching stalagmites on its surface are twisted and woven about each other in the most capricious and complex shapes. Indeed this portion of the cave can not be surpassed for the beauty and quantity of its crystallizations. The roof and walls are literally incrustated with them. It will, perhaps, be our good fortune to notice a curious and beautiful representation of a rainbow on one part of the wall, in which, on a dark ground, the colors of the solar spectrum are accurately displayed in a semicircular form. As a torch is moved back and forth before it the effect is beautiful beyond description. Here, too, the ceiling is, in many parts, of a rare and delicate salmon-color, studded with myriads of brilliants; and graceful colonnades of stalactites, solid to the floor, fall into varied perspective as you move about the chamber, giving to the whole the appearance of some enchanting Oriental retreat.

We pass out of the "Blessed Chamber" and its lovely grottoes and quaint recesses with no little regret, and follow the guide along the last portion of the main corridor into what is known as the "Avenue of the Lake."

On our way we pass many beautiful and interesting objects, but we have seen so much, and our eyes so ache with prying and staring, that we stop only for an instant to contemplate the beauties of a dazzling waterfall called the "Diamond Cascade"—a glowing mass of crystallization, which looks for all the world as though some princely gnome, standing in a niche which is near the roof, had emptied down a casket of diamonds, which, in a glittering shower, had remained suspended in the air.

But we hasten on to obtain a view of the greatest wonder of the cave—the "Lake of the Dahlias," which is at the termination of the avenue. We are now at the bottom or

foot of the Y, and somewhat less than a mile from the pavilion. In order to reach the lake it is necessary to climb up to an aperture near the roof, above the smooth surface of a rock coated with a cascade of crystals, which looks as if it might be an overflow of the waters of the pool. As we approach this end of the gallery we observe a marked change in the temperature of the air, which gently fans our temples with a delicious coolness. This is a breeze from the lake—a beautiful sheet of water, one hundred and eighty feet long, thirty feet broad, and eighteen feet deep. It is pure and transparent, and its bed or bottom is paved with the most remarkable crystallizations, most of them of the shape of flowers resembling dahlias. These dahlias are formed by triangular, concave crystals, starting from a common centre, in layers one above the other, precisely as the petals of dahlias are arranged. They vary from three to five inches in diameter. Their greatest beauty consists in the exquisite manner in which they are tinted with veins of violet and blue and delicate yellow and pale crimson. These colors are probably due to the presence of mineral salts which filter down with the water from the overlying strata. The dahlias are all slightly flattened, as if by the pressure of the fluid above them.

Here, then, we have an enchanted lake in which the most fastidious of naiads would not refuse to dwell. A lake with its surrounding landscape of fantastic, sparry forms and its beds of wondrous flowers, and with its own sky bending above it full of sparkling constellations—a

AVENUE OF THE LAKE.

lake on which the sun has never shone, and whose smooth and silver surface the light wings of the breeze have never rippled, nor the rage of the tempest ever maddened into foam.

Retracing our steps we now return to the fountain, where the avenue of that name is intersected by the passage which, in conjunction with it, forms the V. This passage is called the "Avenue of Hatuey"—in memory of the Indian chieftain whose martyrdom is recorded in the early annals of Cuban history. After proceeding along this passage for a short distance we come to a spacious vault called the "Cupola of St. Peter's," from the symmetrical proportions and great elevation of its dome. Directly under this dome stands isolated a tall, keen stalagmite called the "Lance of Hatuey."

As we continue to explore this passage our attention is constantly directed to the great variety of rare fossils embedded in the walls and roof. The latter consists here of a stratum of yellowish conglomerate. Among other remains are casts of oyster shells, some of which measure six inches in length, with a proportionate width. There are also casts of echini or sea-urchins, some of them measuring as much as seven inches in diameter. The existing species of oysters found in the island are seldom more than two inches in length, being generally found adhering in clusters to the tangled roots of the mangrove-trees along the sea-coast, in the same manner as Columbus, in his fourth voyage, said he saw them along the shores of South America. The sea-urchins found at present on the island are seldom more

THE CONFESSIONAL.

than three or four inches in diameter. These casts carry us back to a remote geological era.

The "Avenue of Hatuey" is rendered very picturesque by the tortuousness of its course and the inequalities of its floor. In some places we descend into deep ravines, to ascend again along erratic zigzag paths; in some parts it is necessary to stoop quite to the ground to be able to creep through the narrower passes. There abound many beautiful incrustations, especially those veins with colors—buff, red, and blue. Some of the colored stalactites are very striking, especially near a beautiful recess called the "Boudoir of the Matanzas Beauties." It is a very beautiful chamber, with arches and pillars tastefully distributed and decorated. A quaint Gothic niche near by also displays the usual wealth of rich ornament and tracery, and fanciful design. It reaches from the floor to the ceiling, but is roofed over at the height of about six feet; a broad, flat stalactite serving as a partition wall and leaving a narrow doorway. In this wall is a small Gothic-shaped opening, or window. We need not be told the name given to this eccentric little nook is the "Confessional."

We have now to toil for some distance over the fatiguing irregularities of the narrow path which leads us up a very steep ascent to a terrace which is on a level with the floor of the "Gothic Temple." We have then returned to our starting-point.

Most of the other galleries are not as yet opened to visitors; it is hoped that before long

they will be rendered safe enough to be exhibited, as they are said to contain many interesting and wonderful objects. But we have seen enough for one visit; we have spent a whole morning in these realms of subterranean mystery, and as we climb up the stairway to the pavilion and behold again the clear, white light of heaven, and breathe once more the pure untainted air of the outer world, we can not but confess that we feel in the best of spirits—a vein of good-humor with which is pleasantly blended that wholesome excitement we always experience after the contemplation of the marvels of nature, even when our investigation has

been associated with a sense of peril.

PHANTOM DAYS.

SWEET-HEART, when the year turns back,
And over her summer track
Goes trailing in robes of mist,
And holding her poor pale lips,
Chill with their half eclipse,
Up to the sun to be kissed—

Then over the parting line
The dead days glimmering shine,
With pitiful faces fair.
They are perfect, all but breath,
And I mind me of their death
By the chill that is in the air.

Yet at the sight I yearn;
And O, that they would return
With the love that I forego!
And I murmur, ah! how long?
And sorrow takes up her song—
"Till the rose blooms in the snow."

So all the story is told.
Cease, for the heart's a-cold,
And the winter claims its own.
In the first night o' the frost
Beauty and bloom were lost,
And what is the stalk alone?

O! when will the rough winds blow,
And when will the blank white snow
Cover the dead from sight?
For, like the haze on the hill,
Lieth on thought and will
The spell of a past delight.

So, over the yellow leaves,
And the empty place of sheaves,
I follow my aimless feet.
O! love that is lost to me,
Are there ghosts that walk with thee
In this time o' the bitter-sweet?

O! what but the heart's desire
Can you have seen in the fire
Of the autumn woods ablaze!
And what but an ended tale
In the ashes few and pale
Of these Indian Summer days!

WE were a party of six—three ladies and three gentlemen. Two of these only were husband and wife, so it can easily be believed we all got on very well together.

We were to take our point of departure from the city of St. Louis, not because the would-be capital of all the States is particularly interesting in itself, but because it is easily reached from any where else; and because one may be sure to find here large and comfortable steamboats, which go all the way to New Orleans.

Steamboats of the largest size, such as the *Thompson Dean*, *Great Republic*, *Richmond*, and others, do not go above St. Louis, neither do they ascend the Ohio, except for a short distance, because of shoal water and rapids, and therefore they do not invite freights. On a "full river," however, they can pass over all of these, and then these monster craft appear at the levee of Cincinnati.

St. Louis is the greatest transfer dépôt on the river. Steamboats bring to this point freights from the Upper Missouri and Mississippi and all the rivers which empty into these largest of the water-courses, and thus there is abundance of business for the great export mart of New Orleans.

To St. Louis, therefore, we repaired in search of the steamboat *Thompson Dean*, whose reputation for size and safety was so well assured as to gain the confidence of us timid travelers. We had a day to spare before the steamboat went to sea—to river, I had better say—and attempted to see the objects of interest, and made a total failure of it; for of all places under the sun St. Louis is the most uninteresting. There is but little architecture, and less art. There is literally nothing of the past or present to interest a stranger.

The boat we were to take was advertised to start at ten o'clock in the morning. An hour before that time we were on board, and had settled ourselves in the plain but large and comfortable state-room, which had been previously engaged for us through the medium of

the telegraph. There were no evidences of haste nor press of business about the gangway of the boat. What freight there was had been stowed away, and the passengers who were to accompany us dropped in quietly. At the hour appointed the lines were cast loose, and we backed easily out from among the crowd of steamers which lay at the levee. There was a raw wind from the north, and the sun shone cold and cheerless through the gray and white clouds which covered the sky. At the bow of the boat were gathered the negro deck-hands, who were singing a parting song. A most picturesque group they formed, and worthy the graphic pencil of Johnson or Gérôme. The leader, a stalwart negro, stood upon the capstan shouting the solo part of the song, the words of which I could not make out, although I drew very near; but they were answered by his companions in stentorian tones at first, and then, as the refrain of the song fell into the lower part of the register, the response was changed into a sad chant in mournful minor key. Very soon we were fairly out into the river, and, with head down stream, with choking gasps from the steam-pipes, and bulging columns of smoke from the huge lofty smoke-stacks, and swift revolutions of the large paddle-wheels, we sped away toward our destination.

At the risk of telling many of your readers what they will know as well as I, let me give a brief sketch of a Mississippi River steamboat. It is one of the most striking, as well as most original forms of our altogether original American architecture. Whenever our people attempt to build public edifices, such as churches, state-houses, and private dwellings, after their own invention, they are pretty sure to make a frightful botch of it; but American steamboat architecture, which has grown out of the needs of our commerce, is not only original to us in its form of construction, but it is sometimes splendid in appearance. This is a noble craft which bears us safely over the turbid waters of the great river. Her actual carrying capacity is thirty-two hundred tons. She is some two hundred and ninety feet in length, and fifty-six in breadth. From her keel to the roof of the upper cabin she includes forty feet. Above that is the "Texas," as it is called, which is an upper row of cabins, where the officers' quarters are, and upon the top of which is imposed the pilot-house. The main cabin is plainly but well furnished, with large state-rooms on either side. Below it is the main-deck, where the big boilers and furnaces and engines are. Below this deck again there is a deep, spacious hold, where a thousand or fifteen hundred tons of freight may be stowed away. This hold is a peculiar feature of our boat. At least, with my experience, I have never seen such a space below decks. Perhaps the most ornamental and most needful parts of this noble creature, as we see her from the outside, are the two big black smoke-stacks. These are the

THE PARTING SONG.

nostrils of this monstrous moving, living thing, that send forth vast clouds of smoke, which, like the terrible Affrete in Arabian story, spread forth and cover the heavens. But no seal of Soliman is required to repress the mighty powers of our genius, for its mission is one of peace and goodwill.

The mention of the officers who control the movements of the boat is necessary to our narrative. They are the captain, without whom the boat is nothing, and with whom it is every thing, in our case; then there are two pilots; the clerk, to whom we all go for every thing we wish; two mates, of whose harsh voices and terrible looks we have more fear, probably, than the forty or fifty dark-skinned deck-hands, toward whom they are usually directed; there are the engine-drivers, coal-heavers, cooks, waiters, barbers, porters, laundresses, and last, but not least, Spencer, our good-natured, handy, irrepressible cabin-boy, who is blacker than darkest night.

Pretty nearly all the incidents which go to make up human life and society are represented on this steamboat of ours; and there are some which are exceptional, and find no parallel elsewhere. During some ten days which were occupied in our trip to New Orleans I passed a good deal of time in the pilot-house, and came to have a deeply interested admiration for the men who guide these noble vessels upon their devious journey.

Of all that belongs to life on our great Western rivers, the business and experiences of the

pilots interest me most; and, as they are to have our lives in keeping for twelve hundred miles to come, it is worth our while to know all about them. No class of public servants stand in a position of greater trust and responsibility than theirs. The captain of our boat, for example, has supreme command, and is held responsible for the doings of all those within his control, but his authority is, in fact, limited in the pilot-house; for, although he has the power of directing the action of the pilot, yet, so far as taking this or that direction is concerned, he seldom exercises it. I can not conceive of a more arduous and dangerous business than that of guiding one of these gigantic steamboats along the twisting, shifting, treacherous channel of the river. The ocean steamship, whatever may happen, has the refuge of the open sea. The direction to be pursued is well known, and the compass points the way, while, if the vessel is deprived of the use of steam, she can resort to canvas, and, beyond delay, but little injury occurs. The man who directs the movement of the locomotive may, by the slightest carelessness, cause the death of hundreds of his fellow-beings; yet most accidents by railroad happen from exterior and accidental causes. There are many other stations in life where the safety of human beings and of property is dependent upon the judgment and good conduct of a single man. But in neither one nor all of them is there any such grave responsibility as that resting upon the pilot of the Western river. Truly must he be a man of rare natural gifts of mem-

ory of localities, quick observing comprehension, a sure hand, rapid judgment, determination of will, iron nerve, even temper, and good habits.

Let the reader imagine himself perched sixty feet above the water in the pilot-house, which is a good-sized box, usually ten or fifteen feet square, built up high above the cabins of the boat, and somewhere near its centre. This lofty eyrie is inclosed upon all sides with glass windows, so that the pilot at the wheel, which is a big thing, may see both shores and up and down the river. Our pilot is surrounded by speaking-tubes and bell-ropes. There are two engines, so that there are duplicate bell-ropes. They signal "stop her," "go ahead," "back her," "slow," "fast," and what not, so that, although fifty feet or more of space and half a dozen decks separate the pilot from the engineer, yet they are as one man, or one is the double of the other.

This is a superior point of observation up here, and we shall have a good deal to describe in the course of our twelve-hundred-mile journey. First, however, we will have something to say about our friend the pilot. He and his "partner" serve at the wheel, watch and watch, which is divided into spaces of time of about four hours.

From St. Louis to Cairo is what the pilots call a "bad piece of river." To me the river all the way down is "bad"—that is to say, difficult of navigation. I stand by the side of our pilot, and watch with curious interest the movement of the boat. To my eye the surface of the water is all the same, and there appears no reason why a course should not be pursued straight down the stream to the point a mile away, where the cotton-wood trees dip toward the gray horizon; but suddenly the large wheel whirls swiftly around, and the bow of the boat points directly in shore at a right angle to the course of the stream. In an instant we are close under the bank, where the water is whirling and tearing along, where big roots of trees, like snakes, are crawling out from the yellow, crumbling earth. On the bank, near a log-hut, there stands a yellow-visaged man, who moves not, but stares at us with lack-lustre eyes. I see all this, so near are we to the bank; in fact, one might jump ashore, but one had rather be left on a desert island than in that dark forest. The man we saw will stay there but a little while. He has "squatted" there for the purpose of cutting wood for the steamers. He owns neither land nor wood, and, after earning a few dollars, will either move to another place, or go to some city on the river, where he can drink and gamble his money away. But we have left him far behind, and pushed out again into the middle of the river, not in a straight course, but winding hither and thither, as if led by some fitful sprite. First one side, and then the other, until your wits are fairly puzzled, and you are almost willing to believe that the pilot is a sham, or that he has some insight beyond that of human ken,

which permits him to pursue his dangerous way among snags and shoals and sand-bars with perfect certainty and safety. You can comprehend how the direction might be taken from certain landmarks on the shore, although that would require a prodigious effort of the memory in these hundreds of miles; but between St. Louis and where the Ohio River joins the Mississippi the channel changes daily. We passed the wreck of the steamer *Lady Gay*. A few days ago an ugly snag went on an exploring expedition in her hold. The water followed it, and the steamer sank. Three or four other steamers had met with the same fate from this same snag; but in two days the channel shifted across, a mile away, to the other side of the stream.

"You see where that bit of brush-wood lies in the water?" said the pilot to me, as he pointed to a spot some half a mile from the shore. "When we came up three days ago the channel ran the other side of it, and up toward that sand-bar; but I see it has changed, and has gone away over to the other shore."

Again the wheel whirled about, and the swift-speeding steamboat shot across with as much certainty as if she were off Sandy Hook, and all the world of water before her.

"I have watched and searched for some sign by which you can find your way, and give it up. It is a mystery I can't fathom," I remarked to the pilot.

"Well, it's sort of instinct," he replied. "I can tell something by the color of the water, something by its motion, and something in the habits of the beast; and between 'em all I manage to find my way."

This was navigation by day; but subsequently in the darkness of night, when neither moon nor stars gave forth their light, and the volumes of black smoke from the smoke-stacks were lost in the black sky—when those big iron fingers arose to the right and left like shadows—when the river was a dark gliding mirror reflecting the darkness above—when the forests of cypress and cotton-wood on the nearest bank were but a spectral line, and always the same, unvarying in its obscurity and monotony—when all human sounds had ceased, and only the deep solemn breathings of our river monster could be heard—then it was not difficult to believe that the silent figure standing there in the darkness, guiding us through the darkness and into darkness, was leagued with powers of the other world.

The pilots of the Western rivers are a vastly superior class of men to those who followed the profession ten years ago. The improvement is in their morals, their education, and their usefulness. Much of this is owing to an organization which unites them in one association for purposes of self-improvement and protection. No pilot is admitted to this association unless he is a man of temperate habits, good character, and capable in his profession. They have in St. Louis, which is the head-quarters, a

place of rendezvous where the members may amuse themselves by reading or otherwise. At one time the captain and owners of the steamboats were inimical to this pilot association, for it was looked upon as a monopoly. But this prejudice has been removed in view of the admirable results which are in all ways manifest. To be sure the society fixed upon \$250 per month as the fair rate of wages for a first-class pilot, but they do not prevent any of their number from accepting less if he wishes so to do. There are many first-class pilots who are not members of this association, but they all work amicably together. One of the invaluable results of this plan is an arrangement by which every pilot going up and down the river deposits in boxes stationed at St. Louis, Cairo, Memphis, White River, Vicksburg, and New Orleans, written reports of the state of the river, changes of channel, appearance of snags, etc., that have occurred in that section over which he has just passed. Thus each pilot is at once informed of the condition of the river, and is able to avoid its new dangers.

It is a life of unceasing care, hazard, and anxiety, but one of intense interest and varying incident. These are men of courage, and at no time was their nerve and coolness more manifest than during the war. From their exposed situation they were in constant danger from the rebel sharp-shooters, who were lying in ambush on the river-bank to pick them off as they passed. The pilot-house is full of stories of adventure, and I will relate one of these, which not only illustrates their courage, but their professional integrity as well.

When the war broke out many of the pilots, whose residence and sympathies were in the South, joined at once in the rebel cause. One of these fought for two years in the rebel army, was disabled by a wound, discharged from the service, went home, and was subsequently induced to serve as a pilot on one of the steamboats running from New Orleans up the river, which then, as Mr. Lincoln had it, "went unvexed to the sea"—not altogether undisturbed, however, for now and then a rebel field-battery would appear upon the bank, and stop and rob and burn the steamboats. The remainder of the story shall be told in the words of one of the actors:

"James Allen was my partner on the *Von Phul*. He had been in the rebel army, but I had known him for many years, and trusted his honor when he came under our flag. We started out of New Orleans and had got up to Morgan's Point, where the river makes a bend. I was in my state-room, and Allen was at the wheel, when I heard a crash of the glass in the pilot-house, and then the sound of a cannon-shot. I rushed out on the Texas, and looked up and saw Allen pale as death.

"'What's the matter?' I said; and just then another shot came from the shore smashing through the boat, and I looked and saw a six-gun battery blazing away like mad.

"'Are you hurt?' I continued, while Allen stuck to the wheel.

"'No,' he replied, keeping his eyes on the bow of the boat, which he was pointing away from the bank where the rebel battery was. 'But the captain and bar-keeper are killed.' I ran up into the pilot-house, and sure enough there they were, dead and bloody; but I hadn't long to look at them, for hardly had we got round the point when there was the infernal battery again firing away. 'Go below,' said Allen; 'it's my watch, and I'll steer the boat.' And I went. Before we had got past, between the two attacks, they put into our boat sixty-two shots; but we were saved, and all owing to the honesty and courage of Jim Allen, a rebel pilot."

However brave the pilots may be wherever human agencies are concerned, they are as superstitious as any Jack Tar who has seen the *Flying Dutchman*. A story is told of an adventure that happened many years ago to a pilot on the steamer *St. Louis*. It was in the summer, and on a trip up the river. A corpse had been taken on board at Memphis, and for safety's sake, and because it was cooler there, it was placed in the pilot-house. The pilot was not altogether temperate. In fact, a cocktail was necessary to his happiness at least every half hour, and he had made an arrangement with the bar-keeper by which, after midnight, he had possession of the key to the bar, so that he could go or send down for his own cocktail. As midnight approached he began to get rather nervous about this corpse, and all the ghost-stories he had ever heard came thronging before him with intense reality. Now and then he would look over his shoulder at the coffin, which stood upright against the window, and the sight did not reassure him.

Suddenly, for an instant, he turned his eyes from the river, and at his very elbow he saw a figure in white which held up a bony finger, as if in warning, while ghostly, hollow eyes stared into his. That one look was enough; for, fully possessed with the belief that the ghost of the man dead in the coffin stood beside him, he gave one frantic scream, and, at a single jump, sprang over the wheel and through the window on to the roof of the cabin, twenty feet below.

It subsequently required the presence of the ghost in person to persuade our poor pilot that he was only the bar-keeper, who had forgotten to send up the key of the bar until after he had gone to bed, and so came up, silently, in his bare feet, shirt, and drawers.

But we have been listening to the stories of our friends in the pilot-house while the boat is rapidly passing points of interest on the river-bank. Here is St. Genevieve, an old French settlement, where, for many generations, the people have cultivated a large extent of land, covering a thousand acres or more, in common. I do not learn that these people are disciples of Fourier or of any of the celebrated communists;

but it is certain that they work together, and, by some mutual arrangement, divide the proceeds of their labor. It is said that this community increases slowly, is not very wealthy, and its members do not quarrel among themselves nor with their neighbors. It would be interesting to know more of the city of St. Genevieve.

The scenery on this part of the river is not at all startling. On the one side we pass low swamp lands filled with forests of cotton-wood. On the other, low bluffs arise, whose red and yellow earths frequently indicate the presence of one or another kind of mineral. This character of scenery is interrupted at Grand Tower, which takes its name from rocks some forty feet high, which have been worn by the action of the water into a circular shape. A railroad strikes the river at this point, and brings coal from a place called Carbondale. It is said to be much better and cheaper than the Illinois coal, and at St. Louis and along the river is largely used.

Cape Girardeau is another town of prominence, but at this, as well as at a dozen and more stopping-places between St. Louis and Cairo, there is little or nothing to attract the attention of the traveler. But grand old nature ever presents glorious spectacles to the reverent eye, and nowhere do the clouds and sky and atmospheric effects take on more exquisite changes of beauty than in the valley of the Mississippi. As the first day of our voyage was closing into evening the sun went down toward the western tree-tops in glowing splendor. We were all gazing in love and delight, when out from the paler rosy-gray of the eastern horizon there came a line of dark, which each instant increased in size and length until the sky was filled with flocks of birds, flying toward us and into the sunlight. At first we thought them flocks of ducks or wild-geese, but as they neared us, beating the singing air with their white wings, we found that they were the beautiful swan; and, as if to do us greatest pleasure, one by one, as gracefully as a feather falls in the quiet air, they settled down upon a bar of golden sand which ran far out into the now darkening waters of the river. A more fascinatingly lovely sight I never beheld, as tens and fifties and hundreds and thousands of these aerial visitors swept round and round as they neared the earth, their snow-white plumage taking on infinite tints of beauty as it glanced and fluttered in the ruby rays of the setting sun.

When the darkness came on the boat went into port for the night. Our wise and careful captain refuses to risk the lives of his passengers and the safety of the boat by running on this part of the river after nightfall. They call this route between St. Louis and Cairo a "bad piece of river," for more accidents and loss have occurred here than in the remaining thousand odd miles to New Orleans.

When near Cairo we bothered ourselves little about currents and snags and sand-bars, but steered in a straight course from point to point.

At times it seemed as if we were crossing large lakes; and when, near nightfall, we rounded a group of trees, and directed our course toward some far-distant lights upon the edge of the horizon, it was hard to realize that we were not upon some large inland sea, instead of the river whose course upon the map is indicated by a crooked black line.

We laid over at Cairo a day and a night. A more disheartening place I never beheld than this same Cairo, which, from its location at the junction of the Ohio and Mississippi rivers, many people professed to believe would become a large city. I would not like to prophesy as to its future beyond that of a third-class graveyard, but to-day it is the vilest hole above-ground, if the streets formed by introducing foreign soil can be said to be above-ground; for the open lots formed by the streets were partially filled with water covered with green scum, and which was also the receptacle for offal, dead animals, and other offensive refuse. Turn which way you would the sight was unspeakably disgusting. The streets were knee-deep in mud, and it seemed impossible to transact business upon them when horses and wagons were required.

"It must be very sickly here in the summer," I remarked to one of the store-keepers.

"Not at all, Sir," he stoutly replied. "We never have chills and fever nor cholera here. One of the healthiest places on the river, Sir. Bound to be a big city, Sir."

The yellow skin and hollow cheeks of the speaker were more eloquent reporters as to the health of the city than his tongue; while in every shop window hung placards of "Chills and Fever Specific," "Jones's Fever Cure," "Osgood's India Collaghough," and so on. All the day and into the night the loading of our steamboat progressed. Thousands of barrels of flour were rolled into the hold, which lies under the main-deck, until it seemed as if not another stave could find place. Then the cars came in from the north, and several hundred "head" of mules and horses came on board, and were put somewhere. Subsequently there came coops filled with geese, turkeys, and chickens, and the air was filled with braying, neighing, bleating, crowing, cackling, and gobbling, until one began really to believe they could appreciate the feelings of Noah when he was loading up for that little excursion he took in the ark.

Upon the following morning, when we were once more puffing our way down the swollen river, I ventured with confidence to say to the captain:

"Well, Sir, we took in a big freight. Crowded full, are we not?"

"Full, my good friend!" he answered, with a smile of pity at my ignorance. "Why, she'll take in fifteen hundred tons more!"

I made no reply, but at the first opportunity plunged below stairs. What a sight it was, to be sure!—piles of sacks of corn ten high and ten

A CREVASSE ON THE MISSISSIPPI.

square, and I do not know how many of them running fore and aft. Piles upon piles of barrels of flour, almost filling the lower hold, which seemed to be another boat when you got down there. Out on the guards of the main-decks were the four-legged animals. In the passageways and on the guards of the saloon-deck above were stacks of wagons, plows, shovels, and all sorts of farming utensils. I gazed at all of this mass of merchandise, and, muttering to myself "fifteen hundred tons more," slowly and thoughtfully ascended to the ladies' cabin of the boat, where the passengers were occupied in reading, playing cribbage, or otherwise amusing themselves.

The morning after leaving Cairo we came upon deck, and, gazing about, we no longer recognized the river Mississippi, of which we have just now used opprobrious epithets.

In the presence of this vast flood of water rushing resistlessly along we stand in awe and wonder.

What the river people here call a rise, in Europe would be an inundation, which would carry havoc in its path. It is not so much what the eye takes in upon the surface of drifting trees and logs and houses, but it is the hidden force which, rushing and whirling and eating underneath, undermines the giant trees of the forest; they tumble as if smitten with the hand of death, and plunge into the stream to be whirled and turned hither and thither like twigs in a whirlwind. Then secret currents dig and dig at the base of some high bluff, and, in an instant, acres of rock and earth and forest sink into the waters, and before your very eyes the solid land is engulfed and disappears. As the steamboat with assured pace steams quickly past the forest of cotton and cypress, with their solemn depth made more than melancholy by their long drapings of hanging moss, as you pass swamps and cultivated fields, you will detect a break in the brimful bank, and in a second the flood is upon the land, not with a rush and a roar, giving the poor farmer with

his wife and children yonder in his cabin notice of its approach, but, with silent fatal speed, it covers and envelops field and cabin, and fortunate is its human prey should he escape the deathly embrace.

All along this great river the water overruns the banks, extending far inland, uniting, by bayou and lagoon and lake, thousands of miles of country in one vast flood.

Now that we are fairly on our way, let us see who are our companions. It is after dinner—that is to say, about three in the afternoon. The cold wind from the north takes on a keener edge as the sun begins to decline, and most all the passengers are indoors. The young gentleman and lady on the sofa yonder came aboard with us at St. Louis. There is a neat, natty look about them, especially the young lady, which has the manner of New York. All her wardrobe is of the latest fashion. Her boots are close, firm-fitting, and have that nice look which suggests a fashionable shoemaker; and so with the looped skirt of the dress, the jaunty hat; and about the *ensemble* there is a nameless something of nicety which breathes the atmosphere of the metropolis. The remark has been made that these people are bride and bridegroom on a wedding trip. Why young people should always be thus accused I know not, but any lady and gentleman traveling together, who have not turned forty, are always subject to this charge. At the piano, which, by-the-way, is an excellent square Chickering, is seated a young lady, who, they tell me, is the sister of a priest; if so, he is Irish to a supreme degree, for she bears unmistakable marks of that nationality. Not unpleasantly so, perhaps, but, in spite of that, Irish. The young lady plays very well; but her escort—a rather wordly looking priest—thinks her a paragon of merit, if one might judge by the attention he gives to her rendering of the "Star-spangled Banner," with variations.

At Cairo we received a decided addition in

the way of numbers to our company. One of them was in the unique shape of a family from Alabama, and, among all the strange faces about us, none are more picturesque and striking than they. The father, with slouched hat and homespun clothes, is a type of a miserable sort of a poor white man, who has grown up under the influences of civilization at the South. His wife has brought at least six children into the world. Poor woman! she seems to be utterly dragged out, and, in common with her husband and children, has that torpid, listless manner which is inseparable from those who have been the victims of the chills and fever.

"Ye-e-es," she said to me, with a long drawl, in reply to a question, while the fingers of one hand wandered feebly about her chin and face as if seeking for thought and resolution of purpose, which had forsaken it, if it had ever been there. "Ye-e-es, thar has been a deal of fever and agur whar we come from. Nigh all the children have been down with it. That child," pointing to a girl of four years old, with large blue eyes and long lashes, as pretty as any mother might be proud of, "has a chill every other day, and the others shook all last summer."

"What medicine do you use?"

"Quinine. And a heap of it we have took since last June. Mr. Culbertson and the rest on us have took fifteen dollars and fifty cents wuth since that time."

"You have been very ill yourself, I should suppose."

"Oh no, I've not been sick, except a touch of congestive chill which I took just afore we got to Florence, where we took the steamboat to come down to Cairo. I had the chills and fever all last summer, but we're used to that. This congestive chill quite took me down. A power of people have died of that whar we come from."

Poor woman! there she sits on the sofa all day long, now and then her listless gaze following the motions of the two-year-old Quincy, who is playing about the floor. Unhappy, and yet fortunate, for her misery is tempered by her ignorance. At Memphis this family take another boat, which carries them up White River to Little Rock, and then out upon the wide prairie, to be swallowed up in that dim line which hovers between barbarism and civilization.

Out of Egypt there also came to us a strangely different pair. As those we have just described stand upon the outer border of civilization, this German man and his wife are near the centre, where the highest faculties of the intellect, the widest stretch of the imagination, are known. These are not the heavy-thoughted, clumsily limbed, honestly stupid Germans who may be found among the working population of this country. This man, with his introspective eyes, his classic face, and long, dark hair, is Auerbach's Eric; this woman, with flowing ringlets, gentle smile, and loving eyes, is

BRIDE AND BRIDEGROOM.

Mauna; and they both are journeying through the New World. Theirs is not a life of dull commonplaces. Jean Paul is the lowest flight they take, unless it is to absorb some abstruse science, or evolve some hidden mystery of mechanics. Yes, this is the wonderful Eric—this later creation of the German fancy. An individual man whose knowledge embodies all there is of the past and present in mechanics, metaphysics, science, philosophy, prose, and poetry. Verily, this is the impossible Eric.

In this after cabin, of which we are writing, there are several more people, who are commonplace, who lounge about, walk the decks, and are punctual when the black stewardess stands behind the piano and rings a little bell, announcing one or the other of our three daily meals.

In the forward cabin, usually gathered about the big stove or at the tables playing cards, there is a motley group of men. There are two sprucely dressed young fellows from Baltimore who are going to Texas on a sporting expedition. Somewhere in the interior of that vast country they have a place well furnished with dogs, guns, and ammunition; the game, they say, comes of itself, of all sorts, and in any quantity, from black bear to quail.

Half a dozen quiet, orderly men I see day by day moving around; these appear to be merchants, farmers, or traders. But of altogether another sort is a part of our invoice from Cairo. Four of these are tall, muscular young fellows, from Kentucky I think, who, in the old time, when it was not honorable in the South to labor, would have turned out first-class ruffians. As it is, they have all the swagger and dare-devil manner which characterizes the cut-throat and bravo. All of this party carry pistols, a strange sight nowadays. One of them wears a Confederate gray coat, and a look into whose eyes reveals a story of adventure.

There is another gang in the forward cabin who are not even as respectable as those we have just described; these last are gamblers.

PLAYING POKER.

We had heard that this feature of steamboat life in the West had, since the war, disappeared. In truth, it has—or, at least, its character has changed.

You can not see now, as we did ten years ago, the cabin tables surrounded by planters, merchants, and politicians, calling themselves gentlemen, who would gamble from morning till night, and again till morning, staking, and often losing, their entire fortunes. We do not now encounter the elegant, gentlemanly, professional gambler, who was accomplished in every way, and not least in the use of the pistol and bowie-knife. Well-educated, fascinating gentlemen were they, whose hands were again and again stained with the blood of their fellow-creatures. All this class of men are hardly to be found in the Southwest in this goodly year of our Lord 1870. The war did splendid scavenger-work in sweeping them into the other world. And the young men now coming up into life, who would have been such as they, find a better existence in working for their daily bread. The gang of gamblers who are our companions on this trip belong to altogether another class than those whose places they fill. These are what the panel thief is to the bank burglar, what Burns is to Morrissey. It is amusing for your experienced traveler to watch the tricks and schemes of these miserable wretches. One of these is short, rather fat, dressed in black broadcloth, and carries under his plug hat a cunning, greasy, smooth-shaven face, which has small, ferrit-like eyes in it, and a red snub nose, like a carbuncle, imposed upon it. This man is called the "Judge," and is, I believe, the leader of the gang, although another fellow in common clothes, with a wolfish, cowardly countenance, gives the cue to all their doings. The third thief of the party is small in stature, with black mustache, and an assumed wobegone look. It is he who, in their make-believe games, bets wildly and largely, who most always loses, gets

angry, and appeals to the lookers-on. The fourth of the squad looks like an honest tradesman, who ought to be in better business than betting.

One day these gentlemen were playing at poker, which is a favorite game for their nefarious purposes. The "Carpenter"—we will give them such names as describe them best—had dealt "Ferret-eyes" a hand of three kings and a seven and eight of clubs. To "Wolf-mouth" he gave three aces and a nine and

ten of hearts. With these hands "Ferret-eyes" and "Wolf-mouth" began to bet and brag in the most excited way, talking to each other, appealing to the crowd, and getting up an enthusiasm pretty much as the clown and ring-master do in the circus, shouting and running in order to make the audience believe that the horse which the "equine queen" is riding is going fearfully fast, when it is all a sham, gotten up for effect. Such was the excitement about our steamboat gaming-table.

"I see your twenty dollars and go fifty better," shouts "Ferret-eyes."

"I see your fifty and go ten better," screamed "Wolf-mouth."

"I see that, and make it one hundred," cries "Ferret-eyes."

At this point there was a dead pause and silence, broken in an instant by "Wolf-mouth," who turned beseechingly to the by-standers with the remark:

"Gentlemen, I'm blowed if I ain't strapped."

Meanwhile moving around the table there was a peaked sandy-haired man, who has on board forty mules, which he is taking to Memphis. This fellow had seen both hands, and knew that "Wolf-mouth" had the strong cards. Just at this moment he caught the gambler's eye, who continued:

"Ef I had a mule, wouldn't I sling him, ears and all, atop o' that pile?"

"You kin bet one of my mules," was the answer of "Sandy-hair."

"Will you take the mule?" cries "Wolf-mouth" to "Ferret-eyes."

"Yes," answered the other, asking the "Carpenter," as he had a right to by the laws of the game, for two cards, in place of his seven and eight of clubs. That obliging gentleman at once complied, giving him the fourth king and an ace. "Wolf-mouth" did not ask for more. They showed their hands. "Ferret-eyes" swept in the pool, and "Sandy-hair," to his dismay, had lost his mule.

Below stairs on the main-deck, among the corn-sacks, mules, and deck hands, there are other travelers, going I know not whither. Filthy, hungry, forlorn wretches are they; men, women, and children on the same errand which hurries us all onward, forward, somewhere; the struggle of humanity, whether on the lower deck or in the cabin, in the hovel or the palace, life, life, to live.

The state-rooms, or sleeping-chambers, on the boat are quite large; they have double berths, wash-basins, and mirrors, and all of this is kept in good, cleanly order. Of course there is a door opening out upon the guards. This doorway has blinds, and a printed notice on the wall tells you there are very good life-preservers, in the event of a burst up, or other accident. It is rather uncomfortably significant to see these means of saving life, and the constant call upon your attention, so prominent; but it is well to know that these and other means of safety, which also include cork life-preservers, are at hand. By-the-way, if there should be an accident, I prefer, as a matter of choice, one of the blinds.

It is a question whether this steamboating is a more dangerous mode of travel than others. It had a sort of settlement the other day, at least in the mind of one of the negroes, who exclaimed:

"If yer blowed up on the railroad, thar you is; but, good Lord, if yer blowed up on a steamboat, whar is yer?"

The cabin of our boat is so large that we are able to have tables placed across as well as lengthwise. Thus, instead of three fearfully long tables, where every thing is in confusion and all is in common, the passengers are divided up into parties of six and ten, to the convenience and comfort of all. The food provided is very palatable.

Take it all in all, the scenery of the lower Mississippi is monotonous. Bluffs rise here and there, but they vary but little from the flat, far-stretching corn and cotton fields and the border of cotton-wood forests. From Memphis to Cape Girardeau is found the most fruitful corn lands in the world. They raise from sixty to one hundred bushels to the acre. Sometimes we passed corn-fields which extended continuously for miles along the river and for a long distance inland. Many of these places were situated upon the shore of some shoot or side channel of the river, which could not be approached by our steamboat but for the high water. But now she entered fearlessly these side channels. All along the bank would be found piles of corn. A signal from its owner would cause our boat to swing round and take the pile of three or ten hundred sacks on board. Again and again and many times was this done, until we ceased to wonder at the receptive capacity of the vessel, and came to believe that there was no limit to her space.

To the passing observer there is very little of interest in the cities of the Mississippi. We

passed places whose names had significance mainly as having been associated with the war. New Madrid and its neighborhood interested me chiefly as having once had, some thirty years ago, a severe shock of earthquake, which submerged the land and disturbed the waters of the river to a dangerous degree. I was told that these shocks continued to take place, greatly to the terror and discomfort of the inhabitants. No explanation is given, if one is needed, for these phenomena in a country which evinces no other evidence of volcanic action. Fort Pillow no longer exists above the surface of the river. Several acres of forest and the remains of the fortification one day collapsed with more suddenness than did the rebellion, and sank beneath the flood. It was but little satisfaction to our curiosity to point to tree-tops swaying in the current as the spot where this famous fort once stood. At Memphis we took on board a party of twenty negroes, who had come all the way from Virginia, and were *en route* for the Red River country. I was told that it was easier to get these people over all the remainder of the long journey than through this city of Memphis, where they are waylaid, robbed, and maltreated. If the representations are true, Memphis is a thriving cut-throat hole, a shade worse even than the city of New York.

From Memphis down the river cotton is raised. The plantations are very large, or they were extensive before the war. Now and then we came upon plantations which seemed to be working a large number of hands, and the far-spreading fields were under cultivation; but most often we passed by lands which ten years ago were valued at hundreds of dollars per acre, but which were now overgrown with weeds, or perhaps the neglected levee had been worn away, and the mad waters were pouring swiftly in to lay waste the land.

At Helena we made quite a halt, in order to take on three hundred bales of cotton. We smiled derisively at the suggestion, but had the pleasure of seeing them piled up twenty feet high on the forward deck. We were to take this cotton to New Orleans; but at this point, and higher up, cotton usually goes up stream, and is forwarded east by railroad at Memphis or Evansville, on the Ohio.

Helena is a place of some commercial importance as the *dépôt* of transshipment for the White River country. Its social aspects, judging from a cursory view, would not fascinate a stranger. You know that General Hindman was assassinated in his own house here, not long since; and I saw an ugly population lounging about the streets and on the levee. Grogeries were to be found at every step, and in one of them a mob of negroes, with clenched fists and drawn knives, were discussing the question of mutual superiority in a way which could have only a bloody ending.

It took a long while for our deck hands to load up the bales of cotton. These men, who

A NIGHT LANDING.

have the technical name of "rousters," have put on board an immense amount of freight since we left St. Louis. They have been up at all hours of the day and night; and the mate, with his gruff voice, growls, unremittingly, "Take a sack, take a sack, take a sack!" or, when the barrels of flour came in, "Roll, roll, roll!" or, on all occasions, "Where are ye? where are ye? where are ye?" uttered at lower C without a change of tone. Whether the men work any faster because of his eloquent periods I do not know; but it is certain that, after four days out, they moved languidly, and made but little headway. These "rousters" are hired by the month, at the rate of \$45. They manage to ship just as the boat is leaving port, and after she is pretty well loaded. Perhaps there are worse occupations in life than theirs; but if I had a choice in the way of manual labor, it would not be in the line of a "rouster."

Lying at the levee at Helena we saw several of those unique flat-boats whose business it is to trade on the river. These float down the stream, or are propelled by broad sweeps; but there are trading steamboats which go from one place to another carrying all sorts of merchandise, which they sell or trade for hides, corn, cotton, or other products of the soil.

At Red River the gang of negroes from Virginia left us. It was after dark when we made our landing at the wharf-boat. As usual, when we made a night landing, the iron cages at the bow of the boat were filled with blazing pitch-pine knots, which threw a lurid light upon the immediately surrounding objects. Beyond those all was deep darkness. Out from the shadows of the between decks crept these poor wanderers. Some bore upon their backs bundles of bedding, clothing, cooking utensils, and children. Out of the darkness they came, men and women, young and old; in the glare of the torches they hobbled across the plank, and then disappeared in a deeper darkness. Some

said the scene was significant of the history and fate of the negro race; while others, more hopeful, said, "Nonsense, the history of the negro has just begun."

Vicksburg we came upon in the night. It was a pretty sight to gaze upon the many lights blinking and sparkling on the hill-side; and one could imagine the magnificent spectacle of the passage of the forts and batteries by the fleet during the war.

No fierce cannon belched forth iron and flame from all the hill-

side as we rounded the celebrated point and finally rested quietly at the wharf-boat. It would have been a great delight to have seen this famous strong-hold of the rebellion by day, to have followed the line of defense which so successfully contended against our arms; but the experience was not vouchsafed to us. A stoppage of a few hours occurred, and again the big steamboat was surging through the darkness.

Neither Natchez under the hill nor Natchez on top of the hill served to arrest our now rapid journey toward the Crescent City. It was on the ninth day of our journey after we left St. Louis that we arrived on the "coast," as that part of the river is termed which is fenced in with levees, behind which lie magnificent plantations of sugar. I had had but little idea of the extent of these sugar plantations. When they were in operation, and many are not, each place with its grand house and manufactory and negro cabins formed a village in itself. I was told that some of the establishments for converting the cane into sugar cost as high as three hundred thousand dollars.

Even with the enormous protective duty on sugar, I was informed by several planters that, with the difficulties of getting labor, it was impossible to raise sugar at a profit. The negro, it is said, is no longer available for economical labor. This is an important question, the merits of which it is not proper to discuss here, but it is one which affects the producing interests of the whole South. The planters are desirous of introducing the Chinese workman, but they say the government has interfered, forbidding long periods of service.

It was in the afternoon of a glorious sunny day that we were presented to the Crescent City, the commercial metropolis of the Southwest. Past groves of orange-trees filled with their rich yellow fruit, past elegant villas surrounded with the waving palm and far-spread-

ing oak, past gardens and fields clothed in fresh tints of green, past all that was charming and refreshing to the vision which a few days before had rested only upon snow and ice, we came upon the city of New Orleans.

The sun was going down behind us, and its

golden light illuminated each roof-top and wall and spire. So that all the length and breadth of this great city was bathed in splendid radiance. It was a noble presentation, and afforded a happy termination of our journey "down the Mississippi."

THE NEGATIVE IN PHOTOGRAPHY.

LIGHT AND DARK SPOTS OF THE OBJECT.

THE word *negative*, which the photographer applies to the first image which he obtains of the subject, whatever it may be, that he is to photograph, is rather a misnomer, inasmuch as the properties which characterize it, though striking and peculiar, do not seem very clearly to involve any idea of negation. If it had been called the *reverse*, instead of the *negative*, its name would have been perhaps more suggestive of its character. But the name *negative* is established, and must stand.

In the first impression which the photographer obtains upon the screen in the camera the image is reversed in three respects: first, in respect to top and bottom; secondly, in respect to right and left; and thirdly, in respect to light and shade.

First, the image is reversed in respect to top and bottom, as in the engraving on page 846. The reason is, that the rays proceeding from the upper part of the object *descend*, of course, in going toward the lens, and continuing their course after passing the lens, are brought to a focus at the *lower* part of the screen; while the

rays from the lower part of the object, *ascending*, come to a focus on the upper part of the screen.

Any person may easily observe this effect by means of any convex lens—a sun-glass, for example, or the glass of a pair of spectacles, such as are used by elderly people, and a sheet of white paper. In the evening, when there is but a single light in the room, as of a lamp, or candle, or gas-burner, an image of the flame may be thrown upon the paper by holding it at the proper distance. This image will be more or less distinct according to the perfection of the glass, the general darkness of the room, and the distance at which the glass and the screen are

IMAGE REVERSED IN POSITION.

held from the source of light. Under ordinarily favorable circumstances quite a distinct image, both of the flame itself, and also of those parts of the object from which it issues which are most brightly illuminated by it, will be given, and it will be reversed in position.

The mode in which the lens accomplishes this inversion is illustrated in the engraving on page 845, where the rays of light, passing from the flame, in the direction of the arrows, through the lens, are refracted or bent in the direction shown by the lines. The image in all these cases is reversed not only in respect to top and bottom, but, on the same principle, and for the same reason, the right side of the object will be the left side of the image, and *vice versa*.

But perhaps the most important of all these reversals, and the only one with the rectifica-

tion of which we have to do in this article, is that in respect to light and shade. The thin, sensitive film which is spread over the plate of glass, or the sheet of metal or of paper, on which the image is to be impressed, consists always of some chemical substance which is *darkened* by the action of rays coming either directly from the sun, or by reflection from any object upon it. Consequently all those parts of the object which are of the lightest color—in other words, which reflect the light most perfectly—will cause the parts of the image corresponding to them to be the darkest, and *vice versa*.

For example, in our leading engraving the faces of the three figures, and certain points and portions of the dress, reflect the light strongly, and appear white in the engraving; while other portions, either from their color or from their being in a position to reflect less strongly the direct rays of the sun, appear more or less dark. Now, as the darkness or brightness of an object depends upon the degree in which it reflects the sun's rays, it is plain that the bright parts will throw most light into the camera, and affect those parts of the sensitive plate on which they fall most powerfully. In other words, the parts of the object which were lightest in the object will be darkest in the image; and, on the other hand, those which were dark in the object will throw *less* light into the camera, and will leave the corresponding parts of the image comparatively light.

It is usual, in speaking of the effect of the sun's rays upon the sensitive chemical plate in the camera, to attribute the efficiency to the *light*; but, strictly speaking, it is not the action of the luminous rays to which the change is due, but to certain other rays accompanying, and to some extent intimately blended with, the light-producing rays. Light and color are really sen-

NEGATIVE.

POSITIVE.

sations of the human mind, produced by the action of certain emanations from the sun upon the human sensorium, through the eye, and the portion of the cerebral system connected with it. The change produced in the sensitive plate in the camera is, on the other hand, a *chemical* effect produced upon a material substance. It is found, moreover, that the emanations, or radiations, which produce the one effect are different from those concerned in the other, and that, although the two influences usually accompany each other, they are really distinct in their nature and action, and may be, to a great extent, separated. The former are known by scientific men as the luminous rays, while the latter are designated the *actinic*, or chemical rays. These rays are, in a measure, separable from each other in the spectrum, and the actinic rays may even be so far isolated that photographic effects may be produced in the dark—

WINTER SCENE—THE NEGATIVE.

that is, without any luminous rays whatever striking upon the sensitive surface.

WINTER SCENE—THE POSITIVE.

In the same manner the rays of *heat* and light, which usually come combined in the radiations of the sun, may be separated by suitable devices, so that we may have solar heat without light, and solar light without heat. This separation is sometimes effected by natural means, as, for example, in the case of the moon, which sends us an abundant reflection of the sun's light, with a scarcely appreciable portion of his heat; and that of the *ground*, which, during the night, after a warm summer's day, returns to the atmosphere the *heat* which it received during the day, without any portion of the *light* which accompanied the heat in its emission from the sun.

The chemical and the luminous rays are thus often spontaneously dis severed from each other, to a greater or less extent, by the various reflections and refractions to which the so-

lar emanations are subject in falling upon different substances upon the earth's surface. Some substances reflect well the luminous rays on which their appropriate color depends, but not those necessary to act on the photographic surface. In other words, they look bright and pleasing to the eye, but, as the photographers say, "do not take well."

But to return to our "negative." The light parts of the object, throwing the strongest light into the camera, and thus acting most powerfully upon the sensitive surface there, as has been already explained, will, of course, make the corresponding parts of the image *dark*; while the dark parts of the object, reflecting little light, will affect the sensitive surface but little, and so leave the parts of the image corresponding to them *light*. Thus the lights and shades of the picture will be the reverse of those in the reality.

The engravings on page 846, representing the negative and the positive of the same object, show this reversal of the light and shade very clearly—the former, the negative, giving the effect actually produced, in the first instance, on the sensitive plate, and the second showing the lights as they exist in reality, in the object, and as they ought to be in the picture.

The illustration shows only the third of the three reversals before mentioned, the other two having been corrected before making the engraving. It remains now only to show how this is also corrected, by the production of a positive picture from the negative, after the negative has been obtained from the natural object by the camera.

The negative is usually taken by photographers upon *glass*. The glass is previously covered upon one side with a thin coating of the sensitive chemical substance on which the impression is to be made. This plate, thus coated, is placed in the camera, and exposed for the proper time to the action of the actinic rays existing in the image of the subject formed by the lens—the bright parts of the image becoming dark, of course, and the dark parts remaining bright.

From the negative thus formed the positives, or the copies intended for use, are afterward printed by allowing the light to pass *through the negative* to a sheet of sensitive paper placed beneath it. Of course the image now formed upon the paper will be *re-reversed*, so to speak, and will come out in the proper condition in respect to light and shade; for those parts of the glass which had been most darkened by the bright parts of the image falling upon them will now shelter the corresponding parts of the paper beneath, while those which had been left most transparent will allow the rays to pass through. Thus the picture on the paper will become the reverse, in respect to light and shade, of that on the glass, and will correspond with the subject itself from which the picture is taken.

The difference in character between the negative and the positive image is very clearly shown

in winter scenery, where the snow, reflecting in all its power the full radiance of the sun, blackens completely those parts of the sensitive surface of the negative on which its image falls; while the other objects, which absorb large portions of the actinic rays, represent themselves more faintly. These effects are shown very strikingly in the engravings on page 847, which are copied respectively from a view taken last winter of a portion of the country home of the writer, while the deep snows still remained upon the ground. In this case the reversal in respect to top and bottom is corrected, while those in respect to light and shade, and also in respect to right and left, remain.

MY DISTINGUISHED FRIEND SELTSAM.

I.

THE evening of September 19, 1855, I went to call on my old university friend, the distinguished Dr. Seltam, Professor of General Pathology, Clinical Lecturer, Accoucheur to the Grand Duchess, etc., etc. I found him alone in his magnificent drawing-room in Bergstrasse, his elbow resting on a little black marble table and his eyes fixed on a crystal globe, which seemed filled with perfectly clear water.

Spite of the crimson rays of twilight which came in by the three lofty windows opening on the palace gardens, my friend Seltam's lean face, with its razor-shaped nose and prominent chin, seemed to borrow from the globe a frightful sort of livid tint, somewhat like the head of a corpse freshly decapitated, and the red edging of his dressing-gown completed the illusion.

All this surprised me so that I did not dare interrupt him in his reflections, and was even on the point of withdrawing, when a big footman whom I had found snoring in the ante-chamber took it into his head to open one eye and cry out with stentorian voice: "Counselor Theodore Kilian!"

Seltam, with a long-drawn breath, turned slowly round to me like an automaton, and holding out his hand, said, "Salve tibi, Theodore! Quomodo vales?"

"Optime, Adrien," I answered. Then with raised voice: "What are you at there, my dear fellow? I should think you were puzzling over the doctrine of Sangrado!"

But here his face wore so singular an expression that I stopped, confused and astonished.

"Theodore," said he, after an instant's silence, "this is no joking matter. I am studying the ailment of your respectable auntannah Wunderlich. What you told me day before yesterday is serious. These fits of ecstatic excitement, these sudden starts, and particularly the venerable lady's exaggerated expressions in speaking of Haydn's 'Creation,' Handel's oratorios, and Beethoven's symphonies, all indicate some dangerous kind of affection."

"And you expect to get at the bottom of it in this vessel of cold water?"

"Exactly. It's very lucky you came. I was thinking of you." Then pointing to a violin hanging against the wall—"Would you be good enough to play me Mozart's 'Abduction from the Seraglio?'" This invitation seemed to me so odd that I began to doubt whether my poor friend Seltsam's brains were not on the point of taking leave of him, like my poor aunt's; but, guessing my thoughts, he resumed, ironically, "Don't be alarmed, my dear Theodore, don't be alarmed. My intellectual faculties are intact. I am on the way to a great—to a sublime discovery!"

"Very good; that's enough."

And taking down the violin, I looked at it with envious eyes. It was one of the famous Lévenhaupt's, of which Frederick II. had a dozen made to accompany him in his flute-playing—perfect, irreproachable instruments, which some connoisseurs put on a par with the Stradivarius. However that may be, I had scarcely laid the bow across the strings when it seemed as if all that had been told me about them were below the reality; and what with the elegance of the composition and the purity of the tone, I felt as if I were lifted to the seventh heaven.

"O great, great master!" cried I. "O sublime melodist! Who could be insensible to such grace, vigor, and inspiration!" My hat had rolled off, my eyes were half closed, and my knees tottered beneath me. I was beside myself. For me, Seltsam, the globe, and my aunt's ailments had no further existence. About an hour after I waked as from a dream, stretched on Dr. Adrien's sofa, and wondering what had happened. I saw Seltsam armed with a strong lens still before his globe. The water had become turbid, and myriads of *infusoria* were shooting back and forward in it in every direction.

"Well, Seltsam," cried I, in a weak voice, "are you satisfied?"

Hereupon he came toward me, his face radiant with joy, and seizing both my hands, cried, emphatically, "Thanks! thanks! my dear and excellent friend, a thousand thanks! You have just rendered the greatest service to science!"

I stood confounded. "How! by merely playing an air I have done science a service, have I?"

"Yes, my dear Theodore, and you shall learn the glorious share you have taken in solving the great problem. Come with me. You shall see every thing, understand every thing." He lit a candelabra, for night had come on, opened a side-door, and signed to me to follow him.

A prey to the deepest emotion, I followed him, and, as we passed through several rooms in succession, it seemed as if some revolution were about to occur in my whole nature, and I was on the point of receiving the key to invisible worlds. The candelabra threw its dazzling light on the sumptuous furniture of the

splendid house. Ornaments, pictures, and carpets spread out in dim vistas through the gloom; smiling heads, half starting from their frames, looked down on us as we passed; and the light, glancing on from gilding to gilding, led us at last to the landing of a broad staircase with bronze balustrade.

We descended into an inner court, where the furtive sound of our steps echoed in the distance like mysterious whispers. In this court I noticed that the air was calm, and countless stars were shining in the sky. Our journey led us past several doors, at one of which Seltsam stopped, and turning to me, said:

"Here is my amphitheatre. It is here that I labor and dissect. Don't be disturbed. It is only into the hands of death that nature will render up her secrets."

I was scared, and would have been glad to back out; but as Adrien had gone in without waiting for my answer, I was fain to follow. I entered, then, pale with emotion, and saw stretched on a great oaken table a body—the body of a young man—the arms close against the sides, head back, and eyes staring, motionless as a clod.

He had a fine forehead. On his left side a deep wound had pierced the breast. But what most impressed me was neither the sight of the wound nor the sombre grimness of the head—it was the motionless stillness. "So this is man!" said I to myself; "inertia—eternal rest!" I was still benumbed by the crushing weight of this feeling when Seltsam, laying the edge of his scalpel on the inert body, said to me:

"All this was alive: all this will come to life again. Thousands of existences, the bond-slaves of a single force, are ready to regain their freedom. All that has ceased to exist in this body is the power of command, the authority which imposed upon all these individual lives a single direction—the will! This power lay here."

And he struck the head, which gave back a dull thud like a block of wood.

I was chilled with horror, yet Seltsam's words somewhat reassured me. "So we are not to believe that every thing is annihilated?" cried I. "So much the better. I had rather live in detail than not live at all."

"Yes," cried Seltsam, who seemed to read on my forehead the thoughts which were passing within—"yes! man is immortal in detail—each molecule composing him is imperishable; they all live! but their life, their sufferings, are transmitted to the soul which rules them, consults their needs, and imposes on them its will. Men have sought for the type of the most perfect government, and have claimed to find it in a bee-hive or an ant-hill. This ideal model is here!" and he plunged his scalpel into the body and opened it completely. I drew back with horror; but he, not even appearing to notice my movement, went on, calmly:

"First let us see the means of action and

transmission employed by the soul. You see these thousands of white fibres branching over the whole body; these are the nerves, the high-roads of this vast country where lightning-like couriers are ever hurrying up and down, carrying to the extremities the orders of the central molecule, or warning the latter of the wants and dangers which affect or threaten its countless subjects. Then every thing stirs, is agitated, and gets on—every thing tends to the end assigned it by the soul. Yet each molecule has its own task and its own nature. Thus, Theodore, look at the organs of respiration—the lungs; here, again, are those of the circulation of the blood—the heart, veins, and arteries; and here are those of digestion—the stomach and intestines. Well, you are not to fancy that they are composed of the same elements, the same beings. No; when decomposition takes place the lungs produce the kind of insects called *douves*, which fasten themselves like leeches by their pores; their body is long and thread-shaped. The intestines produce *lombrics*, formed of fleshy rings; these are cylindrical, pink, and tapered off at the extremities, without any resemblance to the *douves*. The heart produces *hematodic fungi*, a sort of little corrosive mushrooms; and so on of each organ.

"The living man is a whole universe subject to one will! Know, too, that each one of these infinitesimals has its immortal soul. The Supreme Being gives no monopoly in immortality; for every thing, from the atom to the immeasurable whole of space, is subject to absolute justice; no molecule is ever out of the place its merit assigns it, and this alone explains the admirable order of the universe. Just as man, a particle of humanity, obeys God enforcedly, so the molecule acts according to the will of the living man. Now do you understand, Theodore, the infinite power of this great being, whose will acts on us as our soul acts on our flesh and blood? Nature, whole and entire, is God's flesh and blood. He suffers by her, lives by her, thinks by her, acts by her; each one of her atoms is imperishable, for God can not perish in a single one of his atoms."

"But where, pray, is liberty?" cried I. "If I am a subject molecule, how am I responsible for my actions?"

"Liberty remains intact," said Seltsam, "for the molecule of my flesh may revolt against my whole being, and that is just what actually happens; but then it perishes, and my organism eliminates it. It has been free; it has borne the consequences of its action. I, too, am free: I can revolt against the laws of God; I can abuse my power over the existences which compose me, and by that very act bring on my dissolution. The molecules become independent again, and my soul loses its power. When we have shown that we suffer from our own faults, is it not clear that we are responsible for them, and consequently free?"

I had nothing more to answer, and we sat

there looking at each other as if each would read the other's very soul.

"My dear Seltsam," said I at last, "all this appears very logical and fine in theory; but I don't understand how it all bears on your globe, my aunt's illness, and the music you just got me to play for you."

"Nothing simpler," said he, smiling. "You can't but know that the vibration of sounds impresses on sand spread over a drum-head rapid movements, and causes it to describe geometrical figures of wonderful regularity—"

"Certainly; but—"

"But hear me out!" cried he, impatiently. "Sound acts in the same way on the molecules of a fluid, resulting in infinite combinations—with this difference, however, that these molecules being movable, the figures resulting are animate beings; this is what physicists call equivocal creation. Now sounds, acting on the nervous system, produce an electric discharge, which in turn acts on the fluids inclosed in our bodies, from which spring thousands and thousands of insects, which attack the organism and produce a crowd of ailments, such as singing in the ears, deafness, dim sight, epilepsy, catalepsy, idiocy, nightmare, convulsions, St. Vitus's dance, nervous colic, sore throat, palpitations; and in general that infinitude of ailments to which women devoted to music are peculiarly subject, and whose nature has till now remained unknown. In fact, the insects I have mentioned, viz.: *myriapods*, six-footed and wingless; *thysanuræ*, which have their abdomen fringed at the side with false paws; *parasites*, with smooth eyes and mouth formed like a sucker; *coleoptera*, with very strong jaws; *lepidoptera*, with two threads rolled in a spiral for a tongue; *neuroptera*, *hymenoptera*, *ripiphora*—all these myriads of devouring creatures are dispersed through the interior of our bodies, as in an old honey-combed bit of furniture; they dig in with their pincers, their nails, their bills, their rasps, their snouts, and pull you to pieces from top to bottom. 'Tis just the same story as that of the Roman people, enervated by Asiatic luxury, while the barbarians devour it without resistance."

Seltsam's description made my very hair stand on end. "And so you think," cried I, "that music is the cause of these disasters?"

"Incontestably. You have only to watch women long in the habit of playing on the organ, the piano, or the harp, to be convinced of it. Your unfortunate aunt is threatened with speedy destruction; I know but one way of preventing it."

"What way, Seltsam? Though her presumptive heir, I can not in conscience but do all I can to save her."

"Yes," replied he, "I recognize your usual delicacy. It is affection and not interest which guides you. But it is late, Theodore; I just heard it strike twelve. Come back to-morrow at ten in the evening, when I shall have ready the only means of saving Madame Annah. I

wish you to owe her cure to me. It will be radical, on my academic honor!"

"No doubt; no doubt. But couldn't you tell me—"

"What use would it be? To-morrow you shall know all. I can hardly keep awake."

We crossed the court-yard, and he opened the *porte cochère* on the Bergstrasse; we pressed each other's hands as we said good-evening, and I got back to my room, plunged in the most dismal reflections.

II.

I did not sleep a wink the whole night for puzzling how Seltam would manage to free my respectable aunt Wunderlich of her *ascari-des*. All next day I was tormented with the same idea. I went hither and thither, questioning myself aloud, and people in the street turned round to watch me, so marked was my agitation. Passing before the shop of the druggist Koniam, I stopped over an hour reading the endless labels of his vials and jars—*asa-fœtida*, arsenic, chlorine, potassium, Chiron's balm, Capuchin's remedy, Madame Stefen's remedy, Fioraventi's ditto, etc., etc.

"Heavens!" thought I, "what a clever fellow it must need to light on just the vial to cure us, without eliminating the central molecule! What courage it must require to deal with *asa-fœtida*, or Capuchin's remedy, or Fioraventi's, when a simple bit of bread or meat so often causes us an indigestion!"

That evening, supping *tête-à-tête* with my excellent aunt, I watched her with an eye of compassion.

"Alas!" thought I. "What would you say, poor Annah Wunderlich, if you knew that millions of ferocious microscopic creatures are bent on your ruin, while you are quietly taking your cup of tea?"

"Why do you look so at me, Theodore?" asked she, uneasily.

"Oh! nothing—nothing—"

"Yes, but I see that you don't think me looking well to-day. I look ill, don't I?"

"Why, yes, you are rather pale. I would wager that you have received a lot more music?"

"Why, certainly; yesterday I received the opera 'The Great Darius'—a sublime work! a—"

"I thought so. You have been all night drumming on the piano, striking attitudes, going into ecstasies, crying out, 'Ah! oh! perfect! wonderful! divine!'"

She turned crimson.

"What does this mean, Sir? Haven't I the right—"

"Oh! I don't dispute it; but it's ridiculous. You are ruining your nervous system; you—"

"My nervous system! You are going cracked yourself; you don't know what you are talking about!"

"For Heaven's sake, be calm, aunt! An-

ger causes electric discharge, which in turn produces insects by myriads—"

"Insects!" cried she, starting up as if moved by a spring. "Insects! have you ever seen insects about me, you wretch? What, do you dare— Why, it's outrageous! Insects! Louise! Kate! Leave the house, Sir!"

"But, aunt—"

"Go, Sir! Go! I disinherit you!"

She screamed—stammered—her cap got pushed awry: it was a frightful job.

"Come, come!" cried I, getting up, "don't let's get vexed. Why, the deuce! aunt, I am not talking about the insects you think; I am talking about *myriapods*, *thysanuræ*, *coleoptera*, *lepidoptera*, *parasites*—the whole countless crowd of little monsters which have taken up their quarters with you to devour you!"

At these words Aunt Wunderlich fell back in her chair, arms dangling, head fallen forward, and face so pale that the rouge on her cheeks looked like blood spots.

I made but one bound from our house to Seltam's hotel. As I rushed in I must have been pale as death.

"My dear fellow! There's a crisis—"

But I stopped in amazement. Seltam had got together a numerous company. There were, first, the Conservator of the Archæological Museum, Daniel Bremer, with his big powdered wig and maroon-colored coat, full face, and froggy eyes; he had in his mouth a sort of mammoth bagpipe, whose use he seemed to be explaining to the others. Then the orchestral leader, Christian Hoffer, with an opera hat, crumpled up in a big chair, with his long legs stretched in distant perspective under the table; he was playing with his bony fingers on the keys of another queer instrument of tubular shape, and did not even look up at me when the door opened, so absorbed was he in his studies. Kasper Marbach, anatomical lecturer at St. Catherine's Hospital, and Rebstock, Dean of the Faculty of Belles-Lettres, both in black coat and white cravat, were also there, one armed with an immense bronze waiter, the other girded with a sort of wild Indian drum of wood and buckskin.

These sober people, seated about the candleabra, with cheeks puffed out, stick raised, and meditative faces, made so droll an impression on me that I stopped short on the threshold, neck out and mouth open, like one in a dream. Seltam coolly pushed me a chair, and the conservator went on with his explanations.

"This, gentlemen," said he, "is the famous *busca-tibia* of the Swiss. Its terrible sounds reverberate with prolonged majesty among the echoes, and rise above the crash of the torrents. If Counselor Theodore will be so good as to take it, I don't doubt he will get a superb effect out of it;" and solemnly handing me the horn, and turning to Kasper Marbach,

"Your drum, Sir, is the most admirable thing of the kind which we have, the *karabo* of the Egyptians and Abyssinians. The jugglers use

it as dancing music for the bayadères and the serpents."

"Is that the way?" said Marbach, thumping away alternately right and left.

"Very well, very well indeed! You will get on; and as for the dean, he will only have to give a rap from moment to moment on his gong, the famous *tontom*, whose dismal sounds resemble the toll of the great bell in our cathedral. It will have a colossal effect, especially in the silence of the night. You all understand, gentlemen?"

"Perfectly."

"Then we can set off."

"One moment," said the doctor; "we must inform Theodore of our plan." Then, turning in to me,

"My dear friend, your respectable aunt's ailment demands an heroic remedy. After long reflection I have been struck with a brilliant idea. What is her trouble? A relaxation of the nervous system, the debility resulting from the abuse of music. Well, what shall we do in such cases? The most rational way is to combine in the same treatment Hippocrates's principle, *contraria contrariis curantur*, and that of our immortal Hahnemann, *similia similibus curantur*. What can be more contrary to the tame and sentimental music of our operas than the wild music of the Hebrews, the Caribs, and the Abyssinians? Nothing. So I borrow their instruments, play your respectable aunt a Hottentot air, and the principle *contraria contrariis* is satisfied. On the other hand, what is more like music than music? Evidently nothing. So the principle *similia similibus* is also satisfied." This idea seemed to me sublime.

"Seltsam!" I cried; "you are a man of genius! Hippocrates summed up the thesis, and Hahnemann the antithesis of medicine, but you have just created the synthesis. It is a magnificent discovery!"

"I know that," said he; "but hear me through. I have consequently called in the Conservator of the Archæological Museum, who not only consents to lend us the *tontom*, the *busca-tibia*, and the *karabo* from his collection, but is also kind enough to help us by playing on the fife, which will fill out our little improvised music party very happily."

I made a low bow to the conservator, and begged to express my gratitude. He appeared touched at this, and said:

"My dear counselor, I am happy to be of service to yourself as well as to your respectable aunt Annah Wunderlich, whose many virtues are clouded by this unlucky exaggeration of musical indulgence, and the abuse of stringed instruments. If we can only succeed in bringing her back to the simple tastes of our fathers!"

"Yes, if we could only succeed!" cried I.

"Come on, gentlemen," cried Seltsam; "come on!"

We all marched down the large staircase. It was striking eleven, and the night was dark and starless, while the street lanterns swung,

and the weather-cocks creaked in the frequent gusts of wind. We crept along the walls like evil-doers, each holding his instrument of music concealed about him.

At my aunt's door, I slipped the key softly into the lock, and Seltsam having lit a bit of candle, we quietly entered the vestibule, where each one took position before the bedroom door, and, with his instrument at his lips, awaited the signal. All this had been so discreetly managed that nothing in the house had stirred. Seltsam even softly opened the door a crack, and then, raising his voice, cried, "Go ahead!"

And I puffed at my bull's horn, while *tontom*, fife, and *karabo* did their best to aid the din.

It would be impossible to describe the effect of this wild music—you would have thought the roof was coming down. We heard a cry from within; but, far from stopping, we were seized with a sort of madness; the big drum and *tontom* broke out afresh, till I couldn't even hear my own horn, whose blasts generally rise above the crash of the thunder-bolt; but the *tontom* was the stronger; its slow and dismal vibrations awakened in us a feeling of inexpressible terror, as at the approach of a feast of cannibals, where one should have to figure as roast sirloin. Our hair stood up on our heads like wands: the last trump, when it sounds the *reveille* of the dead, will scarcely have an effect more terrible.

Twenty times had Seltsam cried to us to stop; but we were deaf, possessed with a sort of demoniac frenzy. At last, panting, exhausted, and scarce able to stand, so used up were we, we were fain to stop our frightful racket. Then Seltsam, with raised finger, said:

"Silence! listen!"

But we could not hear the slightest sound for the humming in our ears. In a few moments the doctor, uneasy, pushed open the door, and went in to see the effect of his remedy. We waited impatiently, but he did not come back; and I was on the point of entering myself, when he came out, pale as death, and with a strange look.

"Gentlemen," said he, "let's be off!"

"But what is the result of the experiment, Seltsam?"

I was holding his arm. He turned round abruptly and answered, "Well, she's dead!"

"Dead!" cried I, starting back.

"Yes, the electrical commotion was too violent; it destroyed the *ascarides*, but it unluckily crushed the central molecule. However, that proves nothing against my theory. Your aunt died *cured*!" And he left the house.

We followed, pale with terror. Once outside, we scattered, some right, some left, without a word. We were appalled at the upshot of our adventure. The next day the whole town heard that Madame Annah Wunderlich had died suddenly. The neighbors asserted that they had heard strange, terrible, and unusual noises; but, as it had been an unusually

stormy night, the police made no investigation. Besides, the doctor called to testify to the death declared that Madame Annah died of an attack of apoplexy, playing the final duo of the "Great Darius;" they had found her seated in an arm-chair before her piano.

About six months after Dr. Seltsam published a work on the treatment of *helminthæ* (intestinal worms) by music, which had incredible success. Prince Hatto de Schlittenhof sent him the grand cross of the Black Vulture, and her Highness the reigning Duchess deigned to compliment him in person. They even talk of choosing him President of the Scientific Association.

As for me, I shall reproach myself my life

long with having been instrumental in my dear aunt's death, by blowing for a whole quarter of an hour into that abominable *busca-tibia*, which may Heaven confound! True, I had no notion of harming her; on the contrary, I hoped to free her of her *ascarides*, and give her many more years of life; but she died of it, for all that, worthy woman, and I shall never get over it.

Heaven is my witness that the notion of smashing the central molecule never entered my head. Alas! I confess, to my shame, I should have laughed in any one's face who had come to me with the idea that you could kill even a fly *with a tune*.

LIFE IN BRITTANY.

I.—A WEEK AT NANTES.

WE passed out of the Mont Parnasse station, Paris, promptly at half past nine in the evening, and as promptly, at six the next morning, we glided into Nantes, the ancient capital of ducal Brittany. In eight hours and a half we had traversed France from the metropolis nearly to where the shores of Biscay form the western boundary of the empire; and, leaving in the evening the splendid centre of the latest civilization, we awoke amidst a primitive people, whose ideas and habits were in many things those of a by-gone age. Fortunately the early morning sun had awakened us out of that troubled slumber which one snatches as he can when traveling by rail; and during the last two hours of our journey we were able to enjoy to the fullest the singular landscape of the lower Loire.

The Loire, rising in the east of France, and holding an erratic course through its centre, becomes, near Nantes, a broad, deep, and swiftly flowing stream, bordered by meadowy banks, and holding in its bosom a multitude of fertile little islands. The railway runs along its northern bank, following closely the windings of the river. From the carriage window the eye stretches over the lovely islands which are almost crowded as they lie in the stream, so numerous are they, and beyond them were beautiful meadows, with their quaint villages and plenteous crops, until the sight is bounded by a range of lofty, and here and there craggy hills, whose summits are now thick with chestnut and oak forests, now crowned by an ancient Breton château, and now bearing upon their sides a curious, sleepy village, and on the very summit a stately old church, in singular contrast with its flock of lowly huts. In the Loire itself the busy world of raftsmen and fishermen, of little steamers and pleasure yachts, was already astir; and we were amused to note, among the former, how primitive and old-fashioned was their *modus operandi*; how the rafts were still navigated by long poles planted in the river's bottom, and the sails were those of the Middle Ages; and with what patient, snail-like plod-

ding each man did his allotted work. Afterward it occurred to us that this first glimpse of Breton river-life was a hint of the condition of that province in all respects—material, intellectual, social, and religious; for we discovered that in all things these Bretons were slow and patient; that they clung to old customs, appliances, and thoughts, and hated the new civilization as an impudent intruder; that here, of all sections of France, the old religion held the least disputed sway; that education was backward, learning rare; that the stiff and ceremonious social life which, elsewhere, revolutions had subdued, here remained stagnant, and gave the key-note of communication between man and man.

The first view of Nantes, as we emerged from the station, and were for once pleasantly disappointed in not being forced to pass through a pandemonium of importunate *cochers*, was striking indeed. The station stands at one end of the town, upon a slight eminence; and from its porch our view to its further limits was almost uninterrupted. There lay, just awakening to its daily labor, the quaint and fine old city of another age, only just modernized enough to keep life in it.

Just below us the river wound in an abrupt turn, passing on through the midst of the town, and flowing rapidly—perhaps merrily, as if not suspecting its defilement by the crowded city—perhaps desperately, as if conscious that it *must* "flow on forever," defiled or not; and now, as it disappeared among the houses, dividing into many separate streams, and forming as many crowded and thickly built islands, straight before us, its foundation below the level of the street, stood the ancient castle-palace of the sovereign dukes of Brittany, repaired here and there for present garrison service, but wearing the gloomy and mouldy look of extreme age; while just beyond, on the summit of a hill overlooking the castle, stood the square-towered cathedral, "built," the guide-book told us, "in the twelfth century," and now showing indications of the revolutionary desecration which the venerable pile had suffered more than once.

A rickety old city it was, too, as we gazed on it from the station portico. Houses were leaning over against each other, or jutting threateningly over the narrow streets in a most ludicrously drunken fashion; some were sunk below the street, and seemed about to topple into the waters of the Loire; others sought each other's mutual support, and seemed to have made an eternal contract on the principle of "united we stand, but divided we fall." Further down, where the Loire, passing the populated islands, remingled its waters into one wide sweeping stream, lay the shipping—small vessels mostly, engaged in the coasting trade, and now moored to the fine long quays; to build which the Nantais were forced to give up—and not without much conservative grumbling about "these terrible times"—their favorite shady promenade at the river's side. The whole place looked so temptingly odd, so refreshingly unique, that we declined the services of the neat little round omnibus which stood ready to accommodate passengers, and made up our minds to walk to the hotel. My companion fortunately knew the "ins and outs" of the town, having been there before, and promised to lead me through its most interesting parts.

It was Saturday; and, for one reason, we could not have hit upon a better day and hour to reach Nantes. It was the great weekly market-day, when the peasants and *bonnes* from all the surrounding neighborhood came in with their various stock, and the fishermen reaped the reward of their last few days' patient, monotonous toil. It was just the time, my friend said, to see them coming in, and to visit the central "halle." We passed down the hill from the station, took our course along the street which passed just below the high castle walls, and which bordered the river, where the small tradesmen had already begun to let the light of morning in upon their wares, and to prepare for the bartering of the day. Finally we came to a large, open, paved square, one side of which was open toward the quays and the river, and the other three inclosed by tall, ancient buildings, so fantastically decorated with façades and window-carvings that they must once have been the homes of the great, but which were now occupied, in *étages*, by merchants in the lower, and tradespeople and working-people in the upper stories. The square, called the "Place du Marché," presented a most animated, and even to the traveler wearied with sight-seeing, a most interesting scene; for the market was already open, and the farmers—of whom there were far more women and stout, hearty girls than of the sterner sex—were arriving, with their odd-looking wagons of every shape, size, and beast of burden, filled to the top with fruits and vegetables. There were booths made of wood, some with canvas, others with wooden roofs, open on every side, and supplied with stalls fitted to receive the various produce; while the

poorer market-people—those who could not afford the tax for the luxury of a booth—were fain to content themselves with a rude table surmounted by a huge cotton umbrella, or even to spread a cloth upon the pavement, deposit their wares thereon, and deliberately squat down on the ground beside it. It may not be known to all of my readers that in Brittany each village or commune has its peculiar costume—no two having the same; and it is also a matter of pride with the rustic folk that their distinctive dress shall be as unique and showy as possible. The effect of this lively market scene, therefore, was vastly enhanced by the great variety of color and form in the *coifs* and shawls, the shoes and skirts of the women—these having come from some dozen or twenty villages within a range of fifteen miles around Nantes. There was, indeed, little difference in the dress of the men—the empire of dress being conceded, in that primitive district, as all the world over, to woman; it was upon the persons of the *bonnes* that you observed more especially the peculiarities of the costumes. The *coifs*, or head-caps, were the most noticeable feature of the women's attire; and, although neatness is by no means a Breton trait, the Breton women are not only very proud of the starch cleanliness and fineness of their *coifs*, but will often purchase one—so as to outdo their neighbors—with the earnings of a month's hard drudgery. And here, on the market square, was a perfect sea of these dazzling white *coifs*; some flat and broad at the back, some long and tunnel-like, extending parallel behind the head, some perpendicular and rising high above the forehead, some resembling the familiar cap of the Venetian doges, some more simple, fitting close to the skull and adorned by long, fanciful strings reaching to the waist. Their dresses had the peculiarity of extending from the arms, without tapering in the least, to the middle, being as large below as above; and they all wore little shawls fastened in front, and as various in shape, color, and decoration as were the localities from which they came. The men were mostly habited in short jackets, with high, close vests, broad-brimmed hats, leggings, and huge wooden shoes called *sabots*, turning up at the end, and held to the foot by a single strap. But these people themselves, their physiognomies and manners, were quite as curious as their costumes. Mostly rather under medium height, they were solidly and compactly built, their features were hard, sunburnt, and positive, and their whole appearance that of a stolid, sturdy, hard-plodding, obstinate, persevering peasantry. Energy was written upon every face, but energy of an ignorant and dogged sort. Their movements were deliberate, and, except that all over the square an incessant chattering was kept up, there seemed to be little in common between these rude Celts of the west and what are generally regarded as traits of the French character. Brittany was the last of those provinces,

which now compose the French empire, to submit to Roman domination; the last to give up that Druidical government and worship which, even to our modern eyes, had something about it imposing and grand in its simplicity; and the last to receive that mixed civilization which began to fructify in France under the Merovingian kings. It will, probably, be the last to break away from its superstitious allegiance to papal Rome. It is here, therefore, of all France, that you find the purest remains of the Celtic race; and that the hardy and stubborn traits of the Celt, discoverable also in Wales and the Scottish highlands, are still to be found in the ideas and manners of the people. These market-people exhibited a very marked contrast to the peasantry in other parts of France. Sharp at a bargain, shrewd in judging physiognomy and character, quick to seize an advantage, wonderfully clever in the art of bartering, their movements were yet heavy, their faces dull, and their sense harder and more positive than sparkling or versatile. When the buying and selling began it was amusing to witness the haggling and beating down, the fist-shaking and screaming, the rivalry between neighboring vendors, the blunt humor and quaint retorts, the general hubbub and clamor which ensued. Although a primitive people, as far as their backwardness in civilization and their seclusion from the line of travel and the centres of enterprise are concerned, they are, as I had good reason to know during my visit, by no means primitively honest. To that obscure corner of the continent has penetrated the familiar legend that the pockets of Englishmen and Americans are exhaustless, and their "gullibility" boundless; and a single glance of their sharp Breton eye is enough to convince them whether he who stands before them be or not an Anglo-Saxon victim, ready for the sacrifice. In the market-place it was easy to see that the buying and selling were every where a contest, in which the buyer's part was to beat down as much as he could, and the seller's to maintain as high a price as he could; and the whole art of "sharp trading" seemed, among this quaint folk, to have reached perfection. Many were the shouts raised as we passed among the stalls—for they recognized our nationality at once—calling on us to look at the wares, and begging us to buy a "*petit sou*" worth of this or that. Some followed us, holding in somewhat disagreeable proximity to our faces every species of fruit and vegetable, from carrots and cabbages to melons and pears, and, in tones that were meant to be seducing, pretended to offer them to us at a sacrifice. Others, who had—it is impossible to conjecture how—picked up a few English words and phrases, thought to win our patronage by regaling us with a mangled Breton version of our mother-tongue. "Goot day-ee, Sirr;" "Vill yoo a-erve zoom—zoomzing—zis morrnang?" "I go vur to show you zoomzing farry goot!"—these are but feeble specimens of some of the

sentences which assailed our ears, and afforded us amusement. We left the market, after thoroughly enjoying the scene, and passed up the hilly Rue Crebillon—the principal thoroughfare of Nantes, but as narrow and gloomy-looking as the Roman Corso—and, reaching the top, found ourselves in the principal square of the city. It was an oldish, stately, musty-looking square, on the very crest of the hill. On one side stood the theatre, built in the Pantheon style, with a row of high columns supporting an ornate façade, and surmounted by statues of nine very lugubrious Muses, each one of whom having paid the penalty for being patiently graceful for centuries by having lost some limb or other part equally necessary to the symmetry of the human figure. Two sides of the square were composed of high, ancient buildings, uniform in construction and ornament, the upper stories occupied by families and the lower by *cafés*, restaurants, and billiard halls. On the fourth side stood the grim and gloomy-looking Hôtel de France—where we were to tarry—which has been for centuries now the best hotel of Nantes, and has the same staid, stand-still look which both the general appearance of the old town and the people themselves present.

Entering the hotel court, we were almost awe-struck by the sphere of stately tranquillity, of venerable dullness, in which we found ourselves. It was monastery-like in its stillness. We were ushered to a grand and gloomy apartment, which we might almost have imagined to be the well-preserved sleeping-chamber of some merchant of the seventeenth or eighteenth century. The furniture was ponderous and old-fashioned; there were antique clocks and vases and mirrors and curtains and *fauteuils*; the bed was very low, but supplied with a lofty canopy and obstinately immovable drapery; there was the oaken floor of the olden time, with its neatly disposed pieces and its dangerously slippery gloss; gas was wholly wanting—indeed, it is vulgar at Nantes to use gas in the chambers and saloons, it being considered as only fit to light the kitchens and back entries; there were no water conveniences, such as one expects nowadays in first-class hotels, but only the old-fashioned bowl, basin, and ewer; and every thing, indeed, seemed to have remained just as we found it, from a time beyond the memory of living men.

Not caring to await the traditional Breton hour for breakfasting, we called the *garçon* to order something to assuage our hunger; but the *garçon* looked horrified when we gave the direction, seemed never to have heard so audacious a proposal before, and with great dignity assured us that the hour of breakfast was half past eleven, and that no breakfast could be forthcoming before. So we were fain to sit on the pretty balcony before the window, and watch what little life there was astir in the square until the not-to-be-anticipated hour should arrive. A few jauntily dressed gentle-

men were promenading to and fro on the square, which is the favorite resort of the business men, out of their counting-house hours; even so early in the morning there were groups sitting under the awnings in front of the *cafés*, sipping *café au cognac*, and that most baleful but apparently fascinating beverage, *absinthe*; while every now and then street hawkers would go by, screeching their wares at the top of their lungs, and making the whole square ring with their various and discordant cries. The traveler who awakes on his first morning in Paris—especially if he be of an economical habit, and lodges in the Latin quarter—is almost inclined to imagine himself in a vast lunatic asylum. He is appalled by a chorus of weird shrieks and cries, many-keyed and discordant, loud and feeble, far and near; when, looking out the window, he is surprised to find these startling sounds issuing from hard-featured coster-mongers or dapper little peasant women, who are busily engaged in selling their pears and artichokes, cherries and potatoes. But, in this respect, Nantes quite outdoes the great metropolis; and I observed that, at Nantes, nearly all the hawkers were women, and that each had chosen a sort of strange tune or strain, peculiar to herself, which she sung without change day after day. It would puzzle the most accomplished of French linguists, if he did not have a peep into their baskets, to find out from their cries what they were attempting to sell. These women, who, like the market-people, were mostly from the neighboring rural districts, were usually dressed with scrupulous neatness, their long *coifs* white and shining with starch, and their aprons, fresh from the iron, carefully tied with long, wide strings which fell behind; they had cheerful, hardy, sun-burnt, but rather keen and shrewish countenances, which seemed to say, "Here's for a bargain, and if you don't buy, I'll bite ye!" Peculiarly strange were the cries of the shrimp and sardine women, for the reader need hardly be told that Nantes is the great sardine emporium of the world, that delicious fish being caught in the Bay of Biscay near by, and preserved by the large establishments of the Breton capital. The sardine women sell them fresh, or as nearly fresh as possible—for so very delicate is the fish that it is necessary to salt it as soon as it is caught; and their cry is a wild, high-keyed shriek, and fairly startles you, it is so seemingly painful. Probably there are no harder-working people in the world than these Breton peasant women, whose cries distract one in the early morning. Usually the wives and daughters of suburban farmers, they aid in the tilling and planting of the ground; tend the crops during their growth; gather the fruit and vegetables when they are ripe; load their little carts or heavy baskets, bring them into town, and go hour after hour over the stony streets until they have completed their extensive round, screaming at the top of their lungs, and gathering a few *sous* with difficulty here and there; then, their hard day's

work completed, trudging back with their carts and baskets to their distant country home. There are such workers in that frivolous and unthinking France, which we are apt, from a superficial view only, to believe wholly given over to indolence and dissipation. When you learn with what patient labor these creatures earn their daily bread, you are no longer inclined to lie, mentally denouncing them for disturbing your morning nap; you will, now and then, spend spare pennies upon their wares, and not regret it; for sympathy with the trials of the lowly ennobles, as well as gratifies, the right-feeling man.

Exactly at the hour announced we sat down to a thoroughly French provincial breakfast, in a long *salle à manger*, quite as dark and heavy and old-fashioned as our chamber had been. There was no coffee or tea, and no getting either; every one had wine, and excellent Bordeaux it was. We were served with soup, sardines, sole, chops, *filet de bœuf*, vegetables, cheese, and fruit. The people at table were silent, and devoted themselves assiduously to the occupation immediately pertinent; it was in striking contrast with the Parisian table, where there is an incessant talking, and an easy making of acquaintances. On leaving the table we adjourned, with the rest, to the neighboring *café*, which was, at noon, full to overflowing, it being the custom to drink and play dominoes, cards, and billiards for a while after the morning meal. Here were the officers of the regiment which was posted at Nantes, in full military costume, lazily pompous and idly vain, discussing, with their after-breakfast potations, the last review, or the probability of a war with Prussia; merchants making contracts, and inquiring the last news of the Paris markets, over their *hock* and *absinthe*; dandies of the provincial sort—gaudy and boisterous—talking over the gossip of the prefect's ball, or the latest *mariage de convenance*; clerks and tradesmen, idlers and foreigners, each indulging in whatever game or potable best suited his taste. A most dreary life, we thought, this provincial *café* existence. In Paris the *café* frequenter has some distraction in the brilliant surroundings—in the gay crowd collected about the tables, the continuous tide of men and women which passes unceasingly along the boulevard, the incidents constantly occurring, the sparkling outer life of the splendid city; but here, at Nantes, the *café* life is but a dull and empty iteration, without a spark of the excitement which alone would seem to make such a resort tolerable. Yet in the early morning, at high noon, and from before sundown till midnight, the *cafés* are full; you see the same faces there day after day, the same games, the same occupations and choice of beverages; husbands deserting their homes, and bachelors avoiding the marriage tie, in order to enjoy the monotonous pleasures, the attractions of which no stranger, at least, can discover. The Nantes merchant, although shrewd and active when he

is at his warehouse, leads a very easy, indolent existence. He rises at nine, takes a cup of coffee, and goes to his counting-room. He stays there some two hours, reading his letters, arranging his business, and giving his directions for the day. Between eleven and twelve he returns home to breakfast; he leaves the breakfast-table for the *café*, or his club. It is two o'clock before he returns to the counting-room; and at three you will find him on the bourse. Having finished the financial gossip of the bourse, he does not return to his counting-room; but either takes a walk or a drive, promenades with a friend on the square, drops in at the *café* to read the Paris papers, or hastens to his club to meet his cronies at the whist or picquet table. His favorite aim is to amass enough upon which to retire from business, and to be able to do nothing during the latter half of his life; to have his meals at a restaurant, his spare money for cigars and the *café*, for the theatre and concerts; to have it in his power to run up to Paris now and then, and to have his small country seat on the sea-shore, or *à la campagne*, seems to be the limit of his ambition.

We had gone to Nantes to see and study society far from the much-traveled routes; and our week there was not wanting in many interesting experiences. We wandered with delight about the old Breton town, unharassed by *commissionaires*, able to dispense with guides both human and red-bound, and without meeting at every turn a group of sight-seers "doing" the town according to Murray. We sauntered along the quays of the Loire, where the sun, even in October, beat remorselessly down upon us; and observed the curious river life—the sailors in their broad hats, the coast-wise vessels with their freights, the ugly little steamers plying up and down the river. We took the huge flat ferry-boat, and for a *sou* crossed the rapid river, and betook ourselves into the neighboring country, where we found the oddest little broken-down villages, with their long roofs almost touching the ground, their one-sided, ancient churches, and their straggling, rickety, single street; found, here and there, Druidical stones and Roman remains; rambled along the rustic roads for many miles, having on either side of us a vast expanse of vineyards, their fruit just now yielded up, extending as far as eye could reach; and observed that every where the women were the hardest workers, and had the brawniest arms, and seemed far more patient and enduring than their lords. We went back to the city over the many bridges which span the islands of the Loire, joining together the distant banks; and on these islands saw many sorrowful sights of want and filth, and the savageness of an unlettered people which only earns its bread, and scantily that; for these islands, once beautiful in verdure and fertility, as are those further up the river, are now thickly populated, and with the poorest and worst classes of the city. The cathedral, with its huge square towers, not unlike those

of Notre Dame, its great portals crowded with Scriptural *bass-reliefs*, and its broken stones and pillars—the lasting mementoes of the ferocious, desperate men of '93; the curious old castle, a mosaic of the Middle and the Modern Ages, where we saw the room—now used as an armory, and filled to the roof with Chassepots—in which Henry the Fourth signed the Edict of Nantes; the gloomy old building where the victims of the Revolution were confined, and awaited in the dark and damp dungeons their inevitable doom—among them the ninety priests who were drowned in the river opposite; the quaint little house honored by royalists as the hiding-place of the Duchess De Berri—these afforded us many an hour of interest and pleasure. But, as men and women in this world are far more curious respecting men and women than the places they inhabit, our chief pleasure consisted in observing the manners and customs, the traditions, superstitions, and opinions of this population, far away from the centres of civilization, and cleaving to those ideas which to us seem, in this age, amusingly ill placed. At the east end of the city, just beyond the cathedral, is a long and pleasant avenue, shaded by umbrageous trees, and reached by a broad flight of steps at either end. The houses which face it are old, lofty, and substantially built. Here live the descendants of the proud old Breton aristocracy—perhaps the haughtiest and most exclusive in the world. Here they live on, year after year, associating only with each other, seldom appearing in the outer world, leading an almost hermit-like existence, devoted children of the Romish Church, looking with ineffable contempt on the Emperor and all his adherents, observing with pious veneration the anniversary of the death of Louis XVI., awaiting the return of the Bourbons to the throne, and condoling with each other, gloomily longing for the days that are gone. There—if you can but get a glimpse of this fossil society—you will find, faithfully preserved, that grand politeness and chivalrous courtesy which were so famous in the court life of the last century; a ceremonious demeanor which contrasts oddly with the society of the age in which we live. This Bourbon aristocracy takes no part in the affairs of the world around it; eschews politics and official balls; makes no new acquaintance; and passes, year after year, a monotonous, useless, and wholly vain existence. In one respect alone do they appear to have departed from the precepts of their fathers. Many of them are far from wealthy—for there have been, *malheureusement*, revolutions—and the inheritors of the past have been plundered and driven from ancient patrimonies by the claimants of the future; yet wealth is necessary to support their position in their own circle of society. These haughty Bourbon Catholics, therefore, are fain to marry their sons and daughters to the sons and daughters of the coarse-blooded but well-to-do merchants of the western quarter. Marriages of this sort are frequently concluded, oft-

en with a sad result. The young aristocrat of the Cour St. Pierre marries the merchant's daughter from the Cour Cambronne, and henceforth she is a stranger to her father's house. The parents—having granted their child an enormous *dot*—are doomed to neglect, to the contempt of the son-in-law and his family, and even to the slights of their own aristocratic daughter. As soon as she arrives in her new home she is urged to avoid all her old friends and acquaintances, and even to forget her parents and brothers and sisters; and too often the advice is effective, accompanied as it is by menaces and perpetual persecution.

The mercantile community, which resides for the most part at the western end of the city, is hardly more social and hospitable than the proud old aristocracy which contemns it. To strangers they are uncommunicative and slow to make social advances. They are purse-proud, as the others are family-proud. They move in their own circles, have their peculiar habits and pleasures, and pass their lives in a certain groove, with little variety or excitement. They leave town with the first signs of approaching spring, their houses are closed, and they return only when the frosts and bleak storms of November warn them that the country will soon be insupportable. Unlike the mercantile class of England, and, indeed, of most civilized countries, they show little public spirit; invention, the triumphs of science, educational improvement, politics, the sanitary, moral, and material condition of their city, seem to have but little interest for them. The different members of the family have each their daily amusements and duties, and these seem seldom to unite the family together. The father's daily life has already been described; that of the son differs little from it; but he has his own boon companions, his own club and *café*, his own separate amusements, which, of course, take him in a different direction from that pursued by the elder. The mother and daughter devote themselves but little to household cares, which are undertaken by the *bonnes*—who, if there are young children, have nearly or quite all the care of them. The ladies, meanwhile, are devoting themselves to dress and society; managing how to save enough here and there to enable them to meet the demands of the *tailleur* and the milliner; living closely at home, so as to shine abroad; and having their round of duties and pleasures quite distinct from those of the male members of the family. Among other resorts we visited one of the clubs frequented by the wealthier class, called the "Société des Beaux Arts." Instead of the plain and substantial elegance of the English clubs, the building of the "Beaux Arts" was most gaudily and luxuriously decorated. You entered a spacious hall, brilliantly lighted, and decorated with pillars, statues, and flowers; the panelings gilded, and a richly carpeted oaken staircase leading to the rooms above. The apartments used for club purposes were provided with every ap-

pliance of luxury and comfort; the whole invited to indolence and dozy idleness. In one room were to be found newspapers and light reading matter, in another billiard-tables, in a third a spacious restaurant or a *café*, in nearly every one card-tables and facilities for gaming. Attached to the club was a finely frescoed, cozy little concert hall, with a covered gallery running round three sides, supported by graceful pillars; the fourth side was taken up by a tasteful stage, upon which stood a grand piano. Here, twice a month, classical concerts were given by notable artists, to which the members were admitted free, and for which each member was supplied with two cards for his lady friends. We could not help observing, however, that the great attraction of the club was the gambling; that vice, with other ancient customs, continuing to be the fashion in that community. The larger part of the frequenters of the club were at the tables;—young men, with an ambition to be considered "sports," deep in the cards, and old white-headed men looking on approvingly, and often participating in the game. The club, in the Breton towns, is merely the trysting place for gossip and gambling; and so rooted is the custom of playing for money that one not only hears, in the best society, no condemnation of it, but it is rare that a ball or party is given in which a room is not set apart and supplied with cards, dominoes, and tables, for this special purpose. A ball at the palace of the prefect is one of the few events which break the monotony of drowsy provincial life; and there, perhaps, you may best observe this provincial society, which has so obstinately preserved the customs of times gone by. The invitations are freely given, and the company, wanting only in the old Bourbon *noblesse*, presents a mosaic of various classes, and a fair illustration of the community. Being offered a card for one of these occasions, we seized the opportunity to go. The spacious *salons* of the prefecture were daz- zlingly lighted by thousands of candles, and the company had mostly assembled when we arrived. After saluting the prefect and his lady we passed on and observed the throng of provincial fashionables. Around the long *salon* were two ranges of seats, one above and behind the other. Along the upper seats sat, in a long row, the *mères de famille*, pompous and stately old ladies with white curls, and dressed with profuse elegance. In the seats below them sat their daughters, over whom they were keeping a strict and vigilant watch. A gentleman who wished to dance with a young lady had no need of an introduction; it was his duty to approach, salute the mother, and request her permission to dance with the daughter. This obtained, and the young lady also assenting, they would go upon the floor; while, all through the dance, the dowager would sit with her eyes riveted upon the couple, and sharply scan their every look and movement. This gave us a hint of the predominating rule in French provincial society, the strict separation of the sexes in youth.

Paris is fast outgrowing that strange custom, the relic of less civilized times, which has produced so much connubial misery, which makes each sex suspicious of the other, teaches the young men to live dissolute and shameful lives, and the young women to look upon their future lords as conspirators against their honor; but in Brittany the custom still flourishes, and the rule of separation is still inexorable. No young lady, or even, for that matter, no lady of doubtful age, unmarried, goes from home alone. Either her mamma, some elderly relative, or a *bonne* accompanies her to the shops, or to take her music and drawing lessons. Never, by any chance, is she left alone for a moment with a gentleman. Even when betrothed—even when another week will find her wedded—her lover's visits are paid, his soft speeches uttered, in presence of the father or mother, or both. The *mariage de convenance*, which at Paris seems in a decline, still prevails every where in the provinces. All things are arranged through that universal diplomat of domestic life, the notary, excepting that in rural Brittany the village tailor, according to a very ancient usage, is intrusted with the marriage negotiations.

The lower classes at Nantes are as easy going, as fond of their few amusements, as unimpressible—more so, if possible—by modern ideas, as their social superiors. Their day's work done, their steps tend toward the *cabarets*, where they spend their earnings on the hot white wines of the district; then, in parties of a dozen, they will interlock arms and go bawling through the streets till far into the night. On Sundays they attire themselves in their best suits, and ramble into the country, or sail or row on the river, or repair to some rustic inn, where they dance, drink, and gamble the livelong day. Very few can read or write, none seem to be ambitious to better their condition. If they earn enough to satisfy their pleasures, *pour passer le temps*, after work is over, they are quite content. Drunkenness is more frequently met with than in Paris; there are certain streets in Nantes where, go when you may, you are certain of seeing miserable people reeling about, or lying stupefied at the doors and on the sidewalks. Beggary is common, and the beggars importunate. The ragged little urchins of the street will follow you square after square, running after you, and with piteous accents implore you for one *petit sou*; yet, if you give them none, will go skipping off singing some rude song, or cutting such capers as only a French *gamin* can. The Breton peasant, while naturally fierce and passionate, has a great capacity for keeping his temper, and brawls are happily few and far between.

There is no more striking proof of the stagnant condition of Brittany than the fact that the population of Nantes has decreased within three years from 113,000 to 111,000 inhabitants. Thirty miles below, where the Loire empties its broad stream into the stormy Bay of Biscay, a town is growing up, draining the life out of

the old capital, and multiplying with a rapidity which reminds one of our own far Western settlements. The tide of civilization seems to have swept by Nantes, and to have left there but few vestiges of its passage. Ignorance and superstition still cling to it, and dominate it. Even Protestantism, which has timidly penetrated into this strong-hold of the old Church, has caught the drowsy influence of the place, and makes no progress. A week was long enough to stay, and we were glad to get back to Paris, and find ourselves once more in a wide-awake city, frivolously brilliant though it was.

CHOOSE.

My tender thoughts go forth, beloved,
Upon the pleasant morning hours,
With songs of mated birds and sighs
From virgin hearts of opening flowers.

Full laden with love's daintiest store,
Each smallest thought should come to thee,
As from the jasmine's hidden cell
Flies home the richly burdened bee.

My joyous thoughts go forth, beloved,
Upon the golden airs of noon,
With languid sweets from roses rare
That flush and faint through ardent June,

With all the swiftness of the streams
That fling out laughter as they run,
With all the brightness of the day,
With all the passion of the sun.

But when along the cloud-hung west
The purple lights grow pale and die—
When waves of sunshine roll no more,
And all one shade the corn-fields lie—

When twilight veils the hills, and gives
A deeper mystery to the sea—
Then, O beloved! my saddened heart
Yearns through the distance unto thee.

And when the winds come o'er the sands
To sweep my lonely garden through,
To bow the saintly lily's head,
And spill the violet's cup of dew—

And when they higher mount, and beat
The elm's long arms against the eaves,
Troubling the robin in its nest,
And making tumult in the leaves—

Then in the dusk I seem to hear
Strange sounds and whisperings of dread,
And every murmur in the grass
Seems some unfriendly spirit's tread.

I shrink within the shadowed porch,
A nameless fear oppresseth me—
Oh, then my heart, like some lost child,
Calls through the darkness unto thee!

So, dear, of all my life of love,
Choose thou the best and sweetest part:
The glow of day, or gloom of night;
The pride or terror of my heart;

The glad, exultant hope that fills
The morning with its joyous strain,
Or twilight's haunted loneliness,
That stretches out its arms in vain.

Would sigh or carol move thee most?
And were thy tenderest kiss bestowed
On eyes that droop with tears, or lips
With careless laughter overflowed?

So questions, love, the foolish heart
That would thy secret choice divine;
Yet idly questions, knowing well
Thou canst not choose, since all is thine.

A PILOT'S WIFE.

OF course I knew Bert was a pilot when we were married, and knew also what the duties of a pilot were; for many a time had I been down the bay in his boat, ripping up the sheet of harbor water, with its enamel of blue and silver, the sun striking out ahead of us, and the wind just swelling the sails, as if we were drawn by a pair of swift white swans. Bert would be over the side fishing when we had anchored, and presently there would be the nicest chowder that ever contented hunger, the table spread in the neatest cabin afloat as handsomely as in some great gentleman's dining-hall—for all that I know about great gentlemen's dining-halls—with every delicacy of the season on it, and duff stuffed full of plums. When we girls came on deck again, after some of us had taken our naps as comfortably as in Sleepy Hollow, and some of us had peered and pried into the tiny kitchen, and learned how the boys got along in rough weather by examining every thing we could come across, and some of us had prinked in the looking-glass till we were quite satisfied with ourselves, and ready to afford somebody else satisfaction, then we would find one of the boat-keepers tuning his violin, and another wetting up his piccolo, and we would dance till sunset, just as merry and careless as the flies dance in the air; and so at last out swelled the sails again, and up we floated homeward, all of us laughing and chaffing, and lunching with insatiable sea-appetites, till the moonlight softened the sport and made us sen-

timental; and the songs began stealing out over the water so sweetly that all the little boats would turn about and stay to listen; and when we were at home it seemed to us to have been such a day that we could not believe in it any more than if we had stepped upon another star; and we fancied, to be sure, that a pilot's life was, after all the talk—cruising about summer waters, with spacious decks and a flute and violin—as pleasant as one perpetual picnic; or else why were gentlemen who were able to buy every delight that the land affords spending half their fortunes in yachting round the coast from June until November?

I hardly ever gave the thing a thought, though, whether it was pleasant or not, all the time—whether it was safe as a rocking-chair or otherwise—I believed so thoroughly in Bert's skill. But I should have been a greater fool than I was if I had not known that it was really dangerous; for once I was out with Bert and his mates, and it came on to blow in the wildest manner. He brought the boat to anchor under lee of an island, took in every stitch of sail, and was for keeping me below; but I wouldn't be kept, because if I was going to be drowned at all I wanted to be drowned in the open sea, and not in the cabin; so he made me secure and comfortable, and we rode it out, the sun shining just as clear as ever an October sun shone in the bluest of blue skies—skies like burnished steel; but the screaming and roaring wind raging over us in mighty gasps, the boat plunging bowsprit under with every shudder, and throwing the water up around us in great and real rainbows. It was frightful, but the sunshine made it splendid. That was a storm, I thought. Well, Bert knew what to do, it was evident—just down with his sails and out with his anchors, and wait till it blew over. And Bert let me think I had actually been in the worst kind of danger, which it might have been, indeed, if he had been heedless or unskillful—let me think so because he knew, by that time, that I cared for him a good deal, and he didn't want me to be quivering at home with fright whenever the wind blew. But if I had seen some great ship in the distance, union down, and signaling for a pilot, and had seen Bert, in his stout boat-rig, jump with the keeper into the canoe, and fly after her like a petrel, half in, half under, the water powdering over them, uncertain should they reach the ship, unable to return, drawn up at last with bowlines tossed out to them—lines into whose noose they thrust their legs while holding on with their hands above—the canoe sinking under them, as it thumped against the ship's side, while they swung over those black gulfs of death, and were dragged up out of a watery grave into perhaps a worse one—the ship just back from a three-years' voyage, and her best bow anchor gone, so that she would drag ashore in spite of the

others, and must be taken up to still water through all the boiling channel-ways between ledges and rocks and shallows, come what might; or had it been a month later, and in the wintry weather, high seas, and every bucketful of water freezing as it fell on deck, till anchors and chains and ropes and canvas were bedded in ice, and the ship was settling two feet by the head with the weight of the frozen spray about her, so that the first thing for the pilot to do was to put her about as best he could, and run for the Gulf Stream, and melt her out, and wait for a south wind, and come up a week after, if, indeed, he ever came up at all—why, then, if I had seen such sights as these, and lived through the seeing, I might have said that I had known what danger was. Yet they were in reality the scenes of Bert's everyday life, in our climate, where half the year it is foul weather, and where, storm or shine, Bert's boat must be upon the spot. But as I never had seen any thing of the kind, the upshot of it was that I didn't take heed to myself that there was any thing of the kind, and thought Bert, upon the whole, had a much easier time of it than I was like to have; and if he was exposed to storm, why, I should be caught out in the rain sometimes; and I took up my life as happy as any chirruping cricket, and certainly as selfishly disposed as any body that has been petted and cosseted all the early days is like to be.

We went to housekeeping immediately upon our marriage, for mother said she despised these boarding people; she went to housekeeping when she was married, and she meant all her children should do the same; and if their husbands weren't able to go to housekeeping, then they weren't able to be husbands, and there was an end of it; and no two people, she said, brought up in different fashions could unite their lives into one without some jarring, and a third party was sure to turn that jar into an earthquake; and if there were fewer third parties, half the trouble would be done away with; for she believed half the divorces and separations and quarrels in the State were brought about by boarding-house intimacies with third parties. So to housekeeping, as I said, we went—though I knew that by-and-by I should just perish with loneliness—and in the very pleasantest house I am sure that the whole city had to offer, if it was the smallest—the bay-window of the sunny little parlor looking out upon the water, so that we could see every thing that came up the harbor, and, from my bird's-nest of a room above, with the glass that Bert mounted there, I could sweep the bay, and see Bert's boat when it was miles away.

Bert staid up with great contentment for a week or ten days, pottering and tinkering about the house, and finding little odd jobs to attend to where he had thought every thing perfect till experience proved the contrary, planting morning-glories and scarlet beans round the basement to run up over the bay-window, and

a prairie-rose and a basalt for the lattice of the door, setting out a cherry-tree and a dwarf pear, and trimming up a grape-vine in the little yard, and arranging all manner of convenient contrivances in all manner of corners. Then when dark came we would light the drop-lamp, and have a little wood-fire on the hearth; for we were just beginning the cool May nights, and then we would draw round it—I with my worsteds and he with the evening paper; and he would look at me over the paper, and lay it down, and draw a long breath of pleasure, and say that if we had been married nearly a year we could not be more comfortable. When we had been married nearly a year we were not half so comfortable.

But before a fortnight of our new life I could see that Bert began to be restless. He had been on the water ever since he was a child, and a long spell of shore always seemed to dry and warp him a little, he said. He began to grumble about being ashamed to be seen lubbering round so, and to declare that now he had a family to provide for he must be up and doing. And so I had no business to be surprised when one day, long before the end of the regulation honey-moon, a steamer having been telegraphed from Halifax, Bert kissed me, and swung his cloak over his arm, and was off down the bay to find his boat, and be running a bee-line to meet the steamer east of the Cape, and ahead of all the other boats.

Now you may be very sure this was not particularly pleasing. Married a fortnight and tired of me already, I said to myself. I ate no dinner that day, and long before dark I shut the shutters, and locked up the house, and went to bed; and after lying awake, thinking I heard thieves, and smelled fire, and saw ghosts, and was totally deserted and dreadfully abused, at last I was crying myself to sleep, when click went a latch-key, and in stalked Bert, blazing up the gas, and tossing down his cloak in a heap, and crying out that it served him right for leaving the dearest little wife in the world. And I can't say that I was sorry one bit to hear that, coming across a miserable little dirty collier, he had been obliged to take her in, and Tom Holliday's boat got the big steamer after all.

But Bert's penitence was brief—for, you see, he wasn't the fool that I was, and knew business must be attended to—and presently he was off again. A thousand a year, you see, was far too little for people to live on and lay by any thing; for, with the running expenses taken from the earnings, that was about all there was left to the men. And I ought to have had the sense to understand matters; yet when did a girl of seventeen ever have any sense? But Bert had enough for both of us; and so he kept the boat snapping, and never lost a fee for want of being on the ground—if that is what you can call it when there isn't a bit of ground to be found for fathoms.

Of course, then, I was left very much to my-

self. It was unavoidable. And the worst of it was that I wouldn't see that it was unavoidable. And, of course, I was miserably lonely; and, by-and-by, when I was really feeling wretchedly, my once-cheerful little home, still as death now from morning to night, seemed to me to be an actual grave. Mother couldn't come and visit me, for she had married again herself, a few years since, and had a young brood to attend to; and she couldn't spare me any of the children, for she wanted Netty to see after Nanny, and Neddy wouldn't go to school unless Natty went to keep off the big boys; and I didn't like to leave home and visit her, and Bert didn't like to have me, lest I should be away when he chanced to come unannounced, as he always did come—she living four miles off now, in one of the suburbs, for the sake of a garden—and so I was left to weather it out; and when Bert came up I used to cry every time, I was so glad to see him.

Bert couldn't understand that, of course—he was so strong and bluff and hearty, and I so sick and childish and weak. All my nerves seemed to be on the string too. I was as petulant as a porcupine, and so fractious that I wonder the very bird and cat didn't reproach me—for Bert had brought me a mocking-bird to conquer the stillness; and a wandering cat, seeing that we were two poor young people sadly in need of a guardian, had adopted us. And when I looked over at Bert, at some time when he happened to be at home, and thought that he would be off again directly, then the tears and sobs used to burst right out, and astound him and perplex him, so that I can see his great, good, wondering eyes now, and he would be alarmed and vexed enough to make him wish he hadn't come home at all.

I hadn't any appetite when he was away, and wanted nothing to eat myself; and sometimes, if you'll believe it, I would lie in bed all day, and there wouldn't be a morsel of any thing cooked in the house at all when Bert ran in, and if he hadn't been the best tempered fellow on the bay or off of it, he certainly would have staid away altogether. I used to cry half my time; I was afraid Bert was sick of me, and I was certainly sick of myself; I couldn't see to read, for I was so nervous that the letters danced before my eyes, and I couldn't sew, for there were always two needles and two threads; and I don't know but I really might have gone out of my mind, or have driven Bert out of his, if it hadn't occurred to him to close the house, and take me down the bay with him, as he used to do; and it was really wonderful how a fortnight's enjoyment of the cool salt summer air there braced all my nerves taut again; so that I was quite well when he brought me back, and tolerably sensible, and sat down cheerfully to the sewing I had neglected so long, and which must be done so nicely, because, I said, that if a little girl came, and her mother were to die, this sewing would be kept for her to see, and I wanted every stitch to be a moral lesson to her.

So the mocking-bird used to pour out a flood

of music through the little rooms, into which there always poured a flood of sunshine, only half barred out by the pink and purple morning-glories; and the Skye, that Bert brought home from an English schooner one day, with his yellow eyes looking out like coals of fire from his tawny shag, used to bark at the bird; and my great St. Bernard, sent over from home, used to silence him with his big paw; and the little cat used to put up her back at the three; and I sat there with my sewing and my singing and my neighbors and my dumb family—no, they weren't dumb, by any means—all at once metamorphosed into the happiest little house-keeper this side the meridian. Bert came and went, too, a good deal oftener than before—for, perhaps, he had come to question whether he did not owe other duties to his family than the mere providing of the means to live, and whether it was just the square thing to take a young girl out from the bustle and cheer of a great family and shut her up all by herself in a cage; and he was good and kind beyond comparison, so that I learned by heart the meaning of the promise "to cherish" in the marriage ceremony.

But, of course, this couldn't last long. It would have been Eden out of date, and was heaping up the happiness of a long life into these few months. I was aware of that; I knew that either I was going to die or a change must come, since so much bliss was never meant for mortals, who must content themselves with snatches, and judge from a little what a great deal means; and I had been on the watch for the change some days before the horrid windy morning when Bert went to take the British steamer *Assyria* down the bay on her way to Liverpool.

That was a good job, as jobs go, in itself; and he said, in bidding me good-by, that he should try and be up the next day, unless business was so brisk that it seemed throwing money away to leave, and it was not to be done inside the law, moreover. The wind blew a tornado that night, and the water dashed over the sea-wall in scuds; but it had blown a great many tornadoes, and nothing had happened to Bert, and I never dreamed of regarding it. And I heard from one of the men next day that there was hardly a vessel telegraphed; so I knew he would be along presently, and I had made up my mind to have him carve me out a bracket from an old cigar-box to hang at the head of my bed, and I was looking forward to a real happy evening, with him at work opposite me, and the snapping wood-fire again between us, for we were now in the cool October nights; so I set myself at work, and made the nicest little supper ready—scrod, as brown outside and as white inside as a cocoa-nut is, and cold turkey deviled with the East Indian sauce that the captain of the *Bengal* sent me, and a charlotte russe that I had learned how to make myself, with our own little Muscat grapes whipped into it, and a cup of chocolate that was as rich as nectar. And the scrod grew

brown and grew black and turned to a chip, and the deviled turkey sizzled and sizzled away to saw-dust, and the chocolate skimmed all over with a coat of cold oil at last, and the very dog grew tired of watching, and no Bert came; and I ate the charlotte russe myself, and went to bed.

And the next day no Bert, and the next day, and a week passed without him, and then all at once I remembered the tornado and the water whipping the sea-wall, and I began to be seriously uneasy. Began to be!—I was, I had been! I swept the bay, with that glass in my room, day and night, I might say, but no sign of Bert or Bert's boat could I see.

At length, one day, I thought I did make out the boat; but the little signal which it was arranged between him and me should always be visible when he was on board I could nowhere discover, and, of course, I was wild with my fancies: Bert was lost, he had been drowned in returning from the *Assyria*, he had been knocked overboard, his canoe had filled, and he had gone down like lead with all his heavy gear on; and I was working myself into agonies, and was almost down sick, when who should appear but Will Davenant, swinging his surtout over his shoulders by the sleeves, and coming in as though he were sent. As I looked up in his face I noticed that he was pale and grave, and felt he had bad news for me beforehand.

"Well, Bert's gone this time," said he.

It gave me such a turn! If I ever have a stroke I shall feel no worse. I only wonder I didn't drop on the spot. But my will is stout, and that held out to bear the worst.

"Gone?" I gasped. "Lost? My Bert?"

"Oh, pooh! nonsense!" he returned. "Nothing of the kind. I'm a stupid. Gone to Liverpool!"

To Liverpool! Well, you may suppose what a difference that was! All the blood in my body had been gathering round my heart till I was as white as a sheet, and now it was all plunging up my face, that I was hiding with both hands, as red as any rose. Bert gone to Liverpool, and without ever telling me! He had run away and left me! You see I had read so many novels. The whole world was reeling round me in a great noisy whirl, and it was all of a sudden that I grew conscious of Will Davenant's putting me into a chair and sprinkling water on me, and heard him saying to himself: "Dear me! This is rough on her, and no mistake. Look here now, Sady. Listen a moment," I could hear him exclaiming. "It's only for three weeks. He'll be back in a jiffy. Can't you hear? Don't you understand? The *Assyria* couldn't set him down in that hurricane blowing great guns; and so she had to take him on, and send him over next steamer. It's been done before, don't you see? At least that's what our reckoning is—"

"Oh, Will, then you're not certain, after all!" I cried.

"Certain as any thing can be on such slip-

pery stuff as water. Why, it's nothing out of the common course. Old Captain Johnson once was carried round Cape Horn in that way, and his family had worn out their mourning for him before the news reached them. We'd have had letters from Bert, only, as luck would have it, the *Assyria's* on the line that doesn't touch at Halifax. One week's gone," said Will, beginning to stride about the floor. "Come now, you lock up, and run over to your mother's; and in a fortnight you'll see somebody heave in sight, and put out one of his great paws to sweep you back again."

"Oh no, no!" I sobbed. "I'll stay here and wait for him—here, where I saw him last. Perhaps he'll never come! oh, perhaps he'll never come!"

"Come! I don't know what's to hinder his coming," said Will, "unless they kill him with kindness. The captain'll have him at his table; there won't be any thing in the ship too good for him; best of every thing at his command; Champagne just running down his throat; all the pretty women asking him about the weather—"

"Oh, Will!"

"Fact! You see now! And when he gets to Liverpool those British pilots will take him in hand, and they'll treat him so well that, I'll dare swear, he'll never be able to tell you what the house he stops at looks like. Perhaps, then, he won't come home next steamer, the very next," said that cunning fellow, trying to stave off my anxiety, if, indeed, things should prove to be worse than he fancied they were, and Bert didn't come home next steamer, nor ever afterward. "A man isn't treated like a prince more than once in his life, and he couldn't be blamed much if he made the most of that once; now could he?"

"I don't know any thing about that!" I cried. "I know Bert will be back in the next steamer if he's alive."

"Of course he will! of course he will! Keep your craft sharp by the wind, Sady, and he'll hail you before you know it," said Will.

And so he did. Exactly a fortnight from that day. I had been rambling round the house like an uneasy spirit, never still in one place five minutes at a time, neither sleeping nor eating, and finding no peace except when Will Davenant, or some other of Bert's friends, came in and talked the matter over, nor then, either; and mother, who had left every thing to come and stay with me, declared I would lose my wits unless I practiced some sort of self-control; when, one day, after I had seen the great steamer come plowing up the bay, and had vowed that Bert must be in her, as I had concerning every steamer arriving since Will Davenant's first call, and then had given him up at last because he hadn't the wings of the dove, and was plunged in unmitigated despair, all of a sudden in he walks, as large as life, and takes me in his arms and kisses me, while I faint dead away.

Well, that was very delightful—I was such a selfish little wretch, and I don't say that I'm any better now—to think that Bert cared so much to be home, to relieve my anxiety, and, maybe, his own, that he didn't even wait for another steamer on that same line, but caught one that was leaving the very day they made port, and was back again on American shores without having stepped on British soil. Not that Bert wouldn't have cared for it, you know; wouldn't have made the European tour, as they call it, with as good a relish as the best; wouldn't have liked to stand inside the old cathedrals, and see the sunbeams swimming up aloft in the roof, and the doves flying in and out and building their little indifferent nests in the carvings made by fingers dust a thousand years ago; wouldn't have liked to look at the great paintings, as if he were in a vision; to have walked through the old halls where history happened—for you musn't take it for granted that my Bert is an ignoramus because he earns his livelihood in hard work and exposure. I don't know the more finished gentleman than he, if you want the truth. There is an education better than books, and you can't learn at colleges all my Bert knows. Latin and Greek I grant you, and you're welcome—for the use of dead men's tongues, who did no good with them while they had them, and heathen barbarians at that, I've never been able to see; but whatever can be gained by the knowledge of men and of the round earth and sea and sky, the best learning that the world affords, my Bert has at his fingers' tips. A man can't bring into port a great French or British steamer, commanded by some captain next to a nobleman; or a man-of-war, commanded, may be, by a nobleman himself, with all his courtly breeding, and a mind rich with the advantages of generations; or one of our own line-of-battle ships, with an old hero on the quarter-deck; or a merchantman from the East Indies, a fruiter from the Levant, with Portuguese and Greeks before the mast; a South American, with hides and horns; a whaler from the pole; a little schooner, creeping up the coast with lime—can't meet familiarly, as pilots do; welcomed with open arms, and told by many a captain that they would rather see him than their wives—all these different sorts, without getting at the core of countries and races in a way that is like a liberal education. And Bert had always said that, if ever he was rich, we'd take passage for the other side, and for Vesuvius, and the Midnight Sun, and the Catacombs, and the Inquisition, and the Pyramids, and I don't know what all. But there! there's no hope of a pilot's being rich. I tell Bert that if ever they get rid of the laws that restrain them now, so that each pilot can ask his own price, and a ship in a gale refusing it, he can tell her to get in the best way she can, till she calls him back at any price, why, then he won't expose himself to being drowned and his children to being orphaned for a beggarly twenty or fifty dollars; but the

great merchant princes, that own the ships and cargoes, will have to open their purses, and a pilot may be as well off as his neighbors. But Bert says that, once change those laws, decent men would leave the calling, pilotage would be piracy, the bay would be swarming with sharks and wreckers, and he would sooner turn long-shoreman and sweep a crossing.

But all this has nothing to do with Bert's return; and, as I was saying, there was nobody inside of that horizon happier than I that day.

But it was that day. Two or three days afterward, when the bright edge of relief and gratitude and pleasure had worn down the least in the world, I began, of course—or else it wouldn't have been I—to question a little, to worry, and wonder why it happened that Bert couldn't leave the steamer just that time when he'd weathered so many worse gales; and all at once it leaked out, I don't know how or where, that Will Davenant's cousin Kate was aboard that steamer, just married to a rich old fellow who was doing the fashionable thing and taking her abroad. She was a bold and handsome hussy, always making eyes at Bert. And Bert hadn't mentioned her; and Will hadn't mentioned her—it never occurred to me that Will hadn't known of it, or that Bert hadn't seen her once all the way across—and so I put two and two together, and wrought myself up to a frenzy, and there was an end of happiness. For from conjecture I crept to suspicion, and from suspicion I flew to certainty, and from certainty to desperation. I went about my work slipshod, and glowering like a wild woman, and the dishes were half cooked, and the floors half swept, and every thing was rough with dust; the tins and the silver were tarnished and unscoured, the little wood-fire was never lit in welcome at night, and the whole house was just as gloomy and cheerless as I felt myself; so that it must have made Bert groan to set his foot inside the door, and he would hardly have been to blame if he had slipped back to Liverpool, and had his merry-making with the warm-hearted men over there, after all.

But Bert had married me for better or worse, and, though it was pretty much all worse, he was determined to make the best of it; and so he believed that this was all due to my weak nerves and ill health—which it wasn't, but only to a life of indulgence and selfishness and waywardness bearing fruit—and he humored me, and waited on me, and was gentler with me than ever mother was in all her life. For mother came in one day, and found the plates not washed, and the fire gone out, and me sitting down at heel, sulking and wretched, with my hair uncombed, and no collar on; and she declared on the spot that patience had had its perfect work with me, that all I needed was a good sound shaking, and if I wasn't too old to behave in that way, I wasn't too old to have it, and she had half the mind to give it to me; and such conduct, she said, had driven better

"SAY THAT AGAIN, SADY," SAID HE.

men than Bert to drink. She was ashamed to own me for a child of hers, and I'd only have myself to thank if he went to the bad altogether. And up I flared, and said, if it wasn't gone to the bad already to have been chasing across the Atlantic after Kate Davenant, I should like to know what it was. I suppose the fact is that I must have been a little crazy. And just as mother turned round, with the dish-cloth suspended, and her mouth wide open, Bert, who had come in unnoticed in the high words, and had heard those high words, pushed open the door and stood before me.

I shall never forget how Bert looked that

moment. His face was as white and set as a dead man's. It would have looked like a dead man's if the awful living eyes hadn't been blazing out of it like two fires—so dark and terrible that I cowered.

"Say that again, Sady," said he.

And my heart bubbling up with anger at the tone, I said it again, and more of it too.

"I swear to you that this is the first I ever knew of her being on the steamer," said Bert then, in a great, grand voice that of itself seemed to wake me from my evil mood as if it had been a nightmare, though doubtless it was fear, calling the blood away from my brain, that

waked me. He turned to my mother. "Take care of her," he said; "take good care of her. I must get down the harbor before the weather thickens. Maybe I shall never come up again. I hope I never shall!"

With that he paused and hesitated, and took a step forward and toward me; but Heaven only knows what imp of perversity caught my shoulder and twisted me round and away, and in a moment the door was closed gently, as Bert did every thing in the house, and he was gone. And then you may imagine that chaos reigned in that room for an hour, with penitence and self-reproach and fear, and cries and sobs and hysterics, and all so volatile and hot shrub; and mother left off scolding, and hushed me, and bathed my face, and combed my hair, afraid lest I'd do myself a mischief; and finally, as she couldn't stay, Nanny being threatened with the croup, and Neddy being just vaccinated and taking tremendously, she tied on my cloak and furs, and took a basket of things out of the bureau drawer, and locked up the doors, and slipped the key under the stone, and hailed a car at the head of the street, and shoved me in and carried me off to her own house—all in a vague, wild, cloudy state of mind, where nothing seemed to be real but a dull and universal ache, which, whether it belonged to my body or my soul, I had not wit enough to know. "I'm going to die," I said, looking out at the purple, leaden afternoon, and the dreary branches bending in the damp and bitter wind that souged up the street openings like the cry of lost souls. "I'm going to die," I said. "I've begun already. My mind's all dim and dying first." So at last we reached the place, just as the first snow-flakes began falling out of that cold and desolate sky, and mother got me into the house. What a busy, bustling little body she was then! I can hardly realize it when I see her sitting there now, so gray-haired and white and silent, and watching Netty's twins as they tumble together on the floor, just like the cool of the day. And presently I was tucked up warm in bed, and falling off into strange, wild dreams, and waking out of them in terror every now and then.

And that night my baby was born. It was a furious storm outside as midnight drew on; hardly less furious within, as, in pauses of pain, I thought of Bert—his boat lying to far out in the bay, with the gale and the sleet fierce enough to cut the eyes out of his head if he looked to windward, or maybe run down, without the hearing of a cry, by some great steamer in that weather, too thick with the driving snow to see a light or your own length ahead; or else dragging her anchor somewhere, parting cable and drifting on the rocks; and I remembered the wreck on Norman's Woe, where the spouting water leaped round the sailor lashed in the shrouds till he was encased and sealed in a mass of frozen ice, and a spar swinging round with a lurch of the wreck snapped him in two like a dead branch; and I thought, in swift

succession, of all the horrid chances of those dark winter seas, till my brain was raging with heat, and all my words were delirious.

It was of no use their putting the little flannel bundle up on the pillow beside me and bidding me look at it; it was of no use the four pattering night-gowned imps, all waked and peeping in, at the risk of squills and opodeldoc, whispering and on tip-toe, wondering how it came there through all that storm, chuckling over a queer little sneeze that plainly told that it took cold in coming, and which the ridiculous morsel gave with as much self-possession as if the whole atmosphere belonged to it, and scampering off to bed again with their happy tongues subdued only till they were half out of hearing, and already quarreling as to whether Neddy and Nanny were as much aunts and uncles as Natty and Netty; it was of no use their telling me here was the nicest baby ever born into this breathing world, and just to look at these tiny perfect fingers and that atom of an ear. What could I care for that and such as that? There were millions of babies in the world, but there was only one Bert, and I had driven him out into the whirling white tempest of that pitiless night; and every screaming blast, every push of the great shoulder of the gale against the house, made me start up and cry out.

But all at once I heard mother saying in an under-tone, as if she had not said it half a dozen times before, that here was Bert's chin with all the pluck of it, if ever any thing was, and she shouldn't wonder if the eyes—and, without waiting to hear her finish, it came over me, like a fresh tide of feeling and thought, that this was Bert's child, after all; and if I never saw Bert again, yet, perhaps, the boy might grow up to be like his father; and I don't know what there was comforting in the idea, but I turned and laid my cheek down against his, and began to sink away quietly to sleep. And they darkened the room, and set the lamp outside in the next one, where mother went to busy herself about something or other; and presently the nurse was nodding, as I found when suddenly starting wide awake, not having really lost myself at all. What made me start wide awake then, with all my senses about me, as alert as ever I was in my life? I will tell you.

The landing of the front stairs opened directly into the room where I lay; and, as if he had just come in the door, from off the sea, there, in his great storm-clothes, stood Bert.

What a white, fixed face it was he wore! Not the face which I had seen in the afternoon, but a deathly, ghastly face, that it chilled one's marrow to look at; and the hair was hanging wet about it, and around the eyes, that had an appalling, absent, vacant gaze, such as I had never seen in Bert's shining, splendid ones. "Oh, what is it, Bert?" I cried. "Don't be frightened, dear! It's all over, and I'm very well, and it's—it's a boy." Then I remembered how we had parted, and I whispered, half choked, imploring him to forgive me.

"I went home to find you, Sady," murmured he, in as hollow a tone as the whistle of the wind, "and I've been looking for you since, my darling. And so it's a boy, is it?" And he came and laid his cold, wet, rough face down on mine, and on that little velvet cheek beside mine, and stood erect, and shuddered, and was gone—gone like the breaking of a bubble.

And with the outcry that I made the nurse sprang to her feet, and mother came running in; and they both declared what a pity I had waked, and what a sweet sleep I must have been having; and, of course, I had been dreaming; what preposterous nonsense to say I hadn't, for nobody else had seen Bert, as, indeed, where could he have come from in such a storm? And I just as stoutly maintained that they needn't try and deceive me, and Bert was in the house, for I had seen him, and they were doing me a great deal more harm by keeping him away than if they let him come in again. And then, as I detected them looking strangely at each other, I exclaimed again that I had not been asleep at all, and it was not his ghost that I had seen, for all their looks, but Bert himself; and, as they tried to soothe me, and laugh me out of the notion, and I saw they were in earnest, cold shivers began to rush over me, till they shook me as I lay. "He is drowned! he is drowned!" I sung out between my chattering teeth. "And I have done it. I have destroyed my husband!" And I raised such a ululu that presently mother took me in hand again severely, and told me that, whether I had destroyed my husband or not, I should certainly destroy my child by allowing myself to get into this condition; and, if I didn't hush up at once, she would go out in the snow herself and fetch the doctor again, and give me a Dover's powder. And then, as the baby began to cry, she and the nurse made such a racket between them, with their shshshing and trotting and patting and stirring and sipping, that there was nothing for it but that I should be quiet. And, directly, their voices sounded miles away; and, thoroughly worn out, I went to sleep, and never waked till morning, when the storm had all blown up the coast, and the sun was shining brightly, and the sky was bluer than the sapphire in the high-priest's breast-plate.

But I did not wake to suit the day. I opened my eyes with such wonder to see it so bright and careless, with such a load of heaviness, such vague regret that I had waked at all; and, of course, my first thought was Bert.

The storm had been a brief one, it seemed, sweeping swift and furious; possibly Bert's boat might have been beyond its belt, and have known but little of it. Yet that was hardly likely, and I tried to brace myself for the worst, and prayed—I don't know how long it was since I had said my prayers—for strength to receive the blow I feared, and which would be a blow, come how it might, as only fit punishment for my wickedness, or, if not as punishment, at least as only the taking from me that

of which I had proved unworthy. I to have thought any evil of my Bert, with his soul as white and clear as that window-pane that let my glance through into the heavens!

And so all that morning I lay there, not saying a word, never dropping into a doze, but listening, listening at every pore for a step that did not come; and, though I lay like a log in my listening, inwardly I fretted and fumed and fidgeted, and my head burned and my heart beat like a leaf in the wind. And when the doctor ran up stairs he said it would never do in the world, I was getting into a high fever; I must take a draught he mixed, and go to sleep; and so I did, with my baby in my arms. And when I woke up, there sat Bert beside me, with one cool hand grasping both my hot ones.

"Oh, Bert," I said, feebly, closing my eyes again, "is it really you this time? If you are going to go—again—go before I open my eyes, and it won't be so hard."

"Ay, my darling!" he cried, with his great, hearty voice. "Who else should it be? But it came precious near never being—"

"Oh, Bert, weren't you really here last night, then?"

"Here last night? Sady, that's just what I've been asking myself. But no—neither here nor any where else."

"Dear Bert, you must have had such a dreadful night!"

He didn't speak then, but he lifted my hands and kissed them—my little hard hands. It meant that I had had a dreadful night too.

Just then mother came in with some decoction; she had seen Bert before. "Now you mustn't get her all excited again with your talk, Bert, my dear," said she. "Here, you can give her this gruel, while I take up my grandson. Bless his little heart—nobody taking a bit of notice of him! I suppose you've been home and found all safe, Bert?" she added.

"No, I haven't," replied he. "I knew Sady was over here—I don't know how I knew it, but I did—and I just made sail in this direction."

"Weren't you surprised when you saw that little head on the pillow?"

"Not at all," said Bert, crossing over to inspect, for the hundredth time or so, the rosy collection of fists and feet on her lap. "I knew it was there, and I knew it was a boy. I was saying it was a boy when I came to."

"Came to?" repeated mother and I together.

"Oh yes. You haven't heard, of course. Why, I came as near laying my bones where the old anchors lie last night—"

"Bert!"

"Yes, really. Now I'm safe," said he, "and, if you won't flush up and worry, I'll tell you about it."

"I'll worry a great deal more if you don't tell me," murmured I.

"Yes, Bert," said mother.

"Well, this is all, and it isn't much. There was a schooner wabbling round out there in the bay, as clearly as we could make out in the scud and snow, as if every soul on board had lost their heads; and we came to the conclusion that, whether she wanted a pilot or not, she needed one, or she'd be splinters and sawdust on the channel islands before morning. And after a little, feeling desperate and wicked, and hardly caring what happened, I set out for her. And I think I'd have made her, for I've ridden rougher water than that in my canoe, only just at the last minute I remembered a paper in the cabin with the list of the *Assyria's* passengers in it, and my heart melted, and I thought I'd be in town in a couple of hours, and I thought if I showed that to you, Sady, and showed you that there was no such name as Kate Davenant's—"

"Why, of course there wasn't, Bert!" I interrupted. "It would have been her husband's."

"Her husband's?" asked Bert, turning on me his great brown eyes in a wondering way.

"Kate married, Sady, and yet you could—"

"Oh don't, dear Bert! Don't say any thing more about it!" I exclaimed, in a tremor. "I was out of my head—I must have been! And you forgave me for it all last night—"

"That is it, exactly," said Bert, solemnly, while mother's eyes grew round and rounder; "I did. And you, Sady, did you forgive me, then, for having flashed off yesterday afternoon in that rage?"

"Yesterday? It seems a year ago. Oh, I never can forgive myself, Bert!"

"There, there, children," said mother.

"Well, as I was saying," continued Bert, in a moment, "I made for the paper, and found it, and sprang along up with it, and jumped into the canoe. And just then there came one of those seas that run every eighth or tenth wave in a gale, and before we could lift an oar it had roared and raced after us, and had reared and fallen, and the boat had swamped under us, crushing up like paper, and I had gone down in the icy water with it, the whole tempest booming in my ears, and the weight of the whole ocean on my head; and when I came to the top again I could see the row of wild faces just above the lights which the men were swinging over the side, and I shouted for a line and a lantern on it, and out it flew, and I caught it just as I was washing by, and contrived to get it fast under my arms, and give the word to haul me in. And then, as they were pulling hand over hand, there came a hitch, a grasp slipped in the confusion—for every body had a different order to give—the boat pitched, and Morris lost his footing on the wet planks; and I felt myself going, and called to them again, and then I was sucked under and under; and when they laid me on the deck at last there was no more life in me than in a log."

"Oh, Bert!" I cried, starting up, and quite

forgetting for the instant that it was all over now, at any rate.

"There! lie right down again and keep still, or I'll let you guess the rest. Don't you see I'm alive?" said he, laughing. "For they lugged me down below, and worked away on me with hot blankets and rum and hartshorn and the like, and still I lay as dead as a pelt, to all appearance, and they were just giving me up, when one of them dropped the hartshorn and spilled it up my nostrils; and suddenly, with a start and a shudder, and saying over and over, 'It's a boy, it's a boy,' I opened my eyes, and presently was all right, and brought that schooner up to town after all, though I can't rightly say that I've got over the tingle of that hartshorn yet. And I was just as well aware, Sady, of having been in your mother's house—that time while they were working over my body—of having hunted for you at home, of having found you here, of having seen my child, as I am of the same at this moment. And I swear I don't understand it!" said Bert, getting up and setting down the gruel I hadn't touched, and coming back again. "It's been buzzing about my brain, the puzzle of it, all the morning. What is a drop of brandy, a sniff of vinegar, a touch of hot flannel, that they should breathe the breath of life into my nostrils? When my soul had left my body, how did hartshorn, even that whole battery of it that Ben opened at once, call it back again? Suppose I hadn't smelled it—then dead as a pelt I should have remained; and what difference does a little camphor and vinegar make to my immortal spirit, I should like to know? And I'd ask, if they can make souls out of salts, why they don't sell them over the druggists' counters—by George, I would!—if it wasn't that mine crossed the water and came out here and up into this very room, and saw you, and heard you, and kissed you, Sady!"

"Bert," said mother, with great dignity, having a feeling that this was talk Deacon Kemp would have pronounced unsafe, "you are enough to drive Sady into a delirium, if you're not in one yourself—"

"Oh, Bert, I'm so glad," I said, without waiting for the rest, "to think that when your soul was free it traveled straight to me! And I'll promise, oh, I'll promise to try and be a good wife after this—"

"You are now," said he, "the best of wives."

"Oh, I will be, Bert, as long as I live!"

"And afterward," whispered Bert, over my head, "when we're ghosts together?"

"Always, Bert. For ever and ever. How can I help it, and you coming home to me when you might have gone up—"

"Hush, now, dear. We won't talk any more about it. Go to sleep, little mother, beside your baby. I don't know where I might have gone," said Bert. "But I know that when I came into this room last night I came into heaven!"

FREDERICK THE GREAT.

THE NEW PALACE AT POTSDAM.

XII.—FREDERICK AT SANS SOUCI.

“**H**APPY the people,” says Montesquieu, “whose annals are blank in history books.” The annals of the nations are mainly composed of wars, tumult, and woe. For ten years Prussia enjoyed peace. During this happy period, when the days and the years glided by in tranquillity, there is little left for the historian to record. Frederick engaged vigorously in repairing the ruins left by the war. The burned Silesian villages were rebuilt; debts were paid; agriculture and commerce encouraged; the laws revised and reformed. A decree was issued, that all lawsuits should be brought to a decision within a year after their beginning.

The king, weary of the life of turmoil, constructed for himself a beautiful villa, which he named *Sans Souci* (“Free from Care”), which Carlyle characteristically translates, “No bother.” It was situated on a pleasant hill-top near Potsdam, in great retirement, yet commanding an enchanting view of land and water.

On the first of May, 1747, Frederick took formal possession of this beautiful château. The occasion was celebrated by quite a magnificent dinner of two hundred covers. Here, for the next forty years, he spent most of his leisure time. He had three other palaces, far surpassing Sans Souci in splendor, which he occasionally visited on days of royal festivities. Berlin and Charlottenburg were about twenty miles distant. The New Castle, so called, at Potsdam, was but about a mile from Sans Souci. He had also his palace at Rheinsberg, some thirty miles north of Berlin, where he had spent many of his early days.

It is said that, one day, as Frederick was contemplating the royal burying-ground, not far from the spot which he had selected for his rural villa, he said to a companion by his side,

in reference to his own burial, “*Oui, alors je serais sans souci.*” *Yes, then I shall be free from care.* From that remark the villa took its name. Frederick adopted it, and inscribed it in golden letters on the lintel. He appropriated to his private use three apartments—an audience-room, a library, and a small alcove for a bedroom. In this alcove, scarcely larger than a closet, he slept in soldier style, upon an iron bed, without curtains. An old slouched hat, softened by wear, served him for a night-cap. His library was a beautiful room, very richly furnished. There were terrible war clouds still sweeping over various parts of Europe. But their lightning flashes and their thunder roar disturbed not the repose of Frederick in his elevated retreat.

In the month of October, 1747, field-marshal Keith visited his Prussian majesty at Sans Souci. In a letter to his brother he thus describes the results of his observations:

“I have now the honor and, what is still more, the pleasure of being with the king at Potsdam. I have the honor to dine and sup with him almost every day. He has more wit than I have wit to tell you; speaks solidly and knowingly on all kinds of subjects; and I am much mistaken if, with the experience of four campaigns, he is not the best officer of his army. He has several persons with whom he lives with almost the familiarity of a friend, but he has no favorite. He shows a natural politeness for every body who is about him. For one who has been four days about his person, you will say, I pretend to know a great deal about his character. But what I tell you you may depend upon. With more time I shall know as much of him as he will let me know, and no one of his ministry knows any more.”

The king was a very busy man. In addition to carrying on quite an extensive literary

SANS SOUCL.

correspondence, he was vigorously engaged in writing his memoirs. He was also with great energy developing the wealth of his realms. In the exercise of absolute power, his government was entirely personal. He had no constitution to restrain him. Under his single control were concentrated all legislative, judicial, and executive powers. There was no senate or legislative corps to co-operate in framing laws. His ministers were merely servants to do his bidding. The courts had no powers whatever but such as he intrusted to them. He could at any time reverse their decrees, and flog the judges with his cane, or hang them. This is personal government.

Frederick was a great snuff-taker. He always carried two large snuff-boxes in his pocket. Several others stood upon tables around in his rooms, always ready for use. The cheapest of these boxes cost fifteen hundred dollars. He had some richly studded with gems, which cost seven thousand five hundred dollars. At his death one hundred and thirty snuff-boxes appeared in the inventory of his jewels.

Many anecdotes are related illustrative of the kind feelings of the king toward the peasants. He was much interested in ameliorating their condition, and said to the bishop of Varmia, "Believe me, if I knew every thing—if I could read every thing myself—all my subjects should be happy. But alas! I am but a man."

In the ranks all of the army were equally entitled to distinction. Promotion was conferred upon merit, not upon the accident of birth. This principle, which was entirely ignored in the other European despotisms, prob-

ably contributed to the success of Frederick's armies. A Hanoverian count wrote to him, soliciting a high position in the army for his son, in favor of his exalted birth. Frederick dictated the following reply:

"I am obliged to tell you that I have long forbid *counts* to be received, as such, into my army; for when they have served one or two years they retire, and merely make their short military career a subject of vain boasting. If your son wishes to serve, the title of count can be of no use to him. But he will be promoted if he learn his profession well."

The king then took the pen himself, and added with his own hand:

"Young counts who have learned nothing are the most ignorant people in all countries. In England the king's son begins by being a sailor on board a ship, in order to learn the manœuvres belonging to that service. If it should miraculously happen that a count could be good for any thing, it must be by banishing all thoughts about his titles and his birth, for these are only follies. Every thing depends upon personal merit. FREDERICK."

The severity of discipline in the Prussian army was dreadful. The slightest misdemeanor was punished mercilessly. The drill, exposure, and hardships in the camp made life to the soldier a scene of constant martyrdom. Desertion was almost impossible. The only avenue of escape was suicide. In the little garrison at Potsdam, in ten years, over three hundred, by self-inflicted death, escaped their miseries. Dr. Zimmerman states that it not unfrequently happened that a soldier murdered a child, and then came and gave himself up to justice. They thought that if they committed suicide they would be subject to eternal punishment. But the murdered infant was sure to go to heaven, and the murderer would have time to repent and make his peace with God.

Baron Trenck, in his memoir, gives an appalling account of these hardships in the body-guards to which he belonged. In time of peace there was scarcely an hour which he could command. The morning drill com-

menced at four o'clock. The most complicated and perilous manœuvres were performed. Frederick considered this the best school for cavalry in the world. They were compelled to leap trenches, which were continually widened till many fell in and broke their legs or arms. They were also compelled to leap hedges, and continue to charge at the highest possible speed for miles together. Almost daily some were either killed or wounded. At mid-day they took fresh horses and repeated these toilsome and dangerous labors. Frequently they would be called from their beds two or three times in one night, to keep them on the alert. But eight minutes were allowed the guardsman to present himself on horseback, in his place, fully equipped. "In one year of peace," he says, "the body-guards lost more men and horses than they had in two battles during the war."

In 1747 marshal Saxe visited Potsdam. He witnessed a review of the guards. In the account of this review given by Algarotti, he says, "The squadron of guards, which at one time, drawn up close, exhibited the appearance of a rock, at another resembled a cloud scattered along the plain. In the charge on full gallop one horse's head was not a foot beyond another. The line was so exactly straight that Euclid himself could not have found fault with it."

In September, 1749, Madame Du Chatelet, the "divine Emilie" of Voltaire, suddenly died. The infidel philosopher seemed much grieved for a time. Frederick, who never fancied Madame Du Chatelet, was the more eager, now that she was out of the way, that Voltaire should come to Sans Souci, and aid him in his literary labors. A trivial incident occurred at this time worthy of record, as illustrative of the character of the king. At the close of the year 1749 there had been a review of Austrian troops at Mähren. It was not a very important affair, neither the empress queen nor her husband being present. Three Prussian officers made their appearance. It was said that they had come to inveigle soldiers to desert, and enlist under the banners of Prussia. They were peremptorily ordered by the Austrian authorities to leave the ground. Frederick, when he heard of it, said nothing, but treasured it up.

A few months after, in May, 1750, there was a grand review at Berlin. An Austrian officer who chanced to be there was invited by his friend, a Prussian officer, lieutenant-colonel Chasot, to attend. The Austrian was not willing to ride upon the parade-ground without the permission of the king. Colonel Chasot called upon Frederick and informed him that an Austrian officer would be happy, with his majesty's permission, to be present at the review.

"Certainly, certainly," exclaimed the king.

This was on the evening before the review. On the morrow the Austrian accordingly rode upon the field. He had hardly arrived there when, just as the manœuvres were commencing, one of the aids-de-camp of Frederick galloped up to him and said, "By the king's command,

Sir, you are ordered instantly to retire from this field."

Colonel Chasot, exceedingly chagrined, rode directly to the king, and inquired, "Did not your majesty grant me permission to invite my friend to the review?"

"Certainly," replied the king, in his most courteous tones; "and if he had not come, how could I have paid back the Mähren business of last year?"

It is pleasant to record another incident more creditable to Frederick. In the year 1750 there was a poor and aged schoolmaster, by the name of Linsenbarth, a very worthy man, a veritable Dominie Sampson, residing in the obscure village of Hemleben. He had been educated as a clergyman, had considerable book learning, was then out of employment, and was in extreme destitution. The pastor of the village church died, leaving a vacant pulpit, and a salary amounting to about one hundred dollars a year. The great man of the place, a feudal lord named Von Werthern, offered the situation to Linsenbarth, upon condition that he would marry his lady's termagant waiting-maid. Linsenbarth, who had no fancy for the haughty shrew, declined the offer. The lord and lady were much offended, and in various ways rendered the situation of the poor schoolmaster so uncomfortable that he gathered up his slender means, amounting to about three hundred dollars, all in the deteriorated coin of the province, and went to Berlin. His money was in a bag containing nearly nine thousand very small pieces of coin, called *batzen*.

At the custom-house the poor man's coin was seized as contraband. He was informed that the king had forbidden the circulation of that kind of money in Berlin. The heartless officials laughed at the poor man's distress, paid no regard to his remonstrances and pleadings, and locked up his confiscated coin.

Poor Linsenbarth had a feather bed, a small chest of clothes, and a bag of books. He went to a humble inn, called the "White Swan," utterly penniless. The landlord, seeing that he could levy upon his luggage in case of need, gave him food and a small room in the garret to sleep in. Here he remained in a state verging upon despair for eight weeks. Some of the simple neighbors advised him to go directly to the king, as every poor man could do at certain hours in the day. He wrote a brief statement of the facts, and started on foot for Potsdam. We give the result in the words of Linsenbarth:

"At Potsdam I was lucky enough to see the king. He was on the esplanade drilling his troops. When the drill was over he went into the garden, and the soldiers dispersed. Four officers remained lounging on the esplanade. For fright I knew not what to do; I drew the papers from my pocket. These were my memorial, two certificates of character, and a Thuringian pass. The officers noticing this came directly to me and said, 'What letters have you there?' I thankfully imparted the

FREDERICK AND LINSENBARTH.

whole. When the officers had read them they said, 'We will give you good advice. The king is extra gracious to-day, and is gone alone into the garden. Follow him straight. You will have luck.'

"This I would not do; my awe was too great. They thereupon laid hands upon me. One took me by the right arm, another by the left, and led me to the garden. Having got me there they looked out for the king. He was among the gardeners examining some rare plant, and had his back to us. Here I had to halt. The officers began in an under-tone to put me through my drill. 'Take your hat under your left arm; put your right foot foremost; breast well forward; hold your head up; hold your papers aloft in your right hand; there, so—steady—steady!'

"They then went away, often looking around to see if I kept my posture. I perceived well enough that they were making game of me; but I stood all the same like a wall, being full of fear. When the king turned round he gave a look at me like a flash of sunbeams glancing through you. He sent one of the gardeners

to bring my papers. Taking them he disappeared in one of the garden walks. In a few minutes he came back with my papers open in his hand, and waved with them for me to come nearer. I plucked up heart and went directly to him. Oh, how graciously this great monarch deigned to speak to me!

"'My good Thuringian,' said the king, 'you came to Berlin seeking to earn your bread by the industrious teaching of children, and here at the custom-house they have taken your money from you. True, the *batzen* are not legal here. They should have said to you, "You are a stranger and did not know of the prohibition. We will seal up the bag of *batzen*. You can send it back to Thuringia and get it changed for other coin." Be of good heart, however. You shall have

your money again, and interest too. But, my poor man, in Berlin they do not give any thing gratis. You are a stranger. Before you are known and get to teaching, your bit of money will be all gone. What then?'

"I understood the speech perfectly well, but my awe was too great to allow me to say, 'Your majesty will have the grace to allow me something.' But as I was so simple, and asked for nothing, he did not offer any thing. And so he turned away. But he had gone scarcely six or eight steps when he looked around and gave me a sign to walk by his side."

The king then questioned him very closely, respecting the place where he had studied, during what years, under what teachers, and to what branches he had devoted special attention. While thus conversing the clock struck twelve. This was the dinner-hour of his majesty. "Now I must go," said the king. "They wait for their soup."

Linsensbarth, thus left alone, sauntered from the garden back to the esplanade. There he stood quite bewildered. He had walked that day twenty miles beneath a July sun and over

the burning sands. He had eaten nothing. He had not a farthing in his pocket.

"In this tremor of my heart," writes Linsenbarth, "there came a valet out of the palace and asked, 'Where is the man that was with my king in the garden?' I answered, 'Here.' He led me into the palace to a large room, where pages, lackeys, and soldier valets were about. My valet took me to a little table excellently furnished with soup, beef; likewise carp, dressed with garden salad; likewise game, with cucumber salad; bread, knife, fork, plate, spoon were all there. My valet set me a chair, and said,

"'This that is on the table the king has ordered to be served for you. You are to eat your fill and mind nobody. I am to serve.'

"I was greatly astonished, and knew not what to do; least of all could it come into my head that the king's valet who waited on his majesty should wait on me. I pressed him to sit by me. But as he refused, I did as bidden.

"The valet took the beef from the table and set it on the charcoal dish until wanted. He did the like with the fish and roast game, and poured me out wine and beer. I ate and drank till I had abundantly enough. Dessert, confectionery, what I could. A plate of big black cherries and a plateful of pears my waiting-man wrapped in paper, and stuffed them into my pockets to be a refreshment on the way home. And so I rose from the royal table, and thanked God and the king in my heart that I had so gloriously dined. At that moment a secretary came, brought me a sealed order for the custom-house at Berlin, with my certificates and the pass; told down on the table five tail-ducats and a gold Friedrich under them, saying, 'The king sent me this to take me home to Berlin.'

"And if the hussar took me into the palace, it was now the secretary took me out again. And there, yoked with six horses, stood a royal wagon, which, having led me to, the secretary said, 'You people, the king has given order that you are to take this stranger to Berlin, and you are to accept no drink-money from him.' I again testified my thankfulness for the royal kindness, took my place, and rolled away.

"On reaching Berlin I went at once to the custom-house, and handed them my royal order. The head man opened the seal. In reading he changed color—went from pale to red; said nothing, and gave it to the second man to read. The second put on his spectacles, read, and gave it to the third. However, the head man rallied himself at last. I was to come forward and be so good as to write a receipt that I had received for my four hundred thalers, all in *batzen*, the same sum in Brandenburg coin, ready down, without

the least deduction. My cash was at once accurately paid, and thereupon the steward was ordered to go with me to the 'White Swan,' and pay what I owed there, whatever my score was. That was what the king had meant when he said, 'You shall have your money back, and interest too.'

This good old man died in Berlin, on the 24th of August, 1777, eighty-eight years of age.

In the autumn of 1750 Frederick held a famous Berlin carousal, the celebrity of which filled all Europe. Distinguished guests flocked to the city from all the adjoining realms. Wilhelmina came to share in the festivities. Voltaire was also present, "the observed of all observers." An English gentleman, sir Jonas Hanway, in the following terms, describes the appearance of Frederick at this time:

"His Prussian majesty rides much about, often at a rapid rate, with a pleasant business aspect—humane, though imperative; handsome to look upon, though with a face perceptibly reddish. His age, now thirty-eight gone; a set appearance, as if already got into his forties; complexion florid; figure muscular, almost tending to be plump."

The carousal presented a very splendid spectacle. It took place by night, and the spacious arena was lighted by thirty thousand torches. The esplanade of the palace, which presented an ample parallelogram, was surrounded by an amphitheatre of rising seats, crowded with the beauties and dignitaries of Europe. At one end of the parallelogram was a royal box, tapestried with the richest hangings. The king sat there; his sister, the princess Amelia, was by his side, as queen of the festival. Where the neglected wife of Frederick was is not recorded. The entrance for the cavaliers was opposite the throne. The jousting parties consisted of four bands, representing Romans, Persians, Carthaginians, and Greeks. They were decorated with splendid equipments of jewelry, silver helmets, sashes, and housings, and were mounted on the most spirited battle-speeds which Europe could furnish. The scene was enlivened by exhilarating music, and by the most gorgeous decorations and picturesque costumes which the taste and art of the times could create. The festivities were closed by a ball in the vast saloons of the palace, and by a supper, where the tables were loaded with every delicacy.

Voltaire was received on this occasion with very distinguished honor. The king, in inviting him to the court, had sent him a sum amounting to three thousand dollars to pay the expenses of his journey. He had also conferred upon him the cross of the order of Merit, and a pension of about four thousand dollars a year.

For a time Frederick and Voltaire seem to have lived very pleasantly together. Voltaire writes: "I was lodged under the king's apartment, and never left my room except for supper. The king composed, above stairs, works

¹ "About three pounds ten shillings, I think—better than ten pounds in our day to a common man, and better than one hundred pounds to a Linsenbarth."—CARLYLE.

TOURNAMENT AT BERLIN IN HONOR OF FREDERICK.

of philosophy, history, poetry; and his favorite, below stairs, cultivated the same arts and the same talents. They communicated to one another their respective works. The Prussian monarch composed, at this time, his 'History of Brandenburg;' and the French author wrote his 'Age of Louis XIV.,' having brought with him all his materials.¹ His days thus passed happily in a repose which was only animated by agreeable occupations. Nothing, indeed,

could be more delightful than this way of life, or more honorable to philosophy and literature."

But soon the philosopher became involved in very serious difficulties. He employed a Jew, by the name of Hirsch, to engage fraudulently in speculating in the funds. The transaction was so complicated that few of our readers would have the patience to follow an attempt at its disentanglement. Voltaire and his agent quarreled. The contention rang through all the court circles, as other conspicuous names were involved in the meshes of the intrigue. A lawsuit

¹ *Commentaire Historique sur les Œuvres de l'Auteur de la Henriade.*

ensued, which created excitement almost inconceivable. The recent law reform caused the process to be pushed very rapidly to its conclusion. Voltaire emerged from the suit with his character sadly maimed. He was clearly convicted of both falsehood and forgery. The king, annoyed by the clamor, retired from Berlin to Sans Souci. Voltaire was not invited to accompany him, but was left in the Berlin palace. In a letter which Frederick wrote to D'Arget, dated April, 1752, he says:

"Voltaire has conducted himself like a black-guard and a consummate rascal. I have talked to him as he deserved. He is a sad fellow. I am quite ashamed for human abilities that a man who has so much of them should be so full of wickedness. I am not surprised that people talk at Paris of the quarrel of our *beaux esprits*. Voltaire is the most mischievous madman I ever knew. He is only good to read. It is impossible for you to imagine the duplicities, the impositions, the infamies he practiced here. I am quite indignant that so much talent and acquirement do not make men better. I took the part of Maupertuis, because he is a good sort of man, and the other had determined upon ruining him. A little too much vanity had rendered him too sensitive to the manoeuvres of this monkey, whom he ought to have despised after having castigated him."¹

Frederick wrote to Wilhelmina: "Voltaire picks Jews' pockets, but he will get out of it by some somersault."

Voltaire fell sick. He had already quarreled with many persons, and had constrained the king in many cases, very reluctantly, to take his part. He now wrote to Frederick, begging permission to join him in the quietude of Sans Souci. The following extracts from the reply of his majesty will be read with interest:

"POTSDAM, February 24, 1751.

"I was glad to receive you in my house. I esteemed your genius, your talents, and your acquirements. I had reason to think that a man of your age, weary of fencing against authors, and exposing himself to the storm, came hither to take refuge, as in a safe harbor."

After briefly alluding to the many quarrels in which Voltaire had been involved, the king adds:

"You have had the most villainous affair with a Jew. It has made a frightful scandal all over town. For my own part, I have preserved peace in my house until your arrival; and I warn you that, if you have the passion of intriguing and caballing, you have applied to the wrong person. I like peaceable, quiet people, who do not put into their conduct the violent passions of tragedy. In case you can resolve to live like a philosopher, I shall be glad to see you. But if you abandon yourself to all the violence of your passions, and get into quarrels with all the world, you will do me no good by

coming hither, and you may as well stay in Berlin."

Four days after this Frederick wrote again, in answer to additional applications from Voltaire.

"If you wish to come hither you can. I hear nothing of lawsuits, not even of yours. Since you have gained it I congratulate you, and I am glad that this scurvy affair is done.¹ I hope you will have no more quarrels, either with the Old or the New Testament. Such contentions leave their mark upon a man. Even with the talents of the finest genius in France, you will not cover the stains which this conduct will fasten on your reputation in the long run. I write this letter with the rough common-sense of a German, without employing equivocal terms which disfigure the truth. It is for you to profit by it."

Voltaire's visit lasted about thirty-two months. He was, however, during all this time, fast losing favor with the king. Instead of being received as an inmate at Sans Souci, he was assigned to a small country house in the vicinity, called the Marquisat. His wants were, however, all abundantly provided for at the expense of the king. It is evident from his letters that he was a very unhappy man. He was infirm in health, irascible, discontented, crabbed; suspecting every one of being his enemy, jealous of his companions, and with a diseased mind, crowded with superstitious fears.

On one occasion, when the king had sent him a manuscript to revise, he sarcastically exclaimed to the royal messenger, "When will his majesty be done with sending me his dirty linen to wash?" This speech was repeated to the king. He did not lose his revenge.

Frederick was endowed with brilliant powers of conversation. He was fond of society, where he could exercise and display these gifts and accomplishments. Frequent suppers were given at Sans Souci, which lasted from half past eight till midnight. Gentlemen only—learned men—were invited to these entertainments. Frederick was not an amiable man. He took pleasure in inflicting the keenest pain possible with his satirical tongue. No friend was spared. The more deeply he could strike the lash into the quivering nerves of sensibility, the better he seemed pleased with himself.

He could not but respect his wife. Her character was beyond all possible reproach. She never uttered a complaint, was cheerful and faithful in every duty. She had rooms assigned her on the second floor of the Berlin palace, where she was comfortably lodged and fed, and had modest receptions every Thursday, which were always closed at nine o'clock. A gentleman writes from Berlin at this time:

"The king esteems his wife, and can not endure her. It was but a few days ago she hand-

¹ Voltaire boasted that he had gained the cause, because the Jew was fined thirty shillings. But he knew full well, as did every one else, that the result of the suit covered him with dishonor.

¹ *Supplément aux Œuvres Posthumes de Frédéric*, ii.

ed him a letter petitioning for some things of which she had the most pressing want. Frederick took the letter with that most smiling, gracious air, which he assumes at pleasure, and, without breaking the seal, tore it up before her face, made her a profound bow, and turned his back on her."

"The king respects his mother," the same writer adds. "She is the only female to whom he pays any sort of attention. She is a good, fat woman, who moves about in her own way."

It was a peculiarity quite inexplicable which led Frederick to exclude females from his court. His favorites were all men—men of some peculiar intellectual ability. He sought their society only. With the exception of his sister, and occasionally some foreign princess, ladies were seldom admitted to companionship with him. He was a cold, solitary man, so self-reliant that he seldom asked or took advice.

Voltaire hated M. Maupertuis. He was the president of the Berlin Academy, and was regarded by Voltaire as a formidable rival. This hatred gave rise to a quarrel between Frederick and Voltaire, which was so virulent that Europe was filled with the noise of their bickerings. M. Maupertuis had published a pamphlet, in which he assumed to have made some important discovery upon the law of action. M. König, a member of the Academy, reviewed the pamphlet, asserting not only that the proclaimed law was false, but that it had been promulgated half a century before. In support of his position he quoted from a letter of Leibnitz. The original of the letter could not be produced. M. König was accused of having forged the extract. M. Maupertuis, a very jealous, irritable man, by his powerful influence as president, caused M. König to be expelled from the Academy.

Frederick regarded the Academy as his pet institution, and was very jealous of the illustrious philosopher, whom he had invited to Berlin to preside over its deliberations. Voltaire, knowing this very well, and fully aware that to strike the Academy in the person of its president was to strike Frederick, wrote an anonymous communication to a review published in Paris, in which he accused M. Maupertuis—first, of plagiarism, in appropriating to himself a discovery made by another; secondly, of a ridiculous blunder in assuming that said discovery was a philosophical principle, and not an absurdity; and thirdly, that he had abused his position as president of the Academy in suppressing free discussion, by expelling from the institution a member merely for not agreeing with him in opinion. These statements were probably true, and on that account the more damaging.

The authorship of the article could not be concealed. Frederick was indignant. He angrily seized his pen, and wrote a reply, which, though anonymous, was known by all to have been written by the king. In this reply he accused the writer of the article, whom he well

knew to be Voltaire, of being a "manifest retailer of lies," "a concocter of stupid libels," and as "guilty of conduct more malicious, more dastardly, more infamous" than he had ever known before.

This roused Voltaire. He did not venture to attack the king, but he assailed M. Maupertuis again, anonymously, but with greatly increased venom. A brief pamphlet appeared, entitled, "The Diatribe of Doctor Akakia, Physician to the Pope." It was a merciless satire against M. Maupertuis. Voltaire was entirely unscrupulous, and was perfect master of the language of sarcasm. No moral principle restrained him from exaggerating, misrepresenting, or fabricating any falsehoods which would subserve his purpose. M. Maupertuis was utterly overwhelmed with ridicule. The satire was so keen that few could read it without roars of laughter. Voltaire, the king's guest, was thus exposing to the contempt of all Europe the president of the Berlin Academy, the reputation of which Academy was dear to the king above almost every thing else. An edition of the pamphlet was printed in Holland, and copies were scattered all over Berlin. Another edition was published in Paris, where thirty thousand copies were eagerly purchased.

Frederick was in a towering passion. Voltaire was alarmed at the commotion he had created. He wrote a letter to the king, in which he declared most solemnly that he had not intended to have the pamphlet published; that a copy had been obtained by treachery, and had been printed without his consent or knowledge. But the king wrote back:

"Your effrontery astonishes me. What you have done is clear as the day; and yet, instead of confessing your culpability, you persist in denying it. Do you think you can make people believe that black is white? All shall be made public. Then it will be seen whether, if your words deserve statues, your conduct does not deserve chains."

The king, in his anger, ordered all the pamphlets in Berlin to be collected and burned by the common hangman, in front of Voltaire's windows. Three months passed away, during which the parties remained in this deplorable state of antagonism. Voltaire was wretched, often confined to his bed, and looked like a skeleton. He was anxious to leave Berlin, but feared that the king would not grant him leave. He wrote to Frederick, stating that he was very sick, and wished to retire to the springs of Plombières for his health. The king curtly replied:

"There was no need of that pretext about the waters of Plombières, in demanding your leave. You can quit my service when you like. But, before going, be so good as to return me the key, the cross, and the volume of verses which I confided to you.

"I wish that my works, and only they, had been what König attacked. I could sacrifice them with a great deal of willingness to per-

sons who think of increasing their own reputation by lessening that of others. I have not the folly nor vanity of certain authors. The cabals of literary people seem to me the disgrace of literature. I do not the less esteem the honorable cultivators of literature. It is the caballers and their leaders that are degraded in my eyes."

For some unexplained reason, soon after this, the king partially relented, and invited Voltaire to Potsdam. He allowed him to retain his cross and key, and said nothing about the return of the volume of poetry. This was a volume of which twelve copies only had been printed. On the 25th of March, 1753, Voltaire left Potsdam for Dresden.

In the following terms Thiebault describes their parting: The final interview between Frederick and Voltaire took place on the parade at Potsdam, where the king was then occupied with his soldiers. One of the attendants announced Voltaire to his majesty with these words:

"Sire, here is Monsieur De Voltaire, who is come to receive the orders of your majesty."

Frederick turned to Voltaire, and said: "Monsieur De Voltaire, are you still determined upon going?"

"Sire, affairs which I can not neglect, and, above all, the state of my health, oblige me to it."

"In that case, Sir," replied the king, "I wish you a good journey."

Thus parted these remarkable men, who were never destined to meet again.

Voltaire, being safe out of Prussia, in the territory of the king of Poland, instead of hastening to Plombières, tarried in Dresden, and then in Leipsic. From those places he began shooting, through magazines, newspapers, and various other instrumentalities, his poisoned darts at M. Maupertuis. Though these malignant assaults, rapidly following each other, were anonymous, no one could doubt their authorship. M. Maupertuis, exasperated, wrote to him from Berlin, on the 7th of April:

"If it be true that you design to attack me again, I declare to you that I have still health enough to find you, wherever you are, and to take the most signal vengeance upon you. Thank the respect and obedience which have hitherto restrained my arm, and saved you from the worst adventure you have ever had.

"MAUPERTUIS."

Voltaire replied from Leipsic:

"M. LE PRESIDENT,—I have had the honor to receive your letter. You inform me that you are well, and that if I publish La Beaumelle's letter¹ you will come and assassinate me. What ingratitude to your poor doctor Akakia! If you

exalt your soul, so as to discern futurity, you will see that, if you come on that errand to Leipsic, where you are no better liked than in other places, you will run some risk of being hanged. Poor me, indeed, you will find in bed. But as soon as I have gained a little strength I will have my pistols charged, and, multiplying the mass by the square of velocity, so as to reduce the action and you to zero, I will put some lead into your head. It appears that you have need of it. Adieu, my president.

"AKAKIA."

There were some gross vulgarities in Voltaire's letter which we refrain from quoting. Both of these communications were printed and widely circulated, exciting throughout Europe contempt and derision. Voltaire had still the copy of the king's private poems. Frederick, quite irritated, and not knowing what infamous use Voltaire might make of the volume, which contained some very severe satires against prominent persons, and particularly against his uncle, the king of England, determined, at all hazards, to recover the book. He knew it would be of no avail to write to Voltaire to return it.

Voltaire, on his journey to Paris, would pass through Frankfort. Frederick secretly employed a Prussian officer to obtain from the authorities there the necessary powers and to arrest him, and take from him the cross of Merit, the gold key of the chamberlain, and, especially, the volume of poems. The officer, M. Freytag, kept himself minutely informed of Voltaire's movements. At eight o'clock in the evening of the 31st of May, the illustrious philosopher arrived, with a small suit, traveling in considerable state, and stopped at the "Golden Lion." M. Freytag was on the spot. He was a man of distinction. He called upon Voltaire, and, after the interchange of the customary civilities, informed the poet that he was under the necessity of arresting him in the name of the king of Prussia, and detaining him until he should surrender the cross, the key, and the volume of poems. Voltaire was greatly annoyed. He professed warm friendship for the king of Prussia. Very reluctantly, and not until after several hours of altercation, he surrendered the key and the cross. The volume of poems he was very anxious indeed to retain, and affirmed that they were, he knew not where, with luggage he had left behind him in Leipsic or Dresden. He was informed that he would be detained as a prisoner until the volume was produced.

In a state of great exasperation, Voltaire wrote for a large trunk to be sent to him which contained the book. To save himself from the humiliation of being guarded as a prisoner, he gave his *parole d'honneur* that he would not go beyond the garden of the inn. After a delay of three weeks, Voltaire decided, notwithstanding his parole, to attempt his escape. His reputation was such that M. Freytag had no con-

¹ This was a private letter which reflected severely upon the character of Maupertuis.

fidence in his word, and employed spies to watch his every movement.

On the 20th of June, Voltaire dressed himself in disguise, and, with a companion, M. Coligny, entered a hackney-coach, and ordered the driver to leave the city by the main gate. M. Freytag was immediately informed of this by his spies. With mounted men he commenced the pursuit, overtook the carriage as it was delayed a moment at the gate, and arrested the fugitive in the king's name. Voltaire's eyes sparkled with fury, and he raved insanely. The scene gathered a crowd, and Voltaire was taken by a guard of soldiers to another inn, "The Billy-Goat," as the landlord of the "Golden Lion" refused any longer to entertain so troublesome a guest.

All Frankfort was excited by these events. The renown of Voltaire, as a philosopher, a poet, and as the friend of Frederick, filled Europe. His eccentricities were the subject of general remark. The most distinguished men, by birth and culture, had paid him marked attention during his brief compulsory sojourn in Frankfort. Having arrived at "The Billy-Goat," his conduct, according to the report of M. Freytag, was that of a madman, in which attempted flight, feigned vomitings, and a cocked pistol took part. The account which Voltaire gave of these events is now universally pronounced to be grossly inaccurate.

On the 6th of July, the trunk having arrived, the volume of poems was recovered, and Voltaire was allowed to go on his way. His pen, dipped in gall, was an instrument which even a monarch might fear. It inflicted wounds upon the reputation of Frederick which will probably never be healed. Four years passed away, during which Voltaire and Frederick were almost entirely strangers to each other.

The merciless satires of Voltaire, exposing Maupertuis to the ridicule of all Europe, proved death-blows to the sensitive philosopher. He was thrown into a state of great dejection, which induced disease, of which he died in 1759. Maupertuis needed this discipline. In the proud days of prosperity he had rejected Christianity. In these hours of adversity, oppressed by humiliation and pain, and with the grave opening before him, he felt the need of the consolations of religion. Christian faith cheered the sadness of his dying hours.¹

The marquis D'Argens, another of Frederick's infidel companions, one whom Voltaire described as "the most frank atheist in Europe," after a very ignoble life of sin and shame, having quarreled with the king, found himself aged, poor, friendless, and infirm. He then, experiencing need of different support from any which infidelity could give, became penitent and prayerful. Renouncing his unbelief, he became an openly avowed disciple of Jesus.²

What effect was produced upon the mind of

Frederick as he saw one after another of his boon companions in infidelity, in their hours of sickness and approaching death, seeking the consolations of religion, we do not know. The proud king kept his lips hermetically sealed upon that subject. Voltaire, describing the suppers of the gay revelers at Sans Souci, writes:

"Never was there a place in the world where liberty of speech was so fully indulged, or where the various superstitions of men were treated with so much ridicule and contempt. God was respected. But those who, in His name, had imposed on mankind, were not spared. Neither women nor priests ever entered the palace. In a word, Frederick lived without a court, without a council, and without a religion."

Prussia had enjoyed eight years of peace. But Frederick was not a popular man excepting with his own subjects. They idolized him. Innumerable are the anecdotes related illustrative of his kindness to them. He seemed to be earnestly seeking their welfare. But foreign courts feared him. Many hated him. He was unscrupulous and grasping, and had but very little sense of moral integrity. He was ambitious of literary renown; of reputation as a keen satirist. With both pen and tongue he was prone to lash without mercy his brother sovereigns, and even the courtiers who surrounded him. There were no ties of friendship which could exempt any one from his sarcasm. Other sovereigns felt that he was continually on the watch to enlarge his realms by invading their territories, as he had robbed Maria Theresa of the province of Silesia.

Some years before this time Frederick had taken possession of East Friesland, and had made Emden a port of entry. It was a very important acquisition, as it opened to Prussia a convenient avenue for maritime commerce. With great vigor and sagacity Frederick was encouraging this commerce, thus strengthening his kingdom and enriching his subjects. England, mistress of the seas, and then, as usual, at war with France, was covering all the adjacent waters with her war ships and privateers. Frederick had inquired of the English court, through his ambassador at London, whether hemp, flax, or timber were deemed contraband. "No," was the official response. Freightened with such merchandise, the Prussian ships freely sailed in all directions. But soon an English privateer seized several of them, upon the assumption that the *planks* with which they were loaded were contraband.

It was an outrage to which Frederick was not disposed to submit. He entered his remonstrances. The question was referred to the British Court of Admiralty. Month after month the decision was delayed. Frederick lost all patience. English capitalists held Silesian bonds to the amount of about one million two hundred and fifty thousand dollars.

"I must have my ships back again," said Frederick to the British court. "The law's delay in England is, I perceive, very consider-

¹ THIEBAULT, *Souvenirs de Vingt Ans de Séjour à Berlin.*

² *Biographie Universelle.*

able. My people who have had their property thus wrested from them can not conveniently wait. I shall indemnify them from the money due on the Silesian bonds, and shall give England credit for the same. Until restitution is made I shall not pay either principal or interest on those bonds."

The British court was frantic with rage. Frederick had a strong army on the frontiers of Hanover. The first hostile gun fired would be the signal for the invasion of that province, and it would inevitably be wrested from the British crown. The lion roared, but did not venture to use either teeth or claws. England was promptly brought to terms. It was grandly done of Frederick. There was something truly sublime in the quiet, noiseless, apparently almost indifferent air, with which Frederick accomplished his purpose.

Maria Theresa was more and more unreconciled to the loss of Silesia. Never for an hour did she relinquish the idea of eventually regaining the province. The various treaties into which she had been compelled to enter she regarded as merely temporary arrangements. Between the years 1752 and 1755 the energetic and persistent queen was making secret arrangements for the renewal of the Silesian war.

The king of Poland, who was also elector of Saxony, had strong feelings of personal hostility to Frederick. His prime minister, count Von Brühl, even surpassed his royal master in the bitter antagonism with which he regarded the Prussian monarch. Frederick, whose eagle eye was ever open, and whose restless mind was always on the alert, suspected that a coalition was about to be formed against him. He had false keys made to the royal archives at Dresden; bribed one of the officials there, M. Menzel, stealthily to enter the chamber of the archives, and copy for him such extracts as would throw any light upon the designs of the court. Among other items of intelligence he found that Austria, Russia, and Poland were deliberating upon the terms of a coalition against him.

On the 15th of May, 1753, the Russian Senate had passed the resolution that it should henceforth be the policy of Russia not only to resist all further encroachments on the part of Prussia, but to seize the first opportunity to force the Prussian monarch back to the possession of simply his original boundary of Brandenburg. It was also agreed that, should Prussia attack any of the allies of Russia, or be attacked by any of them, the armies of the czar should immediately array themselves against the armies of Frederick. There were many other papers, more or less obscure, which rendered it very certain that Maria Theresa would ere long make a new attempt to regain Silesia, and that in that attempt she would be aided both by Russia and Poland. Frederick also knew full well that nothing would better please his uncle George II. of England than to see Prussia crowded back to her smallest limits.

To add to Frederick's embarrassment, France was hopelessly alienated from him.

Many bitter words had already passed between Louis XV. and Frederick. But recently a new element of discord had appeared. The duchess of Pompadour, the guilty favorite of Louis XV., beautiful, fascinating, and wicked, had become a power in Europe, notwithstanding the ignoble position she occupied. This artful and enchanting woman, having the weak king completely under her control, was in reality the ruler of France. The proudest nobles and the highest ecclesiastics bowed submissively at her shrine. Even the immaculate Maria Theresa, constrained by state policy, wrote flattering notes to her, addressing her as, "my cousin," "princess and cousin," "madame, my dearest sister."

The pampered duchess sent by the French minister to Berlin a complimentary message to Frederick. He disdainfully replied: "The duchess of Pompadour! who is she? I do not know her." This was an offense never to be forgiven.

Frederick was now in imminent danger of being assailed by a coalition of Austria, Russia, Poland, and England. Indeed, it was by no means certain that France might not also join the alliance. All this was the result of Frederick's great crime in wresting Silesia from Austria. Such was the posture of affairs when, in the summer of 1755, Frederick decided to take a trip into Holland incognito. He disguised himself with a black wig, and assumed the character of a musician of the king of Poland. At Amsterdam he embarked for Utrecht in the common passage boat. The king mingled with the other passengers without any one suspecting his rank. There chanced to be in the boat a young Swiss gentleman, Henry de Catt, twenty-seven years of age. He was a teacher, taking a short tour for recreation. He gives the following account of his interview with the king, whom, at the time, he had no reason to suppose was other than an ordinary passenger. We give the narrative in his own words:

"As I could not get into the cabin, because it was all engaged, I staid with the other passengers in the steerage, and the weather being fine, came upon deck. After some time there stepped out of the cabin a man in cinnamon-colored coat with gold buttons; in black wig; face and coat considerably dusted with Spanish snuff. He looked at me fixedly for a while; and then said, without farther preface, 'Who are you, Sir?' This cavalier tone from an unknown person, whose exterior indicated nothing very important, did not please me, and I declined satisfying his curiosity. He was silent. But some time after he assumed a more courteous tone, and said, 'Come in here to me, Sir. You will be better here than in the steerage amidst the tobacco smoke.'

"This polite address put an end to all anger; and, as the singular manner of the man excited

my curiosity, I took advantage of the invitation. We sat down and began to speak confidentially with one another.

"Do you see the man in the garden yonder, sitting, smoking his pipe?" said he to me. "That man, you may depend upon it, is not happy."

"I know not," I answered; "but it seems to me, until one knows a man, and is completely acquainted with his situation and his way of thought, one can not possibly determine whether he is happy or unhappy."

"My gentleman admitted this, and led the conversation on to the Dutch government. He criticised it—probably to bring me to speak. I did speak, and gave him frankly to know that he was not perfectly instructed in the thing he was criticising."

"You are right," answered he; "one can only criticise what one is thoroughly acquainted with."

"He now began to speak of religion; and, with eloquent tongue, to recount what mischiefs scholastic philosophy had brought upon the world; then tried to prove that creation was impossible."

"At this last point I stood out in opposition. 'But how can one create something out of nothing?' said he."

"That is not the question," I answered. "The question is, whether such a being as God can, or can not, give existence to what, as yet, has none."

"He seemed embarrassed, and added, 'But the universe is eternal.'"

"You are in a circle," said I. "How will you get out of it?"

"I skip over it," he replied, laughing; and then began to talk of other things."

"What form of government do you reckon the best?" inquired he."

"The monarchic, if the king is just and enlightened."

"Very well," said he; "but where will you find kings of that sort?" And thereupon went into such a sally as could not in the least lead me to suppose that he was one. In the end he expressed pity for them, that they could not know the sweets of friendship, and cited on the occasion these verses—his own, I suppose:

*"Amitié, plaisir des grandes âmes;
Amitié, que les rois, ces illustres ingrats
Sont assez malheureux de ne connaître pas!"*

"I have not the honor to be acquainted with kings," said I. "But to judge from what one has read in history of several of them, I should believe, Sir, on the whole, that you are right."

"Ah, yes, yes," he added, "I'm right. I know the gentlemen."

"A droll incident happened during our dialogue. My gentleman wanted to let down a little sash window, and could not manage it."

"You do not understand that," said I; "let me do it." I tried to get it down, but succeeded no better than he."

"Sir," said he, "allow me to remark, on my side, that you understand as little of it as I."

"That is true," I replied, "and I beg your pardon. I was too rash in accusing you of a want of expertness."

"Were you ever in Germany?" he now asked me."

"No," I answered; "but I should like to make that journey. I am very curious to see the Prussian states and their king, of whom one hears so much." And now I began to launch out on Frederick's actions."

"But he interrupted me hastily with the word, 'Nothing more of kings, Sir—nothing more. What have we to do with them? We will spend the rest of our voyage on more agreeable and cheering objects.' And now he spoke of the best of all possible worlds, and maintained that in our planet, earth, there was more evil than good. I maintained to the contrary, and this discussion brought us to the end of the voyage."

"On quitting me he said, 'I hope, Sir, you will leave me your name. I am very glad to have made your acquaintance. Perhaps we shall see one another again.'"

"I replied as was fitting to the compliment; and begged him to excuse me for having contradicted him a little. I then told him my name, and we parted."

How soon Henry learned that he had been conversing with the king of Prussia, we do not know. It is evident that Frederick was pleased with the interview. He soon after invited Henry de Catt to his court, and appointed him reader to the king. In this capacity he served his Prussian majesty for about twenty years. He left a note-book in the royal archives of Berlin, from which the above extracts are taken.

DAWN ON THE HEIGHTS.

COME, leave below the shrub-dark vales,
The harvest fields and pastures wide,
And climb, ere yet the day-star pales,
The lofty mountain's lonely side.

See, far around, majestic, grand,
They rise, height towering over height;
Like silent torches ranged they stand,
To wait the kindling of the light.

Against their forest-girdled hearts
The soft cloud rests its flushing cheek;
A first faint glimmer dawns, and darts
From cliff to cliff, from peak to peak.

The light creeps downward to the lakes,
White mists are through the valley curled,
Till one full tide of glory breaks
Upon the reawakening world.

What raptures through the bosom swell!
What silence all the spirit fills—
Touched by the Presence that doth dwell
Upon the everlasting hills!

Oh! blessed are they who love to climb
To solitudes remote, untrod—
To worship there with thoughts sublime,
And feel themselves alone with God.

ANNE FURNESS.

BY THE AUTHOR OF "MABEL'S PROGRESS," "AUNT MARGARET'S TROUBLE,"
"VERONICA," ETC.

CHAPTER XII.

"I AM afraid that perhaps I disturb you, Miss Furness," said Mr. Lacer, coming into the room.

"Oh no. I was doing nothing. At least, I was—only thinking."

I was vexed with myself, as I stammered out the words, for my shy awkwardness. I had been startled, and taken by surprise. Although really, after a second's reflection, I could discern no reason why Mr. Lacer's call should be particularly surprising to me. He, at all events, was quite at his ease, and sat down, and began to chat with me in a pleasant, off-hand manner, that soon put me at my ease also. He had met father riding out at the gate, he said, as he was about to enter. Mr. Furness had been kind enough to ask him to go into the house, although he himself was unable to turn back with him, having an appointment on business with a farmer some miles in the country. He was very sorry indeed to learn that Mrs. Furness was unwell. Nervous headache! That must be a dreadfully trying disorder. He could not say that he had ever suffered from it himself; being, indeed, generally quite unconscious of his nerves! But Mrs. Furness's organization was evidently very sensitive and delicate. What a charming face she had! He begged pardon for taking the liberty of saying so, but the words were sincere. He had never seen any one who had inspired him with such admiration and respect at first sight. There was an atmosphere of grandeur about Mrs. Furness, just as there was an atmosphere of sweetness about a bed of violets.

Mother's praises—and they really seemed to be sincerely uttered—were very delightful in my ears. I told Mr. Lacer, laughingly, that he would be sooner tired of speaking flatteries on that score than I should be of hearing them. "They are not flatteries, Miss Furness," he protested, earnestly. "They are the sober truth. Or rather, they are part of the truth. I must not say all I feel, it seems, for fear of acquiring the character of a flatterer in your opinion. It is not one I am ambitious of."

Then he spoke of my father, and said he had seen him the day after the races at Horsingham.

"Where did you see him?" said I, impulsively. My reason for asking was, that the great betting-rooms in the High Street were usually the goal of father's pilgrimages to Horsingham during the race-week, and wondered whether Mr. Lacer had frequented them also.

"At my own rooms," he answered, quietly. "At a little lodging I had for the week in an obscure street, called Burton's Gardens. One might have had apartments in Piccadilly for very little more than I paid for two cupboards in a cottage there. But you heard, Miss Furness—or, perhaps, happily for you, you don't know—how insatiably rapacious a creature your thorough-bred Horsingham householder becomes at race-time. He's like some horrible animal that gorges itself to repletion at one meal, and then goes to sleep until it is hungry again. However," he added, laughing, "since the Horsingham householder only eats—in that sense—twice a year, I suppose we must pardon his greediness!"

"What is the name of the people with whom you lodged in Burton's Gardens?" I asked, struck with a sudden idea.

"Really I can't tell you! I know the number of the house: it is eighteen."

"And the name of the people is Kitchen?"

"I think— Yes; upon my word, I believe you are right!"

"Oh yes, I know those people. The daughter is called Alice, and is a fair, handsome young woman."

"Y—yes. A large, healthy, blue-eyed girl. Not precisely what I should call handsome. To me there is no beauty in woman that can compensate for the absence of refinement. But, fortunately, tastes differ."

I felt slightly confused under the gaze Mr. Lacer bent upon me as he said the words. Vanity and pride were having a conflict within me that made my cheeks glow. Vanity pronounced that a compliment to my good looks was intended. Pride shyly declared that it would run no risk of unduly appropriating admiration; and that, moreover, the admiration which preferred me to Alice Kitchen was of no overwhelmingly high kind.

"Alice is a very good girl," I said, hurriedly.

Mr. Lacer did not doubt that. He thought, if he might venture to say so, that she was inclined to be a little trenchant in her manner, and a little long-winded in her conversation. But those were not characteristics peculiar to Alice; they were very general among Horsingham people of her class. Did I not think so? Not rare, indeed, among Horsingham people of any class. He knew that Dr. Hewson was not a native of the town, or he would not have made the remark. But, upon his word, he had observed so striking a difference between my mother's manner—he added, and between my manner too—and the manner of the majority of the company at Sir Peter Bunny's house, that he had made up his mind at once

that we were not of their town. And this impression had been confirmed by an inquiry or two he had made. He hoped I was not offended?

"Not at all offended," I answered. "Why should I be offended? Most people in Horsingham knew that my grandfather settled here rather late in life. It is no secret."

"Mr. Furness, your father, don't count among the Horsingham folks. He is country bred. That's different," said Mr. Lacer, carelessly.

"Did you—have you known father long?" I asked. "I don't remember—I mean I never heard—"

"You never heard him mention my name?" he answered readily, finishing my broken sentence for me. "Well, that is not very surprising. I can easily conceive that Mr. Furness has more interesting topics to discuss in the bosom of his family than a chance acquaintance made on a race-course." He laughed as he said this. He laughed rather often. He had fine white teeth, and his laugh was very frank and pleasant.

"Oh," said I, musingly, "it was on a race-course that you first met father?"

"Yes, at W——. I thought I mentioned it to you. I don't habitually frequent all the race-courses in England, Miss Furness, I beg you to believe, although I fear that you will begin to think so!"

I said, impulsively, that I was glad to hear it.

"Are you? Are you really glad? I'm afraid I can't flatter myself that you quite mean what you say." He was not laughing now, but looked very earnest, almost sad. "Do you know, Miss Furness," he went on, after a few minutes' silence, "there is scarcely a human being left in the world who could be made glad or sorry by any thing I do or leave undone!"

As he seemed to wait for me to speak, I murmured (struggling hard with a rapidly increasing fit of shyness), "Is there not?"

"No. It makes a fellow very forlorn, or very reckless, or both together, to feel that whether he goes full-tilt to the deuce or not matters to nobody."

"It matters to himself, does it not?" I stammered.

"Oh, to himself! Well—to himself. A fellow can't live for himself alone. At least, I can't. I lost my mother years ago, when I was a little chap; so little, that they lifted me up to kiss her in her coffin. I have neither brother, nor sister, nor uncle, nor aunt, nor cousin. My father is living; but he married again, a few years ago, a grasping, hard woman who— But I beg you a thousand pardons, Miss Furness! I am prosing on about myself in the most unwarrantable manner. You listen so kindly and gently that I was led on to say what I had not the least right in the world to trouble you with. And I, who have been accusing the good people of Horsingham

of being long-winded and tedious! I hope you will forgive me, I do indeed."

I told him there was no need of forgiveness, and shook hands with him as he rose to go away.

"I forgot to mention that I saw your cousins the other day, Miss Furness," said he. The same amused and half-repressed smile stole over his face that I remembered to have seen there when he had been honored by Miss Tilly's playful reproaches on the race-course.

"Oh!" said I.

"Yes; I went to their house to luncheon on Wednesday last. Mr. Sam Cudberry came to fetch me, and I couldn't get out of it; I—I mean he was so very cordial and pressing, that it was impossible to refuse."

"Oh!" said I again.

"I suppose I shall have the pleasure of seeing you at Woolling before long?"

"Seeing me there? I can not tell. We don't go there very often. It is rather a long drive for mother, now the weather is getting chilly and the days short."

"Oh! but you'll be at the ball, won't you?"

"Eh?"

"The ball. Miss Cudberry told me they were going to give a ball. I thought you must have known of it."

"I suppose we shall be told in due time. I had heard nothing of it."

"May I ask you to express to Mrs. Furness how sorry I am to hear of her indisposition? If you will allow me, I will pass out by the garden—that way, is it not?—for I left my horse in charge of a servant, and—"

"You are riding, then? Mr. Lacer, I am afraid it is possible that Flower, our groom, was impertinently familiar in his manner to you the other day. I hope you will check him severely if he should repeat the offense. He is apt to be forward. I believe—my father says, that he is an efficient servant, and understands his duties. But I know father would be very angry if he thought the man failed in respect to any of our guests."

"Oh, don't think any more about it, Miss Furness. I remember he was rather free-and-easy the other day, but I suppose he had been a little too convivial. The fact is, I have no doubt the man recognized me as an old acquaintance. I knew—that is, I was slightly acquainted with a person in whose service he was. I have a good memory for faces, and his was familiar to me directly I saw it. I assure you he was perfectly well-behaved when he took my horse just now."

Mr. Lacer made his adieu, and went his way. When he was gone I was less able to fix my mind on my books than ever. "Oh dear, oh dear!" I said to myself, pushing a volume away from me impatiently, "what has come to me? The words might be Egyptian hieroglyphics for all the meaning they convey to my mind!"

I gave up trying to study, and abandoned myself to a reverie. The day seemed to have

been crowded with incidents. The visit of Matthew and Selina Kitchen, grandfather's news about Donald, Mr. Lacer's call, and all that he had said, furnished abundant subjects to think upon. The relative importance of the day's occurrences could not be doubtful; yet my girlish brain by no means busied itself chiefly with the chief of them. What does the reader think was the most tangible subject of my musings? (for there was an airy crowd of fancies fluttering hither and thither in my mind, melting and changing like April clouds, and to which I did not consciously give a local habitation or a name). It was the forthcoming ball at Woolling! A ball at Uncle Cudberry's! The thing was marvelous—unprecedented! Tilly, Henny, and Clemmy must intend to "move with the times," and inflict themselves on society in fell earnest. How they had induced their father to consent to the necessary expenditure was a matter for wondering speculation.

And what does the reader guess was the next topic on which my thoughts were intent? I am minded to be quite candid, and to that end I must confess that it was an entirely selfish one. Amidst all the hopes and fears, the dimly presaged troubles, and the present anxieties that pressed around myself and those whom I loved, my fancy lightly turned to picturing what dress I should, could, or might wear if I went to the aforesaid ball at Woolling. Debating if it were more advisable to beg for pale rose-color, or pure white, and wondering whether mother would let me wear a flower in my hair.

Suddenly, as I pushed a lock of hair off my forehead, in the full glow of imagining how I should look with a spray of scarlet geranium fixed above one ear, a subtle association of ideas which I can not follow out—nor could I then—brought vividly before my mind's eye the tiny figure of little Jane Arkwright in her chair, playing with the uncouth dice of rough firewood. And that tiny figure conjured up in an instant all the poverty and dreariness and toils and troubles of that struggling household. I had often asked myself in my impulsive sympathy, was there nothing I could do to lighten Mrs. Arkwright's load of care, or cheer her husband's anxious spirit? There was one way, and, as far as I knew, one only, in which I might show good-will, and make a portion of the good man's labors pleasant to him—I might do my tasks earnestly and zealously, and gratify him by my improvement. And this one simple thing I was neglecting, in order to dream of tricking myself out in finery, and enjoying myself in the company of hard, frivolous people, whom at bottom I neither loved nor respected. I hung my head as though I were abashed by some bodily presence in the room; and the tears welled up into my eyes as I thought of Mrs. Arkwright's toilsome life, and of Mrs. Arkwright's shabby little children, of whom the younger had neither petting nor playthings, and the elder were precociously thoughtful and

grave, and full of careful responsibilities about the preservation of their worn little frocks and their patched little shoes.

I opened my books again, and sat down to work resolutely. At first it was difficult to attend to what I was doing. But by degrees I compelled my wandering attention; and after an hour or so I had completed an exercise and a page or two of translation, into which neither white frock nor adornment of scarlet blossoms had intruded; and if any thing else—any one else, I mean—did flit across the page, it was not—or I honestly persuaded myself that it was not—in connection with my exclusively selfish fancies.

CHAPTER XIII.

"AND so," said my grandfather, finishing a recital brief indeed, but longer than he was in the habit of making his speeches, "Donald rejects the army as a profession altogether. He says 'tis a bad trade when business is brisk in it, and a worse to be idle in."

"Yet his father is a soldier," said I.

"A good one: that I must take on trust. I know him to be a good man; but he would be neither if he followed his calling with an inward conviction of its worthlessness. That is a canker that rots every thing, beginning at the very core. Donald being left entirely free to choose his profession, chooses medicine."

"And come to you to learn it? He could not do better, grandfather."

"He might do worse, perhaps. But we shall see, little Nancy, we shall see."

Grandfather had never relinquished my old pet name of "little Nancy," though I had long outgrown it in a literal sense. He told me further, that Donald Ayrlie would one day be the master of a sufficient fortune to be idle on if he so pleased; his father being a careful, steady, hard-working officer, whose long career in India had enabled him to amass an independence, which there was only Donald to inherit. But Donald, naturally and properly, said grandfather, desired to qualify himself to do some work in the world. The prospect of lounging through life on the strength of his expectations was not an alluring prospect to him. His father might live thirty years (and if the lad's wishes could keep him alive, he would never die); or he might chuck his money into the maelstrom of speculation, though that was not likely; or he might take it into his head to marry again. In short, there was no fortune so desirable for a young man as the knowledge of something serviceable to his fellow-creatures, and the industry and good-will to apply it.

Thus my grandfather. He was in a glow of pleased expectation about Donald's coming; I had not seen him so bright and cheerful for a long time, not that he was gloomy or ill-humored ever. But latterly there had been a set stern thoughtfulness on his brow, and he

was very silent. I could not help connecting these symptoms with the anxious care that might be read on mother's face whenever she was neither speaking nor smiling. It had come to pass gradually; and yet, when I thought of the change in mother, it sometimes appeared to me to have been startlingly sudden. I was tempted more than once to tell grandfather of what I had heard pass between my father and Mat Kitchen. It had made me uneasy whenever I had thought of it since. But I reflected that I had no right to reveal to any one that which I had accidentally overheard; and that, moreover, father had seemed to demand that I should be discreet and silent on the subject by the words he had said, "I tell you this in confidence, Anne"—so I held my tongue.

I was staying at Mortlands for the day and the night. I had been to Mr. Arkwright's, and had got through my lessons with credit. And I had conceived and executed a great project, having first obtained my grandfather's permission: this was neither more nor less than inviting all Mrs. Arkwright's children to tea and a game of play that afternoon at Mortlands. It seems a simple matter enough to tell of, but it was hedged with thorny difficulties. First, there was Mrs. Arkwright's constitutional objection to, and fear of, her children "taking to" strangers too much; then there was the obstacle of their clothes being "too shabby for a company;" then there was the apprehension that cakes and sweets, and so on, would have the effect of spoiling them for their home fare. And, lastly, there was the difficulty of inducing Mrs. Arkwright to believe my solemn assurances that the little ones should be sent home by nine o'clock, in order that they might be up in time for school the next morning. But Mr. Arkwright and I together, aided by a powerful though unacknowledged ally—the strong desire in Mrs. Arkwright's maternal breast to give her children what gratification she could in their somewhat hard young lives—fought and conquered. They should all come, Lizzie and Martha and Mary and Teddy, and my particular friend Jane. Eliza was to be sent for them at three o'clock in a fly, and they were to return in the same conveyance, and under the same escort, in the evening. Grandfather made only one condition on the occasion: "When you give an entertainment of this nature, Miss Furness," said he, gravely, "I think, perhaps, to call it a rout would more properly characterize it than any other title; all I ask is, that you don't expect me to be present. There is the garden; there is the big dining-room; there is Keturah with unlimited flour and butter and jam; and, in brief, every material for biliousness that the most tender lover of childhood could desire to bestow on it, and orders to deal them out royally. You won't grudge me a little peace in the retirement of my study after dinner; and you won't feel hurt if I ask for my tea there also, instead of joining the festive throng in the dining-room."

I laughed, and kissed him, and said, I was so grateful to him for letting the children come, that I would not tease him. But I added that I thought they would like to see him, if only for five minutes.

"Pooh! stuff and nonsense, little Nancy. I should bother them. Their only association with me is an empty spoon holding their poor little jaws open; and a full spoon containing 'nasty physic' to follow!"

He had in fact attended the curate's children for a throat disorder that had broken out among them; and had, I need scarcely add, steadily refused to accept any payment for so doing.

Mrs. Abram was, I was sorry to find, somewhat flustered by the prospect of the threatened inroad on the peace and privacy of Mortlands. She had become rather redder in the face, rather huskier in the voice, rather more despondent in the temper, rather more vague and wandering in the mind, rather "odder" altogether, of late years. But she was tearfully anxious to do her best for the entertainment of the small visitors. I assured her that they were the best and quietest children I knew; that they were grave and steady beyond their years; and that, so far from being riotous or overflowing with good spirits, I expected our difficulty would be to screw them up to the point of thoroughly enjoying themselves for once in a way.

"Ah!" murmured Mrs. Abram, "and then you see their father's a clergyman. That is a satisfaction; but otherwise it is dreadful when you see a lot of little innocents like them to remember that *he* is lying in wait for 'em!"

She uttered the last words in a mysterious and awe-stricken whisper, and glanced round over her shoulder in a way that was calculated to make any one who happened to be nervous or fanciful decidedly uncomfortable. However, Keturah and I between us managed to get her into a little less lugubrious frame of mind before the little ones' arrival. I confided to Keturah that Mrs. Abram was "a little low this afternoon," and Keturah immediately set about the process which she characterized as "routing her up a bit." Keturah, in right of her long and faithful service, was a privileged person at Mortlands. And she had—I think insensibly—copied many of her master's ways and sayings. Her method of treating Mrs. Abram was in fact founded on my grandfather's.

"Come, now, Mrs. Abram," said Keturah, bustling into the dining-room, "here's Eliza putting on her bonnet to go and fetch them bairns, and nobody but me in the kitchen to get things ready. I should be ever so obliged to you if you'd tie on a apron—here's a clean white one as I've fetched a purpose—and come and measure out some sugar for me."

Mrs. Abram rose meekly to comply, but she shook her head as though it were full of the direst presages.

"Ah, dear me, Keturah," she said, with her lower jaw dropped and her mouth curved down-

ward until it resembled that of a codfish, "I hope it mayn't be evil, all this feasting and junketing and pampering of our vile bodies!"

"Well, there's no need for you to pamper yours, you know," was Keturah's practical rejoinder. "If you think short-cake and jam puffs sinful, don't you eat none, that's all! But you know who it is as finds some mischief still for idle hands to do; and p'r'aps he finds mischief for idle heads into the bargain. My opinion is as you'll be comfortabler in your mind when you give your attention to the weighing out o' the sugar. And please be partic'lar to a pennyweight, Mrs. Abram, for in short-cake the quantities must be exact."

In due time arrived the fly full of the little Arkwrights. I could have cried to see the painful neatness of their poor attire; the speckless, threadbare, stuff frocks, the skillfully darned stockings, the little rusty boots that had been "toed," or "heeled," or "soled," as the case might be. The only means that had been unstintingly—nay, lavishly—employed for their embellishment was the application of soap and water, comb and brush. And I noticed round the fair little throat of my small friend Jane a solitary string of coral beads with a queer little gold clasp. The mother's heart could not resist decking her youngest darling with this ornament. Lizzie, the eldest child—a grave, dark-eyed little girl of ten—evidently looked on Jane's necklace as a priceless heir-loom. Her mamma had worn it when *she* was a small child, she informed me; and she kept it locked in a box. Lizzie knew there were some letters in the box. She thought they were letters written by her papa, because it was like his handwriting. She (Lizzie) hoped that Jane would be careful not to pull at the necklace, because the string might break and the beads would roll on the floor, and some of them might be lost, and *then* what should they do? But Jane was a very good child in general, and not rough or careless with her clothes.

Meanwhile this exemplary young person, aged three, was toddling along the garden path holding by the hand of Martha, the second child, and observing the flower-beds with solemn interest. It was, as I have said, late in the autumn, and there was not much color or perfume in the garden. But the little things enjoyed it, being new and fresh to them; and Master Teddy became quite excited when I showed him the place where Robinson Crusoe's cave had been. I could not find the North Pole, nor did Teddy care very much about that. He had never before heard of De Foe's immortal fiction, so I had enough to do in giving him a slight sketch of the story, while we all wandered about the garden, and I pointed out, as well as my memory served me, the various spots in which Donald and I had enacted it together. By the time I had finished it was growing dusk, and we all went into the dining-room, where a good bright fire looked cheerful and welcoming.

As one or two of the children complained of their feet and hands being cold, I proposed a game of puss-in-the-corner to warm them before tea. We pushed the table to one side, and I sent for Eliza to take care of little Jane, while I joined the other four children in a famous romp. Little Jane was not strong or active enough to take much part in our game; but she sat on a stool beside Eliza (she declined to be taken on to the servant's knee, in a certain independent, self-sustained little way that belonged to her), and looked on attentively; occasionally forming the words, "puss, puss, puss," with her lips, but uttering no sound.

Then came tea, over which Mrs. Abram presided with great kindness, but with an expression on her countenance, when she regarded the little Arkwrights, which seemed to say, in the words of Gray, "How all unconscious of their doom the little victims play!" However, the children, *being* unconscious not only of their doom, but of Mrs. Abram's apprehensions, devoted themselves with ardor to the jam puffs and short-cake, and enjoyed themselves immensely. The entertainment was most successful. There was only one interruption to its perfect harmony, and even this was but a passing cloud. It arose from Teddy's unexpected resistance to having his pinafore tied on just before we went to table. Five clean coarse pinafores had been intrusted to Eliza's charge by Mrs. Arkwright, with strict injunctions that they were to be worn during all the time of eating and drinking; but against this humiliating precaution Teddy's manly soul rebelled. In vain Eliza and I coaxed and argued with him. Pinafores were all very well for girls, he said; pinafores were all very well for babies; he was neither a girl nor a baby; and when he was invited out to tea he begged most positively to decline donning his pinafore. But Teddy was subdued by that which had vanquished masculine resolution before his day, namely, feminine tears. Poor Lizzie began to cry, and then Martha and Mary—for no better reason than that they saw her crying—began to cry too. Little Jane did not weep, but she went through the motion of slapping with her mite of a hand, and said, "Teddy naughty," with judicial severity. Upon this Teddy yielded, saying, grandly, that if they were such "cry-babbies" (for which Lizzie mildly rebuked him, and observed that it was a low expression he had picked up at school) as all that, why he supposed he must let them put on the stupid old jackass of a pinafore. *He* didn't mind, then. On with it! Teddy's ruffled feelings seemed to find relief in calling his pinafore a stupid old jackass, and he repeated the epithet more than once. I whispered to Lizzie to take no notice of this little ebullition, and she dried her tears, and kissed her brother; and then Martha and Mary dried their tears, and kissed him also; and little Jane, looking on with bright, attentive eyes, pronounced, as from the bench, "Teddy dood now." And we were

all very pleasant and cheerful again directly. Only Mrs. Abram murmured behind her hand to me, in a voice that fortunately was unintelligible to unaccustomed ears, "My dear Anne, did you notice? Poor little fellow! *he* had a try at him. *He* put that naughtiness into the child's mind. Of course he did. He can't bear to see 'em good and happy. I could fancy I saw him hovering around." And Mrs. Abram glanced over her shoulder again quite awfully.

After tea we made a wide semicircle round the fire, and I asked the children if they knew any games to play at. They were not much versed in games of play, poor little things, but they were very docile and willing to learn; and Lizzie informed me that Mary could "say poetry off by heart." So I begged for a specimen of Mary's accomplishments, which she accorded forthwith. Mary was the next in age to Jane, and was five years old. Next above her came Teddy, aged seven; and above him Martha, nine; and Lizzie, ten. Mary was a very fat child; different in this respect from the others, who were slight and spare. She had great black eyes, and curling dark hair, and mottled legs that overhung her little socks, and fat dimpled arms; and her very voice was fat and husky, with rich contralto tones in it; and in this voice she began with baby accents that were not yet perfectly articulate:

"Pity de so-yows of a poo-wold-man

Who t  mblin lins au' b'ought him to you door;" repeating it all through without any stops, and taking breath in gasps whenever she happened to want it.

This performance was received with much applause. Then the children petitioned me to tell them a story. Lizzie was spokeswoman, and the others all joined in chorus. "Yes, please, *do*, Miss Furness! A story! a story!" Little Jane, who was seated on the low hassock at my feet, put up her hand to take mine; and leaning her soft little cheek against it, said, in a decisive and corroborative manner, as though to express her agreement with the public wish on this occasion, "Et—dat's yight. Oo *do*!"

So, after thinking for a minute or so, I told them I would give them a fairy story. A shout of acclamation greeted this announcement. Then I said that I thought stories sounded prettier by fire-light than by lamp-light. This being unanimously carried also, we had the lamp taken away, the fire mended, a log being added to the coals, and then, amidst a breathless hush on the part of my small audience, and a mingled sound of crackling and seething, that sounded like a subdued and ghostly whisper, from the fire, I began.

CHAPTER XIV.

"ONCE upon a time there were two children, twin brother and sister. The boy's name was Walter, and the girl's name was Lily. Walter was a dark child, with deep brown eyes and

raven hair; little Lily, on the contrary, was as fair as the flower she took her name from. Her eyes were blue, like the bits of clear sky that you see in April peeping between the clouds, and her soft hair was just the color of the down on the wing of a half-fledged chicken.

"These two children loved each other very dearly, and were always together. They lived in a village; and one of their great delights was to go down to the smith's forge at dusk, and watch the showers of sparks leap out of the blackness and melt into it again. They loved, too, to watch the dull deep glow of the red-hot iron and the intense heart of the furnace, that seemed more terrible in its quiet concentration of white implacable heat than when the roaring bellows moved it into flame; but that was beautiful though, to see the waving brightness shoot up and shake vividly upon the smoke-blackened roof and then fall again, while monstrous shadows bowed and beckoned mysteriously, to be in their turn chased away by the clear victorious flame. It was all living in their childish fancy. The sparks had life, and danced and flew enjoyingly. The great bellows labored like a chained monster. The light and shadow chased each other like elf and goblin, fairy and witch, spiritual creatures whose aims were good or evil, kind or cruel."

Here I was recalled to myself by a curious sound from Mrs. Abram. It was something like an incipient whooping-cough followed by a husky long-drawn "Ah-h-h!" and was intended—as I knew by former experience—to express a mournful and warning allusion to the direful subject on which she so much lamented my grandfather's indifference. Oddly as Mrs. Abram's inarticulate interjection sounded, I was sensible of some obligations to it in recalling me to a sense of what I was doing and for whom. For I had been giving my imagination the rein, and it had carried me somewhat beyond the children's comprehension.

"In short," said I, resuming my story, "Walter and Lily went so often to the blacksmith's forge, and watched the furnace so attentively, that they grew quite familiar with the fire, and knew almost every look of it, whether it were dull or bright or quiet or fierce—glowing crimson like the setting sun, or flaming yellow like the great round harvest-moon; and they got to know all the different aspects of the forge. Well, now Walter liked it best when it was bright and all ablaze with light, so that you could see every nook and cranny quite plainly. Lily loved the times when the forge was dimmer, and when there were corners and hiding-places that you could fancy any thing you liked about, because the shadows lurked there and made them very mysterious. By degrees these two children, who had always been so gentle and loving to each other, began to grow quite cross and unkind. They disputed which was the best, the broad glare or the twi-

light glow. Walter said Lily was a little baby who loved the darkness. Lily said that Walter was very stupid to prefer being scorched by a fierce glare, instead of liking the soft shelter of the shadow when the furnace fire was low. So they disputed and argued until they both said a great deal more than they meant, each wishing to get the better of the other, rather than caring to say the exact truth, which is a sad thing to do; but then Walter and Lily were only ignorant little children. Of course, if they had been grown-up, learned men, they would not have done so."

"Wouldn't they?" said Teddy, doubtfully.

"I—I hope not. I suppose not, Teddy."

"Ah! but perhaps they might though!" rejoined that young scholar, "because I was reading in my 'Useful Knowledge' the other day that a man found out about the earth going round the sun; I forget his name. He wasn't an Englishman; and, instead of listening to what he had to tell them, they were ever so angry, because it was different to what they had believed before, and they put him in prison, and went on to him—oh, ever so cruel!"

"Naughty mans!" said Jane, who had only comprehended that some persons unknown were cruel, and that Teddy was indignant. It was quaint enough to see the contrast between Jane's Rhadamanthine sternness of condemnation and the soft helplessness of her baby body as she sat with her little tender cheek leaning against my hand.

"Well, never mind now, Teddy," exclaimed Lizzie. "*Please go on, Miss Furness.*" Lizzie was drinking in the story greedily, quite untroubled by any critical objections.

"Well, and so at last the brother and sister came to quarreling outright. Instead of enjoying themselves in the fields and gardens, and delighting in the sweet smell of the flowers, and the beautiful leafy trees, and the clear river, and the soft grass, they were always wrangling and carrying their dispute about with them. If the sun shone brightly, Lily said it dazzled her, and she could not bear it. If there was a cool, shady spot under a broad, green tree, Walter pretended to shiver and shudder, and would not stay to enjoy it. In a word, at length their quarrel grew to such a height that Lily declared she detested the day, and Walter, that he hated the night; each meaning to vex and jeer at the other. And their little hearts were full of anger and pain."

"Ah, to be sure!" murmured Mrs. Abram. "That was just the thing for him. *He* wasn't going to lose such a chance as that, you know! Not likely."

"Still Walter and Lily went nearly every evening to the forge and watched the fire, and watched the gloom, and sat on a little bench which the blacksmith had had made on purpose for them. He was a very good-natured, honest blacksmith, and very kind and gentle to dumb animals, and little children, and all weak creatures, though he was so terribly strong and

tall, and though he looked very swarthy and fierce when his eyes shone in the fire-light. They sat there side by side, this little brother and sister, and spoke never a word to each other. Or, if they did say a word, it was sure to be a bitter and unkind one. But they mostly sat sulky and silent: Lily slinking back on her corner of the bench into the shadow, and Walter straining forward on *his* corner of the bench until his cheeks were scorched with the glare.

"This went on for a long time; but at length the autumn came and the days grew short, and the nights were chilly, and the children were forbidden to go to the forge any more until the spring should come again. But they begged to go once more, just for the last time, on Hallowe'en, and this was granted to them. Now you must know that Hallowe'en is a night when all sorts of sprites and fairies are very busy, and when they visit mortals a great deal, and join unseen in their sports and merry-makings. At least they used to do so in the old days, when there *were* sprites, and fairies, and goblins. They are never seen now. But the time when Walter and Lily lived was an old time, and in their days the fairies were still busy on Hallowe'en."

"How long ago was it?" asked Martha, a pale, contemplative child, who had been very quiet and attentive.

"It was in quite another age of the world, Martha; when the world was in its childhood."

"Is that why children love fairy stories now more than grown-up people?"

"Perhaps. Very likely, Martha. Well, accordingly Walter and Lily went to the blacksmith's forge on Hallowe'en, and sat themselves down on the bench, and stared—Walter at the red fire and Lily at the black forge, and they said never a word. Hallowe'en was a holiday for the blacksmith. He went home and washed the blackness from his face and hands, and played and made merry with his children. And his chief workmen went away too; and there was no one left but a lame apprentice, who was told to keep the furnace fire alight, for later in the evening the blacksmith and his men were coming back to finish a job they had in hand. But Walter and Lily sat there side by side, and stared—Walter at the red fire, and Lily at the black forge—and they said never a word. It was all very still and quiet. The lame apprentice had curled himself up in a warm corner, with his pipe in his mouth, and seemed to be going to sleep. The fire that he ought to have replenished sank lower and lower, and it grew very cold and almost dark. But still, there sat Walter and Lily staring—he at the red dying embers and she at the black forge—and they said never a word.

"All at once they became aware of the faintest sweet sound, the tiniest clear music you can imagine. It grew, scarcely louder, but clearer and clearer, plainer and plainer, and at last it ceased with one long-drawn sound,

which was sweeter and richer than all the others, and which—strange to say!—seemed to come out of the throat of the great bellows; and suddenly there stood before the children two wonderful little figures not more than a span high."

"How jolly!" exclaimed Teddy, in irrepressible delight. Little Jane cried "Dolly!" in an attempt to imitate her brother; but then, hearing Lizzie whisper "Hush-sh-sh, Teddy!" she too pouted her lips, and said, "Hus-s-s-s!" and held up an absurd morsel of a warning finger with infinite solemnity.

"The two figures," I went on, "were the figures of two beautiful tiny women. It was impossible to tell whether they rose out of the embers or hovered over them, or whether they stood firmly or floated self-supported in the air. But they seemed in some mysterious way to belong to the fire, and to partake of its nature. They were very different from each other though, except in size. One of the beautiful little women was so bright and brilliant that it almost dazzled you to look at her. Her hair was like burnished gold, and her eyes like diamonds; and she wore a floating robe of the most brilliant hues, that seemed to change through all gradations of color, from the golden-purple of a pigeon's breast up to pure dazzling white. The other tiny figure was all dark. Her hair was like the deepest shades in a woodland thicket. Her eyes were of the color of a violet-hued cloud that lingers in the sky when the sun has set. Her garment, loose and flowing, like that of her companion, varied, as she moved or breathed, from sombre shades, like those upon the sea at twilight, or the dark green of a leafy forest, to midnight blackness. And yet, as the two stood close together, side by side, it seemed that each influenced the other. Sometimes the robe of the dark figure would cast a soft veil of shade over the brightness of the other. And sometimes the golden-haired figure would, as her bright draperies moved and fluttered, send little sparkles and streaks of dazzling light upon her companion. And there was a likeness in their faces, too, such as you often see between two sisters.

"Walter and Lily gazed at them in silence. The children were afraid even to breathe, lest the beautiful tiny women should vanish. At length the bright figure spoke. Her voice was like the sound of a clear golden clarion, only very, very small. And this is what she said:

"Do you know our names, Walter and Lily?"

"The children did not utter a sound; but they said 'No,' in their thoughts, and the figure seemed to understand them, for she immediately answered:

"And yet you know *us*, and have seen us often, often; and under various shapes. We are fairies."

Here there was a movement of satisfaction among my young auditors, and Mary even kicked her fat little legs about in ecstasy.

"We are fairies who haunt this forge. And on this night, of all nights in the year, we are allowed to reveal ourselves to mortal eyes in our true shape. But we are only members of a vast family, some of whom are to be found scattered all over the world. My name is the Fairy Shine."

"And mine, the Fairy Shadow.' It was the dark fairy who said this, and the tone of her voice was rich and soft, as though it were breathed through a silver organ-pipe. Only it, like her sister's, was very, very small."

"We,' proceeded the Fairy Shine, 'are very different, but we love each other dearly. We are never far apart. One of us could not exist for long without the other. We try to make our different qualities help and serve, instead of opposing and hurting, each other.'

"Walter and Lily hung down their heads, and their hearts beat very quickly; for the fairy looked piercingly at them with her diamond eyes as she spoke, and their consciences accused them of having behaved to each other in a spirit quite different from that of the good fairies. And they moved just a little tiny bit nearer together, Lily from her end of the bench, and Walter from his.

"Who,' said the Fairy Shadow, 'is so ungrateful as to speak evil of the blessed brightness of sunbeam or fire-flame? Who forgets all the cheering warmth they shed, and all the beauty that they paint the earth with?'

"And who is it,' said the Fairy Shine, 'who rails against the soft refreshment of the shade? The kind, gentle shade, that protects the young lambs at noonday from the strong sun, and keeps the tender plants from withering, and fills the stream with pleasant showers from its dark gray clouds, and brings rest and sleep to the earth with the coming of the eventide; to men tired with labor, and to children tired with play?'

"Walter and Lily hung their heads still lower, and drew yet a little nearer together; and the two fairies went on speaking, each in her melodious voice—that of the Fairy Shine like a tiny golden clarion, and that of the Fairy Shadow like a tiny silver organ-pipe; and each praised the good qualities of the other; and as they spoke, the two children crept closer and closer together on their little bench. 'And know, ye vain and ignorant mortals,' said the Fairy Shine, raising her clear voice until it seemed to pierce and vibrate into the very hearts of the trembling children, 'know that it is thus with all my elfin brothers and sisters who haunt this earth. They bear all sorts of various names among men, and do all sorts of various offices; but they always are set to their tasks in couples, different, like this sister and myself, but able, for that very reason, to minister the better to the different moods and needs of mortals. Some dwell around the hearth and in the chimney-corner; some tend the flower-beds, and some the unfledged birdlings; some whisper in the ears of little children, and make

them laugh in merriment, or shed tears of gentleness and pity; but they all work together for good—those who bring tears quite as much as those who bring smiles; the sprite that hushes the flowers to sleep under the purple twilight, quite as much as his brother sprite who shakes the bright dew from their leaves to wake them in the rosy dawn; and the All-wise, the All-good' (at these words both the little figures bowed themselves reverently, and over the bright form there stole a soft shadow, like a dusky mantle, and over the dark form a quivering glory, like a moted sunbeam)—'He sends these various influences to help each other and to help the world, and there breathes through' all a spirit of love—through mirth and sorrow, smiles and tears, light and darkness!'

"At these last words the faint, clear music sounded sweetly again in long-drawn chords, and the fairies vanished, the light fairy seeming to fade and be absorbed into the shadow, and the dark fairy seeming to brighten and melt into the ruby glow of the fire; and the brother and sister, who had all this time been creeping nearer, nearer, nearer, held out their arms and fell, crying and sobbing, on each other's breasts."

"And the good lesson was not lost on them, for they 'lived happy ever after,'" said a deep, low voice.

"And they learned to know that Shadow has its beauty and its use as well as Shine," added another voice, in a strong, clear, *chest-tenor* tone. And I turned round, startled from the sort of reverie into which I had allowed myself to become absorbed in the telling of my story, to see two figures, that might have been the Ecalistic nineteenth-century version of my fantastic fairy tale, standing close behind me, just outside the circle of children—grandfather, who had spoken first, with a flickering shade upon his head and face, and sober, neutral-tinted garb; and, smiling frankly, with bright, earnest blue eyes, and yellow hair, gilt by the leaping flame—Donald Ayrлие.

CHAPTER XV.

I SPRANG to my feet; and all the children rose also, and faced round and stared at the new-comers.

"Why, we have 'fluttered the Volscians' with a vengeance! A couple of hawks in a dove-cot would cause nothing like the consternation we seem to have brought here!" said my grandfather. "Little Nancy, do you know who this is?"

"Mr. Ayrлие," said I, somewhat stiffly. I felt shy and put out at the idea of my fantastic story having been overheard by ears it was not intended for.

"Donald," said grandfather, quickly. "Yes; you are right. It is Donald Ayrлие."

We shook hands, and said "How do you do"

in a meaningless kind of way. Altogether, the meeting with my old play-fellow was different from what I had thought it would be—when I had thought about it at all. Grandfather looked a little vexed and disappointed. Whether my shyness had infected Donald, or whether he had brought a store of shyness with him to be added to mine, I could not quite tell. But it is certain that we were, both of us, frigid and silent.

Grandfather seated himself, and made Donald draw a chair up in the circle; and then Mrs. Abram had to offer her greetings and bid him welcome, which she did in a dazed manner. I think that Mrs. Abram had not made allowance in her own mind for the changes which the lapse of time since she had seen Donald would be likely to make in him. His height seemed to puzzle her. Donald was not tall—being of a broad, sturdy figure that gave one an impression of combined strength and activity—but of course he was taller than he had been at eleven years old. And Mrs. Abram's eyes, when she addressed him, were invariably directed first to about the middle button of his waistcoat, as though she expected to find his head there, and then raised slowly, with a surprised expression, until they reached his face. His voice, too, appeared to startle her by its full, manly tone. I, who from long experience understood poor Mrs. Abram's manner pretty well, was led to believe that she had a confused notion that Donald's strong voice hurt him; for whenever he spoke she put her hand to her throat, and raised her eyes to the ceiling compassionately. However, I of course kept this discovery—if discovery it were—of Mrs. Abram's state of mind on the subject of Donald, to myself. And no one else appeared to observe it.

Grandfather explained to us that Donald had arrived somewhat sooner than he had expected to do, in consequence of finding himself able to come straight on to Horsingham without breaking his journey at our county town, as he had at first intended. He had traveled all the previous night, he said; but was not tired. He had been hungry, he confessed, when he arrived; but his old friend, Keturah, had got ready some food for him without delay, and he had been making a good meal in the doctor's study.

"Yes," put in grandfather, "Keturah is a first-rate woman—always kind, always alert, always with her wits at hand, bright and ready for use. And she knows how to welcome an old acquaintance heartily. I believe she gave you a kiss, didn't she, Donald?"

Donald blushed like a young lady, and laughed like a school-boy, and said, "Yes, Sir."

"It wasn't a Judas kiss, at all events," said grandfather. "That you may depend on. She's as honest as the sun, is Keturah; and if she hadn't been glad to see you, she wouldn't have kissed you. But she is a good soul—a

good woman. Yes; Keturah knows how to give a hearty welcome, as if she meant it."

I understood very well that grandfather was hurt at the coldness of my manner, and intended to reprove me for it. But I could not help it. I should have been more cordial had I not been taken by surprise. But now no efforts I could make availed to remove constraint from my manner. Nay, my efforts had a contrary effect; so I was fain to sit still and silent, unless I were spoken to, and pass for a stupid, stiff, *missish* young person.

Grandfather passed his hand once or twice through his "mane," and looked round upon the children, who had remained as quiet as mice since his entrance. His face grew brighter as he looked, and he smiled kindly on them, and patted Teddy on the head. "That's a man!" said grandfather. "You're not afraid of me, are you?"

"No!" said Teddy, stoutly, looking up into his interlocutor's face.

Grandfather patted the child's head again and smiled. He had a great horror of inspiring fear or awe. I believe he had hesitated to come among the little Arkwrights, partly because he fancied they might show some dread of him as "the Doctor." With the gentlest heart in the world, his manner was stern at times; but of this he was quite unconscious, and was grieved and surprised if he perceived any traces of timidity or subjection in the behavior of young people toward himself. The little Arkwrights, however, were too mere children to show either. They read his face aright at once; and the slight cloud there had been on it—brought there, I was sorry to know, by my unsatisfactory reception of Donald—cleared off very quickly.

"Have you had any cakes?" said he, addressing the children.

"Oh yes, ever such a lot! *had* jam puffs!" answered several young voices in chorus. Grandfather's eye lighted on little Jane, who had resumed her place on the hassock, and was again holding my hand, and leaning her cheek against it, as she looked thoughtfully at the fire.

"And, let me see, what's *your* name, you Leprechaun?" said grandfather.

Jane did not move, but she withdrew her gaze from the fire, and fixed it on his face, as she answered, with her usual composure and deliberation, "Dane Aweesle Arkyight."

"Jane *what*? What does she say her name is?"

"Jane Louisa Arkwright," explained Lizzie.

Jane nodded her head with grave dignity, as of an Eastern potentate who should sanction the translation of his words by an interpreter into some "barbarian" speech.

"What's a Lepre—that thing that you called Jane?" asked Martha. Martha was of an inquiring turn of mind. Grandfather explained that Leprechaun was an Irish word for an odd old-fashioned kind of sprite; and that led to a general dissertation on fairies: and

that led to a delicately hinted request that grandfather would oblige the company with "a story;" and he gave them "Jack the Giant-Killer" in fine style. Teddy confessed frankly that he thought grandfather's story far superior to mine; and, indeed, all the children enjoyed it far more than mine, naturally. Donald, when I remarked this, laughingly said, "Yes; and I think that the reason is that your story took hold of you, instead of your taking hold of it; and, consequently, it carried you a little out of the reach of your small audience."

I mustered courage to ask him what I had been longing to know, namely, how much of my nonsense he had been a listener to?

"I arrived about the time of the appearance of Mesdames Shine and Shadow," said he, in the same sort of shy, low tone I had spoken in, and without turning his eyes toward me. "But I don't think your story was nonsense."

The little Arkwrights were regaled before their departure in the fly with elder-wine, which had a great deal of sugar and spice in it, and was much relished. By the time it was served—it being then the rakishly late hour of half past eight—poor Mary was very drowsy, and even Martha and Teddy showed symptoms of sleepiness, which, it is needless to say, they denied and struggled against with a heroism worthy of a better cause. But little Jane's bright gray eyes were as wide open as ever when she was wrapped up and carried down the garden path to the fly. It was a moonlight night, and as I stood at the glass door of the dining-room, watching the children depart, I saw little Jane's fair face above grandfather's shoulder; he carried her to the coach himself, the bright eyes turned unwinkingly toward the sky, and the clear moonbeams shining in them with solemn serenity.

Soon afterward Mrs. Abram withdrew, being tired, she said. I never shall forget the hopeless perplexity on her countenance when she shook hands with Donald and bade him good-night. She was so undecided what to call him, and hesitated so vaguely up to the very instant of opening her mouth, between "love" (her favorite word), and "Donald," and "Mr. Ayrle," that she finally conferred on him, as he rose to open the door for her exit, a compound appellation, which sounded, I thought, quite grand and Andalusian—namely, "Don Loveairy."

I slipped away not very long after Mrs. Abram, and left grandfather and Donald chatting by the fire. As I was going up stairs to my room I was waylaid by Keturah. She was full of delight at Donald's arrival. And wasn't he a fine lad? she said. And wouldn't it be a fine thing for the master to have a bright young fellow like that about him? And wouldn't all the house be pleasanter and more cheerful than it had been for many a day? I said I hoped so—and I dared to say so—and that it was very likely. But I suppose my response was not quite cordial enough to be in tune with Keturah's mood, for she looked piercingly at me from

under her overhanging black brows, and said, more sharply, "And you know, Miss Anne, it's like to be a comfort to your grandfather to have a young creature about him, and a sort of a bit of sunshine to all on us as we grow older."

"Why, Keturah," said I, smiling, and laying my hand on her shoulder—for, though I was a little vexed, I did not intend to let her either snub me into silence or sting me into anger—"am *I* never to come to Mortlands any more? or am *I* not to be reckoned among 'young creatures?'"

"Oh, you, Miss Anne!" said the old servant, slowly. "Why, you will be making new friends or new ties, and forgetting all about us, some day, I reckon. It's nat'ral, I suppose. But you know you *haven't* been to Mortlands so often lately but what we have had time to miss you; and we hear of visitors at Water-Eardley—smart gentlemen, with smart uniforms; and what should smart gentlemen go there for but pretty young ladies?"

"You reckon that I shall be forgetting all about you? Keturah, *I* reckon that you're a goose!"

"Aha, child, mebbe you're out in your reckoning then!" returned Keturah, grimly enough. But the next instant that smile, of which I have spoken as being so singularly sweet and attractive, stole over her face, and she kissed me, and bade me "good-night" in her usual manner.

I thought, as I sat brushing my hair that night, that if I had been disposed to be jealous of my place in grandfather's regard, I might have had some excuse for the feeling, in the fuss they all seemed determined to make about Donald. But I was not disposed to be jealous. I said to myself that, after all, Keturah was right in deeming it a good thing for my grandfather to have the new occupation and interest

in life which the young man's presence would afford. Donald Ayrle was a link between the past and the present. His name was connected in grandfather's mind with all sorts of youthful reminiscences; and I was very glad to think of his remaining many years at Mortlands. It would be comforting to those who loved my grandfather to know that he would have such a staff and companion at hand when he should grow very old. And—though Keturah was crabbed, and talked nonsense sometimes when she was cross—still it *might* be that I should not be able to be always within call of Mortlands; so many changes happened in life. There was an elder daughter of Sir Peter Bunny, whom I had never seen, only heard of; she had gone to India, and would probably not revisit her old home for years and years. Her husband was an officer in the army, like—Donald's father.

Almost as plainly as though the words had been uttered from without instead of within, I seemed to hear a voice saying, "Anne, Anne, you are not in earnest! You are trifling and playing at *some feeling* that has no living root in your heart!"

I did not question this importunate voice for an explanation of its sibylline utterance; but I did question myself as to whether I were in earnest or not, and as to whether it were true that I was "playing at a feeling" which had no living root in my heart. Was I drifting idly along under the guidance of a mere fancy? enjoying a make-believe sentiment, just as I had enjoyed enacting make-believe fairies and princesses and Arctic voyagers and Man Friday, when I was a child?

I fell fast asleep in the little bed that had held me so many a night in peace and safety, before having arrived at a final answer to any one question of my self-imposed catechism.

THE SACRED FLORA.

[Part XX.]

WHEN Shakspeare made Falstaff compare the naked Shallow to "a forked radish, with a head fantastically carved upon it with a knife," he either had in his mind the little MANDRAKE figures which were sold in his time—and in French ports within this century—or he followed a suggestion which has been so universal that it has given rise to an entire mythology. There can be little doubt that the forked flesh-colored roots of the mandrake originated those superstitions concerning it, which have attained such importance as to require no fewer than twenty-two learned treatises—stretching between the years 1510 and 1850—to deal with this one insignificant plant!

The mention of mandrakes in Genesis, xxx., and Canticles, vii., shows that the belief in its power to produce love and fruitfulness was current among the ancient Hebrews. Indeed, the

word used in the passages referred to, dudâim, is manifestly from the root דוד, *love*. The Arabs call the mandrake *tuphac el sheitan*—that is, "devil's apple"—from its supposed power to excite voluptuous feeling. Venus was sometimes called, among the Greeks, Mandragoritis (Hesych.), and the fruit of the plant was popularly termed "apples of love." Pythagoras calls the mandrake *anthropomorphum*, and Columella calls it *semihomo*. In the MS. of the charming old writer on healing plants, Dioscorides (A.D. 1), preserved at Vienna, there is a picture of Euresis, goddess of discovery, presenting the author with a mandrake root. The root is in human shape, with five leaves growing out of its head; near by is a dog in the agonies of death. I suspect it was from this Greek source that Josephus received the account he gives (B. J., vii. 6, § 3) of the custom in a Jewish vil-

lage of pulling up the root by means of a dog, which is killed by the shriek uttered by the root in being torn up. This feature of the superstition has followed the mandrake stories every where. To procure it one must cut away all rootlets to the main root; to pull up that is death to any creature that hears it. So one must stop his ears carefully, and having tied a dog to the root, run away. The dog is then called, and, pulling the root up, is instantly killed.

The origin of the German name for mandrake, *Alraun*, has been variously explained. Tacitus speaks of a formidable people among the Germans called "Aurinia," believed to be endowed with magical powers, and some have traced *Alraun* to their name, on account of their use of the plant in sorcery. Jornandes (de Reb. Getic., c. 24) says that King Filimur found among his people a tribe of magicians called Alyrumnæ, whom he hunted into the woods, where they mingled with the wood-devils (Fauni Sicarii), and from this mixture sprang the Huns. They are the same of whom Aventinus speaks as loose-haired, barelegged witches, who would slay a man, drink his blood from his skull, and divine the future from his mangled remains. There is, undoubtedly, a so-called witch's name under Alrune (Grimm, *Deutsche Myth.*, 376 *et seq.*), and Hans Sachs says Alraun was a cross-road goddess. Nevertheless, there is reason to believe that Alraun is simply a late form of the Gothic Alrune, and that the word is related to *rune*, of which mention has been already made. The French word *Mandragloire* is simply a part of the Greek word *Mandragora* blended with the name of the old French fairy Magloire.

In Germany and France the superstition took the following form: The mandrake sprang up from the excrement of a thief or a criminal. It was sure to be found near a gallows, and so was popularly called in Germany Galgemannlein. It was to be obtained generally in the way described by Josephus, though it was added that one must sign the cross three times over the plant before pulling it up. Having got the root up, it must be bathed every Friday, kept in a white cloth in a box, and then it would procure manifold benefits. There is preserved a letter from a burgess of Leipsic to his brother at Riga, written in 1675, which shows exactly the popular notion of the mandrake at that time. It runs thus:

"LEIPSIC, Sunday before Fast-night, '75.

"Brotherly love and truth and all good to thee, dear brother! I have thy letter, and have made out from it enough to understand that thou, dear brother, in thy home and affairs hast suffered great sorrow; that thy children, cows, swine, sheep, and horses have all died; thy wine and beer soured in the cellar, and thy provender destroyed; and that thou dwellest with thy wife in great contention—which is all grievous to hear. I have, therefore, gone to those who understand such things to find what is needed, and have asked them why thou art so unlucky. They have told me that these evils proceed not from God, but from wicked people; and they know what will help thee. If thou hast a mandrake (Allruniken oder Erdmanniken), and bring it into thy house, thou shalt have good fortune. So I have

taken the pains, for thy sake, to go to those who have such things, and to our executioner have paid sixty-four thalers and a piece of gold drinkgelt to his servant, and this (mandrake), dear brother, I send thee, and thou must keep it as I shall tell in this letter. When thou hast the Erdmann in thy house, let it rest three days without approaching it, then place it in warm water. With the water afterward sprinkle the animals and sills of the house, going over all, and soon it shall go better with thee, and thou shalt come to thy own, if thou serve the Erdmanniken right. Bathe it four times every year, and as often wrap it in silk cloths, and lay it among thy best things, and thou need do no more. The bath in which it has been bathed is especially good. If a woman is in child-pain and can not bear, if she drink a spoonful she will be delivered with joy and thankfulness. And when thou goest to law put Erdmann under thy right arm, and thou shalt succeed, whether right or wrong. Now, dear brother, this Erdmanniken I send with all love and faith to thee for a happy New Year. Let it be kept, and it may do the same for thy children's children. God keep thee!

"HANS N."

It is certainly remarkable that in 1675 so much as sixty-four thalers could be obtained for one of these little figures; but it is probable that the dealing in them had become very secret on account of the danger one incurred of being suspected as a witch if the root was found upon him or her. In 1630 three women were executed in Hamburg on this account.

Matthiolus, in his commentary on Dioscorides, describes the great ingenuity which had been reached in the carving of the root into the human semblance, and the training of little shoots from seeds planted in it, which were manipulated so as to look like hair. The same ingenuity was employed to invest each figure with a marvelous legend of its origin or potency. Naturally it was connected with the devil. The Erdmann put into a glass bottle became a spider, then a scorpion, but was never for an instant still. In the cloister of the Capuchins, at Vienna, there was shown, in the last century, a little apparently living, or ever-moving, devil, an inch and a half long, black, with human face and long tail. It was kept in a little bottle which had no opening. By this and similar contrivances throughout Europe the puzzle called "Cartesian Devils" was suggested. Those who had these bottled devils were subject to dangerous liabilities; for, though the demon would perform many services, he who should die with one in his possession would become the devil's victim. Nor was it very easy to get rid of; for unless one could sell it for a little less than he paid for it, it would remain on his hands. There are legends of how they were thrown into fires, into rivers, but were always found in their rooms when those who so threw them returned home. A haunted spot is shown in Lower Würtemberg, where a merchant of Ulm tried vainly to get rid of his Galgemannlein; and for a long time a house stood in Frankfort which was avoided because it was related that there a baker woman had perished miserably with a mandrake in her possession, which she had tried hard to be rid of. This diabolical phase of the superstition was especially strong in France and England. It was believed by

many that Joan of Arc had one of these imps in her possession, and she was even asked by the judge at her trial whether such was not the case; but she replied that she did not know what mandrake was. At Romorantin, Margaret Ragum Bouchey, the wife of a Moor, was hung as a witch in 1603, the charge against her being that she kept and fed daily a living mandrake fiend, which was stated to be in the form of a female ape. In France the mandrake superstition seems occasionally to invest some other root. Thus the author of "*Secrets du Petit Albert*" (Lyons, 1718) says that a peasant had a bryonia root of human shape, which he received from a gipsy. He buried it "at a lucky conjunction of the moon with Venus," buried it in spring, on a Monday, in a grave, and sprinkled it with milk in which three field-mice had been drowned. In a month it became more human-like than ever. Then he placed it in an oven with vervain, wrapped it afterward in a dead man's shroud, and so long as he kept it he never failed in luck at games or work. The same author says that he saw a figure owned by a rich Jew which had a human face on a hen's body, which had been produced out of an egg by a process quite indescribable here, save that the "right conjunction of the moon and Jupiter" was regarded in the procedure. The monster lived for a time on worms, and after death its potency continued.

The German stories are very curious. One of them relates that a horse-dealer of Augsburg once lost a horse, and, being poor, wandered in despair to an inn. There some men gave him an Alraun, and on his return home he found a bag of ducats on his table. His wife becoming suspicious, extorted from him the confession that he had some potent charm, and she induced him to return and take it to the men; but they could not be found. In the night the wife opened her husband's box, and finding there a purse, opened that, whereupon a black fly buzzed out. Soon after the house took fire and was burned, the horse-dealer killed his wife, and then shot himself. The German poet Rist relates that he saw an Erdmann made with great pains, and more than a century old, which was kept in a coffin. On the coffin was a cloth on which was a picture of a thief on the gallows and a mandrake growing beneath it. Most careful and peculiar provisions were made in Northern Germany for the inheritance of the Erdmann. When the possessor dies his youngest son becomes the owner, but he must lay a piece of bread and a piece of gold in his father's coffin, and they must be buried with him; but if the youngest son has died before his father, the eldest inherits, after making the same offerings. (Grimm, *Deutsche Sagen*.)

If any one will examine the specimen of mandrake preserved in the museum of the Royal College of Surgeons, in London, he will hardly wonder that it should have aroused superstitious feelings. It is a British specimen—the gift of Charles Hatchett, F.R.S.—and we

must suppose has not been tampered with, though this is difficult to believe; for nothing could bear a more quaint resemblance to two heavily bearded human faces—the eyes, noses, foreheads being traced upon the heads of the joined bulbs with a distinctness that requires no aid from the imagination. The roots in this specimen are short, and hidden by the long reddish-brown beard; but if, as would seem to be the case in other specimens, such faces should have human-like limbs projecting beneath them, the effect would be startling enough. We can not wonder that Franciscus Imperatus and Fabius Columna should have both described the mandrake they saw as "a man in blossom."

The superstition concerning the mandrake is very strong throughout the south of England, the belief being that it is human, and will shriek when torn up. Shakspeare speaks of its power as an opiate, and the belief that its shriek would kill or madden those who heard it. It is said to be perpetually watched over by Satan; and if it be pulled up at certain holy times, and with certain invocations, the evil spirit will appear to do the bidding of the practitioner. In the mining regions of Germany the mandrake was supposed to reach down to the cobbolds beneath the earth, who shrieked when it was torn up. It was held in some places that if a black dog were tied to it, and made to pull it up, the treasures at its root would be drawn from the hole. In Silesia, Thuringia, Tyrol, Bohemia, we still find it connected with the idea of subterranean treasures. It is also, in the same countries, supposed by some to produce fruitfulness in women—a notion not improbably connected with the story told concerning it in Genesis, xxx., where it seems to have been held in a similar association. Compare also the allusion to the plant in Canticles, vii. 13. Machiavel's comedy, "*La Madragola*," turns upon the vulgar superstition of its power to bring children. Petrus de Crescentiis attributes this power to it also. In some remote districts of Bohemia the roots are gathered before sunset on Good-Friday, dried, pulverized, and given to cows. The cow that eats it will draw the milk of all other cows that come to the place where it has stood, and be able to furnish milk for nine houses. Its milk gathers to butter without churning; but such butter, if melted, gives only froth. In Westphalia and the vicinity of the Hartz mandrake is soaked in water, and the water poured on domestic animals to prevent swellings; but it is deemed essential that the plant should first be taken out of the water and buried. The Tyrolese superstitions are that it reveals treasures, prevents wicked possessions, and, if taken in a decoction, renders the blood proof against blows. In various Alpine regions it is found occasionally laid on the bed to prevent nightmare, borne about to prevent cramp and toothache, and particularly to secure the mountaineer against robbers and bad weather.

The connection of the mandrake with the idea of some buried human being seems to

me traceable to the story of the snaky-locked Medusa. The legend of her head being buried in a mound under the Agora at Athens may possibly be preserved in the Greek name *Μανδράγορας*. The power of Medusa's head to turn all to stone may have seemed represented in the powerful narcotic influence of this plant, of which Plato speaks—*μανδράγορα ἢ μέθη ξυμποδίσαι*—and reappears in the common superstition that he who hears its shriek when it is torn from the ground will fall dead. Pliny speaks of the potency of the mandrake as an opiate, and says that he who would draw it up must be careful to shield himself from its breath, and must draw three circles around it with a sword, while he looks toward the west, provisions which surely suggest the exploit of Perseus. The prize that Perseus won by decapitating Medusa—whether it be considered Andromeda or a kingdom—is reflected in the superstition (mentioned by Hippocrates and Theophrastus) that the mandrake is amatory, and that it draws treasures from the earth; while, more plainly, his indirect method of securing Medusa's head, by seeing it in a mirror, is suggested in the Teutonic superstition that the mandrake must not be touched with the hand, but drawn out by a dog; also by the frequency with which the legends speak of the Erdmann as too horrible to be looked upon. Even the legend that, to obtain the Gorgon's head, Perseus stole from her sisters, the Graæ, the one eye and one tooth they had in common, seems faintly traceable in the Icelandic form of the superstition, in which it is said that mandrake will draw money even from human beings, if the following humiliating conditions be observed: The experimenter must steal a coin from a poor widow between the chanting of the Epistle and the Gospel at one of the three festivals, Christmas, Easter, and Whitsuntide; this coin must be placed under the herb, which will then draw to itself from pockets near by coins of the same denomination. The mandrake is called in Iceland *thjofarót* (thieves' root), and is believed to spring from the froth of the mouth of one who has been hung, or the cairn where he has been buried. The mandrake superstition is still known in Kent, England, where it may be occasionally found, kept to cure barrenness; but its greatest vigor is in Greece, where bits of it are still carried about by young people as love-charms. Among the intelligent this once potent Erdmann survives now only as an infinitesimal pellet of homeopathy to charm away rheumatism.

No plant equally humble has ever had so universal a sanctity ascribed to it as the common *HYPERICUM*, or St. John's-wort. There is hardly any country where one may not still hear of its seed or leaves gleaming like gold on St. John's Eve, and of its extraordinary medicinal virtues. The summer solstice, which had its representation in the Northern mythology as the death of Baldur (the sun), was identified by the Christian missionaries with the nativity

of John the Baptist. The period had in pre-Christian times been regarded as that in which witches—the powers unfriendly to Baldur—held their festivities; and for some reason or other the hypericum was their symbolical plant. The missionaries consecrated the plant along with the day. The reddish sap of the *Hypericum androsæmum* (*ἀνδρὸς αἶμα*), once called elf-blood, now suggested the blood of the Baptist. The day has evidently retained its old pagan characteristics wherever it is still regarded with superstitious awe. It is a night when witches are abroad; a night for second-sight, ghost-seeing, fortune-telling; they who climb on house-tops will see marvels. In every German country it is thought by the ignorant to divine the future. It is stuck on walls, in rafters, and as it grows up or down, as it withers more or less quickly, presages life or death, marriage or disappointment. In Sweden and Norway it is the central plant of the Midsommars-gravstar, or bouquets gathered on St. John's Eve, and hung up as an antidote to witches in house and stable. For on that night the orgies of the Walpurgis witches demanded that every precaution should be taken. The bonfires or bel-fires, kindled in their honor when they were deities, were now kindled to scare them when they had been transformed by Christianity into devils. The plant which was put over every door formerly as their badge, was now, along with the cross, set to bar their entrance. Still, such are the anomalies of mongrel religions, and so much easier is it to change dogmas than symbols, the plant was held to bring chiefly blessings. It was called *devilfuge*. In Tyrol it was, and is by some still, thought that if a traveler has it in his shoes he will never get weary, however long his journey. On the Lower Rhine it is placed in wreaths on the roofs as a general protection. Its sap is esteemed of special potency—it being the elf's or the Baptist's blood—and is sometimes mixed with beer, etc. In Wales St. John's-wort is sometimes made into a tea which produces a certain exhilaration. In France one may see harvesters having their hats decorated with it. It is held sacred by many in the Levant, where it is a current superstition that the plague leaves a city on St. John's Day. In Scandinavia witchcraft is averted by nine plants bound together, of which St. John's-wort is the chief.

It is not a little remarkable that we find the number mystically associated with plants to be generally nine. In most parts of India the number of sacred trees will generally be stated as nine: soma, pipal (*Ficus religiosa*), banyan (*Ficus indica*), boqul (*Mimusops elengi*), huritukee (*Terminalia citrona*), amalakee (*Phyllanthus emblica*), nimbu (*Melia azodaracta*), tulasī plant, and the palāsa (*Butea frondosa*).* In nearly every part of Germany it is said there must be nine herbs, or nine flowers, or nine

* The pipal is looked on with dread as the home of demons, and the sweet boqul as the home of the kindly fairies.

kinds of wood (generally of fruit trees whose fruits have no stones in them), used on various magical occasions. Thus it is said in East Prussia the alarum-fire must be made with nine kinds of wood; and in certain districts of South Germany the priests sprinkle holy-water from an aspersory made of nine kinds of branches. The Fates who went before Odin as he passed through the air with spear and shield to take part in human battles, and named those appointed to be slain, were nine in number. Dr. Wuttke, of whose researches into the superstitions of Germany I have freely availed myself in this paper, states that *Dreimal* has, as a word of magical potency, taken the place of the ancient *Neunmal*. This is probably the result of Trinitarian teaching. Still, as he says, "Neunerlei Holz, neunerlei Kräuter, Speisen, u. s. w., haben hohe Kraft." There is a belief in Bohemia that when a black cat is nine years of age it betakes itself to the service of witches, and is received with honors at the annual Walpurgis gathering as the sacred animal of Huldah. Our saying that a cat has nine lives comes, probably, from this superstition.

Any tree might become sacred by being struck by lightning. The Thunder-god had visibly signified his relation to it. The wood of such a tree would reveal witches. It must never be used for common fires; the fire will all fall out on the floor, and only holy-water can put it back again, or put out the fire (Bohemia). In Voigtland wood-cutters value highly the wood of a tree that has been struck by lightning, for wedges and mallets. An old Hindoo myth meets us in the Westphalian belief that a tooth-pick made of the splinters of such a tree will cure toothache. In Indian and German mythology the teeth and lightning are mentioned repeatedly as related. The tooth of the wild-boar and that of the mouse are said to produce on the body effects similar to those of lightning. Charcoals of a lightning-burned tree are deemed powerful against poisons in many places. The essence of superstition being mystery, it is natural that the stroke of the lightning should call it forth in a pre-scientific age. But still more was the feeling of wonder awakened by the quiet descent on a tree, as it seemed from the upper air, of the MISTLETOE. Mysterious in its origin, choosing generally the most sacred trees—the oak and the apple—upon which to alight, this parasite became, in the North, almost as powerful a symbol as the cross which superseded it. The word mistletoe is usually derived from the Celtic word *Mwsogl*, a moss; but it has a curious resemblance to the Semitic word *Mistar*, a secret place. The meaning of the O. N. *mistil* is not clear; the last part of the word seems to be from *teinn*, a staff. Prior says *mistl* means different, and *tan*, twig—mistletoe being a twig different from the tree it grows on.

We find in India remnants of a superstition concerning mistletoe, especially when it is found on the ill-omened pipal-tree. In the Northern mythology it is associated with the god of sun-

shine, Baldur, who, as the Eastern Baal or Bel, the Russian Byelbog, etc., has appeared in many mythologies, and some have thought gave its name to the Baltic, and perhaps the prefix *Bally* to various Irish localities. Frigg, the mother of Baldur, exacted an oath from all things, except the mistletoe, that they would never harm her beautiful son. Lōki, hearing this, took a mistletoe and went to the place where all were engaged in sports with Baldur. Seeing one—Höd—standing apart, Lōki asked him why he did not shoot arrows like the rest. Höd replied that he was blind and unarmed. Lōki told him he should nevertheless do honor to Baldur, and, giving him an arrow made of the mistletoe, directed him where to cast it. It pierced Baldur, and he fell dead. The identity of this fable with the myths of Eastern countries has been ingeniously traced by Grimm and Mannhardt. The mistletoe was held in high esteem with Faust and other pretenders to the black art. In the Tyrol it is believed to be guarded by the serpent there called hazelworm (our blind-worm, or viper), and that if one can catch that serpent on his watch he will gain great treasure, besides having the power to render himself invisible. In some districts of Bavaria there is hung up in every room in the house a combination of plants—a bunch of palm with mistletoe and savin, all bound to a hazel stick or handle; and it is considered impossible that any witch can approach so powerful a fortress of magical influences as this. In Austria mistletoe is held by the superstitious a safe preventive against nightmare if laid on the bedroom door-sill.

Baldur has left his name in various flowers and plants in the Northern countries. In Denmark, Sweden, and Iceland there are flowers (each different) popularly called "Baldur's-brow." The balsenbro of Skania is the same as the Baldur's-brow (*Anthemis cotula*) of Sweden, and suggests some common origin with the Greek *Βαλσαμίνη*, balsam-plant. "The fires," says Sir Walter Scott, "lighted by the (Scottish) Highlanders on the first of May, in compliance with a custom derived from the pagan times, are termed the *Bealtane-tree*." It may be observed also, as showing that there may be some connection between this *Bealtane* and *Βαλλω*, ball, ballet, that Grimm has called attention to the custom connected with the bel-fires of Germany, to set a cart-wheel on fire and dance around it. The burning wheel is then rolled down a hill, this representing the declining sun. There is also a German proverb that "he who has a wheel over his doorway has luck in his house."

There are many plants in Scandinavian countries which bear in their names traces of their association with the Northern deities. Tyr, the god of war, whence *tir* (honor), a shooting-match, and *Tiwaesdæg*, Tuesday, Dies Martis, Mardi, survives in the Norwegian *tysfiola* (*Viola martis*) and Danish *tyved*, the spurge-laurel. Aconite is called in Norway, after the

god Thor, thorjalm and thorhat, in Denmark and Sweden stormhat, of which our name monk's-hood is partially a translation. Mr. Thorpe has suggested that the common name for it, wolf's-bane, bears an allusion to Thor's combat with the wolf. The aquatic plant *Spongia marina* bears the name of Niörd's-glove—Niörd being the god who could still the ocean. Forniot's-hand (called by the Anglo-Saxons *Forneotes-folme*) related to a deity regarded with more reverence by the Finns. The beautiful Freyja, who has given to German women the appellation *frau*, has left her name with the freyjuhâr (*Supercilium veneris*); and the elf-made hair of Sif, Thor's wife, is celebrated in the sifjar-haddr (*Sife peplum*; *Polytrichum aureum*). Odin's wife Frigg (the earth) has not only named a constellation in Sweden, where in some regions Orion is called Frigg's Rok, *i. e.*, distaff, but also the *Orchis odoratissima*, which is called frigghar-gras or hjona-grass (marriage-grass). Very many plants which were held sacred to Norse goddesses had their names changed by the early Christians to honor the Virgin Mary. Thus Niörd's-glove, and various other species of orchids which have hand-shaped roots, are called also Our Lady's hand, Mary-hand, etc. It will be remembered that all the plants which have "lady" in their names—lady's-smock, lady's-slipper, and the like—were consecrated to the Virgin Mary, or "Our Lady," and that many of the flowers so named had a pre-Christian sanctity is known. The black species of *Mary's-hand* is called *Satan's-hand*. The dew-flower called *Lady's-mantle* seems to bear in its botanical name (*Alchemilla*) some record of its connection with alchemy.

The name *Our Lady's flax* reminds us of the goddess Bertha, who was represented by our ancestors as watching over the fields of flax, and as spinning the same on her distaff. The connection of the distaff and the spinning of flax with the Fates is found in the Southern, Eastern, and Northern mythologies. In many parts of Germany it is held that all the flax must be spun before Twelfth-night,* as one who spins thereafter is liable to be bewitched. In Westphalia it is said the dwarfs will come and destroy what is spun on Twelfth-night. On Shrove-Tuesday the housewife will especially look after her flax. If the sun shines out on New-Year's Day the flax will be straight. In Bohemia it is said if seven-year-old children dance in the flax they will be beautiful. If one has dizziness, let him or her run, after sunset, three times through a flax-field naked, and, the Brandenburg saying is, the flax takes the dizziness to itself. The Bohemians try to cure fevers by running into a pond and dropping therein a spindle, a piece of flax, and a piece

of bread. In Thuringia the bride will place flax in her shoe, that she may never come to want; in Lauenburg she will tie a string of flax around her left leg, believing that it will be endowed for her benefit with the marriage blessing. In Greece a sanctity attached to spinning, and the spindle-tree was called *Εὐνομον*, of good omen (Theoph.). In Germany Bertha was the kindly mother of spinners, and sometimes poor girls who made a precarious livelihood by spinning, or who by cruel mothers-in-law were set to difficult tasks, found knots in their threads, which, when they tried to untie them, proved to be of pure gold. She is the original of all the good fairies in our story books, and there are few nurseries without evidence that her reign is still very potent. The early Christians tried hard to supersede her with the Madonna, but never quite succeeded.

The young science of Comparative Mythology has shown us that the great religions of ancient races converge in the early conception of a divinely endowed tree guarded by a serpent. The medieval legend that from a seed of the Tree of Life in Eden grew the tree which afterward furnished the wood of "the true cross" may not be altogether a fable, though the Tree of Life has been confused with that of the forbidden fruit. The sect of Ophites worshiped the serpent "lifted up" as an emblem of Christ raised on the cross (see John, iii. 14). And, as the legend says three seeds of the Tree of Life were preserved, we can plainly see that one of them flowered into the soma of Persia and India and its many Oriental modifications, and into the Ygdrasill of Scandinavia, which has been reproduced throughout Germany. In considering the analogies referred to, it is important to remember that the particularization of the apple as the fruit by which Eve was tempted is not Scriptural, but traditional. In several countries the notion has prevailed that the forbidden fruit was a kind of grape. In some old Italian pictures the serpent is represented holding out to Eve a cluster of grapes; and in an ancient church fresco which I have seen in Russia the Tree is a vine with fruits which it is difficult to identify. In this form the story approaches more nearly the traditions relating to the Hindoo soma (*Asclepias acida*), which is identical with the Persian homa, though Parsees deny that their holy plant is found in India. It is a climbing plant with a milky juice, which is used only after fermentation. "Homa," says Windischmann, "is the first of the trees planted by Ahura-Mazda in the fountain of life. He who drinks of its juice never dies. According to the Bundeshesh, the gogard or gaokerena tree bears the homa, which gives health and generative power, and imparts life at the resurrection. The homa plant does not decay, bears no fruit, resembles the vine, is knotty, and bears leaves like jasmine, yellow and white." The same author unhesitatingly identifies it with "the Tree of Life which grew in Paradise."

* It was considered by our Saxon ancestors of evil omen to spin on festival days, afterward on saints' days; but the spinner might, at least in always skeptical Prussia, avoid evil results by holding a crust of bread in her mouth, that being possibly an evidence that it was a "work of necessity."

Mrs. Manning, in her very valuable work on "Ancient and Medieval India," has cited several very interesting hymns and legends relating to the soma, an allusion to which opens nearly every invocation in the Rig-Veda. One of the Brahmin hymns says, "Soma, like the sea, has poured forth songs and hymns and thoughts." Mr. Muir has also translated some of the hymns relating to the soma sacrifice. One is rendered thus:

"We've quaffed the soma bright,
And are immortal grown;
We've entered into light,
And all the gods have known;"

which almost literally repeats what the serpent said of the forbidden fruit in Eden. But the legends which have gathered around the soma equally recall the serpent; for it is related that a dragon once seized the soma plant, which was taken from him by a hawk. In the Scandinavian legends the serpent and the hawk both reappear, Odin having found the sacred mead amidst rocks (where also Indra found the soma) and carried it off in the form of an eagle. The eagle perches in the top of Ygdrasill, the serpent gnaws its root. This eagle has between its eyes a hawk. In the Grimnismal it is written:

"Under Ygdrasill lie
Unnumbered snakes,
More than mindless
Men can conceive."

In the Voluspá it is said:

"An ash I know,
Ygdrasill named,
A branchy tree, bedewed
With brightest water.
Thence come the dews
Into the dales that fall:
Ever stands it flourishing
O'er Urda's fountain."

This dew poured by the Nönnir, or Fates, over Ygdrasill to preserve it from decay, drops down as honey-dew, and there are some things in the Eddas which would seem to show that it was of this that the drink of the gods, mead, was brewed. Coleridge's lines,

"For he on honey-dew hath fed,
And drank the milk of Paradise,"

refer felicitously to both that and the more definite legend concerning the mead, namely, that it flows from the udder of the goat Heidrun, which feeds on the leaves of the tree Lærad, growing over Valhalla. This *milky* character of mead allies it with the soma juice. There is some complication in the Northern myth here. Was the Lærad at some period identical with Ygdrasill? "The branches of the tree Lærad," says Thorpe, "are eaten also by the hart Eikthyrner, from whose horns drops fall into Hvergelmir." Now this Hvergelmir is the place beneath Ygdrasill where the serpent is. The name of the goat Heidrun (heidr, *serene*, and *renna*, to flow) signifies the heavenly air, and probably indicates the clear atmosphere from which the honey-dew is distilled upon Ygdrasill. Lærad is from *læ*, calm. The name of the hart

which feeds on the leaves, and from whose horns drop rivers, is Eikthyrner, *i. e.*, oak-thorned. It is not impossible that Lærad may have been a sacred vine from some older mythology, which was adopted and represented as twining about the great ash, though it seems impossible at present to come to a more definite conclusion on the subject than that the Scandinavian has an unquestionable affinity with the Indian myth. The mingling of Lærad and Ygdrasill corresponds to that of the two Trees of Eden.

The biblical account of the garden, the Tree of Life, and the serpent, as well as the parallel legends of the Eddas, may also be instructively compared with the following from the Hindoo Mahabharat: "There is a fair and stately mountain, and its name is Meroo, a most exalted mass of glory, reflecting the sunny rays from the splendid surface of its gilded horns. It is clothed in gold, and is the venerated haunt of Deos and Gandaros. Incomprehensible, not to be encompassed by sinful man, it is guarded by dreadful serpents. Many celestial plants of virtue adorn its sides, and it stands piercing the heavens with its aspiring summit, inaccessible even by thought. It is adorned with trees and pleasant streams, and resounds with the delightful songs of variegated birds." A yet vaster mountain (Mandar) is spoken of in the same book as the haunt of deities, concerning which it is significantly related that it is entirely enveloped in the net of a "twining creeper," defended by savage beasts, whose king—the serpent Ananta—was alone able to remove it, and did so by command of lotus-eyed Vishnu. The ocean was then churned with this mountain to discover its treasures, and particularly *ambrosia*, the immortalizer of the gods. The Elysium of the old Britons was situated on a beautiful island covered with marvelous trees and flowers. It was called Avallach, *i. e.*, Apple Island; but it was also described as a glass mountain, another name of it being Ynisvitrin, that is, Glassmountain. This, as Mannhardt shows, was translated into English Glastonbury (Ang.-Sax. Glæsenburuh), where, as we have seen, was the famous thorn which flowered at Christmas. The author of the "Vita Merlini" gives the following description of it:

"Insula pomorum, quæ Fortunata vocatur
Ex re nomen habet, quia per se singula profert;
Non opus est illic sulcantibus arva colonis;
Omnis abest cultus, nisi quem natura ministrat.
Ultro fœcundos segetes producit et uvas
Nataque poma suis prætores germine Silvis;
Omnia gignit humus vice graminis ultro
Armis centenis aut ultra vivitur illic redundans."

The Tree of Life reappears in the vine of Bacchus, the fig with which Isaiah cured Hezekiah, the Bodhidruma of Buddha, the Talok-tree of Cambodia, with the grotto at its foot and the dragon whose daughter the banished prince Pra Thong marries, the mercury (abbreviated from *muliercurialis*) which Mercury discovered, and which survives in his caduceus with the serpents around it, and the

tree of Æsculapius with the serpent around it, which the leeches formerly took for their sign, and which still survives in the pole with the twining red line around it of our barbers' shops! Mr. William Craft, a very intelligent American negro, who passed some time in the kingdom of Dahomey, related to me the following singular story. On one occasion while he was there a man came from some other part of Africa, and seeing a large snake, killed it. It proved to be one of the sacred snakes, and the man who slew it was at once seized; he was put in the centre of a circle made of dry fodder; the fodder was lighted all around, and the man told to run for his life. Meanwhile the people had all provided themselves with sticks from a tree—what tree Mr. Craft did not mention, but possibly their sacred cotton-tree—and when the man broke through the burning circle they all struck him with the sticks. They pursued him for some distance, until the man came to a pond, into which he ran to quench the fire which was burning his clothing. At that moment the people left him to go free, saying the serpent was satisfied, as the man had passed the "ordeal of fire and water."

Some of the trees that have acquired sanctity are so entirely without mysterious or unusually useful characteristics that it is probable that their sacredness originated in some fact of local importance. The Liberty-tree on Boston Common, associated with American Independence, so long held together by iron bands, would in an earlier age have been worshiped. Herne's Oak—more richly adorned by the genius of Shakspeare than was the plane-tree in Lydia with the gifts of Xerxes—and many other historical trees, may show how, in pre-historic ages, trees planted possibly to commemorate certain events, or favored by some prophet, might have gained an importance which has followed them by tradition. However this may be, it is certain that some, perhaps many, of our trees and plants have reached us chiefly through the religious care with which they have been fostered. It is said that in some regions to which Irishmen have emigrated it is considered worth while to cultivate shamrock to supply them for their patriotic festivals. The Puritans who settled New England found at Plymouth the little *Epigea repens*, raising its fragrant pink-white cup above the latter snow, and it seemed to them such a symbol of their own triumph over their wintry difficulties that it is said they named it after their ship, the *Mayflower*. The care with which that flower is now gathered and admired has given to many of its sisters in the past the sacredness which has secured them an earthly immortality. In Greece particularly, made up as it was by immigrants from the East, the sacred plants were collected, and in their rich gardens they were cultivated. For in Greece there reigned the religion of Beauty, which could include all the floral symbols and add to them a fresh sacredness on account of their beauty. There are few indeed of our trees and flowers which

were not cultivated in the gorgeous gardens of Epicurus, Cimon, Pericles, and Pisistratus; and it is even doubtful whether we have now their arts of culture, unless indeed we are to regard the accounts given of their ability to diversify the shapes and colors of fruits and to render them stoneless as mythical. That many of their garlands and crowns were made of flowers and leaves whose sanctity was from farther East we know. Even in Rome such wreaths were termed "Egyptian." Among the flowers chiefly used for these purposes in Greece we find the rose, violet, anemone, thyme, melilot (a kind of clover), crocus, yellow-lily, and yellow flowers generally, chamomile, smilax, cosmos, sandal (Doric for hyacinth), and the chrysanthemum. Rustics used much the agnus castus, with which Prometheus was represented as crowned. (The Spartans crowned themselves with rushes in the Promethean festivals.) The priests of Hera at Samos crowned themselves with laurel, and those of Aphrodite with myrtle. In the festival of Europa at Corinth a crown of myrtle thirty feet in circumference was borne in a procession. There was a poetic or religious tradition surrounding nearly every favorite tree or flower. The young Greeks were convinced that they could read Apollo's exclamations of woe, AI, AI, on the leaves of the hyacinth, which sprang from the blood of the friend he had accidentally slain; though some said these were indications that the flower sprang from the blood of Ajax. The laurel, narcissus, myrtle, cypress, and pine were transformed nymphs or beautiful youths; the rose sprang from the bath of Aphrodite; the mulberry was red with the blood of loving hearts; even the humble mint had once, in a divine form, been beloved by Pluto; and the cabbage was said to have sprung from the tears of Lycurgus. The platane (the tree which Xerxes loaded with ornaments in Lydia, and intrusted to one of the "immortal ten thousand") was said to have sprung up on the spot where Zeus had reclined on landing with Europa from the sea, in the Gortynian territory. Pliny says the plane-tree was planted at the tomb of Diomedes, when his companions were turned into sea-fowl. The long life and grandeur of this tree would naturally call superstitions about it. In Lycia there was one, the cavity in which formed a room 81 feet wide, in which Licinius Mucinus, proconsul, entertained eighteen persons of his retinue at a banquet. While in Italy the plane-trees were often dwarfs, on the Bosphorus they are giants—the largest being one 90 feet in height and 150 feet in circumference, its age being estimated at 1500 years. The rose-colored lotus (melilotos) was said by Pancrates to have sprung from the blood of the lion slain by the Emperor Adrian, and it is probable that the story was the modification of an earlier myth.

The vine was especially sacred. Sprung, as the Locrians said, from a bit of wood magically produced by a wolf—produced miraculously, according to others, near Olympia, where the inhab-

itants claimed the annual miracle of the filling of three sealed vessels with wine at the Dyonisian festival—brought by Bacchus to mortals, according to the more common fable, and trodden into wine amidst hymns and sports in his honor, the vine had a history which led by necessary steps to its symbolical presence in the cup of the Eucharist. When the English cabman pours a little of his draught of beer on the ground before or after drinking, when the Lord Mayor and his friends take the “loving cup,” they are unconsciously practicing rites that once were libations on earth and divine enjoyments of mead in Valhalla; while in partaking the communion cup Christians are verging upon the ancient wine-festivals which once represented the ecstasies of inspiration. And this not in Greece alone. No ritualist ever held the wine in his chalice to be more mystical than Hafiz, as he quaffs that of his own cup. Von Hammer need hardly remind us that it is only in appearance that such lines as these are Anacreontic:

“Butler, fetch me ruby wine,
Which with sudden greatness fills us;
Pour for me, who in my spirit
Fail in courage and performance....
Bring to me the liquid fire
Zoroaster sought in dust.
Bring the wine of Jamschid's glass,
Which glowed ere time was in the Néant;
Bring it me that through its force
I, as Jamschid, see through worlds.”

Again:

“O, just fakir, with brow austere,
Forbid me not the vine;
On the first day poor Hafiz' clay
Was kneaded up with wine.”*

And although some of the glowing quatrains of Omar Khayyám are more epicurean, in the ordinary sense, than the verses which gained for Hafiz the title of “The Tongue of the Secret,” it would seem that his wine-cup is also a chalice:

“And lately by the Tavern door agape
Came shining through the dusk an angel shape,
Bearing a vessel on his shoulder; and
He bade me taste of it; and 'twas—the Grape!

“The Grape that can with logic absolute
The two-and-seventy jarring sects confute;
The Sovereign Alchemist that in a trice
Life's leaden metal can to gold transmute.”

* * * * *

“Ah, with the Grape my fading life provide,
And wash my body whence the life has died,
And lay me, shrouded in the living leaf,
By some not unfrequented garden-side....

“Then even my buried ashes such a snare
Of vintage shall fling up into the air
As not a True-believer passing by
But shall be overtaken unaware.”

The rebuke of the drunkenness with which the Lord's Supper was attended, in 1 Corinthians, ch. ii., shows that the early church had imitated the bacchanalian festivals quite closely. Yet the ascetic tendency had as much as it could do to bring about a reaction, while even in the canonical books such sentences could be

found as this, in Solomon's Song: “I am come into my garden, my sister, my spouse; I have gathered my myrrh with my spice; I have eaten my honey-comb with my honey; I have drunk my wine with my milk: eat, O friends; drink, yea, drink abundantly, O beloved.”

There is a story concerning a golden communion cup at Viöl, that it was presented by a man in fulfillment of a vow made on his escape from some monsters. Riding by night from Flensburg he passed by a barrow where the underground folk were holding a festival. He asked to be permitted a draught from a large golden beaker they handed around, which contained something resembling milk. They freely offered the beaker, with which he made way, having poured its contents on the ground. He escaped their pursuit only by reason of his house-door being open, but his horse's tail was half singed off by the liquid which he had dashed behind him; though the story reads much as if this Norse Christian had not thrown all of it away. His dedication of the cup to the communion-table was regarded, no doubt, as securing him from all future trouble from the indignant dwarfs; and throughout the rural districts of Germany, Sweden, Norway, and Denmark, no superstition is more commonly met than that which regards the chalice, or the cloth covering it, or a flask of the wine that has been used in the communion, as a charm against evil spirits. The superstitions concerning wine in Germany are very curious. Thus it is said that the wine of a flask that has been buried in an ant-hill from one spring to another will give a man the strength of a giant. In Austria it is said, one who puts a flask of wine in the cellar or in one's room on St. Thomas's night will see his or her future husband or wife. The blessing of the vineyards by the priests was once a familiar ceremony in Germany; and in some regions it is even now the custom to give a private eucharistic service to a household with wine made by it, a drop of the wine so used being afterward placed in all the casks. This wine is supposed to bring fruitfulness and strength, and is not to be bewitched.

A SIGH.

It was nothing but a rose I gave her,
Nothing but a rose
Any wind might rob of half its savor,
Any wind that blows.

When she took it from my trembling fingers
With a hand as chill—
Ah, the flying touch upon them lingers,
Stays, and thrills them still!

Withered, faded, pressed between the pages,
Crumpled fold on fold—
Once it lay upon her breast, and ages
Can not make it old!

ANTEROS.

BY THE AUTHOR OF "GUY LIVINGSTONE," "SWORD AND GOWN," "SANS MERCI,"
"BREAKING A BUTTERFLY," ETC.

CHAPTER XXII.

"SO you have condescended to come back at last. It's a pleasant surprise, my dear. You said nothing about it in your last letter; and I began to think that you meant to shut up Templestowe, and cut Loamshire for this winter, at all events. Yes, you're improved—decidedly improved; though I almost forget how you looked when we parted. The glimpse I got of you in town don't count, you know; you were quite uncomeatable there."

Thus Mrs. Devereux—*inter oscula*—on the day following the Atherstones' return. The style of this impetuous young person, even in writing, was scarcely Johnsonian; and some of her composite words would have made the most liberal lexicographer shudder.

"You put it in that way?" Lena answered. "Now, it's very odd, but I fancied myself neglected about that time, and forgave it, because I credited you with so many engagements."

"Engagements!" the other pouted; "as if provincials, in London for a fortnight, ever had any that mattered. Never mind, I don't want you to apologize; you can't always help being a great lady; but at that Devorgoil ball, for instance—a hateful crush it was, too; I spoiled the loveliest dress, and hadn't a waltz worth remembering—you were always surrounded by mightinesses. Now I don't like mightinesses, and perhaps they don't like me. Didn't you see Lady Montfort's look of horrified curiosity when I ventured to speak to you? I might have been Pocahontas, in native costume. It was something like this."

The stony set of the pretty mobile face was irresistible, and Lena laughed outright.

"No, it escaped me; but I've good reason to recognize it. I was not always in Lady Montfort's good graces, and she remembered our cousinship rather late in the day. After all, the season tired me very much; and, if I look better, it's all owing to the northern air. Now we'll stop recrimination, if you please, and you shall open your budget of Loamshire news."

"It's a very little one," Mrs. Devereux answered, meekly. "There never was such a steady humdrum old county as this. I believe every body and every thing is much the same as when you left. Dick's nearly a stone heavier, I'm afraid—as if a poor man, riding as he does, had any right to get stout. You needn't laugh; it's no joke to us, I assure you. He half ruins himself in horse-flesh as it is. Some new people, a Mr. and Mrs. Malcolm, have taken Erriswell; they will be rather an acquisition, I've heard; but only the servants are there as yet. Malise Walwyn went to Rome at Easter, you know, and there's a rumor that he will come

back all shaven and shorn; and they say that Sir Manners Mannering has taken to bullying his wife instead of neglecting her, and that she likes the change. Major Colville says that if these strikes go on in the north, his detachment is certain to be moved. Perhaps it's only *pour se faire valoir*—that's so like a man—but I shall be too sorry if it's true; he leads me perfectly, and is so nice in every way; and Dick simply worships him. Poor Godfrey!"

There was much meaning in the penitent little sigh, and not a little in Lady Atherstone's smile.

"Don't be despondent," she said; "the trades unions have quite enough to answer for without breaking up your family circle; and you needn't put on mourning yet for the Lost Leader. So that's all you have to tell?"

"I think so. Stop a minute, though; how stupid I am! Somebody is very much altered, somebody in whom you ought to be rather interested, too. Can't you, or won't you guess? It's Arthur Corbett."

Cissy's eyes were not her strong point—"good, useful ones," she herself called them—but they were expressive enough just now, as they rested on her friend's face; however, beyond a faint curiosity, they read nothing there.

"How altered?" Lena asked, after a second's pause. "I hope nothing has gone wrong in Heslingford."

"Nothing in his bank or in his house, that I'm aware of," Mrs. Devereux answered. "Still he's decidedly changed. You remember what oppressively good spirits he was always in, and how incessantly his tongue rattled? Well, he's fallen into such an odd absent way, and hardly does his share of conversation; and, to my certain knowledge, he has declined at least a dozen invitations in the last four months. He was never a favorite of mine. I've a vague recollection of his once having tried to establish a flirtation; but he was altogether too 'sweet,' and my tastes don't lie in that line. So I haven't troubled myself much about his secret sorrow. But he's a favorite of yours, and perhaps you'll be able to explain the puzzle."

Lena's brow slightly contracted. "I particularly dislike puzzles," she said, "I suppose because I never guessed one; and I haven't the smallest intention of seeking Mr. Corbett's confidences. It will be a great pity, though, if he grows silent and unsociable; for the conversational capabilities of Loamshire, so far as I can judge, are rather limited, and any one who can make talk deserves to be encouraged. It's only a passing cloud, I dare say, at the worst; and we shall soon see Mr. Corbett as sweet and sunny as ever."

Mrs. Devereux pursed her lips demurely.

"We shall see," she retorted; and so changed the subject.

About this same time Lord Atherstone sat in his library, giving audience to divers dependents, and among those who brought in their report was the head keeper.

You may remember, in the early part of this tale, that allusion was made to a certain Mary Gilbert, who died within the year of Ralph Ashleigh's departure for India. John Gilbert was her brother, and the only one of the family left surviving. Born on the estate, he had always followed the same occupation, and had filled his present post nearly a quarter of a century.

A hard-featured, beetle-browed man, rather downcast of look, as a rule, but whose bold, clear eyes, nevertheless, could on occasion meet any creature's gaze unflinchingly; almost morose in his great reserve, but never insolent toward his superiors, or tyrannical toward his subordinates, though he was unforgiving to a fault. People at the time said he took his sister's death greatly to heart; and, if he ruled his children strictly, none doubted that he loved them well. About his religion, too—he was a rigid Methodist—there was a gloomy tinge; and his creed evidently did not forbid a pitiless using of the arm of flesh, as the Heslingford poachers could witness; altogether, he reminded one of the old Ironsides, who, after reading out unctiously a blessing on the merciful, would go forth to smite the malignants hip and thigh. As might naturally be supposed, he was a favorite with none, unless it was with his master; and, even here, the word scarcely expresses their relation. Lord Atherstone assuredly treated the head keeper with a consideration that he showed to no other retainer; for he not only allowed him to hold an opinion differing from his own, but occasionally gave up the point in dispute; yet he did so with a certain constraint, as if the concession did not entirely spring from a regard for the other's experience and professional skill; and, though John Gilbert's manner was always perfectly respectful, if you had watched him narrowly, you would perhaps have divined that a sense of duty, rather than personal attachment, was at the bottom of John Gilbert's proved fidelity.

His report of the game was very satisfactory, and his accounts were passed without a word of comment; but the keeper's countenance was more overcast than usual this morning, and when all was done he lingered, as if he had not quite said his say. This did not escape Lord Atherstone.

"You've something to tell me," he said. "You'd better make a clean breast of it."

The other hesitated, shifting from foot to foot uneasily, and crushing his felt hat between his horny hands.

"That's what I mean to do, my lord," he said at last. "Only, as it's altogether a matter of my own, I was loth to trouble you with it on such a busy day; but I daren't hold my peace. I'm sore troubled in my mind about Phœbe."

A touch of the Loamshire bur hung about his tongue; but the man's language was strangely good for his station, and he spoke in a firm, slow way, not slurring his words according to the fashion of the county.

"Phœbe?" the Baron answered, after a moment's reflection; "that is your second daughter, isn't it? The one that went last year to her aunt, in Heslingford, to learn dress-making? You ought to have her home, if she's ailing; perhaps the town air don't suit her. I remember she looked delicate."

The keeper's face grew harder and his eyes were still downcast.

"The air don't suit her, for certain," he said, "and she's at home this month past; but there's naught wrong with the lassie's health, beyond that she's a bit drooping like. We did it for the best, and what is ordained is ordained; but I've wished of late that she had been felled with a sore sickness—ay! if it had gone nigh to death—the day she went down yonder, so happy and hopeful."

The Baron knit his brows.

"Speak out, Gilbert; I can't construe parables. You don't mean"—then he checked himself.

As Mrs. Shafton remarked, Ralph had more delicacy on some points than the world gave him credit for.

The keeper drew his breath hard, and his brown cheek flushed dusky red.

"It's a short story, my lord, and not a new one either. It's only that a—gentleman, I reckon he calls himself—has been knave enough to speak lying words to Phœbe, and that she has been fool enough to listen, and that, if God had not watched over the child, there might have happened shame as well as sorrow; with all her meek looks, she has a wicked, willful spirit of her own that will be broken, mayhap, before it is tamed. How do I know they were lying words? Because, for as simple as I am, I can guess whether Mr. Corbett's favorite clerk is like to mean fairly by John Gilbert's daughter."

His voice was somewhat hoarser, but it was neither raised nor quickened; and he stood now as still as a statue; and yet the spirit working within the man was as evident as if it had rent him like one possessed.

"I remember," Ralph said, contemptuously, "a good-looking, curled coxcomb, aping his master's dress and manner. I shouldn't have thought there was an ounce of harm in him. You wish me to interfere, of course; but how?"

"He wouldn't call it harm, I dare say," the other retorted. "Heslingford's a bit dull in the summer, and the evenings are long, and a gentleman must have his amusements; and, if he isn't strong enough for cricket, playing at shuttle-cock with an honest girl's heart—he found it honest, I'll swear—is pretty pastime. Yes, I do want your help, my lord. I want Mr. Corbett told—he'll listen to *you*—that he'd better work his clerks harder than give them holidays to be spent as Mr. Herbert Farland spent

his but yesterday; and I want yon gay kestrel warned that if he comes hanging about my place, and watching me off on my rounds, I'll trap him, as I do other vermin, and deal with him pretty much the same. I will—by—"

The oath did not sound like a blasphemy; it was clear that, even in his strong passion, the speaker had no thought of taking the holy name in vain.

The Baron pulled his huge trailing mustache, as was his wont when perplexed or annoyed.

"It must be stopped somehow, of course," he said; "but scarcely in that way. I don't approve of threats, nor would I carry such a message."

John Gilbert's downcast eyes were lifted now, and met his master's fairly.

"It's no threat," he said, with a quiet sternness. "I have sought in much prayer for light to guide me in this trouble; and I think that the light has come at last. If I have God's warranty, man's judgment is but a light thing. Mine's a rough message, my lord, all the same; and I'd never have asked you to carry it if I hadn't a good right so to do. You won't disallow it either, I'll be bound; though my poor sister has been buried over thirty year. Stop, my lord—" The other had risen to his feet with a great darkness on his face. "Don't think I'm casting this up in anger. If I'd ever thought you'd meant foul play, it ain't likely I'd have taken your wages. The little she did say was said to me; and she cleared you that far; but it was not the fever that killed her. Phœbe sha'n't go the same road, if I can stop it—stop it—*any how*. I promised Mary the very day she died that I'd serve you faithful during your pleasure; and that I'd never let you guess how much I knew, unless I was drove to it. I think I've kept that promise true. I want no thanks; I only want you to help me here, in my own way."

"No, I never meant harm," Ralph said, gloomily, "and I never guessed till now—how should I?—that I started in life with a death lying at my door. After that, I couldn't expect to thrive. But your poor sister only did me justice, or I couldn't look you in the face now, John Gilbert. Nevertheless, our reckoning won't be settled while we live; it's none the lighter for having run on all these years; I'll pay what I can though. Your message shall be delivered, word for word, before I sleep; and you shall have the answer by this time to-morrow."

The keeper bent his head rather assentingly than gratefully, it seemed; and so the interview ended.

CHAPTER XXIII.

"WHAT's good for you to know you'll be told."

With this formula, rather terse than polite, a certain sage of my acquaintance is wont to quench feminine curiosity, issuing from what-

soever quarter. Lady Atherstone had never met with such rebuff; but she always acted on this principle notwithstanding; and, though she guessed from her husband's face, that neither pleasure nor ordinary business called him into Heslingford, she let him depart without asking him a single question, nor did she mention her suspicions to Mrs. Devereux.

Ralph so rarely loitered when he was riding alone, that even the groom, who was used to the pace, grumbled and wondered, as he led the steaming cattle to and fro before the bank-door.

"It can't be a money mess," he ruminated; "he's as steady as old Time about sich matters, I'll pound it; though he ain't such a screw as that there blessed son of his. Somethin' wrong about the home-farm, like enough. The last oats as come in was a proper bad sample—light as fluff, wouldn't put flesh on to a pig, let alone 'art into an 'oss. P'raps the steward 'll get the sack; not a bad job neither; I never could abear them Scotchmen."

While the retainer vented his discontent Lord Atherstone had walked straight through the counting-house into the sanctum beyond, only pausing to ascertain that the junior partner was alone.

The greeting that passed was cordial enough; but Ralph, as was his wont, came straight to the point, and, before touching on any other subject, explained the object of his visit. Mr. Corbett seemed much shocked and surprised—more so, perhaps, than could have been expected, considering his somewhat frivolous character, and that no harm had actually happened.

"Would you—would you like to speak to Farland yourself?" he stammered.

The other nodded his head, and a few seconds later the culprit was paraded.

Herbert Farland possessed the convenient kind of conscience which, however torpid in presence of crime, always pricks at scent of danger. He well remembered where and how his last free afternoon was spent, and probably guessed that the Baron's visit might bear some relation thereto, for, as he entered, there was a decided abatement in the jauntiness of his gait—his very curls seemed suddenly to have lost their crispness, and his ruddy countenance was almost wan; neither were his tremors assuaged by the brief glance he ventured to steal at Lord Atherstone's face; as for Mr. Corbett's—being a strict man of business, possibly some unlucky debtor, craving for indulgence, may have seen such an expression there, but to his favorite clerk it was surely strange.

"You will listen to what his lordship has to say," Arthur began. "And, before he speaks, you will understand that I indorse every word."

His voice was harsh and cold, yet the words seemed framed with a certain effort, and he sat evidently ill at ease.

Ralph's discourse need not be recorded, for you have heard the substance of it already; but, if brief, it was very much to the purpose,

and John Gilbert's message was delivered faithfully.

"It's a threat, of course," he concluded, "and an illegal one; but I don't think the law will help you much when you're in John Gilbert's hands, nor cure you when you come out of them. He'll keep his word, I know. And, mark me, whatever happens, I'll bear him harmless, if it can be done by interest or money. You can set us both at naught, if you please; but—I don't think you will," and the Baron smiled grimly.

Of a truth, the demeanor of no creature standing upright upon its feet could be much less defiant than was Herbert Farland's. Being neither devout nor deeply read in Scripture, he would have subscribed just then to every one of the preacher's warnings against the snares of woman's beauty, and vowed that, if he ever escaped out of this net, it would be long before he strayed again nigh the toils.

The revulsion of feeling was very natural: besides being a man of peace by temper and profession, he was essentially a man of the time.

It is no wonder, if there be a certain calculation in our courtships, and if a certain prudence moderates our passions, when—on this side of the Channel, at least—no keener blade than the golden sword of justice overhangs the offender; and, howsoever his purse may suffer, his person is sure to 'scape scot-free. And even our loyal devotion must be expressed by bloodless sacrifices; modern knights are not less chivalrous at heart than

"Les noirs chevaucheurs, les marcheurs dans l'ombre;"

but they seldom, very seldom, are enabled to honor their lady at peril of life or limb; such chances only befall the rude fisher-carl, who hopes to build a cottage for his Janet with the silver wrung from the wild North Sea.

The tune of Seven Towers is far out of date; if fair Yoland were to whisper:

"By my love go there now,
To fetch me my coif away,
My coif and my kirtle, with pearls arow,
Oliver, go to-day!"

the gallant knight would, in all likelihood, turn away to seek a less exacting mistress before the lady had time to relent, and her bravery might lie till it rotted within the haunted moat.

But, if Herbert Farland had lived in those days, it would have needed no goblin or giant or enchanter to turn him back—a misshapen dwarf, truculent in aspect, would have served the turn. So, on the present occasion, he poured forth a string of excuses and promises of amendment. The former Lord Atherstone utterly disregarded, but the latter he was inclined to believe.

"I think we may trust him," he said, glancing over at Corbett.

"I think so, too," the other answered, viciously. "If he would risk his bones, he'll scarcely risk his prospects, or, rather, his daily bread. I only look over his misconduct be-

cause his father died in our service; and I doubt if mine would be so lenient. But he leaves at an hour's notice if any thing of the sort happens again. You hear, Sir"—this to Farland—"you can go back to your work now. If you get into mischief for the next year to come, I'll take care it's not from having too much spare time on your hands."

The bitterness was almost beyond that of righteous anger, and it struck even Lord Atherstone—himself in no indulgent mood—as hardly proportionate to the occasion.

"Don't worry yourself about all this," he said, good-naturedly, as the door closed behind the crest-fallen criminal. "I am certain this is all well ended; and no fault could possibly be charged on you. You've acted just as I expected. Don't that satisfy you? We had better change the subject. I've a good deal to talk to you about, and very little time this afternoon. Will you ride over to Templestowe to-morrow? We might do some business after lunch."

"You—you are too kind," Arthur answered, still with the same strange nervousness. "This has upset me a good deal, and I fear it would upset my father still more. I think, with your permission, in his present state of health, it had better be kept from his knowledge; we both trusted Farland so implicitly. I'll take care for the future he's more sharply looked after. To-morrow? I'm very, very busy just now; if the matters are not pressing, perhaps you would excuse me till the next day, or—the day after. I—I hope Lady Atherstone is quite well?"

"Nothing presses. Come whenever it suits you best. I shall be shooting near home all the week, and shall be easily found. Lady Atherstone? Thanks—she's looking brilliantly after her autumn tour; but you had better judge of that for yourself. Mind, we're always glad to see you or Mrs. Corbett, or both, without any business excuse. She and the children are flourishing, I trust? That's well. Now I'll leave you to finish your letters; I've taken up too much of your time already."

The ill plant that was beginning to grow up in the shadow of John Gilbert's roof-tree was cut down, root and branch, that autumn afternoon; and his biggest trap was never sprung.

It was some time before the pretty Phœbe thoroughly shook off the love fever; but she managed to outgrow both her romance and her delicacy, and is now as comely and comfortable a yeowoman as you would wish to see. As for Herbert Farland—married and settled long ago—Heslingford holds no soberer burgess. The junior clerks, who tremble at his frown, never dream that unruly passions could once have swelled under that stiff spotless shirt-front; the wife of his bosom boasts of his virtues to her less fortunate fellows; and if in his walks abroad his eyes linger for an instant on a fairer face or trimmer shape than common, it is only such a demure side-glance as may not misbeseem an embryo church-warden.

Indeed, the episode would not have been worth mentioning if it had not been for the effect it produced on one of the main characters in this story—Arthur Corbett.

Whatever caused his disquietude, it did not cease with Lord Atherstone's departure. For many minutes after he was left alone he sat gnawing his lips and drawing shapeless figures on the letter-paper before him. Watching him then, you would have agreed with Mrs. Devereux that the banker was decidedly changed. Last year it would have been hard to fancy the smooth white forehead furrowed, or the gay blue eyes clouded; yet such signs of unrest were there unmistakably now, and not for the first time.

Arthur Corbett's trouble was no worse than has befallen tens of thousands, better and stronger and wiser than he, causing them to shrink back as if they had come unawares on a ravening beast couched by their pathway—the consciousness of a guilty passion growing up within them, and waxing day by day more masterful—the opening of a book that, howsoever alluring may be its first pages, must needs end with lamentations and mourning and woe.

The man's character was full of frailties and failings; but he had never thus far knowingly harmed or meant harm to any fellow-creature. He had been careless and remiss, perhaps, in his family duties; but, till within the last few months, there had not been a thought in his heart at which his own true wife might not have smiled indulgently; and, if in his frivolous philanderings there was much to despise, there was nothing gravely to arraign. It was otherwise with him now. He felt that he was pursuing, in thought, at least, not a delicate stingless May-fly, but a strange lovely creature, in whose lightest touch, for ought he knew, there might be poison. As he looked within there came upon him a great fear, as well as great shame.

He had not been very strictly brought up; but from youth upward he had been taught that respect was due to human opinion as well as to divine law; and the idea of scandal had been almost as contrary to his creed as that of crime; besides, he was neither morally nor physically brave; and out of the back-ground of the perilously beautiful picture on which he had allowed his mind's eyes to feast for months past there looked out a stern face and menacing eyes, warning him to come no nigher; moreover, the sense of honor and equity still abiding within him made him loathe his late hypocrisy. What right had he to judge his unlucky dependent so harshly, when, if the thoughts of both had been laid bare, he ought to have stood side by side with the criminal?

Do you understand now why Arthur Corbett was so changed? And do you need to be told that the cause was Lena Atherstone?

At length the banker broke from his reverie, and flung away the pen with which he had been toying, muttering a few words half aloud.

"Looking brilliantly! I don't doubt it;

but I won't go over to-morrow, nor the next day. I won't, by—"

Then he betook himself to work again, with a great effort, yet somewhat fortified by the cordial of this virtuous resolve.

Indeed, the morrow was a busy day in Hellingford; yet surely it was either an idle or irresolute man that, a little after noon, rode slowly through the shadows of the huge elms lining the avenue of Templestowe.

CHAPTER XXIV.

In all counties there are certain houses that seem fated to shelter strangers rather than their owners. Erriswell was one of these. Extravagance and unlucky speculations had made the late squire an exile while yet in his prime; and during his twenty years of wandering through cheap Continental watering-places, though he was apt enough to boast or maunder—for his tone varied according to his company or the state of his spirits—about his ancestral acres, he had not visited them thrice. The sickly youth, sole representative now of the Hornes of Erriswell, whose health required almost as much nursing as his property, had never yet set eyes upon his home; nor was it likely, even when his minority should have expired, that he would be overeager to establish himself there. There was no difficulty in letting the Hall; the advertisements described it correctly enough, as a comfortable residence, suited in all respects to the requirements of a moderate family. And changes of occupancy had not divested it of a certain old-fashioned air of dignity. It was just the place to tempt a bureaucrat, desirous of making experiment of country life before investing permanently in land. Of this class, indeed, had been, almost invariably, the tenants of Erriswell; and, at first sight, it seemed strange that none should have chosen to abide there beyond the three or five years for which their lease was signed; but, in reality, this was easily accounted for. No stranger properly introduced had cause to complain of Loamshire hospitality; but the county folk, as a rule, were full against the "squatters," and declined to accept mere length of purse as qualification for residence in the midst of them; so the merchant, manufacturer, or contractor, after a few futile attempts to be sociable, naturally waxed sullen; and when his term had expired, if not sooner, departed grumbling, to make for himself a home among a less stiff-necked and gain-saying people.

However, with these Malcolms, of whom mention was lately made, the case was widely different. There was no mystery about the husband's antecedents; like many other cadets of old Scots families, he had received his modest portion early in life, and had sought fortune beyond the seas, with a dogged resolution as to the end, and an utter indifference as to ways and means, provided only they were honest;

like his forebears, who sold their swords to the highest bidder, provided only he worshiped not Mahound. He started as a sheep-farmer; but by flocks and herds alone Robert Malcolm would never have waxed wealthy so fast. He had a shrewd wit, backed by iron nerve, in business matters, and was one of those "who," according to his country's proverb, "are bound either to make a spoon or spoil the horn." The future of the great colony, with which he had cast in his lot, was scarcely then developed. The air was alive, no doubt, with promises of wealth; but to some, if not most of these, it was ruin to give ear; and though in the very dust of the streets there was sparkle of gold, or what looked like gold, it needed a practiced assayer to discern between the false metal and the true. Malcolm was equal—more than equal—to the occasion. When he first spoke of investing all the savings of four lucky years in the purchase of some building-lots near a town then in its infancy, there was a stormy scene between himself and his partner—also a Scotchman, by-the-by—and the latter preferred buying his mate out to tempting Providence further in such rash company; but douce David Anderson did not plume himself quite so much on his prudence a twelvemonth later, when he heard that the said lots had been resold at a profit almost fabulous in those days; and though his own sheep-shearing turned out well, he looked at the piles of fleeces with rather a jaundiced eye. This was the foundation-stone of Robert Malcolm's fortune; and though the edifice built thereon did not spring up like a magician's palace, not many years passed before it was deep, high, and broad enough to shelter any man, not overweening in his desires, luxuriously for the remainder of his days. When Malcolm thoroughly realized this he acted, as was his wont, decisively, yet deliberately withal; he did not attempt to cut the ties binding him there at one sweep; but severed them carefully, stram by stram, gaining rather than losing in each transfer of securities; yet the business was done so effectually that he sailed for England without an interest in the colony beyond grateful memories.

So much for the husband. Of the wife little or nothing was known, except that her maiden name was Forrester, and that Malcolm had married her, after a month's courtship, at Florence, where her mother, a widow, had for some time resided.

Such as they were, Loamshire was prepared to receive the new-comers with no small kindness.

In those days many people's ideas of Australia were connected chiefly with vast sheep-farms and virgin forests, and there was a fine, healthy, patriarchal smack about money earned by the axe, the crook, or the plow, very different from the taint of devil's dust, or the grime of the coal-pit; moreover, Mr. Malcolm had left a favorable impression on those who had met him in Heslingford, coming to and from Erriswell.

"A real good sort," said Swinton Swarbrick, "with no d—d nonsense about him. We shall

find no more three-legged ones in those coveys."

And this was only the *vox populi* rather forcibly expressed.

On a warm October afternoon Lady Atherstone and Mrs. Devereux paid their first visit to the Malcolms. The place was looking its best just then, for the glory of autumn was on the fine timber still standing in the park, and evidently not only the house, but all its belongings, had been recently set in order, though the sound of hammer and trowel, and workmen clustered here and there, showed that the stable improvements, at least, were not complete.

Mrs. Malcolm was alone in her morning-room when the visitors were announced.

A small, slight woman, with no pretensions to beauty, yet with a certain attraction in her delicate face, gentle manner, and pleasant voice.

They were perfect strangers; nevertheless, it seemed to Lena as if she had seen that face before in a dream, and some of the cadences of the voice seemed familiar to her ears; just so a few chords in a melody, otherwise fresh and original, remind us of a long-forgotten tune.

There was little fear of converse languishing with Cissy Devereux to the fore; and for half an hour or so the cross-fire of conventional question and reply went on apace, though it was not without a little bitterness that Lena listened to Mrs. Malcolm's grateful acknowledgments of the welcome she had met in Loamshire. The road to Erriswell, it seemed, was much easier to find and smoother to travel than that which led to Templestowe.

"I can't imagine where my husband is," the hostess said, at last. "I'm sure he can not be very far off, for he was to drive me out later in the afternoon. He would be so very sorry to miss you, for he has already had the pleasure of making Lord Atherstone's and Captain Devereux's acquaintance."

While the words were on her lips the door opened, and Robert Malcolm came in.

There was nothing colonial, or even provincial, in his exterior; his crisp, light beard was carefully trimmed, and his hale cheeks were not so deeply bronzed as are many that have endured no fiercer sun than that which strikes on Highland corrie or Norwegian feld. Only after looking attentively at his broad, massive forehead, square jaw, and keen, powerful eyes, would you divine that this man

"Was not born for luxury,
For pleasure, nor for rest;"

and that he must needs have worked hard with hand or brain, or both, in his time. Neither in his manner was there a tinge of the shyness or *brusquerie* that speak of long sojourn on the outer verge of civilization; his demeanor was perfectly unaffected, but perhaps rather more polished than that of the average of country squires; and there was something very winning in his frank, cheery way of putting aside Lena's apology for her husband's absence.

"It's entirely my own fault, if there is any

fault," he said. "Lord Atherstone spoke very kindly about it when I met him in Heslingford; but I beg to be allowed to take the will for the deed. Ceremonies are capital things in their place, but few men could afford to waste a whole October day, with blue skies overhead and thick turnips underfoot. We settled it quite amicably, I assure you; and I hope to improve our acquaintance next week, shooting at Templestowe."

"I'm afraid my husband hadn't the grace to excuse himself," Mrs. Devereux struck in. "His is the most hopeless case. I used to worry him into making a round of calls with me twice a year; but I've given that up long ago. He used to fidget and look at the clock till he made me feel guilty, too; and his scruples about 'keeping the horses in the cold' couldn't have deceived a child. But he's quite enthusiastic about you since he heard that you meant to preserve foxes. I hope that rumor is true."

"Quite true," Mr. Malcolm returned. "I want to improve the shooting here; but hunting is first in my affections; indeed, I've had much more practice in saddle than with gun. The only alterations I've made are in the stables; otherwise I found this place nearly perfect. I only hope it will not prove too cold for my wife; she's far from strong."

Mrs. Malcolm laughed musically. "He would make a tropical plant of me, if I would let him," she said; "but I'm really much stronger than I look, and not in the least an invalid. Besides, I'm certain Erriswell must be healthy. Isn't that its character, Lady Atherstone?"

"I believe, so," Lena answered; "but I'm almost a stranger in Loamshire myself, you know. How thoroughly comfortable you have made the house look already! You must have quite a talent for arrangement."

"Robin has, I believe," Mrs. Malcolm returned; "but I'm not often consulted, and have only to approve of what is done. The pictures are a great trouble to us both. We've only ventured to hang just a few of our own, you see; the walls were so very bare; and probably these will all have to be altered. That's the worst of connoisseurs; if their opinion is worth having, they're so terribly tyrannical; and my cousin is no exception to the rule. Have you ever met Caryl Glynne?"

Perhaps those vague memories, awaked within the last hour, may have unconsciously prepared Lena for the home-thrust; and that there was no malice in the dealing of it was plain; nevertheless, even to such as hold with me, that on this earth of ours there breathes no creature so brave as a thorough-bred woman, her composure might have seemed marvelous.

Mrs. Devereux had accompanied her host to the window just then, to give her opinion on some improvements in the flower-garden; but those "useful eyes" of hers would have detected no change in Lady Atherstone's face, unless it were the slightest possible hardening.

"I used to meet Mr. Glynne very often at one time," she said, slowly; "but very seldom of late years. Do you expect him here? I fancied he was still traveling."

"He's on his way home," the other answered, "and I hope his first visit in England will be here; he would be such a help to us just now, for his taste is simply perfect; he chose all the pictures that we bought in Italy. Yes, we miss Caryl dreadfully; don't we Robin?"

Of what was said and done during the next few minutes Lady Atherstone retained no distinct idea. She knew that Mr. Malcolm had turned from the window, answering something with a laugh, and that Cissy Devereux had taken up the thread of conversation again; but she could remember the words of neither. When her senses, so to speak, returned, she caught herself perusing the pale delicate face before her with an earnestness of which she was ashamed, and tracing a resemblance there, line by line. To any other eyes, perhaps, only the faintest family likeness would have been apparent; but to Lena's, the curvature of the brows, and the shape of the mouth, to say nothing of other features, seemed almost identical; and she wondered how this could have escaped her for an instant. With the dawn of recognition came a deepening shadow of danger, till she could have cried out in her heart, like the doomed king of Israel, "Hast thou found me, O mine enemy?" Could friendship, pure and simple, ever subsist between herself and Caryl Glynne? When they parted she had believed it possible; and to this belief, whenever her thoughts wandered that way, she had striven hard ever since to cling; and now the conviction broke upon her that all those fair promises were a delusion, if not a snare, and that she had more cause than ever to wish him far away. To a proud woman like Lena the bitterness of self-contempt was sufficient torture, and, for a brief space, a faintness overcame her, like that of sharp physical pain; this lasted a few seconds only. However she had miscalculated her strength, she was not weak enough to dream of submitting tamely; and the struggle was yet distant, if struggle there must be. But one thing she could not do—that was to sit there bandying conventionalities with the innocent cause of her trouble; besides, the very atmosphere of the room seemed suddenly to have grown hot and heavy, and she felt a nervous craving for fresh air. In truth, they had already exceeded the usual limits of a first call; and Mrs. Devereux, who would willingly have tarried somewhat longer—she had imagined a tour of the stables and gardens under escort of her host—could not demur when Lady Atherstone rose to depart. Still mechanically, but without making one mistake, Lena got through the needful kind and courteous speeches; but when she was fairly in her carriage the inevitable reaction possessed her, and she leaned back, with eyes half closed, scarcely hearing—certainly not understanding—her companions chatter, who was

voluble beyond her wont, in praise of their new acquaintance.

Suddenly Mrs. Devereux checked herself.

"My dear, what *is* the matter with you? I don't believe you've heard one word of what I've been saying; and I never saw you look so white."

Lady Atherstone half raised her heavy eyelids, and dropped them again as if the light pained her.

"There's not much the matter," she said, wearily; "only talking always tires me to death, with such a headache as has been coming on for the last half-hour. Otherwise I would have staid longer, for I saw you were amused; and I quite agree with you about these Malcolms. I shall soon be better, if I keep quite, quite quiet."

Were headaches known in the Age of Gold; or, when the millennium shall prevail, will they cease to be? Certain it is, that in any state where there are secrets to conceal or pangs to dissemble, this convenient malady could no more be dispensed with than the most necessary article of attire. How could society possibly go on without the trite but inexhaustible excuse that—better than any soft answer—turns away wrath, and, for a while, at least, closes the mouth of the accuser, so that the accused, whether innocent or guilty, have time to breathe and brace themselves for the question, if it must needs ensue? There are people, I believe, who discourse quite eloquently on the advantages of gout; surely as many could be found ready to cry *Vive la migraine!*

Lady Atherstone was outwardly almost herself again before she reached home; but her "headache" did not pass away so quickly: indeed it kept her rather silent throughout the evening, and wakeful through most of the watches of the night; and when she slept at last she woke with a start, fancying that some one had whispered close in her ear, "We miss him dreadfully."

"We miss him—" Well, blood is thicker than water, and, with all his faults, there was no reason why his own kindred should not regret the absence, or wish for the presence of Caryl Glynne; but was it fitting that such words should find an echo in the heart—ay! and once almost issue from the lips—of the woman who, not a year ago, had promised loyalty at least, when Ralph Atherstone rendered to her keeping his happiness and honor?

AN OCTOBER IDYL.

THE red maples glowed on the hill-side, the golden and russet oaks waved their glistening leaves in the valley, and the light breeze from the northward came over the purple hills and stirred the hazy atmosphere of the Indian summer. The houses of the little hamlet were clustered together near the river, and away on every side stretched the broad fields, resting from their labors after the abundant harvest, each clod of earth basking in the red sunshine,

and warm to the touch with heat and life. In the woods the squirrels ran gayly from tree to tree, and the leaves dropped silently all day long, until the ground was tinted gorgeously, and the air filled with the expiring fragrance of summer's last breath. The purple grapes glowed in the vineyards, and their massive bunches full of merry juices were carefully gathered by old olive-skinned Frenchmen who had passed their youth on the banks of the Garonne, while the orchards also were gay with life, and the old red cider-mill poured forth its foaming nectar, and groups of little boys sought each his straw wherewith to taste and enter Paradise.

Katherine Van Schoonoven sat on the river bank idly weaving an autumn wreath, while her friend, Laura Parker, read aloud from a volume of Wordsworth. Dear little Laura was a good girl, and loved Wordsworth with an affection inherited from a fair faded aunt of the past generation; but Katherine Van Schoonoven, a woman of the world, with sharp experiences of the intense reality of life, scorned the shadowy lake poet, and, suddenly taking the volume from the placid reader, she threw it into the glittering river, and crowned the astonished head before her with the maple wreath as she said, "Let the damp, unfeeling old curmudgeon go, Laura—water is his native element, for he is as cold-blooded as a fish. Idle dreamers were the lake poets all, reclining on the hill-sides half asleep through the lost days, and meeting, half awake, to discuss infinitesimal shades of word-meaning in clouds of smoke through the wasted nights. Lotus-eaters, from whose tender mercies may we both be delivered!"

"But, Katherine, that was my aunt Wini-fred's beautiful edition."

"I will replace it with a Robert Browning full of strong wood-cuts, *liebchen*, and you will forget those prim steel engravings of non-descript scenery. But come, father will be waiting for us, and it is quite time for you to start; remember not to betray to any one the place of my retreat."

"I am afraid you will be lonely, Katherine."

"Oh no, for I am going to make the acquaintance of myself, a personage very little known to me. There are the horses drawn up at the door, and father beckoning to us. Good-by; I shall come home just a week from to-day."

The light carriage soon disappeared down the curving road, and Katherine stood alone on the piazza, gazing over the glowing valley. The little French community that owned the broad fields and surrounding hill-sides was indebted to Judge Van Schoonoven for valuable legal aid in some early lawsuit, and therefore himself and family were always welcome guests at the quaint little hotel, "*L'Oiseau Bleu*," where a brilliant blue-bird was swinging on the sign, and embroidered in bold relief on the snowy linen. Far from the noisy railroads,

and lying isolated in the centre of its own broad acres, La Beolle was seldom visited by strangers from the outside world at any time, and at that late season, so beautiful but so generally neglected by travelers, Katherine Van Schoonoven looked forward to six idle days in the undisturbed company of her own thoughts. As twilight came on she sought the slow moving river, where, seated on the moss-grown dyke, she watched the rich colors fade slowly over the hill-tops, and the white mist rise silently from the valley like the wraith of Kühleborn. She thought of her past life, so full of painful memories—of the years wasted in frivolous gayety—the unfailing round of summer indolence and winter dissipation, without a useful deed to break the idle monotony of her actions, or a solitary earnest impulse to gild the chaos of her thoughts. The ten long years since her school-days had brought only disappointment and bitterness, while the pure white record of eighteen summers was shaded by the worldliness, the heartlessness, and the skepticism of twenty-eight. But it was too late for change then—the iron weight of habit could not be broken, and, after a few breaths of country air, she must return to her voluntary bondage in the great city.

As she mused thus over the visions of the past the distant song of the grape-gatherers returning from the vineyards came faintly to her ears, and reminded her that night was approaching, and that L'Oiseau Bleu would soon betake itself to rest; as she entered the vine-covered porch she observed a crowd of villagers gathered in the hall around two strangers, one of whom was addressing them in French, with a clear tone and cultivated accent which charmed his foreign audience; and at the little supper-table, later in the evening, much to her surprise and annoyance, she found the two gentlemen composedly enjoying the rolls, cream, and *café noir*, and glancing at her with evident curiosity as she entered the room. Never before had Miss Van Schoonoven encountered intruders in her favorite valley at this late season, and with haughty dignity she maintained a profound silence, while the new-comers conversed freely together concerning La Beolle and its peculiarities, unrestrained by the presence of black-eyed Thérèzon, who, ignorant of a word of English, waited smilingly upon her infrequent guests. Katherine soon discovered that the mission of the strangers was political, and that the elder gentleman was the member of Congress for the district, now for the first time visiting his French constituents, while the younger person accompanied him as interpreter.

Toward the close of the meal the white-haired Congressman addressed a direct question to Miss Van Schoonoven concerning the distance to the next village, and as she, for the first time, raised her eyes, even her fastidious taste could not deny that they met the gaze of two as perfect gentlemen as the country con-

tained. Mr. B—— betrayed in his countenance the keen reasoning ability and acute perceptive power which rendered him so famous in the debates of Congress; his clear cut profile and dark eye seemed as strangely youthful under his silver hair as his slender figure and active movements when contrasted with his calm distinct sentences, uttered with the careful deliberation of ripened age. In spite of herself Katherine felt the charm of his courtly manner, and listened with increasing interest to his words, until, as they rose from the table, it was with decided pleasure that she accepted a seat on the piazza where the moon was shining, and took her share in the graceful, desultory conversation that followed. Late in the evening they said good-night, and the white-haired gentleman added, "And good-by also, young lady; we shall not see you again, as we leave at dawn."

Katherine sought her turret chamber, and before sleep came she found herself regretting the departure of the two agreeable strangers, and wondering who the younger might be; he was a tall, broad-shouldered man of, perhaps, thirty-five years, with the dark auburn hair and beard which sometimes accompany those peculiar hazel eyes with a red flame in their depths, which no artist has ever yet successfully painted. He said little, and seemed principally occupied in keeping the red spark slowly glowing in his cigar, and occasionally throwing back his head to watch the white rings of smoke, as though he saw in them visions of wondrous beauty.

The younger man had called his companion by name, thus giving Katherine the clew to the identity of the celebrated lawyer; but Mr. B—— gave to the hazel-eyed stranger no title but "my friend," and Katherine smiled as she remembered that she also had remained incognito, and that the farmer-landlord had long since abridged her Dutch patronymic into "Mademoiselle Vans."

The following day passed slowly; Katherine wandered through the forests, and sat musing by the river, without exchanging a word with a human being, except to answer the polite "good-night" of honest Pierre as she took her candle and ascended the uncarpeted stairs to her eyrie in the turret. The next morning she awoke with a dull headache, and decided that "herself" was not an agreeable companion, and that she must return to her accustomed amusements and artificial excitements, or suffer the malignant attacks of imps of the most cerulean order. "Myself" does not show well under these bright skies," she thought; "the wan ghost needs the gas-light and decorations of the city to conceal its deficiencies; my past life does not stand inspection bravely, and as for the future, I dare not think of it. I must go back to the world."

At the breakfast-table Miss Van Schoonoven was surprised to find another plate beside her own, and was about to ask Thérèzon who

the intruder might be, when the door opened, and the hazel-eyed stranger appeared and seated himself opposite, with a warm flush glowing in his face as he met her astonished glance. "Pardon my intrusion into your little private Arcadia, Mademoiselle, but, having some idle days, I was tempted to return and taste the simplicity of this primeval village before going back to my busy life in Washington. Mr. B—— has gone on to the northern part of the State, but I, not being the fortunate owner of a Congressional seat, felt myself privileged to ask for another cup of the delicious *café au lait* which this little maiden served to us yesterday at dawn." Rosy Thérèzon smiled and blushed as the stranger addressed her fluently in her provincial patois; while Katherine, half indignant, half pleased, glanced up occasionally at those hazel eyes with the red flame within, and briefly answered the numerous remarks which came forth from under the auburn mustache of her unknown companion. Lightly and easily the stranger's words flowed on; now an amusing description of some recent mass-meeting, and then a trenchant criticism on the latest English poem; gradually Miss Van Schoonoven relaxed her stateliness, and even condescended to listen to the criticisms and laugh at the stories, until, as they left the table, she found herself accepting an invitation to walk in the forests with the persistent intruder, and, escaping to her room, sat down to wonder at herself. But her latent admiration for audacity impelled her to keep her unguarded promise, and so they went wandering off into the painted woods, with thousands of red and golden banners waving over them, soft red and golden tapestries under their feet, and all around the misty red-golden atmosphere of the Indian summer. Through the long sunny hours they loitered under the trees, wrapped in the glowing beauty around them, and only interrupting the delicious silence to regret that the American poets have given so few and so inadequate descriptions of this millennium of the year, for, with the single exception of the venerable Bryant's autumn word-painting, the Muse is dumb. The maples flamed in scarlet, the beech-trees shone in pale yellow, and the varnished russet leaves of the giant oaks glowed against the everlasting green of the pines; over the fences ran wreaths of crimson vines, and now and then a huge orange-colored leaf floated silently down to the ground from the ancient sycamore that raised its hoary head and outstretched arms far above them; the thousand voices of the forest were stilled, and the air seemed full of longing for the unknown, the *Sehnsucht* of Nature for eternity.

After the simple dinner Katherine retreated to her turret, loaded with treasures of scarlet vines and brilliant maple leaves, with which she decked the white walls and wreathed the pictures until the little room glowed with rich coloring; as she twined the gay creeper around

the mirror she caught the reflection of her own dark face aglow with unwonted rosy tints, and smiled upon the reflection of her lost youth peeping from the crowned mirror in the leafy bower. A tap at the door, and Thérèzon appeared, carrying a shining golden apple with a slip of paper attached: "Will you come to the orchard and gather more?"

Involuntarily Katherine seized her straw hat, and ran down the winding stairs; Hazel-eyes was waiting in the hall, and together they climbed the hill, where, hidden away on the breezy summit, guarded around by the thick forest, stood the ranks of richly laden trees rejoicing in the sunshine, and every now and then gayly dropping a ripe apple on the soft grass beneath them. Round, ruddy apples, great golden apples, sturdy russets, plain, honest greenings, and the delicious pear-shaped apples, whose delicate white is just tinged with ruby dye.

Katherine ran from tree to tree, and piled up the fruit in heaps, while her companion shook the props and brought the rosy hailstones rolling around her in wild profusion; soon they heard the voices of the gatherers as they came up the hill, and seating themselves on the grass, they watched the four-horse teams driven into the orchard, and saw the merry boys and girls begin to strip the trees with song and laughter, now doing prodigies of work in loading the antiquated old-world wains, and now pelting each other with the fruit all around the field. In the centre of the orchard upon a little mound stood pitchers of new cider and heaps of sugared biscuit; Hazel-eyes brought Katherine a supply of these sylvan dainties, together with one perfect apple, the Queen of October, and, sitting in the mellow sunshine, they gazed on the autumn scene, and with tacit consent their words rippled along over simple rural subjects, until the sinking sun reminded both idlers and workers that the day was done. When darkness closed over the valley Katherine sought her chamber with slow and dreamy steps; as the candle-light shone on the white walls, the red leaves with which she had decked them glowed brightly, and the sweet odor of the forest filled the air; a little shelf was fastened to the wall on one side of the room, and upon this she grouped the perfect apples she had collected, with the Queen of October in the centre, and then, without one thought of the past or one aspiration toward the future, wearied with the long hours of sunshine, she sank into a dreamless sleep.

Down in the South Meadow stretched the great vineyard away to the river on one side and up to the hill-tops on the other; baskets of plaited rushes stood between the vine-covered trellises, and the ripe grapes, carefully selected, were laid within on layers of green leaves, one above the other, until the purple richness fairly overflowed; the hands of the gatherers were stained with the juice, and the olive-skinned girls wore little bunches of grapes

and curling tendrils in their dark hair, entering into the spirit of the scene with a natural abandon quite foreign to the wise practical maidens who are born under the sober American eagle. At one side of the vineyard a little log temple held the old god, Bacchus, in the person of Père Housard, a jolly, red-faced patriarch, wise with half a century of wine-making, who inspected and classified the vintage, giving to the Isabellas, Delawares, and Catawbases musical names brought from Southern France, and prone to fire his merry jests at the youths and maidens as they appeared before him, carrying the heavy baskets suspended on a pole from shoulder to shoulder.

Under the solitary tree of the vineyard flagons of new wine and baskets of crisp cakes were offered freely to all; and what if the inspiring juice began to dance in the veins before the sun went down? Tradition decreed that the gatherers worked all the better for the stimulus, and that as long as the hands were busy with the grapes the juice was powerless to harm the brain, but showed itself only in renewed vigor and gay songs which the vines loved to hear. "The boys and girls sing and laugh," explained Père Housard to Katherine and Hazel-eyes as they visited his treasure-house, "and the vines like it, for it is an undoubted truth that they refuse to yield plentifully under the hands of cold, silent Americans; they know we love them, and they enjoy the vintage as much as we do, taking in a full supply of sunshine and song to last them through the bleak winter. See, Mademoiselle, here is the finest bunch of the vineyard; accept it, for it is beautiful enough to grace the banks of la Garonne in la belle France."

Katherine and her companion spent the whole day in the merry vineyard; they joined the ranks of the gatherers and stained their white fingers with the purple fruit, while the laughing girls crowned the city maiden with a vine-wreath, and even decked the hazel-eyed stranger with a chain of giant bunches. Retreating, thus adorned, from the busy throng, they sought the central oak, and, reclining under its russet foliage, they tasted the new wine, and sang to each other songs culled from the Volkslieder of all nations, inspired by the gay genius of the vine, that every where maketh glad the heart of man.

Slowly going homeward as the twilight came on they listened to the rollicking song of the villagers in the distance, and lingered on the piazza until L'Oiseau Bleu fairly closed its eyes, overcome with the labor and merriment of the day. Katherine hung her bunch of grapes by a ribbon to the shelf; and then, as the church clock struck nine, the spoiled child of fashion was sleeping soundly, while her companions in the city were making themselves ready for conquest in the lighted ball-room.

Broad and tranquil the beautiful river flowed on toward the south, and, floating on its clear

bosom, Katherine reclined in the stern of the skiff, while Hazel-eyes, now and then lazily dipping the light oars in the water, gazed on the gorgeous ranks of the trees sweeping down the mountain-side clad in royal robes of sylvan splendor. A fickle breeze stirred the air, and into the water dropped myriads of red leaves; some fell into the boat and decked the silent mariners, while the rest went floating away like flame spots down the tide. Gray willows stretched long arms over them, and threw a shower of slender, silvery foliage down upon their heads; and alone by the water-side the last wild flower dropped its purple petals, one by one, upon the withering rushes. Out from the fading lily leaves a flock of wild-ducks rose slowly into the air as the boat came round the curve, and wheeling into martial order, turned their heads toward the south, following the course of the beautiful river shining beneath them. Now and then a farm-house came into view, the fields close cut, the last crop ingathered, while the men lounged lazily about their work, and the cattle basked in the sunshine. The windows of the houses stood wide open, with the sweet air blowing the white curtains; and often in the porch sat an aged grandmother enjoying her knitting, while a group of kittens frolicked at her foot-stool. Here and there on the hill-side meadows some round-topped maple stood naked and alone, with a circle of bright leaves on the ground beneath; but generally the forests were thickly clothed in gorgeous foliage, and perfect beauty reigned every where through the enchanted land.

At noon, under the shadow of an old bridge, they moored their boat, and building a fire, made coffee in the French fashion, and tasted the plump little quail reposing placidly on their backs, surrounded by crackers toasted brown, and fantastic green pickles.

Returning as the sun began to sink, they discovered an old chestnut standing on the shore, and stopped to gather the shining nuts scattered over the ground, their little velvety homes ruthlessly invaded by busy Jack Frost, and themselves turned adrift upon a cold world after a long summer of ease among the swinging branches. As the evening-star, fair and pale, rose slowly in the heavens they fastened the boat to the old willow, and strolled through the lane to the village.

"It is All-Hallowe'en," said Katherine. "Do you see any mermaidens under the water, or peris floating in the air?"

"I see what is better than either, Mademoiselle; I see my long-lost happiness coming toward me; I see Contentment giving me a shadowy benediction, and

"From belt to belt of crimson seas,
On leagues of odor streaming far,
Up there from yonder Orient star,
A hundred spirits whisper 'Peace.'"

The red full moon rose late in the evening, and brought the frosts in her train. A thick white mist ascended from the river, and a bright

fire of logs glowed on the hearth of L'Oiseau Bleu, around which the village boys and girls were gathered as Hazel-eyes explained to them the mysteries of the burning nuts, and told their fortunes with the long apple parings. Many a laugh arose as the hot chestnuts flew around the room, and not a few blushes dyed the olive cheeks as the magic parings betrayed the wished-for initial; but at midnight the gay group dispersed, and Katherine and her companion were left alone in the fire-lighted room. Hazel-eyes peeled a golden apple, and threw the paring over his left shoulder; then, stirring the dying embers, he called up Katherine to look. She stood by the door with her candle, but turned her head at his request. There on the carpet lay a great golden K.

"Good-night and hallowed dreams," she said, and left the room.

"All-Saints' Day! Glorious, golden All-Saints' Day! When I think of Jerusalem the Golden, her alabaster bulwarks always appear to me bathed in the purple atmosphere of Indian summer," said Katherine, as with her companion she sought the quaint old garden, surrounded by low stone walls, and dignified by a miniature tower, and draw-bridge over the rippling moat. The gardener's daughter opened the barred gate, and they entered the smooth paths bordered with prim box, and shaded by arbor vitæ clipped into the shapes of birds and lions; simple fountains played gently into broad stone basins, and plaster shepherdesses coquetted with companion shepherds in myrtle arbors; a few lingering martins haunted the dormer-windows of the tower; and through the open glasses of the green-house the transplanted flowers looked out upon the garden beds where so late they had flourished in company with their hardy mates. From the central mound Hazel-eyes plucked one perfect rose, the sole survivor of her race: "The last rose of summer, Mademoiselle, and now sing me the melody."

Katherine complied, and the sweet, pathetic verses seemed the very spirit of the garden singing his last farewell.

At noon pretty Marie brought them white bread and golden honey, with choice grapes from the vines: and then, sitting in an arbor, the sunshine flickering down upon them through the withered leaves, Hazel-eyes read aloud to Katherine, who sat dreamily gazing on the fair landscape, the meadows bathed in gold, the hills far distant in the hazy air, as she listened to the story of Evangeline, and fancied the lily maid of Astolat floating

"upward with the flood,
In her right hand the lily, in her left
The letter—all her bright hair streaming down."

The voice ceased, and the vesper bell rang out in the still air, calling the villagers to honor the saints' day. As the priest gave his parting benediction two unaccustomed heads bent to receive it, and two low voices murmured Amen.

A bleak wind came down from the north at sunset, and with it the cold rolling clouds of November. Pierre piled the logs high on his hearth-stone, and in the blaze Katherine Van Schoonoven sat alone, thinking earnestly. Eight, nine, and ten sounded from the tall clock in the corner, and still she remained motionless; finally the door opened, and Hazel-eyes entered the room, and drawing a chair up by her side, stooped to replenish the failing fire. The wind had increased to a gale, and came whistling around the corner of the house, and beating at the windows with loud fury. "A wild night; the winds are let loose in the valley, and our golden leaves will all be gone before to-morrow; it is as well, for now I shall not feel so many regrets. Mademoiselle, my idle week is over, and I must go back to the world; may I hope that these halcyon days will linger in your memory as well as mine? And as for the future—" He stopped, and gazing earnestly into Katherine's dark eyes, took her hand, and raised it gently to his lips. With a slight start Katherine drew her hand away, and, as the color deepened on her cheek, she said, in a low tone, "I have been foolish, and perhaps my folly may deserve a harsher name, because I have allowed myself to float with you through these golden days without a thought of the past or a fear for the future. I, too, must leave La Beolle to-morrow; forget me, and forget also my transgression of the rules of life in being so constantly with a stranger, far away from all my friends. My real name is Katherine Van Schoonoven. I stepped out of the world for a season of communion with myself, and I found—you! Blame me not for enjoying my last hours of liberty, and forgive me when I say our acquaintance must end here, for—for—I am to be married on the 15th of December to Judge Wallingford, of Boston, a grave man of sixty, who wishes a wife to preside in his elegant mansion. I have learned to like you well, and perhaps in some better world we shall meet again, but not here—here there is nothing left but to say farewell."

She ceased, and two tears rolled slowly down her glowing cheeks as she extended her hand to her silent companion; he pressed it closely in both of his, and then, dropping it suddenly, he rose to his feet and stood before her, with his eyes fixed on the burning logs. "Miss Van Schoonoven, you have never asked my name, and I have purposely abstained from asking yours, lest the charm of strange friendship should be broken; I saw you here alone, in this enchanted valley, and I owe to you the bliss of five days of boyhood's thoughtless happiness amidst the last glories of the departing year. The Indian summer is over; the storms of November have come; it is fit, then, that we should part, and, returning to our stations in the hard world, take up each one our load of sorrow, and bear it as bravely as we can. My name is James Tracy Chillingworth, of Washington, and I have the pleasure of your father's acquaintance

professionally. I have been married ten years, and my wife is awaiting me in Washington. Good-by."

Katherine rose in silence; her face was flushed, and she trembled violently; but, making a powerful effort, she raised her eyes bravely to his, and, with all the aroused pride of her nature, she, too, echoed the word "Good-by." But when she saw the hazel eyes swimming with tears, and felt the cold touch of those strong hands upon her own, her courage gave way, and, with an instinctive impulse of self-concealment, she rushed from the room, never pausing till she had reached the turret, where, throwing herself upon the bed, she wept out the bitterest tears of her life, as the storm howled over the roof, and the rain dashed against the narrow windows.

The morning broke dark and gloomy; the

bitter wind whistled through the bare forests, and the villagers, wrapped in winter clothing, went shivering about their daily work. As Katherine descended to the dining-room she saw, through the open door, that Mr. Chillingworth's room had not been occupied, and soon the voluble Thérèzon was relating how he had insisted on leaving for the next southern railroad station late last night, during all the fearful storm, and how Pierre had finally accepted double pay, and driven him to L—, fifteen miles away, in the pouring rain.

An hour later, and Katherine, wrapped in shawls, was riding northward through the sodden country, and Thérèzon, broom in hand, was clearing out from the turret chamber the fading leaves, the golden apples, the purple grapes, the brown nuts, and the drooping rose—deserted mementoes of the October Idyl.

THE ROCK OF THE LEGION OF HONOR.

By BERTHOLD AUERBACH, AUTHOR OF "ON THE HEIGHTS," ETC.

In Two Parts.—Part I.

CHAPTER I.

A MASQUERADE ON THE RAILROAD.

AT the railway station, in a mountain district of Central Germany, in the shade of a spreading beech-tree covered with the fresh foliage of spring, stood a handsome open carriage drawn by two white horses. In the carriage, lined with damask, sat at her ease a young lady in a gray suit, with her arms crossed, and her large dark eyes fixed upon the range of hills, whose curving lines were represented in beautiful relief against the sky.

Now she threw back her head, on which was a sort of fashionable Tyrolese hat with green waving feathers, rose from the seat, took from a pocket of the carriage a large port-folio bound in gray linen, and began to draw, casting now a rapid glance upon the landscape, and now fastening her look upon the paper before her. The expression of her countenance became grave and earnest, and a slight flush spread over her face, which was somewhat long, and had lost the freshness of its youthful bloom. Her finely cut mouth, whose upper lip showed a slight down, was closed, as if in vexation; she did not seem satisfied with her work; she put it aside and resumed it more than once, shook her head, and at last shut up the sketch-book. Then nodding, as if encouraging herself, she opened it again, proceeded with her work, and her features gradually assumed a calm, almost a satisfied, expression.

The laying out of the railroad had given a view of the beautiful landscape which probably had never been observed before; for it is a marked characteristic of our time that every thing is presented under a new visual angle.

The lady became more and more engaged

in her drawing; and, notwithstanding it was only a moderately warm spring day, she seemed to be heated. She hastily took off her hat and laid it aside. Her dark hair, smoothed down in front, was put up in two thick braids behind; and in the middle of her forehead, not remarkable for height, deep lines were drawn whenever she was engaged in thought, whose trace did not wholly disappear in her ordinary mood. The whole countenance plainly showed that the seriousness of life had inscribed upon it a lasting memorial.

Mingling with the lark's song, high up in the air, and the finch's note in the tree, there was now heard the long, shrill whistle of a locomotive. The lady made, hastily, a few more strokes of the pencil, then shut the book, put it away in the carriage, and crossed her arms in an attitude of quiet, expectant waiting. A servant in brown livery stepped up to the coachman, who was holding the reins, and, lifting his hat, on which was a brown cockade, said to the lady, whom he addressed as *Fräulein*, that the train had been signaled. He opened the carriage door, and made a movement to help the lady out, but she said, as she looked into the air, without directing her glance toward the servant, "I shall not get out; you may bring *Fräulein Von Korneck* here." In her voice there was an authoritative tone, and possibly also a slight expression of vexation.

Louise Merz, for this is the lady's name, was expecting on old friend, with whom she had formed an intimacy at boarding-school, generally so short-lived, but in this instance well kept up. It would almost seem as if the expected friend occasioned the restlessness, which she never failed to bring with her; for Louise stood up and sat down, appearing to consider

whether she ought not to receive her as she alighted from the train; but as she now perceived that the railway employes on the platform at the station were looking toward her, and pointing her out to others, she remained quietly where she was. People should not see that she had a friend of such a lively temperament, who, no doubt, would be very much excited and make a sensation. The whole country round should understand that Louise Merz had settled down into a staid and matronly demeanor.

The horses had to be held by the head as the train rushed so near to them. A white handkerchief waved from a second-class car. Now the train stopped, and a lady carefully handed out and placed in the arms of the servant what seemed a child closely wrapped up, and then alighted from the car. She was of slender form and gayly dressed; she nodded once more back to the car, and also greeted her friend waiting under the tree. All her movements were quick and lively, and she looked about her, and looked into the faces of people, as if she were always wanting to ask whether there was nothing she could laugh at. Valises and hand-bags were speedily deposited on the ground. The newly arrived passenger took the swathed-up bundle, which seemed to be a child, from the servant, handled it tenderly, and hastened with it to her friend. The servants followed with the luggage, and even the dépôt-master carried one of the valises, for he knew the person who had just arrived, whose father had formerly been his captain.

When she reached the carriage in which her friend was sitting she cried, in an animated tone, "Louise, what do you say to my bringing with me a child?"

And before the amazed lady could give any reply, she opened the wrappings, and out jumped a brown spaniel spotted with white, which shook its long ears, as if it had just come out of the water, leaped this way and that, looked up into the face of its mistress, who did not vouchsafe a single glance, but who, amidst the laughter of the by-standers, was saying, as she turned now to the dépôt-master and now to Louise: "Isn't this a clever child, under ten years of age? The stiff official gentlemen of the railway wouldn't permit me to take my well-educated friend Scheck into the car. Well, tyranny makes people cunning. I disguised Scheck as a child, and I have had the merriest kind of adventures. The fashion of only having for tenants in houses persons without children extends also to railways. In several cars which I wanted to get into they cried out, in a very friendly and humane tone, 'The seats here are all taken,' and when I, pretty angry, at last succeeded in getting a seat, the ladies wished to get sight of the child, and a quite good-looking widower, to whom I was obliged to confess that I had no husband, almost offered himself to me. Herr Dépôt-master," said she, turning to that gentleman, "I hope you are no Philistine, to make me

pay a penalty." And as the dog, who seemed to know that he was the subject of conversation, sprang up to his mistress, she said to him, "Yes, you were very clever; you have human understanding."

The railway employes and all the passengers who had stopped at the station were standing near, and joined in the laugh; and even the waiters of the refreshment saloon came up, and the cook appeared at her door to look at the group, not being able to absent herself from her realm on account of her attire. The dog seemed to divine that yonder was a heart well disposed toward him, for he suddenly disappeared.

Louise looked on all this merriment with considerable vexation, and begged that they would make haste to drive away. This free and easy pleasantry of her friend was distasteful to her. Trunks, valises, and bags were stowed away, and, when they were all ready to drive off, Scheck was missing. After being repeatedly called, he came from the cook's dominions, still licking his chops; casting one look back upon his benefactor, he jumped into the carriage with his mistress. The servants found it very hard to stop laughing. The carriage rolled off on the highway, and the people at the station continued for a long time looking after it. The dépôt-master told those who were less acquainted with the neighborhood who the two ladies were. The keeper of the saloon and his wife gave supplementary information, but there were many things that they were ignorant of.

CHAPTER II.

THE DAUGHTER OF THE PARLIAMENT.

OPINIONS differ, some asserting that Louise was fifteen, and others that she was eighteen years of age when her father, the rich manufacturer Merz, was first chosen deputy ten years previously, and removed, with his only child, to the capital. As an independent, practical, and cultivated man, Herr Merz was a prominent member of the liberal majority, which had a ministry of its own character. This ministry did not proceed, indeed, from the majority by any special constitutional arrangement, but was rather the choice of the prince; and there prevailed a peculiarly elevated sentiment, as they were acting in harmony with the government, which was in essential harmony with the general tendency.

Herr Merz had encountered nothing worthy of being called an opposite party; and he accepted his authorized position so much the more readily, as he was not by nature fitted to be in continual opposition, but was glad that he could be faithful to his principles and loyal at the same time. It was no easy thing for him to leave his large manufacturing business in the charge of an agent, however trust-worthy he might be; but he hoped, by a change of scene

and new interests, to overcome and to forget for a season his deep affliction in the recent loss of a wife with whom he had been most happily united.

He hired a house in the capital, and his mother-in-law with his daughter constituted a pleasant household.

Herr Merz made no speeches in the Chamber of Deputies; but he was so much the more industrious in committees, and zealously executed those labors which, like the foundations of a building, make no show, but sustain the superstructure.

Louise and her grandmother frequently sat for half a day in the gallery appropriated to the friends of the deputies. The gentlemen in the hall below would often look up at the worthy matron and the beautiful girl by her side, who looked so interesting in her mourning dress. And frequently, in intervals of business and during some tedious details, one and another of their more intimate acquaintances among the deputies would join the ladies in the gallery and engage with them in conversation. Louise was generally silent; but what she heard constituted a peculiar element in the formation of her character.

Spring, when the session closed, was hailed as a deliverance; and when they returned to the manufactory it seemed to all as if they had just come into the free air out of the sultry atmosphere of the Chamber. Louise at once seemed to enjoy new life. And when she returned in the autumn with her father and grandmother to the capital, her mourning now laid aside, she was welcomed by a large circle as an old acquaintance. Some other deputies had brought with them their wives and daughters, and they formed a circle of their own, whose special charm consisted not only in the fact that choice spirits from all parts of the country came together, but that, while away from home for months at a time, they could have all the peculiar advantages of a home.

The third year there was an inspiring novelty. A boarding-school friend of Louise, Marie von Korneck, had come with her father to the capital. The two girls had been good friends at the school, but their friendship had not been of that kind to pledge them to its continuance after their separation. But it seemed now as if they had been on most intimate terms: there were the common youthful recollections; they had much to say about their schoolmates scattered in every part of the world, about the pedantry of their teachers, and also about that teacher of history with whom all the pupils were in love. And the very difference in the characteristic qualities of the two girls seemed to constitute a special attraction. Marie had a sort of soldier-like promptness of speech, was never at a loss what to say, and looked at life as a merry game; Louise, on the other hand, was rather of a reflective turn, was not quick at small-talk and repartee, listened quietly and with attention, and when she expressed herself

it was always in fitting and well-arranged words. Their fathers, too, formed a friendly intimacy; and, as a liberal ministry was uppermost, and the party of Herr Merz seemed to be its main stay, Major Korneck was not disinclined to be on terms of friendly intercourse with a politician of decidedly liberal tendencies. Marie von Korneck had very soon entered into the social pleasures of the capital, and became acquainted with the best dancers and the most amusing old gentlemen; while the young Ensign Von Birkenstock, who was a distant relation, and was permitted to call her cousin, was her obedient admirer, and also showed himself devoted to her friend.

Louise was soon drawn into the whirl of winter dissipation. The saloons of the minister and the best social circles were thrown open to the deputies and their families, and through many a dancing-hall Louise and Marie promenaded arm and arm, while many eyes, spectacled and unspectacled, were directed toward them.

There was also some talk of suitors of Louise, but she was uniformly friendly to every one, and showed no particular preference for any. She was an enlivening element in the society of men, combative and positive in her replies; and she had not been a listener to the debates for several sessions, sometimes siding with one speaker and sometimes with another, without perceiving that she lacked independence of judgment, and that it needed to be cultivated.

An entirely new life was opened to her when she and Marie entered the painting-school which a celebrated artist had opened for girls. Marie could draw human figures well, but she liked far better to make caricatures; Louise had a decided talent for landscape. In the studio Marie was the chief speaker, and knew every thing that was going on at the capital, especially in military circles. As was to be expected, Louise was regarded as possessing the soundest judgment; and when her opinion was asked she gave it with such reasons, and such a consideration of objections, that she received very naturally the title of Daughter of the Parliament.

Marie was extremely good-humored and cheerful, and particularly merry with the father of Louise. After his wife's death he had resolved to devote himself exclusively to his child and to the general good of his country; but before the close of the first winter he found himself so greatly cheered and enlivened by her daily intercourse in the family that his determination became somewhat shaken. Marie was not indisposed toward him—was, in fact, quite confidential; and her father, the major, bore himself toward Herr Merz in a manner that said: "Why are you so faint-hearted, old boy? The affair could be all settled with two words."

For weeks Herr Merz heard nothing of the debates going on in the House of Deputies—he was listening to the debates within himself,

and these were so stormy, and the parties contended in such an unparliamentary way, that the president, in the shape of calm reason, had frequently to call them to order.

Herr Merz closed up every avenue by which these commotions of his heart could be reported to the public, but they did not escape the notice of his mother-in-law. While every one else was in raptures with Marie's cheerful disposition, father and daughter vying with each other in her praise, and while her absence seemed to leave a void—the old lady would shake deprecatingly her gray head, as she dropped her knitting-work from her delicate hand, and say: "What a great pity! Fräulein Von Korneck would make a first-rate actress!"

Herr Merz put a restraint upon himself, and was careful to say before Marie, as well as in her father's presence, that he had unconditionally given up every thought of changing his own way of life, and placed all his dependence on Louise. He hoped that his child would soon find the man who would appreciate her rich heart and mind and her solid qualities. Louise, too, was ready enough to confess that she was not unwilling to be married; but year after year passed, Louise was in friendly relations with some of the best men, and said at first jokingly, and at length in deeper earnest, that it seemed as if married men were the only ones who conducted themselves toward her in a sensible and straightforward manner; she always found the bachelors either foppish or sentimental, and sometimes she was inclined to believe that one and another were attracted to her on account of her expected wealth.

During the summer a letter was received from Marie, in which she wrote that her father was dead, and that she was left alone and destitute. Louise wanted her father to receive her into the house, but he positively refused, although, in general, every wish of his child was to him a law. He maintained that Louise, by means of such an association with her friend, would fail to gain an individual reliance upon herself; she ought not to get rid entirely of the desire to have an independent household of her own; but secretly he had a dislike to Marie, which, strangely enough, proceeded from the compulsion he had put on his inclination. Marie wrote soon afterward that she had concluded to be the companion of an old lady on a journey.

Herr Merz, who desired to devote himself more and more to political life, and regarded it as a duty that men of independent position should give their whole attention to it, sold his manufactory. He wanted to live the whole year at the capital, but he yielded to Louise's urgent entreaty, and retired to an estate which he possessed in the mountains. But that very year in which he had become entirely at leisure to devote himself to public life he failed of an election. After the first pain of disappointment he consoled himself by saying—and with

him it was not a mere form of words—that there were a great many clever men who could represent the various interests of the country. He would often say: "One must obey her call, but one must also wait, if he is not called, until the right time comes."

At the same time there occurred a change in political matters, which made it desirable to a man of his temperament not to be obliged to belong to an opposition where party lines were strictly drawn. He was not one of those combative natures who enjoy a sharp antagonism; he loved comfortable quiet, so far, of course, as was consistent with the maintenance of his principles.

Now could he peacefully await in his ark the deluge which the chaos seemed about to usher in? The newspapers were the doves which brought to him news of the height to which the flood had risen in the world. He read very diligently the proceedings in the Chamber of Deputies; he had telling and well-arranged speeches in his head, which now, alas! there was no opportunity of delivering. He devoted himself energetically to the affairs of the community and the neighborhood, but he felt a continual void, and hoped for some new interest in life only through the marriage of Louise. But she was now more than twenty-five years old, and openly asserted that she had definitively closed up her account with life, and would devote herself exclusively to her little talent.

Marie had now returned from her journey, which had lasted several years, and was living with the old lady in the garrison city. On her first visit to the country house of Herr Merz, when she was alone with him, she at once perceived his embarrassment, and said, in the liveliest way: "Ah, Herr Merz, why did you not marry me years ago? It is too late now; I am engaged."

"May I ask to whom?" inquired Herr Merz.

"No; that is a secret."

Since that first visit they had not again seen each other. Now Marie had been invited to visit them, as they wanted to be together a few days before Herr Merz and his daughter set out on their journey to Italy.

CHAPTER III.

ON ONE'S OWN GROUND.

THE carriage containing the two young ladies drove at a quick trot along the highway.

"Ah, how happy you are to call such a carriage your own!" cried Marie. "No one would believe that a person who could ride in her own carriage would ever look so gloomy."

Louise knew the perpetual wrangling of her friend with her pecuniary situation, and she nodded at the remark, so that Marie, by jesting freely in regard to her peculiarly hard and dependent position, might be relieved and

cheered. Marie possibly perceived her friend's drift, for she declared that life was a mere farce, and the best way was to play it briskly. She told very humorously some of her traveling adventures.

Louise diverted her from these by asking how she got along with the lady with whom she was living as a companion.

"Ah!" cried Marie, "she is all the time complaining about her former companions, and will most assuredly complain about me to future ones. The noble lady is always wanting to be loved, and at the same time to be very little out of pocket! She ought to have a broom and duster crossed on her coat of arms, for sweeping and dusting are the objects of her existence. Every evening her servant-girl must tear an old newspaper into small bits, and then she scatters these into every nook and corner of the rooms, so as to make sure the next day that every place has been swept."

"But you must be glad that you have a calling," Louise said, attempting to turn the conversation.

"Calling? I say with Rückert—or is it some one else?—'If I had had a hundred thousand dollars income, I would never have dished myself up for you.' Calling? Never use that word again to me. If I were rich, I would marry a man who pleased me, and let others take the calling."

Marie now struck into a serious vein, and exhorted her friend not to continue playing the prude, and decline all suitors.

Louise replied that she had given up the world.

"Given up the world?" laughed Marie. "Why don't you say, too, 'I am dead and buried.' You are a year younger than I. Oh, if some one would only come and tame you for once!"

"Tame me? Am I wild?"

"No; don't misunderstand me, you are, on the contrary, too tame—I mean too cultivated."

"Too cultivated?"

"Yes, you have seen a great deal too much, thought a great deal too much. You perceive each one's deficiencies, and you think, besides, that he does not want me, he wants my money. You open a parliamentary debate when any one makes his appearance. You are the Daughter of the Parliament."

"Good! You have now said the whole, and now I beg that you will say nothing more on the subject."

Louise uttered this in a decided tone, and for a while they drove on in silence. They were approaching some of the outlying buildings which were a short distance from the manor-house. The farm-dogs barked, they took note of the new arrival, and Scheck was quick at reply, like his mistress. But Marie ordered him not to utter the least sound, and he silently obeyed.

The carriage stopped at the steps of the house, and Herr Merz bade Marie welcome.

There was a slight flush in the countenance of the elderly man, who, perhaps, had not wholly overcome the impression that he had once had a passing, repressed inclination toward his daughter's friend. Marie immediately addressed Herr Merz in a tone of raillery, and he replied in a friendly way.

Marie was conducted to her chamber, but she soon came down, and promenaded with Herr Merz up and down in front of the house. She asked what that unfinished addition was which had one large window with a single pane of glass. Herr Merz replied that he had built it for Louise's studio, and that it was to be completed during their proposed journey to Italy, as Louise wanted to devote herself wholly to her artistic talent.

"This is very wrong in you. You must not do this!" exclaimed Marie, defiantly.

In answer to his amazed inquiry, she declared that he ought not to encourage Louise in carrying out her proposal to give up the world. Now a suitor would have to encounter additional resistance.

"I stick to this," cried she, "that Louise must marry. And if I am obliged to conjure up here the swan-knight, she shall be married. Done with life! All done! Did any one ever hear of such a thing in a beautiful, rich girl, who is—well—is twenty-six years old! Do you give me full power to set in motion what I please?"

"And what if I should not?"

"To be sure; but I should do just the same without it. Yet it's better that I have said what I have. 'This respite is mine, and I will use it,' she recited in pathetic style.

Louise came down and her father went away in a short time. She and Marie strolled in the park arm in arm.

Suddenly Marie stopped and cried: "Ah, I should like to know how one walks when she treads on her own soil. This is the way!"

She raised her dress a little, disclosing a handsome foot in brown gaiter boots, and she set it firmly on the ground. Then she went on to depict in enthusiastic terms how happy that person must be who could call a piece of ground his own, and who had a settled home.

Louise made no contradiction, for she had a sincere compassion for a girl who, belonging to the higher class of society, was homeless in the world, and obliged to eat the bread of service—a service really, though seeming to be a voluntary work. She simply said, at last, that Marie was rich enough—she had such an inexhaustible fund of humor.

"Don't appeal to that!" cried Marie, with an expression of trouble. "When one appeals to that it is all over."

They had entered a copse where the birds were singing merrily. Louise stood still and asked her friend whether she did not wish to tell her something more about the heart-affair hinted at in her letters while abroad.

"Not just now," Marie hastily exclaimed;

"but by-and-by I will tell you. Don't, I beg, ask me any further. When the right time comes I will let you know every thing, and you must help me."

They spoke now of the proposed journey to Italy, and Louise expressed her regret that Marie could not accompany her. She would have been a good guide, for she had already been over the ground.

Marie knew, and Louise guessed, why the father, usually so indulgent to every wish of his child, had positively refused to have Marie accompany them. Silently they went through garden and park, and then returned to the house. The grandmother of Louise, who had not been well during the day, had recovered by evening. They sat together in pleasant mood, and after tea Marie began a game of chess with Herr Merz. She was a very skillful player, and, as the game lasted a long time, Louise and her grandmother retired, and Marie and Herr Merz were left alone.

Hardly had they been left alone, however, than Marie broke up the game and said she must speak still further about Louise. Herr Merz was to name over the men in the neighborhood who were to be his guests the next day, who among them might be suitors of Louise, and which of them he himself would desire; for it was of great importance that a friend should express herself pleased with a wooer, and she hoped to bring Louise in this way to a definite point. He named over several, among them a proprietor and a young official from the county town not far off, between whom he had no choice, but who were equally indifferent to Louise.

Marie was very confident that she could bring her friend to the point.

CHAPTER IV.

A REVIEW.

THE next day, which was clear and cool, saw the arrival of guests of both sexes in carriages and on horseback. Marie had induced Louise to adopt a new style of wearing her hair, and to dress in bright colors, laying aside her favorite shade of sombre drab, as Marie called it. The neighbors gazed at her in surprise when she first met them, and Marie was pleased at this, for she knew that Louise was looking unusually young and animated.

When the neighboring landed proprietor and the young government official were introduced to Marie she made a courtesy, and, instead of casting down her eyes, looked steadily at them. She passed them both in review, and found that in respect to external appearance the choice was by no means difficult.

Fortunately for Marie, the man held in highest estimation in this circle of friends was an old comrade of her father. By this means she was at once accorded a high place of honor;

the whole circle gathered around her, and Louise did her best to make her the centre of attraction.

The young official saw at once that Marie's opinion had decided weight with Louise, and he therefore showed her a great deal of attention. He attended her when the company took a walk in the garden, and in the course of conversation incidentally mentioned that he was an officer in the militia. He could see that this made quite a favorable impression.

Marie thought well of his appearance and general bearing, but he either was, or pretended to be, rather bashful; he was not sufficiently confident and self-asserting. She came to the conclusion in her own mind that he would not do, for whoever would win Louise must excite in her a positive interest.

He appeared to be familiar with landscape-painting not only in reference to the character of the foliage and the fore-ground, but he was quite enthusiastic in speaking of the necessity of having an artistic eye, and of the prevailing taste for landscape-painting as in harmony with the tendencies of our age in its study of natural science. He pointed out a group of trees, and extolled to the skies the happiness of being able to revel in light and air. All this he reeled off to Marie like a book, as they say, with the idea that she would report it to her friend.

Marie smiled inwardly: "This swain is played out; let us see what sort of a child of humanity the landed proprietor is!"

The proprietor attached himself to father Merz. "Good manners, and not a bad move," thought Marie. "He really has a high respect for the old gentleman, or else he pretends to have. No matter which, it will have a good effect upon Louise, for she loves her father to distraction, and he who loves him too is in a fair way to gain her good graces."

The proprietor, on the other hand, took a different view from the official, and looked upon Marie as in the way. He was a seriously disposed man, and, next to his own life-calling, devoted to politics. He had soon seen through Marie, and thought that a friend of a character like hers would be apt to make Louise frivolous and fickle. He even imagined that there was a visible constraint in the bearing of the latter toward her friend, and therefore he did not wish to have much to do with her. And when Louise asked him how Marie pleased him, he replied, in a straightforward way, "She pleases me just as she does you. I think that you would not like to live all the time with such a sparkling, effervescing, fun-loving temperament."

Louise endeavored to modify his opinion, but she did it in such a way that he was convinced he was not wholly in the wrong, and for the first time he began to entertain some hope.

The dinner passed off cheerily; the old Herr Von Beuthen, who conducted Marie to the table, felt that he had the privilege of saying what he pleased.

The conversation turned on the intended journey to Italy, and the old Herr said: "You have begun in the wrong way. What makes you put up a studio for our dear Louise? A nursery-room would be more to the purpose."

There was a general laugh. Marie looked around the table with sparkling eyes. She saw that the young official blushed, while the proprietor joined in the laughter.

All glanced toward Louise, but she looked straight before her, as if the joke had no reference to her at all. Finally, feeling that she must say something, she observed, in a quiet and undisturbed tone, "I am very glad to have given the opportunity to Herr Von Beuthen to exercise his pleasantry." She occupied herself very zealously with a stately gentleman who sat next, so that his wife, whom the young official conducted to the table, became more and more flushed in the face; and this redness was not lessened by the several glasses of wine which she drank at the persuasion of the official.

At last they rose from table, and while the older gentlemen were sitting on the terrace, smoking their cigars, Herr Von Beuthen exclaimed, in a very loud voice, "It is a disgrace to all bachelordom that Louise is not yet married!"

The younger portion of the company enjoyed themselves in the garden. Louise remained for some time talking with the gentleman who had sat next her at table, but yielded finally to Marie's urgent entreaties and joined the younger part of the guests in the garden. Jest and merriment were the order of the day, and from a thicket came the sound of a lively Swiss jodel, such as the mountain-boys sing.

Marie had induced Louise, who could not sing especially well, but who excelled in this Swiss caroling, to give a specimen of her skill. She did not like to be seen when she did this, and so she went aside, placed her delicate left hand to her cheek, and *jodeled* so loud that it seemed as if the mountain-sides were echoing and re-echoing the notes.

Old and young now mingled together, and all were in good spirits until evening came and the guests went away.

When they were again alone Louise said to her friend, blushing deeply, "Ah! Marie, it is indeed horrible, and I can't understand it. I am so—"

"So what?"

"No; it is better not to say it."

"Not even to me? Speak out!"

"Well, there were here some cultivated and able men"—naming several—"but those who pleased, those whom I find clever and agreeable, are—"

"Married," interrupted Marie.

"Yes," assented Louise, covering her face with her hands. "Why is it that only such please me? Why can I speak with freedom only to them?"

"Don't you know why?—you, the Daughter

of the Parliament? It's a very simple matter. You allow yourself to be free with them, and they can be unconstrained in their conversation with you. But when you are with an unmarried man you are thinking all the time that he has some designs on you, and, most probably, on your wealth, and so you are never natural—never free from constraint."

"Oh, how right you are—how much in the right!"

For a long time they were silent, and then Marie suddenly said, as an expression of roguish triumph overspread her countenance, "Come here and sit by me; I will tell you my secret."

She grasped the hand of Louise, and her voice was choked; Louise thought it was from deep emotion, but it was from a wholly different cause. Marie related, in a hesitating and broken way, in marked contrast with her usual off-hand fluency, that she was as good as engaged to Von Birkenstock, a cavalry officer in the neighboring garrison city, who was a distant relative of hers, but whom she had seen only at brief intervals. She had now the desire, as it was important that she should become more intimately acquainted with him, that Herr Merz should invite him to make a visit; he could lodge at the tenant's house. And, besides, it was his intention to resign and take up farming, as he was the son of an agriculturist.

Louise promised to bring it about. Marie went to her room, and not long afterward Louise brought her an unsealed letter of invitation, written by her father. Marie sat up late that night writing a letter, which a messenger carried to the railway station.

CHAPTER V.

A GAME OF CHESS.

LOUISE wanted to accompany her friend, who was to drive, two evenings after this, to the station to meet the cavalry officer. Louise spoke of him as Marie's betrothed, though the latter protested against it; but, as Louise persisted in calling him so, Marie let it pass.

Marie drove alone to the station, but she did not when there remain seated in the carriage, as did her friend a few days previously; she walked back and forth on the platform and in the garden, which had been freshly laid out, and as yet showed but a scanty growth, and looked frequently at the watch which she wore in her belt.

The train came in, and a young man, with a fresh, grave countenance, and very heavy and long mustache, beckoned from the cars. He alighted, and, although he wore a citizen's dress, it was evident at the first glance that he was a soldier.

In an easy, off-hand manner he said to Marie: "You have not invoked the spirit of the hussar in vain. Here am I! I obey your mysterious summons. I have an ample leave of absence.

Now unfold: where is the adventure? Where is the monster, the dragon?"

Marie begged him not to ask any questions now, and, above all, not to speak German. They seated themselves in the carriage, and he asked: "Are not my eyes to be bandaged?"

Marie smiled, and said no. He further asked if he might be permitted, as modern knights were, to smoke. Leave was given.

"What should you say," began Marie, at last, "if this carriage, these horses, and with them a fine manor-house and some hundreds of thousands in a fire-proof safe, were your own?"

"With, or without a wife?"

"With."

"With you?"

"Do not jest."

Drawing her breath quickly, Marie continued: "Ah, we are all nothing but Philistines, I as well as the rest. Why am I all at once so afraid?"

"You afraid? Is there such a word in your dictionary?"

"You are right! It is such a beautiful and advantageous—in fact, a moral intrigue which you are to engage in with me."

"You see me armed and equipped for every thing, like a hero in some fairy tale; and, more especially, I have the virtue of silent obedience. I listen to your oracle as patiently as Tamino in the 'Magic Flute.'"

"It will soon be all revealed to you. Do you remember Louise Merz?"

"Who could forget her! Am I to marry her?"

"Yes!"

"I am ready forthwith. Let the church bells be rung! I am of age; it is spring; and I have some new gloves with me."

"Cousin, I am in earnest."

"Dreams are the stuff that life is made of. Does she still remember me, how I danced with her at that time at the minister's? Does her father remember me? He has one good quality—he smokes capital cigars."

"Albrecht, don't make fun of the really worthy man. To win Louise you must respect him."

"I regard him now as most eminently respectable."

"Albrecht, tell me, in the first place, whether you would marry Louise if she had no property?"

"No."

"That is honest, at any rate."

"I pray you, dear cousin, let me finish what I was going to say. I could not marry her if she were poor; but if she were poor and I rich, then—"

"Then you would marry her?"

"No; then I would marry you."

Marie blushed, and forbade her cousin to joke any farther in that manner, or he would not answer for the business in hand; for he must for a while pass as her lover, even as her betrothed. Louise desired that it should be so.

"I don't understand," laughed the captain.

"The good knight must consent to have his eyes a little blindfolded," replied Marie.

She recovered her good spirits, and said that Louise was prejudiced against every man who was not already bound. With those who were married and betrothed she unfolded all the amiable qualities of her nature, and acknowledged also the fine traits in their character. And therefore her cousin was to pass for a while as her betrothed.

"But, Marie, what are you playing with? You know that you are to me—"

"I beg you to stop. You know—"

"Certainly, certainly," observed he, making a motion in the air with his hand as if he were using a paint-brush.

Marie shrank back in the carriage, but quickly recovering her position, said, in a lively tone: "But don't regard me as prudish. I permit all the attentions which your cousinly relation has allowed heretofore."

"Then, first of all, I beg for a kiss."

"For shame! And you are trifling with your good fortune. But if it must be, here, kiss my hand."

"Take off your glove, I beseech you!"

"No. And one thing more—be kind to Scheck. If you must show tenderness, practice it on Scheck. And, don't you play chess?"

"My fame is great! Who could stand the tortures of outpost duty without tobacco and chess?"

"And you can draw?"

"Don't slander the military school!"

"You understand, too, how to take landscapes, and to talk about trees in the foreground, and perspective?"

"My gracious Fräulein! Observe this tree with its melodious branches, this rhythm, this symphony—"

"Very well!"

"No, it won't do," said he, seriously. "We shall make ourselves contemptible, and your friend an enemy. Can the prim Louise ever forgive us for tricking her?"

"Indeed? Is this throwing cold water upon a fine adventure the hussar bravery you spoke of? Be easy. After a few days we will have a quarrel, and we must arrange that Louise shall be an involuntary listener. Then I will give you your dismissal, and you will thank me—I will allow you on your knees to thank me—you will express your high opinion of me, and honestly confess that you—what is the term they use?—madly, distractedly, infatuatedly love Louise. And trust me, you will not have to lie, it will be the actual truth."

For some time neither of them spoke. The captain seemed to be thinking of the part he was to play. Then he, aroused from his long reverie, stood upright and offered his cigarette to the coachman and the footman, who accepted the cigars with thanks. They had both been soldiers, and knew how to appreciate this courteousness in an officer.

Marie nodded triumphantly. Herr Von Birk-

enstock had one good custom from early youth up to the present time; he kept regularly a brief diary, which luckily he now had with him. He found the date noted down at which he had met Louise, and some particulars which refreshed his recollections.

Marie was very well satisfied with the various points he introduced, and was able to supplement them from her own memory.

The campaign was well begun, and in high spirits they drove up to the manor-house.

CHAPTER VI.

A SKILLFUL MANŒUVRE.

LOUISE welcomed her friend's betrothed with hearty warmth, as if he were a member of her own family. She had carefully attended to the arrangement of a room for him in the neighboring farm-house, and when he thanked her there seemed a strange contradiction between his look of youthful strength and the emotion in his voice, and the shy, almost timid expression of his eyes, as he first looked full at her and then cast them down, while she begged him to look upon her as a friend.

He reminded Louise of their meeting at the capital, and she thought it very singular that he should still remember the dress and flowers which she then wore, and what they had said to each other.

"How do you like him?" asked Marie when she was alone with Louise.

"I don't see how you can ask how any one likes the man to whom you have given yourself for life!" answered Louise.

Marie seemed impressed by her earnestness, and her usually ready tongue hesitated and stammered a little as she excused herself, adding that her engagement to the captain was not yet so absolutely settled.

The captain was soon on good terms with the father of Louise, although he said directly that he had but little interest in the political questions of the day; his manner of looking at the estate, and his pertinent remarks expressed in few words, which he skillfully and modestly put in the form of questions, won for him immediately the favor of the master of the house, who expressed his liking for him to his daughter.

The captain told Marie that he felt less constrained with Louise than with her father, and wanted to know whether the latter understood the position of affairs; but Marie would not let him ask any thing further. She felt a pleasant excitement in her cousin's moving in the dark, as well as the rest. This gave his bearing a certain gentleness which she thought taking; and, moreover, she had not herself decided whether Herr Merz ought to share the secret. Meanwhile, she delayed the decision until a favorable moment.

The grandmother had known the captain's mother, and an unexpectedly pleasant relation

was established between them; the old lady, who, at other times, generally sat silent in her arm-chair by the window, often talked with the young man, in whose looks and whole bearing she saw a resemblance to his mother.

Thus the days passed pleasantly on the estate. They rode and drove in the country about them, or walked to fine points of view on the neighboring mountains, and Louise could not help frequently congratulating her friend on having found such a man for a husband. It seemed to her most suitable that the volatile, ever-jesting Marie should be united to a man who showed, considering his youth, a remarkably earnest character.

It often happened that Marie walked with Herr Merz and Louise with the captain; and a special sympathy was established between them from the fact that the captain had a talent for landscape-drawing. They worked together and compared their sketches, and Louise could give the young man many useful hints, as he had, he said, used his talent but little. The captain was very quick in learning, and often surprised her by the ease with which he knew how to apply her instructions.

Marie often withdrew, when Louise was with the captain. The father remarked to his daughter on the strange coldness that struck him in the demeanor of the pair; but Louise thought it just as it should be, and depicted the captain's character in a sympathizing and feeling manner.

When the father spoke of this to Marie, she begged him to go into the garden with her, and there explained to him the whole state of affairs. He was greatly astonished, and remembered how often his mother-in-law had said that Marie ought to have been an actress. How was it possible to carry out such a comedy in real life, which belonged to and might be allowed on the stage?

For a long time he could find no words, and declared at last that Marie's proceeding was, to say the least, a mistaken one, for she would not accomplish the object she aimed at. Hereafter he would have to make an effort to treat the captain in the way he had begun. What sort of a man was he to lend himself to such a plot?

Louise and the captain had one day begun to sketch the ruins of a castle in the neighborhood, which they wished afterward to paint—the captain, in water-colors, Louise, in oils. They worked busily all day. Marie and the father were to go for them toward evening. On the way Herr Merz expressed great uneasiness at a course which would lead to nothing, and leave a bitter feeling behind; but Marie, with her confident, overflowing good-humor, represented to him that this was making much too serious a matter of the little plot; Louise would be surprised, even angry at first, but would afterward rejoice that an opportunity had been given her to become acquainted with so intelligent a man in uncon-

strained intercourse. She repeated to him how often Louise had said to her that it was her misfortune to know well only married or engaged men. Now this misfortune should be turned to advantage. Marie spoke with such animation and cleverness that he could only shrug his shoulders. They arrived at the point from which the sketches were taken; a good lunch was brought from the carriage, and they sat comfortably together. Louise, however, was very grieved, she often looked dreamily before her, and said she was much dissatisfied with her work. The captain confessed that he had expected something better of her; there was neat precision shown in her drawing, but it was worked up too carefully, with too minute a fidelity of detail, and wanted boldness. Marie looked at him in surprise as he expressed this opinion, but she soon smiled again: just this frankness, this honest fault-finding, would be the most likely to win Louise.

CHAPTER VII.

FLEEING FROM ONE'S SELF.

THE four wandered about the ruin, and did not enter the carriage to drive home till the moon had risen. Little was said as they drove on, the father slept, and Marie seemed asleep also; only the captain and Louise were awake. The stars shone in the sky, the nightingales sang in the bushes, and a spicy breath of spring filled the air.

The captain seized Louise's hand. He held it fast, and she could not withdraw it though she tried; she trembled. He pressed her hand, and she—did she return the pressure? She did not know. An icy chill ran over her. Is it indeed so? Do you love a man who belongs to another? "No, no!" she muttered to herself, as she clenched her fist, and involuntarily she suddenly exclaimed aloud: "Father!"

"What is it?" asked her father, awaking from his nap.

"Ah! did I call you?"

"Yes."

"I didn't know I did! Yes! I should like to get out."

She called to the coachman to stop, opened the carriage door, alighted, and begged her father to get out with her. She would not allow the others to come with them, but abruptly ordered the coachman to drive on; and as the carriage rolled away she fell on her father's neck, crying: "Alas, alas! I am wicked, very wicked, a miserable creature! Father, help me!"

Her father could hardly utter a word to calm her. Louise threw herself on his breast, and cried, in a heart-rending tone: "Oh, father, I'm afraid I may, I shall love Marie's betrothed, and he me."

"But what if he were free?"

"Oh, pray, father, do not speak so. Let us not speak a word, I beg you."

Her father did not know how to explain the strange position of affairs. He could not say that he knew of the plot, for he could not but acknowledge to himself that, in doing so, he should lose all influence over his child; and the longer he walked in silence by his daughter's side the better it seemed to him that she should exert self-control and stifle the first germ of love for a man who would lend himself to such a game.

They reached the house in silence. Louise hurried to her own room, and sent word that she wanted to see no one that night. She sat on her sofa in an agony of painful self-accusation. It was past midnight when she finally went to rest; but she could not sleep. She rose again, and sent to wake her father and beg him to come to her. He came, and she entreated him to set her free while there was yet time. There was only one way. Her father tried again to explain that perhaps the captain still— But Louise would not let him speak; she cried: "No, never! I should be dishonorable in my own eyes!" She begged her father that they might set out on their proposed journey directly—that very night; she could not see Marie or her betrothed again. Her father tried once more to soothe her; but Louise vowed that she would leave the house in the night, and wander out into the world, if her father would not comply with her wish. He had never seen his child so overmastered by excitement, so resolved and determined to break all bonds asunder. He agreed to her proposal. Louise wrote a letter telling her friend that for the next few months she would hear no news of her. She wrote also to her grandmother; and in the gray of the morning, while Marie was still asleep, the carriage rolled away in which Louise and her father sat.

The captain, who, in the farm-house, had found no sleep either, and was standing at his window at dawn, believed himself to be dreaming when he saw the carriage pass, heavily laden with trunks, and bearing away Louise and her father.

CHAPTER VIII.

PLAYING WITH FIRE.

FATHER and daughter were far away—Louise sleeping, or at least sitting motionless with closed eyes, in a corner of the carriage—when Marie came down to breakfast in the garden-parlor. She was surprised to find no one there, for Herr Merz was generally early. The house-keeper brought her two letters. One was from Paris; the other had no address. Marie reddened when she saw the first, but quickly opened the other. It contained the lines which Louise had left behind. Marie could not understand what had happened; she opened the second letter, but seemed unable to read it properly;

she put her hand to her head several times, then sat down, staring before her, and holding the letter in the hand which hung nerveless by her side.

The captain was announced; Marie quickly hid both letters. The captain looked as if he had been awake all night. He told Marie that he saw he was not yet fit for such adventurous enterprises; he spoke jestingly, but there was a seriousness in his tone as he spoke of the painful position in which he was placed. He stood between two girls, both worthy to be wooed; one must pass for his betrothed, the other become his wife; he was in a false relation toward both; this must not go on.

Marie listened patiently; she pressed her lips tightly together; and when the captain asked at last whether he had been dreaming, or had really seen Louise and her father drive away in the early morning, she handed him the letter left by her friend. She was not a little surprised when the captain exclaimed, joyfully: "I'm thoroughly glad of it! Now I'm rid of her and her money. I might have deluded myself into a sentimental mood. I was on the road to it, but we are not fit for each other, and I don't believe that a really lasting life-union can be founded on such an intercourse as ours here. It may do on the stage, where people don't ask: 'How does it fare now, after the curtain has fallen? What are the after-effects of her game of hide and seek?'"

He stopped suddenly, and Marie said: "They did not want to send us off, and so they have gone out of their own house."

The captain nodded, and Marie went on: "I ought not to have said any thing about it to Herr Merz."

"Did you do that?" cried the captain. The blood mounted to his brow, his eyes flashed as he continued: "Now all is well! I am free, and glad of it. I am rid of the gold-devil, and have the angel of sweetness instead. I'm glad the play is over. We will show the purse-proud people that we have fooled them. Are you agreed?"

"Agreed? I don't understand!"

"Marie, I've seen that you alone are fit for me. Now tell me frankly, don't you think, too, that I am the only right person for you? To be sure we have nothing, but if we have each other we are rich, and we are no Philistines to make many cares for ourselves. I am strong and courageous; I will make my way. Now only say one word. Have I not already made my way? Have I not won you? Say only one word!"

Marie put her hand in her pocket: she was on the point of taking out the other letter, which she had received from Paris, but she drew her hand out again empty, and held it out to her cousin: "Don't make me speak now. I did not know that I had something in me—they call it jealousy, but—pray, don't make me speak now. Trust me, I will consider it all. We are no longer children, you and I. No, we are no children—we have no one, either of us, to con-

sider for us. Pray go away now, but don't give yourself any hopes—remember, I have said nothing at all. Good-by! When the time comes you shall hear from me. But again—remember, I've promised you nothing."

"And I do not give you up," exclaimed the captain; "I put my seal on your mouth."

He embraced and kissed the trembling Marie, who resisted at first, then passionately returned the embrace. Suddenly she tore herself away, and left the room. The captain gazed after her; then he went to the farm-house, took off his citizen's dress, put on his uniform, and returned to his post.

Marie also went away in the evening. On her return-journey she did not conceal little Scheck, in saucy defiance of the rules, for the inspector allowed her to take him with her openly in the carriage. She sat still a long time, and Scheck watched her in wonder, for he had never seen his mistress in such a mood—not vouchsafing him a single word, or even a glance.

After some time she took Louise's letter from her pocket, read it through quickly, and tore it into little bits, which at intervals she allowed to flutter out of the window of the railway carriage. The pieces of paper were scattered at wide distances; no one could have collected them again.

She took out the other letter. Shaking her head she looked at the photograph inclosed in it, then read:

"Whose is this picture? No, that you will not ask when your eyes, beaming with warmth and light, rest on this photograph.

"I have certainly changed much in appearance, but if a photograph of my soul could be taken, you would not find a single strange feature in it.

"And now, where are you? How do you live? Have I still a right to speak to you thus? Are you still free? Are you still your own, to become mine?"

"Oh, forgive the crooked question mark. I have something certain to tell you. What I vowed to you on the swiftly-moving vessel is now fulfilled. I have attained an honorable position, and am in a position to make for you—for us—a cheerful home, free from want and care.

"I come to you, wherever you summon me. Only one thing, in all sincerity and good faith. If I should not seem to you as I did, you are free. We will solemnly clasp hands and say, It must not be!

"I read this letter over. I have written confusedly, but my mind is clear, though I do not know how to express myself otherwise.

"My heart beats as it did when I saw you gliding down the Rhine. I am full of courage and confidence, and, so long as I live, would be your ———."

Marie made a rent through the name. She was about to tear this letter also, but she stopped, and said to herself, "He calls you free, in order to be free himself and to be able to make some new experiment. No, no! He is a true, frank soul, without deceit! Yes, that he was. Is he still?"

She gazed long at the photograph; then put letter and picture again into her pocket.

When she reached home she found the old lady busied with her accustomed occupation of strewing scraps of paper in all the corners of the room.

LITERARY FORGERIES.

II.

WHILE the trial of Vrain-Lucas acquaints us with the details of a fraud at once the most audacious and the most stupid ever committed, I proceed to add another chapter to this history of false autographs. It has been seen with how little material skill Chatterton and Ireland succeeded in deceiving their contemporaries. English literature furnishes a recent example of forgery in which poetic talent plays no part, but where the fabricator's art is carried to the very extreme.

In the beginning of 1852 appeared a little volume of letters by Shelley. Every one knows who Shelley was—the friend of Lord Byron, the poet-dreamer, powerful, mystic, one of the most marked of that line which descends, unbroken, to Tennyson and Browning. The volume contained twenty-five letters; it was prefaced with an introduction by Browning, and brought out by Moxon, the publisher of most of the poetical works of the day. It must be owned that the contents of the book were somewhat disappointing; nothing striking; some uninteresting details concerning the first marriage of Shelley, and the decision which took away his children; some descriptions of Italy; nothing more. Let us add, however, that this insignificance gave rise to no suspicion; the letters of a great writer might precisely resemble the letters of any other person. Nevertheless, it was but a few weeks after the appearance of the book that an incident revealed its true character.

Moxon, the publisher, had distributed among his illustrious clients copies of the new work. Tennyson, especially, had received one of these. Tennyson, just then, was receiving a visit in the country from one of his friends, Mr. Palgrave, son of the historian, and brother of the traveler who has told us of Nedjid. Mr. Palgrave found the letters of Shelley on the parlor table, opened them, ran them over; what was his astonishment upon recognizing, as he believed, an old acquaintance! Continuing, he could no longer doubt that a pretended letter from Shelley to Godwin was a forgery, together with an article on Florence, published in 1840, in the *Quarterly Review*. It is not surprising that Mr. Palgrave could so readily recall an article printed twelve years before, the article having been written by his father. As for this proceeding on the part of the forger, it is nothing extraordinary; the makers of autographs are all reduced to this, even as the author of the false letters of Marie Antoinette borrowed from the gazettes of the time, and finally, again, the author of M. Chasles's manuscript treasures copied from ancient scientific memoirs. It can not be supposed an easy thing to draw from one's own imagination the materials and the style of a fictitious correspondence; one could scarcely get, in this way, that tone of the situation, that unstudied air of reality, which is found

in all the letters, even the most insignificant; hence the necessity for the forger to seek some assistance—a canvas, a text unknown or forgotten, which he may adapt more or less satisfactorily to his design.

But to return to the letters issued by Moxon. It is easy to imagine the publisher's surprise on learning the discovery just made. He had bought these papers at a public sale, and at once produced the originals; there were the letters attacked, with every mark of authenticity. The handwriting appeared to be that of the poet. The seal was his. The address bore the stamp of the Italian cities where he had lived. The pieces were shown to certain upper clerks of the post-office, who declared that they saw nothing suspicious. One means of proof remained. Murray possessed numerous letters of Byron, written in the same cities at the same time, and also directed to London; comparison was easy. This was fatal to the letters issued by Moxon; the stamps of Venice and Ravenna betrayed important differences. From this time the forgery was considered established, and the publisher hastened to withdraw the copies already offered for sale, and to condemn the entire edition to destruction. Suspicion once awakened, it was soon perceived, in addition, that these pretended letters of Shelley formed only a part of a vast enterprise of epistolary fraud. At the same sale where Moxon had bought the pieces which he published, the poet's son had purchased, as he believed himself in duty bound, other letters of Shelley, addressed to his wife, and filled with private affairs and family secrets. The forgers had likewise offered for sale letters of Keats and Byron, besides books bearing the name of the latter, with marginal notes apparently written by his hand. Murray, always on the watch for works by the author of "Childe Harold," had bought forty-seven letters for more than three thousand francs.

The fact of the fraud established, the only question now was to trace it to its source. Moxon had bought the letters at a public sale: from whom had the auctioneer received them? From a bookseller named White. And White himself? The latter, if his published account may be credited, had bought all these false documents of an unknown woman, who brought them successively, never dropping her *incognito*, speaking of a sister in need, of a dead father who had been a collector of autographs, taking care, at the same time, to insinuate that these literary treasures came to them through Fletcher, Byron's faithful servant. Seeking farther yet, there appeared behind the lady an adventurer, who was undoubtedly the real author of the fraud. This was an individual who, abusing a somewhat striking resemblance to Byron, had taken his name, and passed himself off for his natural son, although the poet's family had always repulsed his pretensions. The knave had gone so far as to announce the publication of inedited works of Lord Byron; the publisher,

warned, withdrew in time, and the book did not appear. It should be added that the bookseller, White, was not able to clear himself completely before the public; it was generally thought that, even if he did not actually know of the forgery, he must have suspected it; and, in any case, that he had gained too largely, getting out of the affair in time, and selling for three hundred guineas documents which had not cost him the third part of that sum.

I have already remarked that literary forgeries differ according to the market for which they are intended. Thus, while the English are contented with Shakspeare or Shelley, the Germans want something more solid: they are given the fathers of the Church; they are offered a Sanchoniathon. For the London market, it is sufficient to write more or less indifferently in old English and Gothic characters; for that of Leipsic or Berlin, it is necessary to know how to write in Greek, and, upon occasion, to fabricate palimpsests.

Do my readers know who Sanchoniathon was? The surest are probably not quite certain. Sanchoniathon was a Phœnician, who wrote, in his own language, a history of his country. When did he live? That is completely unknown, since some consider him as ancient as Moses, while others place him only one or two centuries before our era—a little difference of twelve or fifteen hundred years! Besides, the original work of Sanchoniathon is lost. It is true, an Egyptian Jew of the second century of our era translated the book, but this translation is also lost. There remain only a few fragments, amounting to about a dozen pages, which have been preserved to us by Eusebius, a father of the Church. It is easy to imagine the grief of the learned in every age in thinking of so great a loss. The Phœnicians, indeed, were one of the most considerable nations of antiquity—the inventors of writing, the founders of Tyre, of Sidon, and of Carthage; great navigators, who had even passed beyond the columns of Hercules; cousins-german of the Hebrews, with whom they were sometimes found in relation, but from whom they differed, as a commercial people must always differ from an agricultural people, and the worshippers of Moloch from the worshippers of Jehovah. Truly, how this Sanchoniathon was venerated by philologists and historians! How they found in the fragments of his translator the fascination of difficulty to surmount, of mystery to penetrate, of hypothesis to risk! And if ever the original should reappear! If only the version of that Philon of Byblos would rise out of the depths of some library! If, instead of some miserable morsels, treating only of cosmogony and mythology, there should be found, at last, the nine books of that history, what a flood of light might they not cast upon all Semitic antiquity!

One can judge, after this, of the emotion which took possession of the learned public of Germany, when it was reported, in 1836, that

the Greek translation of Sanchoniathon had, in fact, been discovered, and was to be published. A Portuguese officer, named Pereira, had accidentally found the manuscript in the convent of Santa Maria, at Merinhao, near Oporto, in Portugal, and had sent it to his friend, M. Frédéric Wagenfeld, at Bremen. The manuscript was written on parchment, and contained one hundred and twenty-seven pages of the large quarto size, and with from twenty-five to thirty-five lines per page. Impatient to let the whole world enjoy so precious a treasure-trove, M. Wagenfeld hastened to publish an extract, about one-half, with notes and a fac-simile of the manuscript. The volume, issued at Hanover, was preceded by an introduction by M. G. F. Grotefend, one of the principal German philologists. Here, then, was the recovered work of Philon, complete in nine volumes. It appeared that Sanchoniathon was the royal historiographer. One might read the account of the maritime discoveries and settlements of the Phœnicians, and learn that the Sidonians discovered the island of Ceylon. There were anecdotes, popular poems—the latter, by-the-way, with a counterfeit air of Ossian. “Amisus has driven me from the city; my slaves have mocked me. But I will chastise the slaves, I will slay Amisus. Once I reposed upon the purple of Tyre, and my pillow was the silk of Babylon. Now the crag is my dwelling-place, and the desert my pillow. But think ye that I tremble when the shadows fall on the wood, when the storm howls among the trees like a roaring beast of prey? or that I am affrighted by the glimmer of the rocks in the light of the moon, or by the pale faces that look at me from every clod of earth? Is the lion afraid in the darkness of his den, or have ye seen the wild-boar terrified? The savage wild-boar wanders unscared through the mountain passes, and the roar of the lion makes all his enemies quake.”

Sanchoniathon, were we to credit M. Grotefend, was a writer of Ezekiel's epoch. He had incorporated with his work various important documents, one of them a report on the power and commerce of Tyre under Hiram, contemporary with Solomon. The work terminated with the accession of Adonidlibnas to the throne of Byblos, about the tenth century before Jesus Christ, leaving the reader to regret that Sanchoniathon had not carried his recital yet farther. But Sanchoniathon excused himself—the modern history of Phœnicia had already been written by another than himself.

In this world there are always keen spirits ready to call every thing in question. It was not to be expected that M. Wagenfeld's discovery could escape criticism. Wilcken, author of the “History of the Crusades,” had the hardihood to pronounce against the authenticity of the manuscript. On the other hand, Gesenius, the great Hebraist, ranged himself among the partisans of Sanchoniathon. It is true that Gesenius was occupied with Phœni-

cian antiquities; that he had published dissertations on the subject; that he found the conclusions at which he had arrived confirmed by the new publication, and that this coincidence was well calculated to create in his mind prejudices favorable to the honesty of M. Wagenfeld.

But Gesenius was deceived. In vain did the Greek of the printed text appear specious and flowing; in vain did the historical contents of the book seem conformed to probability; there was no resisting the evidence of contrary proofs. The whole story of M. Wagenfeld concerning Colonel Pereira and the monastery of Santa Maria turned out to be false. Inquiries being made in Portugal, it was shown that no manuscript had been discovered. Finally, once fairly aroused, criticism found in the text itself more than one weak spot. There was no remedy, the fraud was exposed. Wagenfeld alone held fast, and the following year published the whole of his pretended manuscript, together with a Latin version of his own (1837). This, at the same time, furnished new arms against himself, and gave a memorable example of invention and erudition. He died ten years later, in 1846, leaving the remembrance of one of the most extraordinary frauds the world has ever witnessed, and bequeathing to other unscrupulous Hellenists a precedent not likely to be lost.

The mantle of Wagenfeld was taken up by Simonides. Simonides was the most learned, the most skillful, the most remarkable of all the fabricators of manuscripts. No one could crown more worthily than he a list of these ingenious and criminal falsifiers of history.

Constantine Simonides was born, if his own story can be trusted, in 1823, in the Greek isle of Hydra. It is probable that he has made himself younger by some years than his actual age. It is not clearly known where he received his education and passed his childhood. In 1837 we find him employed by a printer of Athens; then at Mount Athos, near an uncle of his, the Superior of a convent, and a great lover of Greek manuscripts. Two years after the uncle died, and the nephew betook himself to traveling over the world, pursuing his studies, connected, it is said, with secret societies, hence an equivocal and suspected person. In 1846 he returned to Athens, and began to fabricate manuscripts, which he pretended to have got through a legacy of his uncle. At the same time he showed great zeal for study, taking lessons in ancient Greek. He is described, at this period, of agreeable manners, endowed with a power of persuasion, imperfectly educated, but eager for knowledge, full of imagination and taste. He read the ancient authors with enthusiasm, gathering together all sorts of historical and archæological information, and essaying to write correctly in Greek. With all this he was vain, ambitious, and fickle. At the end of two months he left his teacher, and threw himself into adventures.

Simonides published an account of his wanderings, but this relation, intended to support

his speculations, had the effect simply of casting a deeper shadow upon this whole part of his life. It is certain, however, that, after having tried his fortune at Athens and Constantinople, he found it necessary to strengthen his base of operations by renewing his supply of documents and materials, and that he returned to Mount Athos. There he copied manuscripts, and even succeeded in procuring some quite valuable ones, which should serve to pass off those of his own manufacture. Hence, to quote his own story, he departed to visit the islands of the Archipelago, then traversed Egypt, penetrating as far as the Asian deserts. It should be added that every where he made the most precious and unlooked-for discoveries. For instance, falling into the hands of a noted brigand, he found this bandit himself a distinguished archæologist, who had preserved in a cavern choice antiquities, and who parted from our Constantine with tears of regret, presenting him with valuable vases as a farewell gift.

It must not, however, be supposed that Simonides imposed upon every one with his tales and his manuscripts. His forgeries, like all others of the kind, disclosed a singular mixture of astuteness and credulity, of subtilty in the means used to deceive the public, and temerity in his estimate of the folly of that public. Thus, very early, Simonides made up a history for a pretended academy of Symia, written by a monk of the thirteenth century, and did not hesitate to attribute to the doctors of this school the greater part of our modern inventions—paper, printing, the telescope, and even steamboats. At another time he interpolated a work of the fifteenth century, and introduced therein the discovery of the daguerreotype. At the same time he manufactured fragments of classic authors, manuscripts of Hesiod, Homer, and Anacreon. Things went so far that the Minister of Public Worship at Athens appointed a committee to examine these treasures. Fortunately, the resemblance between the manuscripts of Simonides and certain recent editions issued abroad was observed in time; our forger had procured and copied these comparatively unknown texts.

Athens becoming too hot for Simonides, he returned to Constantinople toward the end of 1850. There he found powerful patrons; in particular, Baron Tecco, minister from Sardinia, who lodged him with himself. It was at Constantinople that Simonides began to turn his studies toward the East, announcing, first, a Sanchoniathon; then an ancient Greek work on hieroglyphics; then a history of Armenia, which he endeavored to sell to the chief Armenian prelates, and for which he demanded the trifle of a million dollars. The rogue did not despise any means calculated to dispose of his wares. He pretended to possess a document according to which the Comneni had hidden precious manuscripts in the environs of Constantinople, in order to conceal them from the Latins; and he added that the hiding-places were designated

with sufficient exactness to render them easily recognized. His object is not difficult to divine. He announced one day that excavations must be made in the gardens of Ismael-Pacha, Minister of Public Works. The place indicated was searched, and, indeed, a manuscript on parchment was found inclosed in an old box. It is unnecessary to say that Simonides was familiar with the garden, and had already walked there. Another attempt of the same sort ended less favorably for Simonides. A certain Ibrahim was digging the foundation of a house, when some one took the opportunity to ask Simonides if the spot where they were working did not happen to be one of those containing manuscripts. Simonides examined, and declared that, in truth, there should be found, somewhere near, an Arabic work, written in Syrian characters. At once arose a curiosity easily understood; they dug and dug, but nothing came to light. Our savant was present; but he was forbidden to descend into the trench, which, to be sure, could have served him little, since he was under the eye of the assistants. After some hours of labor, every one went to breakfast. On their return the excavations recommenced. But the workmen had scarcely struck a few spade-blows when Simonides cried out: "There it is! there it is!" In fact, they had come upon a box. Ibrahim observed immediately that the earth clinging to it was of a different nature from that of the place where they were digging. But the workmen had laughed: why this merriment? On questioning them, it appeared that during breakfast Simonides had slipped away, had gone down into the trench and worked there. Whereupon Simonides thought proper to quit Constantinople.

Here should come in the pretended travels of Simonides in Asia, and probably the fabrication of the works which we shall one day see appear. In 1853 we find our savant in England, where his business transactions were tolerably successful. A celebrated amateur, Sir Thomas Philipps, gave him, for one manuscript, as much as £500 sterling, that is to say, 12,500 francs. The British Museum bought seven, but refused several others as spurious. From London Simonides came to Paris, where he passed four months, and where, likewise, he boasted of having made some advantageous sales. Finally, in July, 1855, he reached Leipsic, where his career of learned frauds and dishonest gains was to terminate.

Faithful to his system of screening his false manuscripts with pieces really ancient and valuable, Simonides commenced by exhibiting, at Leipsic, some leaves of the Greek text of Hermas, a Christian writer of the second century, whose works were known only through a Latin version. This was enough to surprise and delight the learned world. But Hermas was to serve only as introduction to an original work. Simonides had manufactured a history of the kings of Egypt, reaching back to most ancient

times, and said to have been written by an Alexandrian named Uranios. The manuscript, fabricated with much art, was designed to pass for a palimpsest—the name given to a parchment on which an old inscription has been erased to make room for another, the original text reappearing only by means of chemical reagents. This was Simonides's first essay in palimpsests, and there is no denying that it gave evidence of an extreme skill. Is this skill sufficient to explain the countenance at once afforded to our Greek by William Dindorf? May not other motives have served to blind the celebrated philologist? So much, at least, is certain, that Dindorf immediately declared himself convinced, that he rejected all representations, combated all objections, that he himself bought the manuscript for the sum of 2000 thalers, and that he sought directly to sell it again to the Prussian government for 5000 thalers, which would have insured him a pretty little profit. Before buying, however, the King of Prussia charged some Berline savans, among them M. Lepsius, the first of modern Egyptologists, with the examination of the document. More than one warning had already been heard. M. Lycurgos, a Greek scholar, who had given lessons to our Simonides, conceived suspicions on finding, in Uranios, the solecisms that he had formerly corrected at Athens, in the themes of his pupil. Then there were strange idioms, modes of speech entirely modern. M. Tischendorf, a poor enough critic, but an experienced paleographer, declared, on his side, that the manuscript in question presented the writing of the eleventh century, but could not be a palimpsest of the fifth. M. Lepsius, who appears to have been deluded at first, had no sooner obtained permission to take away the manuscript, to study at leisure, than he found the contents completely at variance with the most recent and certain discoveries of science. The chemical and microscopic tests finished by demonstrating that the text of the pretended Uranios, instead of being more ancient than the effaced writing, was more modern—in other words, that it was a counterfeit, the work of a forger. Furnished with all these proofs, M. Lepsius went to Leipsic, in company with a police-agent, and on the first of February, 1856, Simonides was arrested, at the very moment when he was making his arrangements to go to London. At his dwelling was found the whole apparatus with which he had manufactured his Uranios: chemical inks, essays of old writing, manuscripts, some spurious, others authentic, works of Egyptologists such as Bunsen and Lepsius himself, and, to crown all, the text of Uranios. The money which Simonides had received from Dindorf was still in his possession.

The offense was evident, yet it remained unpunished. The Prussian tribunal set Simonides at liberty, and restored to him his effects and his money. The criminal, in fact, had not committed his fraud in Prussia, and M. Dindorf, who had been its only real victim, was not

a Prussian. As for the Saxon tribunals, they could interfere only on condition of making it a civil suit, which M. Dindorf, for some reason or other, did not care to do. The forger did not fail to cite his acquittal as a proof of his innocence, and betook himself to Vienna, where I know not what became of him. At thirty-five he had accomplished labors beside which the forgeries of which M. D'Hunolstein, Feuillet de Conches, and Chasles have been the dupes must always appear very tame and paltry.

In closing this account of the more noted literary forgeries, perhaps it may not be amiss to devote a few words to the cheat of which M. Chasles has been the victim; and this by reason of its being the latest piece of knavery, rather than from any claim it possesses to rank with those already described.

Some eight years since, a man named Vrain-Lucas presented himself before M. Chasles, a member of the Institute, and proposed to sell him a large number of autographs and curious pieces belonging to a M. De Bois-Jourdain, who was desirous of parting with them. On this basis Vrain-Lucas constructed the whole fable: The collection in question had been made in the last century by a rich personage, who was obliged to emigrate in 1791. He went to America, carrying with him his collection: on his return he was shipwrecked; all his autographs, letters, and books fell into the water, but were afterward recovered. This explained the condition of some of the pieces offered to M. Chasles.

M. Chasles believed the word of this man,

and made many purchases of him. Twenty-seven thousand forged pieces were sold for the sum of one hundred and forty thousand francs—at different times, of course.

Some of the pretended letters were as follows:

Letters and poems of Abelard, one of the latter entitled "The Unfortunate Lover;" letters from Alexander the Great to Aristotle, from Argesilaus to Euripides, from Cleopatra to Cæsar, from Æschylus to Euripides.

Letters of Attila; of Catherine Boren, Luther's widow; of Julius Cæsar, Cicero, Clovis, and Charlemagne.

Three songs of Blanche of Castile, and sixty letters of Joan of Arc.

A letter from Judas Iscariot to Mary Magdalen.

Two letters from Gremius Julius to Jesus Christ.

Twenty-five letters to St. Peter from that Lazarus who was raised from the dead.

Of course there were many others; these are but a few of the most striking ones.

The wonder is, how M. Chasles could credit the authenticity of these pieces.

Finally, the discovery of the truth was brought about by an experiment on some letters of Galileo. Vrain-Lucas was arrested on a charge of swindling, and, being convicted, was condemned to two months of imprisonment and a fine of five hundred francs. The examination, which lasted a long time, was only very recently concluded.

And, in future, M. Chasles would do well to renounce autographs!

Editor's Easy Chair.

IT is difficult for an old traveler in Europe, of more than twenty years ago, to believe that the Prussian King William, who has become suddenly the hero of liberty and order, is the same prince who at that time stemmed the current of popular revolution in Prussia. The King, indeed, has probably not changed. He is, doubtless, the same tough old Tory, believing in his God-given crown, and despising a popular constitution as heartily as ever. But the ocean currents are stronger than the will of the sailor afloat upon them. In the inevitable battle between political progress and reaction, typified by Germany and by imperialized France, the old King has been lifted into a prominence which makes him more the hero of civilized order than ever Frederick the Great was of Protestantism. Few kings in history have had a deeper and nobler popular sentiment behind them than this grim old Prussian Tory; and his heart must be triply hard if it has not been touched both with admiration and awe by the spectacle of a great nation resistlessly united in an intelligent and lofty unity of purpose.

The political education of Germany proceeds steadily with its general development. Its movements are not hysterical, and the German does not run into the street to throw up a barricade

at every point of friction between opposing political tendencies. But while the political form remains absolute and despotic the substantial intelligence of the people gradually makes absolutism impossible. The condition of 1815 is like a legend of the dark ages. It is not William nor his dynasty, it is threatened Germany and civilization, it is the genius of political reaction letting loose Turcos and Zouaves upon intelligent and liberal Europe, that summons the great steady German people into the field to fight the battle of modern liberty and order. And as the Easy Chairs upon this side of the sea contemplate the tremendous spectacle, and see the people waving hats and flags and handkerchiefs to the King and the princes, holding their stirrups and kissing their hands, one of the Easy Chairs, at least, reverts in memory to those other days of '48, when Europe was also shaken, and when William was not yet king, but was only Prince Royal of Prussia, the King's brother.

The King in those days was his poor Majesty Clicquot, as he was called; a man not without literary cultivation, of a great deal of maudlin sentimentality, and a prodigious capacity for drinking Champagne. He was sensible enough to make Humboldt his familiar friend, having him constantly with him at his country palace;

and his minister in England was Bunsen. But Champagne and political sentimentality were his bane and his ruin. It was a great pity both for him and for his country, but his Majesty was not respected. Even *Punch*, in London, made merciless fun of him. The poor King should have been kept from general view like a Grand Lama. If trouble were to come, his image in the national mind could not possibly prove to be a tonic, and trouble did come.

The Reform banquets were proposed in Paris. Louis Philippe was king and Guizot was his minister. The assembly was apparently devoted to the dynasty. But Odilon Barrot, then liberal and eloquent; De Tocqueville, constitutionalist and sagacious; and the late Montalembert, a legitimist *sans peur et sans reproche*, were all in opposition. Odilon Barrot was the popular tribune of the moment, and his speeches excited the people and harassed the government. De Tocqueville, in a remarkable discourse, full of practical wisdom and political sagacity, distinctly foretold the revolution. Montalembert, in a passionate and electrical appeal, so moved the Chamber that it voted to adjourn, distrusting its action under the influence of his spell. Then came the catastrophe; the flight of the King; the proposition of the regency of his daughter-in-law, the widow of the Duke of Orleans and mother of the Count De Paris; the significant cry of Lamartine, "Too late! too late!" and the proclamation of the republic with the provisional government.

What a wonderful spectacle it was! and at this moment let us remember how well the nation behaved, how orderly even the mob of Paris was—that mob which is so constantly and wrongly called "the people," by those who speak of French events—and how noble and memorable was the service of Lamartine, who, more than any other Frenchman, in that hour of incredible excitement and vague, terrible apprehension, kept the peace at home and abroad; and, by a stroke of rhetoric, which was also a sublime act of humanity and patriotism, made the flag of liberalism, and not that of terror, the accepted flag of France. Carlyle sneered at Lamartine as squirting rose-water upon the revolution. But no thoughtful Frenchman, and no man any where who reads or remembers that history faithfully, will deny to Lamartine the praise of the most sagacious inspirations and words. It is not clear that any other man in France could have tided the country over the perils of those early weeks of the revolution. Lamartine was not wholly a hero, indeed; but it is not the blind begging Belisarius of later days, it is the brave king of the occasion, whom grateful France and civilization will remember.

For many days in Berlin there had been thunder in the air. It was evident that something impended. The reading-rooms along the pleasant street Unter den Linden, and all the *bier-lokals*, were full of attentive students of the papers, who discussed the chances of events. At length the final news came. The first thing that we heard in Berlin was that the government was ready and had plenty of soldiers. Probably it knew the necessity, for the city had an air of suppressed excitement, and the feeling was such that troops of the cavalry of the paternal government paraded the streets at night to help every

body keep quiet. But there were some irrepressible spirits who would not "move on" at the paternal request, and it became necessary to emphasize it with sabres. The cavalry charged upon groups of talkers that would not disperse; and, indeed, one evening the pleasant Unter den Linden was so full of people that the paternal cavalry made a clean sweep through it at a rapid trot with drawn swords, and one free-born son of Columbia pursuing the higher humanities at the university had his head laid open by the admonitions of the government.

But the amazing and sudden success of the revolution in France put all the crowned heads of Europe into a panic, and they began to make concessions to the people. It was pitiful to see, because it implied a kind of conscious robber-relation between the rulers and the nations. The kings seemed like pirates who had been overtaken, and in mortal terror at the probable consequences of their crimes, proposed to disgorge their plunder. They professed willingness to restore large shares of the treasures of liberty that they had stolen, and were evidently much more conscious at that moment of the power of the people than of their "God-given" authority. King Cliequot went with the rest, and promised well. There should be a constitution and all the modern improvements added to the political edifice of Prussia. There were optimists in those startling days, who thought that Europe was to be republicanized by the mere force of reason, and that kings were about gracefully to own themselves in the wrong and to retire.

But suddenly, one Saturday afternoon in Berlin, the mere force of reason gave way. The Easy Chair was dining with some student friends at the old Belvedere.—Is it standing still? Do the pudding and the soup still meet in the middle of the feast? Is the white beer of Bavaria still drunk there by the yard? Is the kind old man long since departed, who, overhearing the English tongue, and learning that the Easy Chair was American, exclaimed with satisfaction, "We love die Americans, and we know very much your General Vashington Irving?" Is the palace of the Prince of Prussia still standing close at hand? But who sees Humboldt walking by? Who hurries across into dear old Ritter's lecture-room?—While we were yet dining anxious faces appeared, and we were told that trouble was brewing. A crowd of people had been to the royal palace to demand arms, and they had been refused. The revolution was coming! The tidal wave was even now lifting us! We all arose and went out. A huge concourse of men was swiftly swarming from the palace into the broad street. As it passed along, like a dark cloud, covering every thing with shadow, doors and windows were closed, and shop-keepers hurried to make all fast. Before the palace of the Prince of Prussia, his present Majesty King William, a carriage was standing, and the moment the crowd had passed the Princess of Prussia, the present Queen, and a beautiful woman, came out with children, and stepped quickly into the carriage, which drove off rapidly toward the King's palace. The crowd swept on, and the leaders of revolution knew that the hour had come.

As the Easy Chair strolled curiously along, it saw men with clubs and iron bars hurrying by evidently to a rendezvous, and officers on horse-

back clattered through the streets, which all carriages had deserted. The leaders knew that no time could be safely lost, and by three o'clock barricades were rising in the chief streets that led into Unter den Linden. The Easy Chair turned into its room in the Friedrich Strasse, and at the same moment it saw from the window that a crowd had brought the materials to build a barricade just beneath it. Suddenly there was a low knock at its door, and opening it, the Easy Chair saw a young officer of the King's Guards. He was pale, and explained courteously that he had been making a visit at the rooms of the General upon the floor below—he was the General's daughter's lover—and that to attempt to pass the barricade in the uniform that he wore would be to invite destruction. Would the Easy Chair be so gracious as to lend a gentleman in that unhappy predicament a few garments of the civilian? While he spoke they could both hear the heavy rumble of artillery, and far away shots of musketry. The uniform was quickly concealed, and with the utmost courtesy the young officer thanked the Easy Chair, and hastened away, as he said, to reach his post.

The barricade beneath the window was soon built, and the sound of firing grew heavier and nearer. The Easy Chair heard the approach of soldiers advancing upon the barricade. At the same moment the sloping roof of the house opposite to its window began to heave, and was finally burst through by the iron bars of the insurgents, who, completely protected by the eaves from the fire of the soldiers in the street, could throw down upon them every kind of deadly missile. But the clear voice of the commanding officer ordered, loud enough for all on the neighboring houses to hear, that the troops should fire upon every person who appeared at a window, and he sent a detachment into the opposite house. The barricade was then assaulted and carried, and the Easy Chair was at once within the military lines that were pushed outward from Unter den Linden. But for hours the alarm-bells rang, and the sharp volleys of musketry rattled, and the dull heavy cannon thundered and shook the air. A great battle was going on in the city. The moon shone, the white clouds drifted through the sky, and there was no other sound than that of the bells, the muskets, and the cannon.

The next day the city was like a city that had been carried by assault. The soldiers had taken the barricades and held the streets. But there was a universal feeling that the people were strong enough to bring King Clicquot to terms, and there was bitter hatred of the Prince of Prussia, who had counseled and directed the operations of the night. The King issued a sentimental proclamation to his *liebe Berliner*, his dear Berliners. But the dead were carried to the royal palace and brought into the court, and his poor Majesty was compelled to come to the window and to look upon his subjects, whom he was plainly told that he had murdered. He wept and promised; and it was understood that his brother sharply reproached him for not maintaining his prerogative by the grace of God. But there was a kind of national guard organized and armed. There was a solemn and triumphal funeral of the dead, and Humboldt walked in the procession among the national

mourners. There was a little feeble talk of Clicquot as Emperor of Germany. But after the ludicrous and brief empire of the Archduke John, the last of poor Clicquot's wits ebbed away; Robert Blum, the popular leader, had been shot, and the Prince of Prussia, becoming king, stoutly held that he owed his crown to God, and was responsible to Him, and not to the people.

But while his Majesty the King has held his views, their Majesties the People have held theirs. The political education of Germany has steadily proceeded, and the old doctrine of divine right has been surely undermined. The deepest political desire in Germany to-day is for a union of the German race. Germany heard with amazement, like the rest of the world, the declaration of Thiers three years ago, that the true policy of France was the continued dismemberment of Germany. It was the statesmanship of barbarism, and Germany does not forget it. When Louis Napoleon made his monstrous declaration of war, without even a pretense of just occasion, Germany rose with a single heart, not to protect a Prussian dynasty, but to defend its own integrity, and to assert the power of civilization against the incursions of anarchy. William became of necessity the head of the movement. But as the old man rode into the field, followed by the prayers and benedictions even of those who were his victims in '48, he was the representative not of a royal house, but of a royal people, whose triumph would be that of civilized order, intelligence, and progress. Yet still, as the sound of the German cannon echoes over the sea, the advancing guns of liberty, the Easy Chair must curiously remember those other guns long ago which the same King fired.

MANY of the American bishops of the Roman Church returned during the summer, and Archbishop Purcell, of Cincinnati, one of its most conspicuous and beloved prelates, delivered a lecture upon the subject of the Council, which is of peculiar interest from the American point of view. The Archbishop described very simply and graphically the proceedings of the Council, and we have nowhere seen a more intelligible report. He mentioned the great inconvenience of the wing of the huge transept of St. Peter's, in which the Council assembled, and the clumsy canvas ceiling which was contrived to remedy the acoustic defects, and which did not remedy them. Then the atmosphere of St. Peter's made mischief. The great cathedral has a climate of its own. It is an air which the outer heat and cold does not affect, and which is odorous with the continual incense of centuries. In the burning summer you lift the huge leathern curtain that hangs over the door, and you are chilled by a wintry coolness. In winter you pass from the raw air of the great Place, or piazza before the church, into a mild, sweet temperature.

But this sudden check and change were fatal. Thirteen of the cardinals and bishops died within the first three months, and many more have since died. One day, the Archbishop says, they thought one of the brethren had died in the Council. "In the hall," he says, "there were three openings, and consequently many currents of air. So that many of the older bishops came in leaning on their staffs, tottering along to find their places, hardly knowing whether they would live or die.

.....These openings made it very unpleasant. And then the slamming of doors, the coughing and sneezing, made it extremely difficult to hear the orator. Nevertheless, under all these inconveniences, we did the best we could."

It was, according to the Archbishop, a perfectly free Council, which Father Hyacinthe denies. "The Pope was never present," says the Archbishop. "He sought no control over us, leaving us under the direction of five cardinals. There was entire liberty of speech," he adds, "provided we first obtained permission, which was never refused;" and then he describes a regulation which is worthy the most serious attention of all conventions, ecclesiastical and political, of all legislatures and public meetings of every kind. Going up into the ambon, or pulpit, where we addressed the brethren, "we spoke as long as we thought necessary; and it was only when we were, in the estimation of the audience, too tedious or lengthy, that a little bell was rung, and we were requested to descend from the stand." This does not seem to be precisely speaking as long as we thought necessary, but as long as was thought agreeable by the hearers. Moreover, who decided that the audience considered us tedious the Archbishop does not mention. But, as he speaks of one bell only, it was probably in the hand of one of the five cardinals under whose direction we were always perfectly free. And when that Eminence thought that our remarks—tending, possibly, toward some remote doubt of the wisdom of proclaiming infallibility—ought to be tedious to the audience, even if they were not, he tinkled the little bell, upon which we, whose minds and discourses were uncontrolled, and who spoke as long as we thought necessary, straightway descended from our ambon, or pulpit. The freedom of speech was apparently perfect. "The little joker is unquestionably under this thimble," quoth the positive gentleman at the fair.

The Archbishop tells us further that the rights of science were never more amply vindicated. The Bishop of St. Augustine was their champion. He took the cardinals to task for the old judgment against Galileo, which, however, he said that the Pope never signed. And the Bishop called Galileo "that great, good man." Surely this is significant, that the great modern Council of the Church should hear one of its members praise Galileo, and without rebuke! Science has its rights, said the Bishop. Scientific men should pursue their investigations with the largest liberty. The Bishop of St. Augustine proceeds to illustrate his conception of the largest liberty of science, as the good Archbishop has already given us his of the perfect freedom of speech. We must say to scientific men—who are wholly free—says the Bishop, that they must not pretend to find in science any thing antagonistic to the revelations of the Bible. When they think that they have done so it is their duty to submit it to learned men in the Church, and the Church will never find fault with them if they do so. Archbishop Purcell states that another American bishop wished science to have the same liberty—the liberty, that is to say, of submitting its conclusions to the revision and approval of the doctors of the Church.

But the modern St. Augustine deserts us at the very crucial point. When science, being perfectly free, submits to us the results of its investigation, and we of the ecclesiastical body do not

approve them, what is to be done? Are the conclusions of science to be rejected as false because they do not agree with our opinions, who are not versed in science? Or is the opinion of the ecclesiastical body to be considered science? Suppose, for instance, that science, in the person of Galileo, teaches the revolution of the earth, and that we, the Church, in the persons of the cardinals, declare that such a doctrine is contrary to Scripture, what is to be done? Shall we denounce Galileo, as we did before, or confess our own incompetence? Is the truth decided by science or by our opinion? If by our opinion, then the earth does not revolve around the sun. If by science, why should wise men submit the results of their investigation to us who are proved to be dunces, and who confess it?

There is something very artless in this conception of freedom. The liberty of science to submit the result of its investigations to the doctors of the Bishop's Church, and its equal liberty to have its conclusions approved or condemned by those doctors, is very much the kind of liberty that Galileo enjoyed. It is the liberty of doing and saying exactly what the ecclesiastical doctors choose. The excellent Bishop of St. Augustine must hold to one position or the other. If he said, as the report of Archbishop Purcell's address declares, "Science has its rights, which should never be interfered with; and scientific men should pursue their investigations with the largest liberty," why does he say, as also reported, that if they reach certain decisions, they must submit them to the decision of certain doctors of the Church? Does he not see that he also unavoidably suggests the remark of the gentleman at the fair, "The little joker is certainly under this thimble?"

Presently, in a frank and manly way, Archbishop Purcell describes his speech in the Council upon civil government; and this merits the most careful attention, as the view of one of the most justly eminent and distinguished dignitaries of the Roman Catholic Church in America. He had obtained leave to speak—subject, of course, to the tinkling of the little bell—when the entire order of proceedings was changed, and "I was left out in the cold, as were other bishops." He therefore wrote out his speech, and sent it to the archives of the Council. But he must also have delivered it at last, because he says that when he came down from the ambon, or pulpit, the English Archbishop Manning, one of the most uncompromising advocates of the infallibility, rushed forward, took his hand, and said, "You are a true republican," which, however, was a very questionable compliment from Dr. Manning. But our American Bishop said plainly that it would have been better for the Church if kings had never assumed to protect her; that our American form of government is the best in the world, because it finds the rightful source of power where God placed it, in the people. He said that our civil constitution gives perfect liberty to every denomination of Christians, and looks with equal favor upon all. This, said the Archbishop, "I believe is better for the Catholic religion than if it were especially protected. All we want is a fair field and no favor. It is for the people to decide. If they approve our religion, they will embrace it; if they do not, they will reject it."

These were remarkable words to hear in a

Council summoned to decree the infallibility of the head of a Church, for there is not the least insinuation in them that if the people do not approve they will go to Hades. The American Bishop pushed his radicalism still further. He said that he wanted to know when to obey the pope as an infallible interpreter, and he cited two classes of historical illustrations. We are told, he said, that the popes were always infallible, although the dogma was never defined. Very well; when a certain pope taught that baptism in the name of the Son only is sufficient, was he infallible? Again, by what right does the pope assume to control temporal affairs? The power has been distinctly claimed by them; it has been exercised. The popes have deposed English kings and queens, and have declared their subjects relieved of their allegiance. "I find no text for it in the Bible," says the American prelate. And "the entire Council, with one voice, cried out, 'Those popes had no authority, no commission from God to pretend to any such power.'"

No wonder that the good Archbishop exclaimed that he thanked God he had spoken, and that the Council had decided that the day had gone by when such things were possible. It is unquestionably one of the most important decisions of the Council, or, more properly, one of the most significant expressions of the present sentiment of the Roman Church. This claim of universal and paramount political authority, which the popes exercised in the great days of their supremacy, was renounced by Pope Pius VI., and by the chief Continental Catholic universities, at the close of the last century; but the expression which Archbishop Purcell has drawn from the General Council is conclusive of the present attitude of his Church upon the subject.

He makes the best of the dogma, like all of his brethren who were opposed to it. Their arguments were evidently not answered, but they submitted to the decision of the Council. Yet it is curious how little knowledge or how little harmony of interpretation upon this subject there is among the doctors of the Church. Thus the Holy Patriarch of Jerusalem said that the question had long since been decided in a certain Council of Lyons and a Council of Florence. But Archbishop Purcell states that those Councils, unable to find authority in Scripture or tradition for the declaration of infallibility, "laid the question aside." Then comes Bishop Bailey, of New Jersey, telling us that "the Catholic Church has always believed in infallibility; that it is one of its accepted doctrines, and all that it ever needed was to be confirmed by council." That seems to settle the question, when Father Hyacinthe, in his ringing voice, declares that "it is a doctrine unknown to all ecclesiastical antiquity, which is disputed even now by numerous and eminent theologians, and which implies a radical change in the constitution of the Church." And the universities of which we were just speaking, the universities of Sorbonne, Louvain, Douay, Alcalá, and Salamanca, deliver their fire side by side with Father Hyacinthe, and directly into the face of Bishop Bailey. "It is no matter of faith to believe that the pope is in himself infallible, separated from the body of the Church, even in expounding the faith." And even Archbishop Purcell, who desired the reporters to announce

that there is no more devoted Churchman of his faith than he, says, with energy: "If he denies any dogma of the Church held by every true believer, he is no more pope than either you or I."

THE Easy Chair has received a letter which is undoubtedly genuine, but which, whether it be genuine or not, describes a very common situation, and asks advice which is often passionately sought and utterly disregarded. The letter is the revelation of a familiar tragedy. A young mechanic, refined, and, to a certain degree, cultivated, marries a woman five or six years older than himself, after a year's courtship. He made five hundred dollars in the first year of his marriage, and saved sixty. He did better the second year, and continued to prosper. But, after marriage, his wife confessed that she knew nothing of housekeeping, and could not cook, and it was soon evident that she had no talent for management, nor even personal neatness. For three years he did almost all the work in his house as well as out of it. Then, with greater prosperity, he "hired a girl," and every thing was a hundredfold worse.

During all this time he remonstrated gently and patiently, trusting to time, to affection, to the mother's love of her children, to pride, to—any thing. Ten years have passed, and the situation is only ten times more terrible and insupportable. Endless shiftlessness and waste and scolding and disorder make up the daily story, and over all hangs the undimmed ideal of a home to which he wooed and won his wife.

"I don't know what to do. If, after years of patient effort, things remain the same, what does the future promise? I am at home always, except when traveling upon my employer's business. All I want is a quiet, peaceful, ordinarily well-managed home. I can't get it, and God knows I am in deep trouble." He does not deny that he has become impatient, for he is utterly discouraged. "Is it morally right for two people to live together in such relations? Must a mistake in judgment cost me the happiness of a lifetime?" That final question is the key of the whole position. In all such cases the question is not individual or simple; if it were, it could be easily answered. The Easy Chair reminds his correspondent that there are four persons concerned—himself, his wife, and two children, and that the happiness of the last three is quite as precious, and as much to be considered, as his own. There can not be a question that, under the circumstances he describes, if there be any fault, it is his own original fault of judgment. But from that fault new relations have sprung, and from them new duties. His first duty is not to consult his own happiness, which, if lost, is lost by his own act, however innocent. His paramount duty is care for the welfare of his wife and children. He has deliberately assumed responsibilities; and, although rashly and unwisely, he can not evade them. There is no insupportable vice nor disease upon either side. His wife loves him, and would remain.

The law, as he truly says, gives him no relief. What relief could it, or ought it to give him? If there were a law that every body who found, or supposed that he found, or said that he found—for all those alternatives must be considered—that his marriage was a mistake could dis-

solve it by walking away from his wife, the consequences are easy to imagine. One of the great disciplines of marriage, according to all experience, and in the nature of things, is the necessity it imposes of self-sacrifice and infinite mutual forbearance. Its spiritual benefit is nobler character. Its end, indeed, is happiness, but happiness interpreted in the loftiest sense—happiness which may require incessant self-renunciation.

These are grave things for an Easy Chair to say; but they are things that should be deeply pondered by its correspondent. Can he honorably, even if he could legally, deprive his wife of her children? Can he honorably leave them to her unchecked influence by abandoning them all? and if not, is not his honorable, however painful and perplexing, duty clear?

WHEN Father Hyacinthe was the hero of the hour he wrote a letter saying that if the Great Council of his Church at Rome should not be truly free in its deliberations, he would not accept its declaration of papal infallibility, but would cry aloud and continually for a council which should really represent the Church, and whose voice should indeed be authoritative. Now that the dogma is declared, the father promptly repudiates it, because, as he says, he is a Catholic and a Christian. But his protest is leveled not only at the declaration, but at the dogma. Not only, in his judgment, was the Council not free, and its declaration, therefore, not to be considered binding, but the dogma is in itself monstrous, and therefore to be rejected.

The difficulty with Father Hyacinthe's position as a member of his Church is, that it puts him out of it. As we said, upon the publication of his first letter, his position is essentially Protestant. He asserted his own judgment against the decision of his Church. And it is not a valid plea to urge that it was not, in his opinion, a real decision of the Church. For if that liberty of judgment is to be reserved to every member, there is, obviously, an end of unity and harmony.

The doctrine of the Church must be authoritatively pronounced by some body or by some person, and in some way. If the pope and the cardinals and the bishops, in universal council, may not declare the faith, who may? May Father Hyacinthe? But if he renounces such a claim for himself, does he not immediately reassert it when he declares the conditions upon which alone he will receive the declaration from others? Is he to be the judge of the freedom of the Council? May he properly insist that the decree shall be made unanimously, and that the voice of less than the whole is not binding? Or, leaping over all forms and conditions, if the individual Father Hyacinthe may declare that the doctrine of papal infallibility is repugnant to the spirit of the Gospel and to human instinct, and yet remain a member of the Church, may not every other member do precisely the same thing? And what then becomes of the dogma? And what need then of any council for any purpose? If the individual member of the communion may decide for himself that the doctrine of infallibility is contrary to the Gospel, he may surely decide for himself upon every other declaration which his Church may make.

Father Hyacinthe will probably find that when he laid aside the robe of his order he laid aside

the authority of his Church. The prelates in the Council who opposed the dogma have either assented to it or will assent to it, or they will hold their positions, as it were, under false pretenses. If any bishop, for instance, should say to his people what Father Hyacinthe says in his letter, that the Council had overstepped its powers, that its declarations, consequently, were without authority, and that he repudiated the doctrine of papal infallibility, he would undoubtedly hear from his official superiors. But the good Father Hyacinthe no longer, as we understand, exercises ecclesiastical functions; and the Church leaves him severely alone. As we said last year, he had but three courses before him. He must either be reconciled to the Church, which would be the last we should ever hear of the former fervid orator of Notre Dame, or he must lead a schism in his Church, or he must leave the fold in which he was reared, and which he loves with the enthusiasm of a sentimental and passionate nature.

He has not chosen either, but the choice is made for him. If he remains nominally a member of his old Church, it is as a protestant against its most solemn and universal modern act, and a protestant upon principles which subject the whole authority of the Church to the inquisition of the individual judgment. "Man," he says, in speaking of the Council, "has been powerless to procure the triumph of truth and justice." And he appeals to God. But is not the Church of his affections divinely directed? If in so momentous an act as the declaration of the dogma, if in the Great Council which has brought the ecclesiastical ends of the earth together in the historic capital of his faith, God has not influenced the Church, where can he be expected to do so? And if the father's cry could be heard, if another council should assemble and undo the work of the present, and other fathers, with all the sincerity of Hyacinthe, should, in turn, repudiate its declarations, they must be justified by him as he demands justification, and thus, upon his own principles, the great assumption and authority of his Church would be overthrown.

The choice, we say, is made for him. Father Hyacinthe stands upon purely Protestant ground. If he were able to turn his pure and flaming zeal to the leadership of a schism, he would hardly fail to become, like Savonarola, an historic figure. But he is of too gentle and tender a nature. And as yet it is doubtful if he sees the scope of his own protest.

In the August Number of this Magazine a letter was published from Mr. Fitzhugh Ludlow to the Easy Chair, stating that a remedy had been discovered, which seemed to him almost infallible, for the relief of opium-eaters, a subject in which Mr. Ludlow has been, as is well known, long interested. Mr. Ludlow was just sailing for Europe, and referred inquirers to Mr. Henry Read, of Lowell, Massachusetts. Letters which the Easy Chair presently received, from persons evidently painfully anxious upon the subject, stated that a large sum was required to be paid in advance, and that the whole business had a mysterious and suspicious aspect. The Easy Chair, which had printed the letter of Mr. Ludlow as that of an old correspondent of the Magazine, and an authority upon the subject, wrote to

Mr. Read, and received from him a long and detailed account of the facts. Mr. Read confirms the statement of our correspondents, that an enormous price is demanded for the antidote; but he claims that he is not responsible, being an agent only, and that neither he nor Mr. Ludlow, who both attest the efficacy of the remedy, has any control of the price.

Editor's Literary Record.

WE have never read any novel, and rarely any history, with greater interest than that with which we have perused EUGÈNE TÉNOT'S *Paris in December, 1851, or the Coup d'État of Napoleon III.* (Hurd and Houghton). M. Ténot is an ardent republican. But he does not write as a partisan. His circumstances did not allow it. His book, published in France in 1868, could not be an indictment of the French Emperor. He has written with singular but necessary self-restraint. He has confined himself to recording the history, mainly compiled, too, from official documents, without note or comment. Whenever a quoted document itself contained any thing directly derogatory to the Emperor, the obnoxious matter has been expunged, and fragmentary extracts alone been given. The reproduction of Victor Hugo's pronunciamento to the army, issued at the time, is a curious illustration of the author's reserve. Notwithstanding the fact that it is an historical document, the page which contains it is about equally divided between print and asterisks. But this very reserve makes the book more significant, more entertaining, let us add, more trust-worthy. No one will pretend that M. Ténot is an impartial historian. But he is compelled to be so fair and honest that not even Cæsarism could find in his book an excuse for its suppression. The attentive and unprejudiced reader of this book will reach a conclusion, we think, midway between that of those who have most violently denounced and those who have most energetically defended this crime. He will neither accept the conclusions of Mr. Kinglake nor those of Mr. John S. C. Abbott. The republic which existed in December, 1851, was without republicans. Neither of the three political parties into which France was divided was satisfied with the Constitution. The monarchists wished to overthrow it to restore the Bourbon or the Orleans dynasty. The then President was intriguing to supplant it with a Napoleonic empire. The republicans wished to guard against the double danger by taking from the President the control of the army. A law, taking from three millions of voters the right of suffrage—a high-handed outrage, of which the monarchical party were the authors—followed by an ineffectual attempt to place the military under the partial control of the President of the Assembly, was the pretext upon which Louis Napoleon justified his act. His blow was avowedly on behalf of universal suffrage. The working-men of Paris applauded the act which checkmated the Bourbons and Orleanists, or viewed it with supreme unconcern. M. Ténot's testimony on this point is clear and decisive. "Why should we fight?" responded one of the workmen to the appeals of their would-be leaders. "They give us universal suffrage." They had no faith in their own representatives. Just before Baudin's death one of

a group of working-men to whom he appealed replied, with cruel sarcasm, "Do you think we wish to be killed in helping you retain your twenty-five francs a day?" The most dangerous, though not the bitterest opposition to Napoleon was not from the working-men. The greatest slaughter was not among the blouses of the Faubourg St. Antoine, but among the "yellow gloves" of the boulevards. This is one significant fact, a key to the success of the *coup d'état*. The other is not less significant, nor less a key to what is otherwise an enigma in history, the wonderful success, and yet more wonderful and disastrous failure, of the empire. The *coup d'état* was the victory of the military civilization of the past over the peaceful civilization of the present. The empire was built upon it. "What makes the discipline of our army, and consequently its glory," writes an enthusiastic admirer of the *coup d'état*, "is, that in spite of civilization, of newspapers and books, it has never had ideas, but instincts." "You," said General Leflo, on perceiving an inferior officer participating in his arrest—"you, an old soldier—you consent to become an accomplice in treason, to lay your hands upon your chief?" "Go!" was the response; "we have had enough of lawyer-generals and general-lawyers." The Prussian campaign has proved the superior value of an army endowed with ideas to one that has only instincts, and the inauguration of the republic is a proclamation by France to the civilized world that she has had enough of generals that despise the laws. The monarchy may be restored; we will not even assert that the age of miracles is wholly past, and that the empire may not be raised again from the dead. But the military Dagon, before which for nineteen years the French people have bowed in superstitious reverence, has fallen from his pedestal, and is broken in pieces, and he can never be restored again.

THERE is no American author, we hardly know any English author, whom we would sooner select to write a biography of Charles Dickens than Dr. SHELTON MACKENZIE. For over half a century he has lived in familiar fellowship with the *literati* of his time. He has that peculiar cast of mind which seizes upon significant incidents, treasures them up, and, as needed, reproduces them. He is, too, a literary critic—professionally so—and although his criticisms are not and do not assume to be profound, they are pervaded by a personality, a sympathetic appreciation of the writer's aim and spirit, a knowledge, in short, of the man, which is, in some sense, the first condition of either accurate or interesting criticism. His critical writings, like his conversation, are always lively, entertaining, anecdotal. His *Life of Charles Dickens* (T. B. Peterson and Brothers) might almost be

termed reminiscences. It contains, of course, a great deal we all knew before. The birth, the parentage, the first captivation of the public by "Pickwick," the order in which the subsequent stories followed each other, their literary qualities and characteristics; in all this there is nothing with which the newspapers have not already familiarized us. Of the great novelist's interior life and character, of what he was in his family and with his children, what in society and in religious conviction and association, what not merely as an author, but as a man, it tells us but little. Of that unfortunate but still inexplicable separation between himself and his wife it gives us really no information, except the scanty and unsatisfying information afforded long since by Charles Dickens's public card. But of the novelist, as a novelist, of his habits of mind and methods of composition, of the current criticism of his day, of the praise and blame which his succeeding works provoked from the critics and the public, and especially of the sources from which Dickens obtained his power, Dr. Mackenzie tells us a good deal. One secret of Dickens's success lay, doubtless, in the fact that he made real characters sit for the portraits which he drew, albeit he idealized them in the drawing. This we knew before; but we did not know how to detect the originals beneath the disguise. This, in the most entertaining chapter of the book, Dr. Mackenzie explains to us. Tony Weller was a coachman who used to drive between London and Portsmouth. Tracy Tupman—a certain Mr. Winters—was a well-known *habitué* of Hyde Park. The "fat boy" existed in veritable flesh and blood, the servant of a gate-keeper in Essex, between London and Chelmsford. Mrs. Ann Ellis, who kept an eating-house in Doctors' Commons, sat for the portrait of Mrs. Bardell. Mr. Justice Stareleigh was hardly a caricature of Sir Stephen Gaselee. The publication of "Oliver Twist," with its sharply cut portraiture of Mr. Fang, police magistrate, resulted in the removal of A. S. Laing, Esq., from the office which, by his brutality, he disgraced, and from which no previous pressure had sufficed to eject him. All the world knew that the Cheeryble Brothers were the shadows of the brothers Grant, cotton spinners and calico printers near Manchester; but it is a new revelation that the characteristics of Mrs. John Dickens, Charles's mother, are unmistakable in good, poor, doting, foolish Mrs. Nickleby; while traits less amiable, yet that awaken a friendly feeling more akin to pity than contempt, in Micawber and in Turveydrop, were borrowed from his father, who struggled throughout life in perpetual financial difficulty like the one, but, like the other, never failed to maintain the dignity of his department. Mr. Bucket, the detective, passes for Inspector Field, under whose protecting escort the great author made more than one tour of the wretched regions he so graphically described. The rascally but accomplished Mr. Julius Slinkton, whose crimes in "Hunted Down" surpass belief, is the exact fac-simile of Thomas Griffiths Wainwright, the story of whose incredible crimes, penned by Mr. Dickens himself, forms one of the papers which help to swell Dr. Mackenzie's volume to its goodly size of four hundred and eighty-four pages. Dr. Mackenzie has not altogether done himself justice. The public demand

a good book *now*, rather than a better book by-and-by. And Dr. Mackenzie, writing to supply the demand, has not permitted himself the necessary time to collect his material or to arrange what he had collected. His whole book, begun, it is said, on the 14th of June, was finished on the 23d of July. But though it is probable that some more elaborate and thoroughly digested biography will supplant his work in the future, it is certain that for the present want there is no biography more entertaining, and probably none more accurate, than that which Dr. Shelton Mackenzie has given to the American public.

THE American system of government is an extensive and important subject. A good account of the organization and methods of administration of government employed in this country, written in a manner adapted to popular use, would be a valuable contribution to the literature of the day. The years that have elapsed since the close of the war have witnessed a marked advance in the ascendancy of the national government in the degree of popular confidence accorded to it, and in the magnitude and importance of its transactions, and have developed important changes in the administration of the States. The view of the workings of our governments given in books published twenty, or even ten years ago, is incomplete and inadequate for the wants of the present day. A fresh and correct display of the processes of their administration, as now carried on, would be of general interest and value. To give such a picture is the task indicated by the title of Mr. SEAMAN's treatise on *The American System of Government* (Charles Scribner and Co.), which promises us a discussion on "its character and workings, its defects, outside party machinery and influences, and the prosperity of the people under its protection." The work does not, however, fulfill the promise of the title-page. It is not so much an account of the management of the American government as an expression of the author's criticisms and objections to particular features of the system. He describes pretty fully and pretty fairly those departments and branches of administration in which he wishes to suggest improvements; he passes over in silence or with disproportioned brevity those which do not incite his criticism. Thus the volume abounds with suggestions of evils and remedies; and these give to the production its tone. It is not an account of the "American system of government," but of "Dr. Seaman's system of medical practice for the treatment of diseases, deformities, and general decline in the American government." Doubtless it has its good points, probably it may abound in valuable prescriptions, though we apprehend a government that could bear them all would need a naturally fine constitution of its own at the outset. We cordially invite those who think the American governments are in a sick and dying condition, who apprehend a congestion in the Treasury, or general inflammation under the income tax, or boils and tumors in the unreconstructed States, or marasmus among the office-seekers, or general prostration in the army and navy, to "read up" Dr. Seaman's remedies. But, for our own part, we think more favorably of the American government than our author does. We consider

the administration of government in the United States to be, at the present day, in pretty fair case. The patient has been through a severe illness, has had a rub for his life, but is now fully convalescent, and in a fair way to be discharged cured, without requiring new treatment. It may be necessary to keep the extremities in hot water a short time longer, and to maintain a judicious course of bleeding for a couple of years yet, and, possibly, though we doubt it, to sustain the constitution by a few fresh provisions. But, upon the whole, the American patient is doing well.

HAVING made personal trial of *Harper's Hand-Book for Travelers in Europe and the East* (Harper and Brothers), we speak whereof we do know when we say that no man should essay the tour of Europe without it. Of course he will add, abroad, guide-books of special localities. But for a volume to give him the outline of the whole field there is nothing to equal it published either in this country or in England. Mr. FETRIDGE, the author, resides abroad, and makes it his business to keep himself acquainted with those constantly occurring changes which so greatly affect the traveler, and so speedily render the ordinary guide-book out of date. The present is the ninth annual edition of "Harper's Hand-Book," and is greatly improved, not only by material additions and corrections, but yet more by admirable maps of nearly all the principal European cities. In truth, one might take this volume, and, without going out of his house, acquire by its study during the long winter evenings a better knowledge of Europe than many tourists do in their three months' mad gallop over its chief lines of travel.

We have reserved our notice of Lippincott's series of *Ancient Classics for English Readers* until we should have more than one volume by which to judge of them. Four volumes are now before us—Herodotus, Cæsar, the Iliad, and the Odyssey. Of these the two latter are by the editor, Rev. W. LUCAS COLLINS; the two former are by GEORGE C. SWAYNE and ANTHONY TROLLOPE, respectively. The idea is an admirable one. It is to give to English readers, and in a small compass—the volumes are about 175 pages each—an adequate idea, for the purpose of general information, of the great writers of antiquity. The books are not criticisms; they are not translations; they are not abridgments; they are a curious combination of the three. Let us take the Odyssey for example. In successive chapters, answering to the successive books of the poet, the editor gives an account of the adventures of Ulysses. He intersperses translations, from various authors, of the more striking passages. He adds hints of criticism, and suggestions of the various schools of interpretation. One may read the book through, lazily, in an afternoon. To a large proportion of readers it will afford a better conception of the poet than they could get from any translation, or even from the exercises in grammar and scanning through which most college students are put, under the shallow pretense that they are studying Homer. To any of our readers who want to know something about the classic authors of antiquity, but have not the time to master them in their original tongues, nor the inclination to read the translations, which are so often only travesties, we recommend Lip-

pincott's edition of the "Ancient Classics for English Readers."

DE PRESSENSÉ, following close upon the track of Renan, continues his history of Christianity by a volume on the *Apostolic Era* (C. Scribner and Co.). We have read it with some disappointment. Indeed, nearly all that Pressensé writes impresses the reader as being the work of a man who could produce something far better if he were to write with greater thought and more painstaking. This volume is less brilliant in description than Renan's kindred work on St. Paul, less rich in classic lore than the work of Conybeare and Howson, less transfused with poetic sentiment than the author's previous volume on "The Life and Times of Jesus Christ," and is not characterized by any original conception or novel presentation of the teachings of the great apostle. It is a useful without being a pre-eminent book.

What need we say of Mr. BEECHER's *Sermons* more than that J. B. Ford and Co. issue a third volume of them? These sermons are taken down just as they fall from his lips, and are published without revision and without selection. Greater care would give a volume less open to criticism, but this method does just what it purports to do—opens the doors of Plymouth Church to thousands who can never sit within the sound of the great preacher's voice. There are many sermons that are greater in particular qualities than Mr. Beecher's, but none that are more characteristically helpful to every kind of soul want.

The Three Brothers, by Mrs. OLIPHANT (D. Appleton and Co.), is a thoroughly original story in its construction, and very natural, though not strikingly powerful, in its characters and its incidents. It is composed of three stories, woven into one strand, of the brothers Renton, thrown upon their own resources by their father's singular will, and struggling up to manhood in different quarters of the globe and with diverse experiences, each with his own battle to fight and his own heart problem to work out in love's school. There is no intense villain, there are no hair-breadth escapes or thrilling adventures. It is the farthest possible remove from the sensational; a tale, it might be a true tale, of English life. We cordially commend it as a healthful and entertaining story.—Just the opposite kind of story, powerfully written in its way (which, however, we do not think is a very good way), is *Veronica*, by the author of "Mabel's Progress" (Harper and Brothers). Veronica is a proud, vain, and unwomanly girl, who has nothing but her beauty to render her attractive, except as her wretched life and miserable death awaken at last our sympathies for one whose life and character are a sore trial to our patience. The moral is very evident; but whether it is worth while to read the story of so much vice to get, at the end, so slight a lesson of virtue, is questionable.—There is no very ostensible moral to make or mar the interest of *A Dangerous Guest* (Harper and Brothers), which is the rather attractive title of a very entertaining novel, the "dangerous guest" being a charming young French girl, and the danger a wedding, which, despite the guardian care of some officious intermeddlers, is consummated at the end of the story. The experiences of the French family in England are

very happily sketched, and the character of Josephine is a very fascinating one.

Recollections of Eton, by an Etonian (Harper and Brothers) is written unmistakably by a follower of Mr. Hughes, but the book is no imitation. It is a simple story of school life at what is the most famous and characteristic of the English schools. It is very evidently a picture, or series of pictures, from the life; and its photographic accuracy is, moreover, vouched for by the English critics. It is of interest to all who like a book which introduces them into a new and otherwise inaccessible world. We have read it with unusual relish. The illustrations are very characteristic and very significant.—The same thing may be said of Harper's new edition of *Tom Brown at Oxford*, published in a cheap form, in paper covers. The book itself is almost a classic, the worthy companion of "Tom Brown's School Days," and is so well known as without a peer in the portraiture of English university life that it needs no commendation from us. Both books are capital ones to put in your boy's trunk when he starts for boarding-school, if you really want him to make a true man of himself, and are not afraid of the exuberance which always accompanies vigorous growth.

Charles Scribner and Co. add to their Library of Illustrated Wonders a volume on *Light-houses*

and *Light-ships*, by W. H. DAVENPORT ADAMS. Most of the series are French; this is of English origin, though the author has drawn largely from the work of M. Renard. The book is profusely illustrated, and gives, in a concise and interesting form, a great deal of useful information; but it would be much more useful, as well as interesting, to the American reader if the publishers had secured the addition of some supplementary information concerning the American light-house system.

The *Princes of Art* (Lee and Shepard) is the title of a translation, by Mrs. S. R. URBINO, from the French, giving some account of the lives of celebrated painters, sculptors, and engravers. The biographies, if so they may be called, are written in a lively and entertaining manner, and are not so much interspersed with anecdotes as a collection of anecdotes respecting their various subjects. But though they are certainly entertaining, and avoid the common error of dry detail which usually characterizes biographies of such extreme brevity, they are neither solid nor full enough to be satisfactory. The book is rather entertaining than instructive. The biographies of thirty of the "old masters" in a compass of three hundred pages could hardly afford more than a morsel. But the morsel is appetizing.

Editor's Scientific Record.

FLIGHT OF BIRDS AND INSECTS.

IN the Scientific Record for October we presented to our readers some considerations in regard to the flight of birds and of insects, as based upon the researches of Doctor Pettigrew and Professor Marey. Some additional experiments have recently been published by the last-mentioned gentleman, correcting and somewhat extending the ideas there presented. Our paragraph was illustrated by two diagrams, the references to which, in part of the edition, were transposed by a typographical error, the cut illustrating the flight of an insect being marked as that for the bird, and *vice versa*. We therefore reproduce them in the present article, for the purpose of correcting the mistake, the figures themselves illustrating the new views on the subject, rather than those first obtained by the authors. By an improved artificial apparatus, Professor Marey has succeeded in simulating with entire accuracy the movement of the membranous wings of insects in flight, to wit: the raising of the body above a given level, and its forward motion in space. The apparatus shows clearly that it is the resistance of the air which imparts to the wings the figure-of-eight motion referred to, as the same curve was described by the wing of the artificial insect, which, of course, only received as its motor rectilinear movements of elevation and depression in the wings. It is, therefore, erroneous to say that a movement of torsion is voluntary on the part of the insect, and assimilated to the effect of the action of a helix, in screwing its way through the air. The flight of the bird, as Professor Marey now finds, differs totally in its principles from that of the insect, and he promises, in a future communica-

tion, a detailed statement in regard to it. For the present he remarks, that, while in the insect the upward and downward beat both take part in the act of flight, in the bird, in consequence of the peculiar imbrication of the feathers, it is the downward motion alone which comes into play, since, in the elevation of the wing, the air passes so freely through it as to supply no positive resistance. He states, in illustration of this difference, that an insect allowed to take flight after a string is tied to its leg can remain in the air without difficulty, while a bird similarly treated will fall to the ground as soon as the string is stretched. The apparatus of Professor Marey, as improved by him, is sufficient to determine, with the greatest precision, the number of beats of the wing per minute, as well as the particular curve of flight; and, among other observations, he informs us that, while the sparrow makes thirteen movements of the wing in a second, and the wild duck nine, the buzzard (*Buteo vulgaris*) beats its wings only three times in the same interval. As a general rule, he finds that the time occupied in depressing the wing is always decidedly longer than that of elevation, excepting in birds of a small wing area, in which case the two periods are almost equal. At starting the bird appears to make fewer strokes, but with a greater amplitude of stretch than subsequently. The rapidity of the stroke, on the other hand, appears to diminish anew when the bird has obtained a high degree of velocity.

The comparison of the two modes of flight may be summed up by saying, that in the bird the extremity of the wing describes a simple helix, while in the insect a series of lemniscates is traced. The difference in the two curves will

be appreciable by an examination of the diagrams.

FLIGHT OF A BIRD.

FLIGHT OF AN INSECT.

PHYSIOLOGICAL ACTION OF MEAT EXTRACTS.

Considerable misconception appears to exist in regard to the true function of the various extracts of meat, whether those prepared abroad by Liebig and others, or the extracts of Borden and Tourtelot in the United States. Many persons, on being assured that a given weight of these preparations contains the essence of a much larger percentage of lean beef, are apt to be quite incredulous, or unable to understand how this can be the case; and can not appreciate the assertions of manufacturers, that an ounce of the extract is equal to a pound of flesh as a stimulant. A recent article, however, by Dr. Lankester, of England, one of the highest authorities in regard to questions of food, explains the rationale of these preparations, and shows why they are really efficient as asserted. In comparing the composition of Liebig's extract with fresh beef, he states that the former contains the following ingredients:

	Parts.
Creatine, creatinine, inosic acid, osmazome, etc.	51
Gelatine	8
Albumen	3
Mineral matters	21
Water	17
	100

while one hundred parts of lean beef contain the following elements:

	Parts.
Fibrine	4
Albumen	4
Gelatine	7
Fat	30
Mineral matters	5
Water	50
	100

From this it will be seen that, while the water and the albumen are less in the extract, a new set of bodies is introduced, which occupy half the bulk of the compound, and that there are also four times the quantity of mineral matters. The difference, therefore, between the two is essentially in the substances mentioned first in the former of the preceding tables.

According to Dr. Lankester, creatine is a substance of alkaline reaction, resembling, in this respect, quinine, morphine, and other substances, and to a less degree theine, and, like this, possibly exercising a powerful influence upon the human system. Creatinine, again, when decomposed, forms sarkosine, a substance contained in the juice of flesh. The inosic acid is also an important substance; and the combination of all

these, together with the other ingredients mentioned, in the extract, can exercise an influence on the animal system which they will not exert when in the form of flesh meat. The true theory of the action of these extracts Dr. Lankester maintains to be that they exercise a stimulating influence upon the digestive organs, which enables them to digest and dispose of food which, without this stimulant, would be a simple burden to them. The action in this respect appears to be somewhat similar to that of other stimulants, but much more efficient.

AROMA OF COFFEE.

It is well known that in the process of roasting coffee many changes take place in the composition of the berry. The horny material becomes brittle, and the tannin, sugar, and fat are partly destroyed, and the oil of the coffee driven off by the heat. As it is to this latter ingredient that the pleasant aroma of coffee is due, it is important to retain this as much as possible, which may be done by introducing pieces of dry bread, together with the coffee, in the roaster, which will absorb the vapor of the oil like a sponge; and, as it becomes heated to a less degree than the coffee beans, serves to condense this vapor. When the coffee is ground the bread is to be ground up and prepared with it, increasing to a not inconsiderable degree the excellence of the coffee. The proportion of bread to be used is a quarter of a pound to three-fourths of a pound of coffee. The coffee, when roasted, must be kept in a closed vessel, as well filled as possible. To keep roasted coffee for a long time, and prevent the loss of its aroma, it is recommended to sprinkle over the bean, while still hot, white loaf-sugar, in the proportion of about three-quarters of a pound to twenty-five pounds of coffee. This completely envelops the bean with a layer of sugar and preserves its aroma.

LIVING ORGANISMS IN CHALK.

Mr. Béchamp continues to insist upon the existence in chalk of actually living forms, called by him microzymas, a statement which he endeavors to prove by the following reasoning: Pure carbonate of lime, according to his statement, exerts no action upon a solution of starch or sugar, even when in contact with the atmosphere, the experiment having been tried for over two years, with the vessel closed to prevent the access of organisms from the air. If, however, chalk taken very carefully from the very centre of the block be used, instead of the pure carbonate of lime, it acts immediately upon the starch, so as to render it fluid, and interverts the cane sugar, producing immediately, with both, alkali, acetic acid, lactic acid, and butyric acid. He therefore concludes that it is to the living organisms referred to, of a nature somewhat similar to bacterias, that the changes are due; and he finds a similar result—from experiment with various tertiary marls—with the lower cretaceous and with the oolitic limestones, all of which exert the same influence upon the solutions in question. The inference is drawn, therefore, that these microzymas are the organized and still living remains of forms of objects which were developed at the period corresponding to the formation of the rocks, and that they are morphologically identical with the microzymas of modern

times, their action as ferments being quite similar, even if a little more slow.

The influence of these organisms in producing chemical changes is well illustrated, according to the author, in the case of glue or gelatine, which can be kept, even in a state of solution, for an indefinite period of time, provided no organized matter is introduced. If, however, these microzymas are added, in however small quantity, as will happen when exposed to the air, the glue becomes liquefied and assumes a peculiar odor, and is incapable of further gelatinizing.

NATURAL GAS FOUNTAIN.

An interesting communication was recently made by Professor Henry Wurtz to the New York Lyceum of Natural History, in regard to a new and extraordinary gas well in Ontario County, about twenty miles south of Rochester. According to his statement, the reservoir was discovered about four years since, when boring for petroleum, and was entered at a depth of 500 feet. The hole was tubed into the solid rock, the tube, five inches in diameter, projecting about ten feet above the surface; the gas that issues, when burning, giving a flame some thirty feet in height. The estimated flow is at the rate of four to five feet per second, or equivalent to about 400,000 cubic feet per day, or an aggregate of some 600,000,000 annually, which is said to be about half the yearly manufacture of the Manhattan Gas Company of New York. The illuminating power is stated to be that of about six candles. The gas proved by analysis to be principally marsh gas, with, however, a large percentage of carbonic acid, a proportion of nitrogen, and a still smaller quantity of oxygen and of the illuminating hydro-carbons.

SECRETION OF SULPHURIC ACID BY MOLLUSKS.

The remarkable fact was announced some years ago that certain gasteropod mollusca secrete free sulphuric acid, and this has since then been not unfrequently observed in the case of the gigantic *Dolium galea*, which discharges from its proboscis a drop of liquid or saliva that produces a very sensible effervescence on chalk or marble. This secretion from different mollusca, carefully analyzed, showed a considerable percentage of free sulphuric acid, some of combined sulphuric acid, combined chlorohydric acid, with potassa, soda, magnesia, and other substances; the glands secreting the liquids constituting from 7 to 9 per cent. of the total weight of the animal. With this acid secretion there is, at least in some species, an evolution of pure carbonic gas, one gland, weighing approximately about 700 grains, yielding 206 cubic centimeters. The genera so far known to furnish this secretion are *Dolium*, *Cassis*, *Tritonium*, *Cassidaria*, *Pleurobranchidium*, *Pleurobranchus*, and *Doris*. The precise object of this secretion is not entirely understood, although it is suggested that it is used in perforating the bivalve shells or other mollusca which serve as articles of food.

PREPARATION OF HYDROGEN.

A new process for the preparation of hydrogen on a large scale consists in heating to redness a mixture of damp coals and alkaline hydrates.

By this means a mixture of hydrogen and carbonic acid is disengaged and conducted over certain carbonates, which retain the carbonic acid and become bicarbonates. The pure hydrogen is collected in a gasometer, to be used as required. The bicarbonates are employed as such, or as reservoirs of carbonic acid. The oxides produced in the carbonization of the alkaline coals may be utilized for purposes of agriculture, or else to form the hydrates for subsequent operations. Hydrogen may also, it is said, be obtained pure by passing common illuminating gas over lime, heated to cherry redness, the dry residue being carbonate of lime.

SINKING OF THE ANDAMAN ISLANDS.

It is announced that the Andaman Islands are gradually sinking, at the rate of about one foot in the century, the inference being derived from the fact that trunks of trees, still rooted in the ground, may be seen in the water of the straits which separate the islands, and belonging to species which never grew in mangrove swamps, and which are only found further inland. It is even possible to trace, in several places, the stumps of several trees in the sea, up to the state when the trees are just dying by the influence of the sea-water, and the subsequent change of the soil by the formation of the mangrove swamp.

PRIZES PAID FOR IMPROVEMENT IN PARAFFINE MANUFACTURE.

It may be interesting to some of our readers to learn that the Mineral Oil Association of Halle has offered two prizes of \$5000 each for the following purposes: First, for the discovery of some chemical method of purifying the cakes of crude paraffine with the least possible loss of the material; this not to exceed five per cent. Secondly, for the discovery of some apparatus for cooling down masses of paraffine to a temperature of at least twenty-three degrees at any season of the year. It is to be understood that the colorless tar oils, benzine especially, can not be used for purifying paraffine, since they act as a solvent upon it. The loss in purifying must not exceed five per cent., and the operation must be rapid, easily applicable, and inexpensive. The purified paraffine must have a bluish-white color, and be free from smell. The apparatus for cooling the paraffine must be so arranged that in one or more rooms masses of at least 500 hundred-weights can be brought to a temperature of twenty-three degrees in vessels holding 500 pounds each. It is suggested that this can be most advantageously done by cooling the apartments themselves in which the masses of paraffine are placed for crystallization. The cooling of the masses must be gradually accomplished, so that the formation of the crystals in them shall not be interfered with as to their peculiarities, size, etc. The prizes are open for competition until the 1st of January, 1871, to whoever will solve these problems to the satisfaction of the committee of the Mineral Oil Association at Halle.

RED COLOR FROM PICRIC ACID.

According to the *Chemical News*, picric acid may be employed for imparting a beautiful red color to ivory, bone, and horn, by means of the following method: Take 4 grammes of the picric acid (the gramme about equal to 15 grains),

and dissolve in 250 grammes of boiling water; and, after cooling, add 8 grammes of liquid ammonia. Dissolve also two grammes of crystallized fuchsin (magenta) in 45 grammes of alcohol, dilute with 375 grammes of hot water, and next add 50 grammes of ammonia. As soon as the red color of the magenta solution has disappeared the two solutions are mixed together, making a bulk of liquid amounting to about a pint, which is a sufficient quantity for dyeing from four to six sheep-skins. Ivory and bone should be placed in very weak nitric or hydrochloric acid first, before being immersed in the ammoniacal liquid; wood can not be dyed by this liquid unless it has been previously painted over with paste made from flour. When, to the ammoniacal liquid, some gelatine solution is added, it will serve as a red ink, which does not attack steel pens. By changing the proportions of the magenta and picric acid, the tints obtained may be varied from a bluish-red to a bright orange-red. The desired colors do not appear until the ammonia is evaporated.

CUTANEOUS ABSORPTION.

Dr. Scoutetten, of Metz, has, for some years, been carrying on a warfare with what he considers the old-fashioned physiologists, who believe in the doctrine of cutaneous absorption, he himself maintaining that such action, unless when the skin is mechanically abraded or otherwise exposed, is entirely impossible. He insists, in a recent essay, that when immersed in a solution, a healthy surface of skin can not be reached by the liquid, in consequence of the sebaceous secretion, which itself prevents any absorption; and that every substance to be absorbed by the skin must be soluble by, or mixed with, this sebaceous material; and that the application of any finely pulverized substance whatever to the skin, unless chemically corrosive, is not accompanied by absorption. Experiments were made by a commission upon such substances as iodide of potassium, yellow cyanuret of potassium, bichloride of mercury, digitalis, belladonna, etc.; and the immersion of a portion of the body was maintained in solutions of one or the other of these substances for from thirty minutes to two hours. The urine and the saliva were carefully collected at a suitable time after the immersion, and it is said that in no case was there the slightest trace of iodine, of corrosive sublimate, or of the cyanuret in the urine; and that the vegetable substances exhibited no action upon the urine, upon the heart, the circulation, or the innervation.

SOCIETY FOR ASSISTING DESTITUTE MEN OF SCIENCE.

Among other excellent institutions of France is an association intended to furnish aid to destitute men of science during their lives, or to their families after their death. This was founded in 1857 by Thénard, a well-known savant, and the report for 1869, just published, shows that it has accumulated since then a principal fund of over \$150,000, besides the expenditure of nearly \$60,000 for the purposes mentioned in furnishing assistance to forty-one families. Among the beneficiaries of the past year were Madame Petit, of Toulouse, and the family of Mr. Nicklès, the well-known Paris scientific correspondent of the *American Journal of Science*. An allow-

ance was also made to Mademoiselle Silbermann, the daughter of the eminent mechanic of Paris. A similar society, we believe, exists in London, though nothing of the kind, as far as we are aware, has ever been attempted in the United States. How far it would be practicable or desirable to initiate an enterprise of a similar character in this country is well worthy of consideration.

COMPOSITION OF THE SKIN OF ANIMALS.

In a recent article on the composition of the skin of animals, and the changes which it undergoes in tanning, it is stated that, when fresh, from two-thirds to three-fourths of the weight of the skin consists of water; and if dried at 220°, it gradually absorbs water; but dried at the ordinary temperature, the moisture in it varies with the amount in the atmosphere. An analysis of a perfectly dried skin gave about 95 per cent. of gelatine tissue; 3 per cent. of cellular tissue not soluble in water; 1 per cent. of fat; and half of 1 per cent. of mineral material.

AMELIORATION OF THE CLIMATE OF SAVOY.

The abbé Vaullet, Director of the Hospital at Annecy, is satisfied that the temperature of that part of Savoy has become sensibly elevated within the past forty years. The mean temperature, formerly fifty or fifty-two degrees, at the present time exceeds fifty-five degrees. Positive proofs of this change are shown by facts connected with the culture of the vine and wheat, and by the recession of the glaciers. The causes suggested for this amelioration of the climate are, the removal of the forests, the extirpation of hedges, the cultivation of new land, the multiplication of roads, the drying up of the marshes, the growth of the population, the increase in the number of the domestic animals, etc.

FRICITION OF IRON ON ICE.

The determination of the coefficient of friction between iron and ice was ascertained during the past winter by Professor Müller, of Freiburg, in the following manner: A young man on skates with smooth runners was stationed on the ice with a spring balance in his hands, to which a strong string was fastened, and by means of which a second skater drew him upon the ice. At the beginning of the motion the spring balance showed a tractive force of ten or twelve pounds; and during the motion it varied between two and four pounds. As the young man in question weighed 125 pounds the coefficient of friction at the beginning of the motion amounted to 9 per cent. of the weight, while during the motion it amounted to from 1.2 per cent. to 2.6.

PURIFICATION OF WATER BY FREEZING.

Careful experiments have recently been made in regard to the solid constituents of the ice of certain lakes compared with those of the unfrozen water beneath it; and a very decided difference was found to exist, the residuum from the evaporation of the melted ice being much less than that from the same weight of the water in question. In one experiment in the Lake of Zurich, while the water furnished .128 of a gramme of solid matter to the quart, the melted ice yielded only .026 of a gramme. It, therefore, would seem that

freezing tends to reduce the hardness of water, and possibly by successive repetitions of this action water might be brought to a state of very decided purity.

INCREASED HEAT OF THE SUN'S RAYS IN PASSING THROUGH CLOUDS.

Forbes, in his travels through the Alps of Savoy, made the observation that when the sun was slightly obscured by thin clouds the temperature of his rays was higher than after the cloud had passed—an announcement which has recently been verified by careful experiment. Thus, in one instance, on the 12th of May, 1868, at about ten o'clock in the morning, the sun being unobscured by any cloud, the approach of a light cirrus caused the thermometer to rise about four degrees; and when completely covered by thin clouds an additional increase of three degrees was observed. At eleven o'clock, the sun being still behind the cirrus clouds, the thermometer indicated a temperature of 101 degrees Fahrenheit; but it fell nine degrees in three minutes after the cloud passed away, rising again six degrees more as a small cloud passed over the sun. The air during these experiments was perfectly still.

CANNIBALISM IN ANCIENT EUROPE.

However strongly combated by naturalists and theologians, it has come to be almost an established fact that cannibalism was not merely an incident of European pre-historic customs, but an almost universal rule; fresh discoveries coming to light in caverns and other primitive habitations, where, in the food-refuse, the bones of man are found mingled with those of animals generally, and all subjected to a similar treatment by fire and by being split, to obtain the marrow from the long bones.

In certain caverns of Mount Chauvaux, in the province of Namur, Belgium, it has been found that the largest proportion of bones consists of those of mankind, the rest being those of the deer, ox, sheep, fallow-deer, wild-boar, dog, fox, marten, and hare. A single fragment of breccia, about as large as an ordinary paving stone, contained not less than five human jaws, one of them of a child of seven or eight years, while all the other bones of the skeleton were represented in one form or another. All of these were burned by fire and broken up, the long bones being split, as already mentioned, while the flat bones, containing no marrow, were undisturbed. Among these bones was a human parietal that had been split by a flint hatchet, which still remained embedded in it.

Another remarkable fact connected with these remains is, that among the entire number there was not a single one of an adult man or of an old woman, all the remains belonging to children, youths, and young women, showing conclusively that a selection was made of the tenderer members of the human race, and that this habit was not the result of any necessity, but one of choice; and that it is quite probable that the victims were fattened expressly for the occasion, precisely as is the case among the Battas of Sumatra and other Eastern cannibals. Indeed, this peculiar taste appears to have existed in Europe a long time after the epoch of the bone caves, since St. Jerome is said to have met among the Gauls a

race possessing large herds of cattle, who yet made an habitual use of human flesh as food.

The remains from this cavern in Mount Chauvaux belong to a very small race, as far as can be judged, five feet being the supposed average, and of small cranial capacity, with a brachycephalic retreating forehead, temples flattened, jaws prominent, and the teeth oblique. These constitute the distinguishing features of a race existing in Europe at the time of the immigration of the Aryans, whom (being armed with bronze and iron weapons) this people were but little able to resist. It is quite probable that long after this new people overspread the land the ancient race maintained a precarious existence in the remoter forests and inaccessible valleys of ancient Gaul.

So far no evidence has been presented of a similar habit of cannibalism among the pre-historic people of North America, the only hint toward any thing of the kind being the discovery of a human jaw in an ancient shell heap near Ipswich, Massachusetts.

INHABITANTS OF MADAGASCAR.

A recent author, in discussing the character of the inhabitants of Madagascar, refers to their division into Madacasses and Hovas, or light and dark races, and considers them both to have been of the same ancestry, since their language and customs are the same. He suggests that Madagascar must have been formerly connected with both the African continent and the Malay Archipelago, and that it was possibly the seat of the earliest civilization.

VARIATION IN PLANTS WITH SOIL, ETC.

Mr. Kerner, a German author, in an article upon the influence of climate and soil upon plants, remarks that in the centre of distribution of a species, where it reaches its maximum of abundance, it is very unusual for varieties to become established, since, even if deviating forms were to appear, they would not be perpetuated, in consequence of a law of nature that cross fertilization with other individuals, rather than self-fertilization, is the rule. On the outskirts of the region of distribution, however, where the individuals are much scattered, variations once developed are likely to become established, because the chances of self-fertilization being much greater, the peculiarities are likely to be perpetuated by inheritance. Here, therefore, we must look for those aberrant forms which become the ancestors of new species. The author thinks that the direct influence of climate and soil in originating changes of structure is extremely slight, these changes being due, in the course of many generations, to the process of natural selection; those individuals which exhibit slight divergencies, suitable to the circumstances in which the plant is placed, being most likely to survive, and to produce large numbers of seeds. Changed conditions of life can kill the plant or destroy its health, but can have no direct influence in changing it into a form more suitable for those conditions.

AGENCY OF HUMMING-BIRDS IN FERTILIZING PLANTS.

It is well known that the fertilization of many flowers, so as to cause them to produce fruit, is dependent entirely upon the agency of insects;

and the barrenness of some plants, when transported to regions remote from their native home, may be accounted for by the absence of the associated insects. It has been suggested lately that the humming-birds of America perform a part almost as important in this respect as insects, since in their passage from one flower to another they necessarily carry with them the pollen dust, and distribute it again, or by stirring up the entire flower in their rapid motion they produce the desired effect. This agency may, perhaps, explain the object of the enormous number and variety of humming-birds, and their universal distribution throughout America.

FLORA OF ICELAND.

According to Professor Babington, Iceland contains about 450 flowering plants, native to the island, all of which, excepting about 60, occur also in Great Britain. The remainder, with three exceptions, are natives of the European continent, chiefly Scandinavia. No species of flowering plant is peculiar to the island. No forests occur in the country, although some have existed not long ago. The trees are all of birch; nor is there any trace of the former existence of pine, nor even of any other kind of forest tree. At the present time extensive woods of dwarf birch are found in several places, and some shrubby willows. No grain of any sort is grown on the island.

KEEPING ROSE-BUDS FRESH IN WINTER.

A method employed in Germany to keep rose-buds fresh into the winter consists in first covering the end of the recently cut stem with wax, and then placing each one in a closed paper cap, or cone, so that the leaves do not touch the paper. The cap is then coated with glue, to exclude air, dust, and moisture, and when dry is stood up in a drawer in a cool place. When wanted for use the rose-bud is taken out of the cap and placed in water, after cutting off the end, when it is said the rose will bloom in a few hours.

RELATION OF BARBERRY PLANT TO RUST IN GRAIN.

Considerable interest has been excited lately in the announcement that a time-honored belief in regard to the barberry shrub was strictly founded in fact, namely: that the proximity of this plant to growing grain caused a development in the latter of the disease known as the rust. It has lately been established that this rust of grain is, though a different form, of precisely the same species as the fungus producing the well-known orange spots on the leaves of the barberry, and that the spores of each form will not reproduce itself, but the other form; and consequently the floating seeds or spores proceeding from the barberry shrub rust, and fastening upon the grain, develop into the apparently very different grain rust. So true is this said to be, that the planting of a single bush of the barberry will produce the disease in a region where it had never appeared before.

As long ago as 1796, and possibly even at an earlier period, an enactment prevailed in Connecticut authorizing persons, with the consent of the civil authorities of the town, to go upon any land whatever and cut down or uproot any barberry bushes that might be growing there,

without being liable to any action or suit for damages. This legislation was continued as late as 1839, and repeated in an enactment by which the liberty was extended to any one feeling himself aggrieved by the proximity of barberry bushes to his own fields to enter upon the land where they were growing, at any season of the year, and to destroy them; and the selectmen were empowered to authorize any suitable persons to do the same thing, and to pay them from the treasury of the town.

TREATMENT OF BRITTLE BONES BY SOLUBLE GLASS.

A hint which may be of service to our comparative anatomists is supplied in a recent communication of Mr. Forez to the Academy of Sciences in Paris. The fragile condition in which fossil and other bones frequently reach public museums, and the consequent difficulty of handling them, or of making plaster casts from them, is well known to persons interested. Various substances have been used to remedy this inconvenience, all of which are liable to various objections, among others, that of leaving a lustre or varnish on the surface. The author recommends, instead of these substances, a silicate of potash or other soluble glass, the amount of concentration varying from a solution of thirty degrees Baumé to the sirupy form in which it is usually sold. In the latter state it can be made use of to very good advantage for cementing broken fragments together, since all that is necessary is to bring them in position and then pass a brush dipped in the solution over them, holding them a short time, or tying them, until sufficiently adherent.

Very porous bones are best treated by successive immersion in a more dilute solution, and should be wiped dry after each application. Specimens thus prepared resist all atmospheric influences, and can be handled with as much freedom as entirely fresh bones. One advantage in the use of this substance is, that it can be applied cold, the solution soaking up readily, and in a short time becoming perfectly firm and hard. As already stated, it is very important to wipe the outer surfaces dry, in order to prevent a shining appearance.

The same substance may be used to advantage in joining the fragments of broken flint or stone antiquities and implements.

RELATION OF HOME GOVERNMENT TO SCIENCE.

It is well known that in France there is a much closer connection between the government and the various literary, scientific, and educational establishments of the country than exists in our country, nearly all the institutions of the kind mentioned being regulated and controlled by one or another of the ministries, or bureaus of the administration.

By a recent decree the ministry of fine arts has been charged with many of the duties belonging to that of public instruction, and is now styled the Ministry of Letters, Science, and Fine Arts. The special objects of supervision with which this newly arranged ministry is charged are the Imperial Institute of France; the Imperial Academy of Medicine; the Library and Museum of Algiers, and the teaching of the living Oriental languages; the Imperial School of

Charts; the Imperial Library, and the course in archæology annexed to it; the Mazarin Library, and those of the Arsenal and of St. Geneviève; the general service libraries, and the editing of the catalogues of the libraries of the departments; the learned societies of Paris; the *Revue des Sociétés Savantes*; the Library of the Committee of Historical and Learned Works; the *Journal des Savans*; subscriptions of scientific and literary works, and their distribution among the public libraries; the consolidating of subscriptions; the encouragement and aid of savans and men of letters; subscriptions and encouragement to voyages and literary and scientific missions; the publication and distribution of the unpublished works concerning the history of France, and the topographical map of Gaul; the Legal Dépôt, and the reception and distribution of works proceeding from the Legal Dépôt.

In this connection it may be stated that few governments have done so much as that of France in the way of advancing science by the institution and maintenance of scientific explorations in different countries, and of publishing the results in a costly and elaborate form. Among other well-known illustrations of this statement may be cited the volumes relating to the explorations in Egypt, under the direction of Denon, made at the command of Napoleon I.; the account of the voyages of the *Astrolabe*, of the *Venus*, and of the *Coquille*; the scientific explorations of Algiers, and many other publications.

It is, however, a matter of pride to Americans to know that no single work of this kind published by any nation equals the report of the results of the great exploring expedition under Captain Wilkes, the series of volumes already printed and distributed having no parallel in their extent, their beauty of illustration, and excellence of typography. Another work, the report of the Pacific Railroad surveys, occupying thirteen quarto volumes, is a similar instance of enterprise on the part of the United States. These two works differed, however, very greatly in the size of their editions, since of the former but 100 copies were printed, which were distributed only to State libraries in the United States, and to government libraries abroad, while of the latter 25,000 copies were printed, and distributed with the greatest liberality throughout the world.

PRESERVATION OF HARBORS BY TORPEDOES.

An instance of great ingenuity in adapting sunken torpedoes to the defense of harbors has recently come to light in connection with the history of the Austro-French war, during which an attempt at the capture of Venice was feared by the Austrians. To guard against this result a camera obscura was erected near to the harbor, and so arranged that the horizontal table of the instrument reflected the whole area of the channel. Large wooden cases, each containing 400 pounds of gun-cotton, were lowered, at certain fixed distances, into the water, and as these disappeared, one by one, a small row-boat described at the time a circle round the spot to indicate the extreme confines of the distance at which the torpedo would prove effective. An observer was stationed in the camera as these operations were going on, carefully watching their reflection

in the instrument; and as each torpedo disappeared into the water he marked with a pencil its precise locality on the camera table, tracing, also, the ring formed by the row-boat. Thus a series of circles was formed in the camera, each of which was marked with a distinctive number, and in this way a miniature but exceedingly correct plan of the obstructions in the harbor was prepared. The wires in connection with the torpedoes were afterward led up into the camera obscura and furnished with numbers to correspond with the circles. By means of this arrangement a sentinel stationed in the apparatus might at once explode any one of the torpedoes as soon as he observed the reflection of an enemy's ship pass within the limits of the circles marked upon the table. The channel itself was quite clear of any suspicious buoys and beacons, and appeared to the enemy wholly free from obstruction.

VALUE OF BAMBOO AS A FIBRE.

We have referred heretofore to the value of the leaves of the palmetto of the Southern States as a material for textile fabrics, and other applications as fibre, and the impossibility of supplying the commercial demand for it. We are now informed that the bamboo of the West Indies has become an article of similar importance. At the present time the exportation of this substance from Jamaica to the United States is very large; and although at first the bulk of the article constituted a serious difficulty in the way of its exportation, the experiment has recently been tried of crushing the bamboo between mill rollers, and, by a screw press, preparing it for being carried in bales. This condenses the bulk greatly, and relieves the obstacle to its transportation at a reasonable expense for freight.

HUXLEY ON THE EARLY INHABITANTS OF GREAT BRITAIN.

According to Professor Huxley, the inhabitants of Great Britain, at the time of the Roman Conquest, belonged to two distinct physical types—the one being tall, fair, with yellow hair and blue eyes; the other short, dark, with dark hair and black eyes. The former resembled the old Germani, who lived on the east bank of the Rhine, as well as the Belgæ of Northeastern France and what is now Belgium; while the latter were related to the people of Aquitania and Iberia. According to his statement both these people spoke Celtic—probably Cymric in Britain and Gaelic in Ireland—while on the Continent the dark type spoke the Basque tongue, the ancient Gauls speaking Celtic and the Germani Teutonic. These latter nations appear to belong to the Aryan family, while the Basque has no affinity to any other European-Asiatic language. None of the invasions to which Britain has been subjected seem to have introduced any new race-element.

PHYSICS OF THE SUEZ AND DARIEN CANALS.

Professor Haughton, of Dublin, is not very sanguine of the ability to keep open the new Suez Canal without the expenditure throughout all future time of an enormous amount of labor in dredging and excavating. The reason of this is to be found in the nature of the Mediterranean and Red seas, these being the seat of very con

siderable currents, which, in meeting, cause a rapid deposit of sand; and while there is not much doubt that at one time there was a continued connection between them, yet in time this sand-bar was formed, which can not be kept open except artificially. The proposed Darien Canal, according to the learned professor, would be entirely different in its character. Here the currents of the Caribbean Sea are continually beating against the isthmus and endeavoring to force a passage, and should such an opening be once made, artificially, there seems little doubt that it would be kept open by the ocean flow, and possibly even enlarged much beyond the original intention. The anticipations of harm from a possible diversion of the Gulf Stream in consequence of this opening were considered unfounded, since, even if one mile wide and a hundred feet deep, it would carry off but one thousandth part of the heat Great Britain now receives from the Gulf Stream.

BEST FORM OF SUBMARINE TORPEDOES.

In a recent article upon the torpedo it is asserted that the great problem of an electric fuse, which should combine high conducting power with great susceptibility to ignition, has been solved by Mr. Abel, the well-known chemist of the Woolwich Arsenal. His mixture consists of a combination of subphosphide of copper and subsulphide of copper with chlorate of potash, this being exploded with perfect ease and certainty by a current from a small magneto-electric machine, a larger apparatus of the same kind being capable of igniting twenty or thirty of these fuses almost instantaneously. The idea of mechanical torpedoes, or those exploded by simple contact of a vessel, has, it is said, been abandoned, to a very considerable degree, since they are very difficult to arrange so as to be safe under ordinary circumstances, and they are liable to unanticipated disturbance by friendly vessels as well as those that might prove hostile. Electric torpedoes, therefore, seem to have the preference; and these are of two kinds, one, the self-acting, and the other those which will send a signal when touched by a passing vessel, to indicate the proper time of effecting their ignition from the shore.

The self-acting torpedo is of very simple construction. An Abel fuse is fixed in the torpedo, one pole of which is connected to a constant battery on shore by means of an insulated wire, while the other pole is in communication with an insulated metal plate fixed inside a pivot in the upper part of the machine. Upon this pivot swings a movable hood or cage; and the latter, though not affected by the motion of the waves, will, upon being struck by a passing vessel, swerve round and come into metallic contact with the insulated plate above mentioned, thus completing the electric circuit with the earth, or, more strictly speaking, with the water. As will be readily perceived, therefore, in this case, a single wire only is needed to connect one element of the battery with the fuse, the other element being, of course, allowed to pass to the earth. In the other description of torpedo a *circuit-closer* of the same construction is used, and this, on being struck, furnishes a signal to the shore, whence a sentinel at once explodes any charge or charges which may be in the vicinity of the

submerged machine. When disconnected from the batteries these torpedoes naturally cease to be a source of danger; and herein lies one of the most valuable qualities of the electric exploding method. If considered desirable, the machines need, in fact, never be put into an active state except in a case of imminent danger. Thus, if a fleet of friendly vessels were pursued by hostile ships, the sentinel on the look-out would not connect his batteries until the former had passed the torpedoes; and when the machines were well left behind, by simply turning a switch arrangement, he would be enabled instantly to close the line of defense, and set up a formidable barrier not to be passed with impunity.

LOSS OF LIGHT IN REFLECTION FROM MIRRORS.

According to Professor Rood, of Columbia College, a mirror silvered by Liebig's process, by placing the silvered side at an angle of 45 degrees, reflected 91 per cent. of the light emitted by a flame, and from the glass side, 78 per cent.; while the ordinary amalgam mirrors, such as are in common use, reflected only 45 per cent. at the same angle. We are not aware whether any experiments have been made in regard to the amount of light reflected by the platinum mirrors, such as we have already described in a former article.

EUCALYPTUS—A REMEDY FOR INTERMITTENT FEVER.

A new remedy for intermittent fever has, it is said, been discovered in a tincture of the leaves of the *Eucalyptus globulus*, a well-known native of Australia. Experiments are now being prosecuted in regard to the use of this substance in the malarial districts of Germany, with results which appear to indicate that it is likely to assume an important place in the materia medica.

CURIOUS HABITS OF BRAZILIAN FISHES.

Among the instances of animal instinct brought to our notice few are more curious than the habit of certain fresh-water fish in Brazil, in regard to the protection of their young. The species in question, belonging to the genus *Geophagus*, may frequently be seen in shallow water surrounded or accompanied by a brood of twenty or thirty young. Should any cause of disturbance, especially any imminent danger, present itself, these young disappear almost in an instant; and to a naturalist traveling in the country it became a question what could possibly have become of them. After a time, however, he caught the parent in a hand-net, and on opening its mouth this was found filled with the young, packed away toward the gills and filling the entire cavity. When this fact was mentioned to the natives they stated that it was well known to them, and that it was continued until the young attained a considerable size.

A somewhat similar case is observed with a species of *Arius* (*A. commersonii*), the male of which takes the fertilized eggs from the female into its mouth, and there retains them until they are hatched. The size of these eggs is unusually large, and they furnish an admirable opportunity to the embryologist for studying the development of the young. It is quite possible, although not yet certain, that the species first

mentioned carries its eggs in the mouth until hatched, and that the young return to this as a place of refuge when exposed to harm.

The eggs of the *Arius*, it is said, are frequently secured by the natives, by catching the parent fish by the tail and shaking it until the eggs drop out, when they are collected and dried, and in that condition used as a choice bait for a favorite fish of the country, the *Arius* itself being considered entirely unfit for food.

This habit of the fish of gathering its young into its mouth will call to the mind of some of our readers the popular belief in a similar practice among certain species of snakes. The truth of this has been asserted by many reliable observers, and may, perhaps, be considered as authenticated, although it is not improbable that many of the instances are really cases of ovo-viviparous species, such as the common garter-snake, the water-snake, and the rattlesnake of our country, the eggs of which are retained in the body of the parent until they have passed through all their transformations, and the young then discharged in a perfect condition.

SOUNDS OF INSECTS.

In a recent memoir upon the Music of Insects, by Dr. Londaïs, he divides the various sounds emitted by them into three classes: noise, mu-

sical notes, and voice, respectively. A voice is the sound produced by the organs of respiration, as in man; but if the sound be produced mechanically by the friction of the external parts of the body, it is called a note when musical, and noise when unmusical. The *Orthoptera* alone, such as crickets, grasshoppers, katydids, etc., possess the power of expressing sound in the form of musical notes. Among *Coleoptera* (the beetles) we find both note and voice. Among *Diptera* (flies, mosquitoes, etc.) we find that voice is quite common, especially with the smaller flies, but is often inappreciable to the human ear in consequence of its high pitch. Among *Lepidoptera* (butterflies and moths) the musical note is rarely found.

WHITE COATING ON PRUNES.

Our readers are all familiar with the whitish efflorescence that forms upon the surface of dried prunes, and which has been ascribed to various causes, frequently to a supposed addition of sugar and flour to increase the sweetness and weight of the fruit. It appears, however, from recent experiments, that this white coat or layer consists entirely of the grape sugar which has been left behind by the dried juice of the prune, and that it is entirely free from the sugar mites supposed to abound in it.

Editor's Historical Record.

UNITED STATES.

OUR Record closes September 24.—The résumé of domestic intelligence is made up chiefly of political news. Most of the State Conventions which have been held up to the time of closing our Record have been Republican.

The Republican State Convention of Missouri met at Jefferson City August 31. Of 800 delegates 100 were colored. There was a division in the party, the "radicals" nominating Joseph M'Clurg for Governor, and the "liberals" B. Gratz Brown. The Convention in favor of M'Clurg included in its platform the following resolutions:

Resolved, That the Republican party stands pledged to remove all disqualifications and restrictions imposed upon the late rebels in the same measure as the spirit of disloyalty may die out, and as may be consistent with the safety of the loyal people; that we consider the time to have come; and we cordially indorse the action of the Legislature of Missouri in submitting to the qualified voters of the State the amendments removing all disqualifications from the disfranchised people of Missouri, and conferring equal political rights and privileges on all classes; and we earnestly recommend them to the people for their approval and adoption.

Resolved, That we are opposed to the alienation of our public domain to private corporations, to the exclusion of actual settlers; and that the public lands should be held in trust for the landless and laboring men of the country.

Resolved, That we are in favor of as rapid a reduction of taxation as will be consistent with the conscientious discharge of our public obligations, and such a reform in the revenue service as will simplify the mode of collecting taxes, and reduce the number of officials employed for that purpose; and that we are opposed to any system of taxation which will tend to the creation of monopolies, and benefit one industry or interest at the expense of another.

Resolved, That while, as Americans, we feel in duty

bound to preserve a just and equitable neutrality in the contest now raging in Europe, yet we can not forget that in our late war the sympathies and material aid of the German states were freely given us, and we do not hesitate to declare our unqualified sympathy with the earnest efforts of the Germans to maintain and defend their national unity; and we condemn the course which the Democratic press of the country has been and is now pursuing in support of a despotic and imperial dynasty, and a causeless war against a people desiring peace and aspiring to perfect liberty.

The Convention in favor of Brown adopted, among others, the following resolutions, by which it will be seen that, notwithstanding the apparent division in the party, both wings are substantially in accord as to the measures advocated:

Resolved, That the Republican party, as it fought against slavery, which deprived a man of the whole of his earnings for the benefit of another, so it now opposes every form of taxation which deprives a man of any share of his earnings for the benefit of others; and it is, therefore, unequivocally hostile to any tariff which fosters one industry or interest at the expense of another.

Resolved, That the time has come when the requirements of public safety, upon which alone the disfranchisement of a large number of citizens could be justified, have clearly ceased to exist; and this Convention, therefore, true to the solemn pledges recorded in our national and State platforms, declares itself unequivocally in favor of the adoption of the constitutional amendments commonly called the Suffrage and Office-holding amendments, believing that, under existing circumstances, the removal of political disabilities, as well as the extension of equal political rights and privileges to all classes of citizens, without distinction, is demanded by every consideration of good faith, patriotism, and sound policy, and essential to the integrity of Republican institutions, to the prosperity of the State, and to the honor and preservation of the Republican party.

Resolved, That we are in favor of as rapid a reduction of taxation as will be consistent with a conscientious discharge of our public obligations, and such a

reform of the revenue service as will simplify the mode of collecting taxes by the officers employed for that purpose.

The Republican State Convention of Illinois met September 1, at Springfield, and renominated General Logan for Congressman at large.

The Republican State Convention of Michigan met at Detroit September 1, and renominated H. P. Baldwin for Governor, Morgan Bates for Lieutenant-Governor, and S. Hastings for Secretary of State.—The Michigan Democratic State Convention, August 31, nominated C. C. Comstock for Governor.

The Republican Convention of New York State met at Saratoga September 7. George William Curtis was chosen temporary and General Van Wyck permanent chairman. On the third ballot General Stewart L. Woodford was nominated for Governor.—The Labor Reform Convention of New York State, at Saratoga, September 13, nominated James S. Graham for Governor.—The Democratic State Convention of New York met at Rochester September 21, and nominated John T. Hoffman for Governor.

The Republican State Convention of Kansas, on September 9, nominated J. N. Harney, the present incumbent, for Governor.

The Labor Reform Convention of Massachusetts, held early in September, nominated Mr. Wendell Phillips for Governor of that State.

The Democratic State Convention of Tennessee, held at Nashville September 13, nominated John C. Brown for Governor. The platform adopted declares that all the Southern States should be restored to their rights under the Federal Constitution, and that the disabilities of all citizens should be removed. It denounces the present tariff and the substitute proposed by the Ways and Means Committee in Congress; declares the law to enforce the Fifteenth Amendment unconstitutional; demands a tax on all Federal bonds, and opposes National banks.

The Kansas Democratic State Convention, at Topeka, September 17, nominated for Governor Ira C. Sharp. The platform adopted favors the taxation of Federal bonds and the abolition of National banks, and opposes cooly labor.

An election law passed by the Georgia Legislature September 21, and approved by Attorney-General Akerman, provides for an election in that State, to be held on the 20th, 21st, and 22d days of December next, at which members of Congress will be elected for the unexpired term of the Forty-first and for the whole term of the Forty-second Congress; also for members of the State Legislature and county officers.

The Vermont State election took place September 6. Hon. J. W. Stewart, the Republican candidate for Governor, was elected by a majority of over 20,000. The entire Republican delegation to the present Congress was re-elected.

The election in Maine, September 12, resulted in a triumph for the Republican party, whose candidate, Mr. Perham, was elected by over 8000 majority. A full Republican delegation was returned to Congress.

The Oregon Legislature has elected Colonel J. B. Kelly, a Democrat, United States Senator, to succeed the Hon. George H. Williams, Republican, whose term expires March 4, 1871.

In addition to the expedition to survey the Tehuantepec and Nicaraguan routes for a ship-

canal, for which Congress made an appropriation of \$30,000, Lieutenant-Commander Selfridge will return to the Isthmus of Darien in November to complete the survey of all the possible routes for water transit in that region. The operations of Commander Selfridge's party last winter convinced them that a practicable canal passage was not likely to be found across Darien, but it is desired to settle the question absolutely by actual surveys, and the expedition will return for that purpose, and explore some ground which they were unable to traverse last season.

Two important acts have been put in operation against the Mormons of Utah by the Federal authorities: 1st, General Shaffer's proclamation against the Mormon militia system; and 2d, the decision of Chief Justice M'Kean against the Mormon jury system.

The vacancy occasioned by the death of Admiral Farragut has been filled by David D. Porter, formerly Vice-Admiral. The latter's new commission is dated August 20. Rear-Admiral S. C. Rowan becomes Vice-Admiral.

The total internal revenue receipts during the last fiscal year, ending June 30, amounted to \$37,024,338.—The public-debt statement for August shows a decrease of over \$13,000,000.

President Grant has nominated Senator Morton, of Indiana, to succeed Mr. Motley as our minister to England.

Hiram Ketcham, a well-known lawyer of New York, and once a prominent man in the local affairs of that city, died at Riverdale, New York, September 16, aged 78.

Rev. Dr. Nathan Lord, for more than thirty-five years President of Dartmouth College, died at his residence in Hanover, New Hampshire, September 9, at the advanced age of 77.

CANADA.

The Red River rebellion terminated ingloriously on the 24th of August, with the capitulation of Fort Garry, on the approach of Colonel Woolsey. Riel had fled.

EUROPE.

Our last Record brought the Franco-German war down to August 25. Marshal Bazaine, at Metz, had been made commander-in-chief of the French. M'Mahon had reached Chalons, where Napoleon had arrived, before Metz had been entirely cut off and besieged. A new ministry, with Count Palikao at its head, had assumed the reins of government in Paris, and preparations were being made to defend Paris against the approach of the German forces.

During the period which has elapsed since August 25 events have occurred as memorable as any that stand prominently forth in European history. In the short period of a single month we have seen a French army, estimated at 120,000 strong, defeated and captured, involving in its own capitulation the surrender of an Emperor who, three months ago, was presumed to be the foremost man in the affairs of Europe. Following quickly upon these events of September 2, we have seen the rejection by the French of the imperial dynasty, the flight of the Empress Eugénie from the palace of the Tuileries, and the quiet establishment of a republic in place of the empire. We have seen Paris besieged by the victorious Germans. Finally, we have witnessed

the occupation of Rome by the Italians, involving the destruction of the temporal power of the papacy.

All these events have followed as the result of the initial blunder of the French Emperor in the conduct of his campaign. After the defeat of M'Mahon at Weissenburg and Wörth, September 3 and 6, all that was necessary for the Germans, in order to reap the full results of these their first triumphs, was rapidity of movement and skillful strategy. Neither of these conditions has been wanting. King William was materially assisted by M'Mahon and Bazaine, neither of whom seems to have fully realized the hopelessness of his attempt to reopen communication with the other. The attempt of Bazaine to accomplish this led to the battle of Rezonville, which lasted nine hours, and after great loss on both sides resulted in Bazaine's retreat upon Metz, where he was shut in and besieged by the Prussians. By the 24th of August the Crown Prince, with the left wing of the German army, had advanced beyond Chalons. The next day King William's head-quarters had been transferred to Bar-le-Duc, to reinforce the Crown Prince in his march on Paris. The fortresses of Toul and Phalsbourg still held out against the Prussian forces in the west; so likewise did Strasbourg on the Rhine, though the right side of the citadel and the arsenal had been destroyed.

M'Mahon's attempt to communicate with Bazaine resulted in the crowning disaster of the campaign. He left Rheims on the 22d, and on the 29th turned up at Vaux, near the Belgian frontier, and on the right bank of the Meuse, with an army of 100,000 men. De Failly's corps at the same time took up a position between Beaumont and Storre, on the left bank of that river. Both these armies were attacked the next day by the Prussians, the force marching on Paris having suddenly turned northward to baffle M'Mahon's efforts to join Bazaine. The result of this action, which took place near Sedan, was a defeat of the French, with a loss of 7000 prisoners, 20 guns, and 11 mitrailleuses. M'Mahon's head-quarters were at Sedan. September 1 brought with it two important battles—that of St. Barbe, near Metz, and that of Sedan. In the former Marshal Bazaine, after an action lasting all day and through the night, was defeated. The battle of Sedan began with the dawn of September 1. Two Prussian corps were in position west of Sedan to cut off the possible retreat of the French to Mezieres. On all sides, indeed, were posted various corps of the Prussian army. De Failly held the French right and M'Mahon the left. The battle began on the Prussian left, where the Bavarians were posted. At 8 A.M. a hot artillery action began at all points. King William, in a letter to his Queen, thus describes the subsequent events of the day:

"The villages of Illy and Floing were taken, and the fiery circle drew gradually closer around Sedan. It was a grand sight from our position on a commanding height behind the great battery, when we looked to the front beyond St. Toney. The violent resistance of the enemy began to slacken by degrees, which we could see by the broken battalions that were hurriedly retreating from the woods and villages. The cavalry endeavored to attack several battalions of our Fifth Corps, and the latter behaved admirably. The cavalry galloped through the interval between the battalions, and then returned the same way. This was repeated three times, so that the ground was covered with corpses and horses, all of which we could

see very well from our position. I have not been able to learn the number of this brave regiment, as the retreat of the enemy was in many places a flight. The infantry, cavalry, and artillery rushed in a crowd into the town and its immediate environs, but no sign was given that the enemy contemplated extricating himself from his desperate situation by capitulation. No other course was left than to bombard the town with the heavy battery. In twenty minutes the town was burning in several places, which, with the numerous burning villages over the whole field, produced a terrible impression. I accordingly ordered the firing to cease, and sent Lieutenant-Colonel Von Bronsart, of the staff, with a flag of truce, to demand the capitulation of the army and the fortress."

Marshal M'Mahon had been wounded, and his command had devolved upon General Wimpffen. In reply to King William's demand, the Emperor personally capitulated at 5.15 P.M. His letter to the King opened with these words: "As I can not die at the head of my army, I lay my sword at the feet of your Majesty." On the 2d of September the whole army was surrendered. The next day King William assigned Wilhelmshöhe as the residence of the Emperor, to which he was conveyed through Belgium.

The news of this defeat was immediately announced in Paris by a proclamation of the cabinet ministers. A great popular commotion was apparent on Saturday the 3d. On Sunday the streets were thronged, the peaceful but excited masses shouting for a republic. As the responsibility of action in the Chamber of Deputies rested with the Left, a republic was proclaimed, and a new ministry announced, as follows: Leon Gambetta, *Minister of the Interior*; Jules Favre, *Minister of Foreign Affairs*; Ernest Picard, *Minister of Finance*; Jules Simon, *Minister of Public Instruction*; Isaac Cremieux, *Minister of Justice*; General Trochu, *Minister of War and President of the Council*; Pierre Dorian, *Superintendent of Public Works*; Joseph Magnin, *Minister of Commerce*; Martin Fourichon, *Minister of Marine*. This revolution in the government met the acclamations of the populace. It called Rochefort from his prison and Victor Hugo from his exile, both of whom were accorded splendid ovations by the Parisians.

This Paris—one moment cast down by defeat, and the next rejoicing over the death of the empire—is now besieged, like Metz and Strasbourg. The immediate future we can not predict. Both Jules Favre and M. Thiers are occupied by missions designed to secure a peace that would be honorable to France. Whether they will succeed, and whether the siege of Paris will develop into a bombardment of that city, are matters for future record.

The French republic was promptly recognized by the United States, Italy, and Switzerland. The Spanish minister at Paris, Señor Olozaga, also recognized the new government, but for this act was recalled to Madrid.

The French provisional government has decreed an election for a Constituent Assembly, to be held October 16.

On September 20 the Italian forces occupied Rome without resistance. The capital will now be transferred to that city.

The British iron-clad *Captain*, one of the most powerful war ships ever launched, foundered off Cape Finisterre, on the French coast, during a sudden gale, on the night of September 6. She had on board 500 men, all but eighteen of whom are reported lost.

Editor's Drawer.

SOME months ago the Drawer had an amusing account of the impertinent curiosity of a Connecticut man, who undertook to pump out of the gentleman seated in the seat next him in the New Haven cars who he was, where he was going, whom he was going to see, etc. The pumpee having a weed upon his hat, the pumper took him to be a widower (he wasn't a widower—he was a doctor), and having four or five “darters,” thought he might work one off on the stranger. Another instance of the irrepressible Yankee comes from the same quarter. A peering New Englander overtook a gentleman who was traveling on horseback, notwithstanding the disadvantage of having lost a leg. His curiosity was awakened, as he rode alongside of him, to know how he chanced to meet with such a misfortune.

“Been in the army, I guess?”

“Never was in the army in my life,” was the reply.

“Fit a duel?”

“Never fought a duel, Sir.”

“Horse throwed you off, I guess, or something of that sort?”

“No, Sir; nothing of the kind.”

Jonathan tried various dodges, but all to no effect; and at last, almost out of patience with himself as well as with the gentleman, whose patience was very commendable, he determined on a direct inquiry as to the nature of the accident by which the gentleman had come to lose his leg.

“I will tell you,” replied the traveler, “on condition that you will promise not to ask me another question.”

“Agreed!” exclaimed the eager listener.

“Well, Sir,” remarked the gentleman, “it was bit off!”

“Bit off!” cried Jonathan. “Wa'al, I declare; I should jest like to know *what on airth bit it off!*”

Jonathan was no more inquisitive, and no more taken aback, than the inquiring Englishman who had been betrayed into the presumption of asking a gentleman with whom he was traveling if he was a single man.

“No, I am not, Sir.”

“Oh, I beg your pardon. A married man?”

“No, Sir, I am not.”

“Pray excuse me. I perceive you are a widower.”

“No, I am not a widower.”

The inquisitor was nonplussed. Not a single man, nor a married man, nor a widower.

“Pray, what may you be, if I may be so bold as to ask?”

“It is none of your business; but if you are very anxious to know, *I am a divorced man, Sir!*”

MR. SECRETARY FISH, though one of the most refined and courteous of gentlemen, can scarcely be said to have a national reputation as a wag. Yet here is a trifle that shows what he might do if very hard pressed: A few months since Major Jack S——, of California, was in Washington in quest of office. He had besieged Senator Cole to such an extent that the horn buttons on

the back of his coat had made two holes in the Senator's sofa. At last the irrepressible Major was referred to the Secretary of State, and promptly gained an interview with that gentleman. Entering the presence, his tall white hat leaning back at an angle of forty-five degrees, stroking his huge mustache, and relieving his forehead from perspiration by means of a huge red handkerchief bordered with blue, the Secretary addressed him: “Well, Major, I am told you were of great service to our good cause in California during the last political campaign.”

The Major, throwing himself back into that graceful position peculiar to himself, and placing both thumbs in the arm-holes of his vest, exclaimed: “Oh no, I guess not! it's the man around the corner, in the grocery!”

Mr. Fish, somewhat daunted by the attitude struck by the Major, and deeming the language rather unbecoming for a gentleman to make use of who was an applicant for a high Federal position, replied: “That being the case, Major, I will have a conference with the gentleman who occupies the grocery, and endeavor to reward him for his services. Good-morning, Sir.”

On the ensuing morning the Major inserted his various shirts and things in his leathern bag, and left for California.

THE active competition for business between rival life-insurance companies, and the zealous efforts made to establish agencies in the remotest parts of the country, are fairly exemplified in the following correspondence:

“SAINT LOUIS, MO., June 1, 1869.

“To the nearest Justice of the Peace, Fort Buford, Dakota Territory:

“DEAR SIR,—We take the liberty to send you a statement of the condition and working of the Mutual Life-Insurance Company of New York, feeling assured that, by reason of your official position, you can furnish reliable information which may be very useful to us in future, and we respectfully request information upon the following points, viz.:

“1st. What is the population, business prospects, etc., of your place?

“2d. What insurance companies are doing business there, and by whom are they represented?

“3d. Please give us the names of two of your citizens whom you think would make reliable agents, and what, in your opinion, are the prospects for business, etc., in case we should wish to establish an agency in your place.

“If you will furnish answers to the above questions, you will place us under many obligations.

“Very respectfully,

“——— and ———,

“General Agents N. Y. Mutual Life-Ins. Co.”

To this very reasonable request the following detailed reply was given:

“FORT BUFORD, D. T., August 28, 1869.

“Messrs. ——— and ———, General Agents Mutual Life-Insurance Company of New York, St. Louis, Mo.:

“GENTS,—Your communication of June 1, inclosing Statement of Condition, Working, etc., of the Mutual Life-Insurance Company of New York, came to this place only a few days since, and as there is no Justice of the Peace within six or eight hundred miles of Fort Buford, presuming upon my own official dignity, I undertake to furnish the information you solicit.

“Your first question, as to population, etc., is a difficult one to answer, owing to the migratory habits of our people. If we could get together the seventeen tribes of Sioux, the Crows, Assiniboines, Gros-Ventres, Rickarees, Unk-pa-pas, Santees, and Mandans, we would probably have five thousand lodges, or twenty thousand people. A few days ago we had one hun-

dred and eighty lodges of Assiniboinés, but to-day they are gone. To-day we have twenty Sioux, and to-morrow they will be gone.

"Secondly—'What insurance companies are doing business here, and by whom are they represented?'"

"There is at present but one company doing business here—the 'Union,' principal office at Washington, D. C.; U. S. Grant, President; Schuyler Colfax, Vice-President; and is very efficiently represented by Brigadier-General H. A. Morrow, U. S. A., assisted by a corps of subordinates and three hundred men with breech-loading guns and bayonets. Medical Examiner, Assistant-Surgeon James Kimball, U. S. A., assisted by Dr. H. N. Marcellis.

"Thirdly—You 'wish the names of two of our citizens who would make reliable and efficient agents.'"

"As the Unk-pa-pas and Te-tons are the principal terror in this section, I give you the names of two of their principal chiefs, viz.: Tich-tun-ka U-tun-ka (or Sitting Bull) and Wee-sap-pa (or Black Moose). They are very efficient life-destroyers, and if you can enlist them in the life-insurance business, you will have accomplished a great and good work, and will be justly entitled to the gratitude of all frontiersmen; for the lives of white men would then be comparatively safe. It is less than a month since four white men were killed and scalped within three miles of the fort, each being pierced by more than a dozen bullets.

"Very truly yours,

"W. H. CAREY,
"Ass't P. M.

"P.S.—Should you wish to correspond further on this subject, I must beg you to inclose twenty-five cents in each letter, to defray the expense of getting them from Fort Stephenson, one hundred and fifty miles distant, and the nearest post-office in running order.

W. H. C.

"P.S. 2d.—On the whole, I estimate that 'Sitting Bull' is the man for you."

THE reader of the morning journals, notably the *Herald*, can not fail to have been struck with the grief, in four lines, that may be read almost any day in the obituary column. It generally takes this form:

"Dearest Tommy, thou hast left us,
And thy loss we deeply feel;
Still there is a God above us,
He can all our sorrows heal."

This stanza appears to be kept in type, ready for all comers who would assuage their sorrow with a bit of poetry. In a volume before us, recently published abroad, a healthier mode of treatment is suggested, viz., to eat something; and, in proof of its good results, the author quotes the case of the hero of one of Captain Marryat's novels, a boy who has just lost father and mother, one by fire and one by water, at one and the same time, but who gluttonizes over an exceptionally good breakfast given him in a stranger's kitchen. "Grief had not taken away my appetite. I stopped occasionally to cry a little, wiped my eyes, and sat down again. It was more than two hours before I laid down my knife, and not until strong symptoms of suffocation played around the regions of my trachea did I cry out, 'Hold, enough.'" One might have supposed the youthful crammer steeped in the practical philosophy of Canning's lines, arguing that

"—when the mind's oppress,
Confused, elated, warmed, distressed,
The body keeps an equal measure
In sympathy of pain or pleasure;
And whether moved with joy or sorrow,
From food alone relief can borrow.
Sorrow's indeed, beyond all question,
The best specific for digestion;
Which, when in moderate force it rages,
A chicken or a chop assuages.
But, to support some weightier grief,
Grant me, ye gods, a round of beef!"

Quite as good, though less poetical, is the case

of the estimable Mark Tapley when he defines himself as a Verb—the only article of grammar he ever learned: "A Verb is a word as signifies to be, to do, or to suffer; and if there's a Verb alive, I'm it. For I'm always a bein', sometimes a doin', and continually a sufferin'." Mr. Tapley took this occasion of looking about him with a grin, and subsequently attacking the breakfast with an appetite not at all expressive of blighted hopes or insurmountable despondency.

A STORY has just come from abroad of the late Count Montalembert, which is droll as an instance of the difficulty that Frenchmen have of appreciating the humor of Englishmen or Americans. The distinguished Frenchman, in company with Thackeray, an eminent professor, and a well-known literary peer, formed a party of four, many years ago, to go to the Derby races by road. On their return they passed a van-load of drunken sailors with their trulls, upon which Montalembert observed, in his cynical way, "I suppose dese are vat you call your joli Jack tars?" "Not at all," replied Thackeray; "they are only Epsom salts." It was half an hour before the astute French savant was made to comprehend the scope of the observation.

SPEAKING of the tendency of the American citizen to whittle, a gentleman writes that at the General Assembly of the Old School Presbyterians, held at Albany, he observed Dr. Charles Hodge, the well-known theologian, sitting on the sofa of honor in rear of the platform, intent, during the greater part of a debate, in cutting the top of a stick into what appeared to be intended for a dog's head.

A story something of the same sort is told of a young man, who, being poor, found great difficulty in overcoming the objection of his inamorata's father to the match. One day he took his minister with him to testify to his character and urge his suit. While the minister did so the excited youth sat nervously whittling the top of his stick. The old gentleman watched him, and at last got up and said, "No, Sir; you sha'n't have my daughter. I have watched you whittling that stick, and if you had made a man's head of it, or a dog's head, or the likeness of any mortal thing, I'd have said, 'Take the girl;' but a man that whittles a stick for fifteen minutes and makes nothing of it ain't worth a ten-cent cuss."

ANOTHER war story. When the Mississippi cavalry, retreating from Corinth, had joined Pemberton's army at Grenada, a lad came riding into camp one day, crying out to the soldiers that he had brought important news from headquarters.

"What is it?"

"A flag of truce from Grant."

"From Grant! What does he want?"

"Nothing much; only he says he wants to conduct the war on civilized principles; and as he intends to shell this here town, he requests that the women, and the children, and the Mississippi cavalry be carefully removed out of the way of danger."

A fair anecdote. But they fought well. It is related of one shoeless Southern regiment that the men clothed themselves almost entirely from killed Yankees. In driving some Northern troops

out of the woods, one of the barefooted men took careful aim and fired. The moment he saw his man fall he cried, anxiously, "Them's my shoes!"

AMONG the war stories of the South that are rapidly making their way North the following is not bad:

Some of the North Carolina boys, who didn't know much else, had fine heads for soldiering. After the battle of Sharpsburg a number of men who had won laurels were examined with a view to promotion. One of them was found so woefully deficient in his education that it was moved that the Board pass on to the next candidate.

"President," said the man, "I can't read or write; I've never been vaccinated; I don't know about tactics; but I'll tell you what I *can* do. I can whip any man on this Board." The Board looked up one leg and down the other of the tall and brawny individual, and thought that perhaps he could; but as they were after grammar, they left the warrior out in the cool.

ABOUT these days, when so many gatherings take place of the "Grand Army of the Republic," the "Reunion of the Army of the Potomac," the "Annual Meeting of the Third Army Corps," etc., etc., where the boys, amidst the flashing of gas-lights and popping of Champagne corks, fight their battles o'er again, it may not be out of place to go back to the war of 1812, and put before our modern heroes what was done at New Orleans against the British, as described by one of the fighting men in that little affair. Note the clearness of the narrative:

"The first *atempt* was made to fight
Was on December, the twenty-third night;
The volenteers from Tennessee
Was *kild* and captured sixty-three.

"The next atempt the British made
Was on December the twenty-eight;
Then marched the invader toward our line,
Til wee frustreated their dezine.

"But sum of our own men did yeald
And faul a victim on the field;
Those that ley kild in their own goare
Was *Kernel* Henderson and six more.

"On New Year's morning, as the sun did rize,
A heavy fog darkened the skize,
A British *kenon* did us alarm,
Which made us all fly to our *arm*.

"The battle lastid that hole day—
Artillery on both sides did play;
The fiery darts that at us flew
Was kennon bauls and rockets two.

* * * * *

"Wee are melitia from Tennessee,
Turned out to fight for *Libertee*:
Come, let us join with one acord,
And hold our freedom by the Sward.

"Now wee have gained the victoree,
And caused our enemy for to flee,
We wait to hear our Ginerall say
Heel march us back to Tennessee.

"Then we will bid Orleans *adew*,
And on our journey *weel* pushue,
And for sweet Tennessee *weel* steare,
To meet our wives and sweethearts dear."

"From ANDREW K. LAWSON to CYRUS MILLER."

A CORRESPONDENT at Marysville furnishes an account of the first case disposed of by Justice A—— after having been appointed for Struckee Township, Nevada, in 1860. The reader will ad-

mire the paternal style of the Judge, and his generous way of ignoring every thing like law or precedent. The case originated in a dispute for the possession of a wood-claim, which terminated by one of the parties shooting the top of the other's head off. The want of any mitigating circumstances, and the fact that a person had shortly before been executed for a similar offense near by, caused the friends of the prisoner to make unusual preparations for his defense; and the best counsel in the State, including an ex-chief justice of California, and Mr. Low, our present Minister to China, appeared for him at the trial, with a ponderous pile of law-books, evidently prepared for the worst.

Judge A—— listened closely to the evidence, promptly overruled all attempts to exclude any portion of it, and then waving down, with the utmost dignity, the prosecuting attorney, who was about to address the Court, delivered himself as follows to the prisoner: "Young man, seeing as this is your first offense, I shall let you off *this* time; but you must be *very careful* how you go shootin' round this way in future, for they hung a man over to Carson the other day *just for doing the very same thing!*"

GENTLEMEN-FARMERS may ponder with profit the following verbatim communication, sent by an honest Hibernian (and thorough Fenian), who looks sharply after the gallinaceous interests of a gentleman most of whose time is spent in town:

"TUCKAHOE June 15th 1870

"C. P. JONES Esq, New York,

"SIR,—I mean to address you with a few lines all a bout Dick Jackson, Mr. Jones, I cannot Provent that man of Picking up the eggs that is outside the Lock & Key for If they was a Egg on top of one of the highest trees on your Demesne that man would have that Egg before me. Mr. Jones I mean to inform a little more a bout that unfortunate man. When he came on your place he Bought two Pigs. When he is Going home at Night he has a Bag of Straw or a Board. Mr. Jones that man has Oates & Male under his hands all the year, due you think! But that man would take your oates and male home to his Pigs as well as he would take the Eggs from me. For it would take General grant & his Army to watch that man.

"Mr. Jones I do not like for any Person or Persons to have to say that I was the man that got Jackson out of your Employment. Do you as you please, Mr. Jones I see one Sheep has the hole flock Disfigered.

"I will end my tale in Figure hand,

"Your humble servant,

"PATRICK M'GUIRE."

GENERAL JOE GEIGER, who has furnished many good things for the Drawer, told the following of himself, not long since, to a small but select audience. It illustrates the proverbial diffidence of the Ohio lawyer:

Soon after the fall of Vicksburg the General took a run down South, for the double purpose of seeing the army in the field and for pleasure, and not at all averse to turning an honest penny, should occasion offer.

While in Vicksburg, a cotton speculator became involved in some trouble with the revenue and military authorities, which resulted in the seizure of his cotton. The General's presence in the city was known, and his legal talent promptly secured by the speculator. On examination it was shown that no fraud had been perpetrated or intended, and the General soon had all the legal formalities put right, and the cotton released. The speculator at once proceeded to load, informing the General that it must be put on board that

night, and that he would see him in the morning. The General passed a sleepless night, debating with himself whether or not he should charge him a \$500 fee. The amount involved was large; so were his responsibilities. He thought he had earned, yet feared to ask it. Morning came and found him still undecided. Donning his clothes he sallied forth, and, naturally enough, toward the levee, where the steamer was lying which was to take the cotton North. Before reaching the levee, however, he was met by his client, who said:

"Well, Mr. Geiger, that was a good day's work you did for me yesterday."

"I endeavored to do my duty for you."

Taking from his pocket a large roll of bills, and holding up one knee, the noble speculator in "long staple" counted off four \$500 bills, and asked, "Is that enough?" still holding up the knee with his fingers on another.

The General looked on, quite speechless, but promptly recovered himself so far as to reply: "I guess you had better lay on another!"

It was laid on. The General inserted the xxv. hundred in his pocket, and kindly bid "by-by" to the other party.

DURING the last century there was a great predilection for all those toasts in which the same words or phrases were repeated several times. One of the most popular ran as follows: "Here's a health to you and yours, who have done such things for us and ours; and when we and ours have it in our powers to do for you and yours what you and yours have done for us and ours, then we and ours will do for you and yours what you and yours have done for us and ours." Another, of which there were a great many versions, some very complicated and confusing, was:

"Here's a health to all those that I love;
Here's a health to all those that love me;
Here's a health to all those that love those that I love,
And to those that love them that love me."

Another, generally given by a guest as a kind of thank-offering to the host, runs thus:

"Here's a health to me and mine,
Not forgetting thee and thine;
And when thee and thine
Come to see me and mine,
May me and mine make thee and thine
As welcome as thee and thine
Have ever made me and mine."

MANY testimonials of the eccentricities of the late Thomas W. Thomas, Judge of the Superior Courts of the Northern Circuit of Georgia, have appeared in the Drawer. I send you another, as an evidence of one of the many good characteristics of the Judge, and showing his dislike of the flummery of pleas designed for delay, and his uncompromising stand in having causes brought before him tried upon their merits.

An execution had been levied upon a tract of land. Sale-day arrived, and the defendant, in order to gain time, presented to the sheriff an affidavit of illegality, alleging for cause that the sale had not been advertised in the three most *public* places in the county of Lincoln. The sheriff postponed the sale, and returned the papers to the clerk of the court for trial. At the next court the case was called. Judge Reese, attorney for defendant, moved to dismiss the levy on the ground stated, citing the statute.

H. J. Lang, Esq., counsel for plaintiff, contended that the law requiring sales to be advertised in the three most *public* places in the county had become obsolete from non-usage, and, even admitting the law was in force, the objection would not hold good, because the law always presumes that the officer has discharged his duty. In the midst of the argument the Judge interposed, observing to plaintiff's counsel that he did not desire to hear further from him, and delivered the following decision:

"Gentlemen, I must overrule the motion of defendant's counsel to dismiss the levy in this cause, because it is not, and can not possibly be known which are the three most *public* places in the county of Lincoln. Were this case before me in the county of Heard I should rule differently, because in that county there are three public places which are known as the most *public*. The first is the *muster-ground*, where they all go to *muster once a month*. The second is the *clay-bank*, where they all go to *eat dirt once a week*; and the third is the *still-house*, where they all go to *licker every day*. Mr. Clerk, enter the motion overruled, at defendant's costs."

A CORRESPONDENT at Canton, New York, asks if the Drawer has ever thought it worth while to take a stroll into Père la Chaise, the beautiful necropolis of Paris. The "Advertisement" in the July number of the Drawer brings up a little incident which befell him there. Visiting that cemetery on last All-souls' Day, his attention was arrested by the faint glimmering of a delicious little lamp, a glow-worm of bronze, keeping silent and sentimental vigil under a modest urn of black marble, bearing an inscription, which is translated thus:

HERE LIES FOURNIER (Pierre Victor),
Inventor of "Everlasting Lamps,"
Which burn only one centime's worth of oil in an hour.
HE WAS A GOOD FATHER, SON, AND HUSBAND.
HIS INCONSOLABLE WIDOW
Continues his business at No. 19 Rue aux Ours.
Goods sent to all parts of the city.
N.B.—Do not mistake the opposite shop for this, S.V.P.
R. I. P.

Meditating upon the neat stroke by which the mournful Artemisia had mingled grief and advertising economy, our friend visited the Rue aux Ours to give custom to the sorrow-stricken spouse. On entering the shop the little bell tinkled and brought out from the hidden depths behind a rubicund tradesman; but on intimating a wish to do business with the inconsolable widow, the defunct inventor, with a graceless shrug, made answer: "Ah, pardon! that's me! I am—yes, myself—I am Pierre Victor, inventor. The widow—pif—she's un symbole, un mythe!"

APROPÓS to our friend Saxe's card-table anecdote of Judge Turner, in a recent Number of the Drawer, is the following of Judge Mattocks, which is vouched for as authentic. Mattocks, like many of the judges in those early days, was extremely addicted to card-playing, and nearly all his evenings, during term time, were, in company with congenial spirits of the bar, devoted to "seven up." One morning in court, after a whole night spent in this amusement, one of the brethren of the bar, Mr. J——, having occasion to comment upon the unfortunate citation of an

authority by one of the "weaker brethren" on the other side, said: "May it please your Honor, the gentleman has trumped his own trick." "Brother J——," said Judge Mattocks, interrupting him, with an air of severe dignity, "*you will be good enough to use language that the Court can understand.*"

THEY have an amusement in Carson City, Nevada, which is peculiar to that lively little town. It is a "rooster-pulling match." For these matches many roosters are provided—fine, strong fowls. The match is thus described by our friend Dr. Schermerhorn:

"Each competitor seats himself on a log of wood with his feet against a board. He first deposits a dollar, and then takes one of the roosters, places it between his legs with its head downward, and, seizing the feet of the poor fowl, pulls with full force. If he succeeds in pulling the legs of the rooster clean off, he will win the bird; if not, he will lose the dollar. Few succeed in the attempt."

The gentleman to whom this recital was made noticed that the fowls, though subjected to such severe torture, did not make any noise, and asked Dr. Schermerhorn the reason:

"They can't," answered the Doctor. "*They are too much absorbed!*"

THE latest instance of a bald attempt to lacerate the feelings of lovely woman has been put upon record by a literary man of Brooklyn, and runs thus: A gentleman of that city, well known for his mild and gentle disposition, took the cars recently to attend to some business at Elizabeth, New Jersey. The cars being nearly full, he was obliged to take a seat with a lady, as the young men say, "one of uncertain age." Not *daring* to engage in conversation with her, he remained quietly thinking, until nearing, as he thought, his destination, he ventured to remark, "Is this Elizabeth?" Instantly drawing herself up, she quickly replied, "What do you mean, Sir?" Without perceiving that she had made a mistake, he again asked, "Is this Elizabeth?" Furiously turning to him, and with half-frightened air, she screamed out, "You may think you are a gentleman, Sir, to address a lady so, but I do not wish to continue any farther talk with you."

The conversation at this point terminated by the stopping of the cars, and the conductor sang in at the door, "All out at Elizabeth!" The gentleman rose and left the cars, but not until he had heard sufficient laughter to convince him of the many perils besetting railroad traveling.

THE curious and "troublesome" style of Carlyle is said to be quite in contrast with his simple, straightforward way of talking. Hatred of sham is one of his notable characteristics. One evening, at a small literary gathering, a lady, famous for her "muslin theology," was bewailing the wickedness of the Jews in not receiving our Saviour, and ended her diatribe by expressing regret that He had not appeared in our own time. "How delighted," said she, "we should all be to throw our doors open to Him, and listen to His divine precepts! Don't you think so, Mr. Carlyle?"

The sturdy philosopher, thus appealed to, said, in his broad Scotch, "No, madam, I don't. I

think that, had he come very fashionably dressed, with plenty of money, and preaching doctrines palatable to the higher orders, I might have had the honor of receiving from you a card of invitation, on the back of which would be written, 'TO MEET OUR SAVIOUR;' but if He had come uttering His sublime precepts, and denouncing the Pharisees, and associating with the Publicans and lower orders, as He did, you would have treated Him much as the Jews did, and have cried out, 'Take Him to Newgate and hang Him!'"

On another occasion, when Ernest Jones, a well-known Chartist leader, was haranguing, in his violent manner, against the established authorities, Carlyle shook his head, and told him that, "had the Chartist leaders been living in the days of Christ, he would have sent the unclean spirits into them, instead of into the swine of the Gergesenes, and so we should have happily got rid of them." This delicate allusion to the suicide of the pigs so astonished the respectable representative of the numerous family of the Joneses that he said nothing more about Chartism that night.

In the Know-Nothing times occurred the election of Judge Comstock, ex-Chief Justice of the Court of Appeals, and son-in-law of that sterling and eminent lawyer, the late Hon. B. Davis Noxon, of Syracuse. Soon after Judge C.'s election, Judge Gray, of the Sixth Judicial District, met Mr. N., and congratulated him on the elevation of his son-in-law to the Bench, who, after having been so long a judge in theory, had now become one in fact, and who, no doubt, would make an excellent judge. "Yes," Mr. Noxon, replied, "he will—if he isn't most awfully deceived in himself!"

THIS is Frenchy, and fresh from Paris: Just before his death, Dr. Cabarrus, the great homoeopathic physician of Paris, was sent for by Mlle. Julia Barron, who was out of sorts. "What is the matter?" asked the Doctor. "Oh, I hardly know myself," she replied; "my spirits are terribly unequal. Sometimes I am greatly elated, and then I suddenly sink into the deepest melancholy." After a moment's reflection, Cabarrus said, gravely: "I am afraid there is but one way to cure you." "What is it?" she inquired, eagerly. "You must get married," he replied, with a mirthful twinkle of the eye, but still keeping a grave face. "Well," said Mlle. Barron, after a little hesitation, followed by a long-drawn sigh of relief, "perhaps you are right. Would you marry me?" "*Ma chère,*" replied Cabarrus, blandly, "the doctor prescribes, but he doesn't take his own medicines."

A FEW days after the evacuation of Richmond by the Confederate forces, Colonel Y—— of the 990th Ohio Volunteers, while in command of a small detachment, was on a scout in that portion of the vineyard known as East Tennessee, and not far from the home of Andrew Johnson. Being some distance from camp, and not knowing the country, the Colonel halloed at a log-hut on the opposite side of the river, from the chimney of which the smoke was curling, indicating it to be inhabited. In response to the hail, a thorough-bred, mossy-backed mountaineer, evi-

dently a nabob, counting his wealth by the number of hounds that yelped at his heels, appeared, and through the mingled howls and barks we managed to hear him say,

"What der yer want?"

"Have you heard," said Colonel Y——, "that Richmond is taken?"

The mossy-backed mountaineer replied not, seeming to be dumfounded at the announcement.

"Don't you know," continued the gory Ohio chieftain, "that the Yankees have taken Richmond at last?"

The mossy-backed answered that he "hadn't hearn nuthin'."

"Well," said the Colonel, "they have. Can't you give three cheers for the old flag?"

"Oh, my Lord, mister Yank!" replied the mossy-backed resident of the cot, "we hain't got but three cheers in the house, and one o' them's a stule!"

No "hooray" to be had there.

SOME of our Fifteenth Amendment citizens in Pittsburg, having formed an association known as "Knights of the White Cross," amused themselves one warm day in August last by a grand tournament, in which the dusky knights vied with each other for the honor of crowning the "Queen of Beauty." The entertainment was announced by hand-bills, properly displayed, some of which were distributed in the street-cars. One of these was picked up by a sedate gentleman, who, after glancing over it, inquired of a jocose attorney who sat next him:

"Mr. B——, what does this mean?"

"Why, it is a negro tournament."

"But why do they call themselves 'Knights of the White Cross?'"

"I suppose," replied Mr. B——, "it is because they are mulattoes."

The explanation appeared to be entirely satisfactory.

MR. JOHN W. YOUNG, a son of Brigham, of Salt Lake City, has been for the past year engaged in making collections for a Territorial museum, designed especially to illustrate the animal kingdom, minerals, etc., of Utah. Being in San Francisco a short time since, he bought a pair of monkeys for his museum. On his way home, while the cars stopped at Elko, on the Central Pacific, for dinner, seeing a considerable number of Indians about the station, he called them to the baggage-car, and opening the door, pointed out to them the pair of pre-Adamite men. The Indians surveyed the monkeys with characteristic gravity.

"Do you know what they are?" asked Mr. Young of the chief of the noble red men.

"Yes," said the chief, with some indication of surprise at the simplicity of the question; "me see 'em; me know 'em—Chinaman's pappoose!"

LIFE-INSURANCE men are not debarred from reading the following:

Even in the old Bay State there are men who in oral reading of the Bible will accidentally mention the wrong word in the right place. Example: A worthy farmer was reading aloud the 22d chapter of Matthew as a part of his morning devotions. He had got along without

serious mishap till he came to the 25th verse, which reads as follows:

"Now there were with us seven brethren: and the first, when he had married a wife, deceased, and, having no issue, left his wife unto his brother."

He read it thus: "And the first, when he had married a wife, deceased, and, having no insurance, left his wife unto his brother."

That was the kind of life-insurance popular in the time of St. Matthew. Our reversible policies are better. The point now is that men, faithful to their courtship vows (and *all* of us are), are willing to die for their wives, and when they do die "that life-insurance man" comes around with the collaterals. The fact is, the women don't really seem to know how good we men are. Those fellows in St. Matthew's days were not a priming to us!

To inculcate a wide regard for temperance is one of the amiable objects of the Drawer. When, therefore, it finds an incident that seems calculated to promote temperance, it pounces upon it. Such an incident is related by Artemus Ward in the "Genial Showman," where he describes the country "store" in his native town in Maine.

"I usually encounter there on sunny afternoons an old Revolutionary soldier. You may possibly have read about 'Another Revolutionary Soldier Gone;' but this is one who hasn't gone, and, moreover, one who doesn't manifest the slightest intention of going. He distinctly remembers Washington, of course. They all do. But what I wish to call special attention to, is the fact that this Revolutionary soldier is one hundred years old, that his eyes are so good that he can read fine print without spectacles—he never used them, by-the-way—and his mind is perfectly clear. He is a little shaky in one of his legs, but otherwise he is as active as most men of forty-five, and his general health is excellent. He uses no tobacco, but for the last twenty years he has drunk one glass of liquor every day—no more, no less. He says he must have his 'tod.' But because a man can drink a glass of liquor a day, and live to be a hundred years old, my young readers must not infer that *by drinking two glasses of liquor a day a man can live to be two hundred.*"

"PUNCTUAL men," says Mr. A. Ward, "are nuisances. Where their heart should beat they have only a clock ticking. Your doctor is like the New England doctor I tell about sometimes. He was very punctual. When his wife died he went to her funeral. As the earth fell on her coffin every body around cried. All he did was to take out his watch, look at the time, and say: '*Well, we've got her under, and it's just twenty minutes past two!*'"

THE REV. J. H. K—— was, several years since, pastor of a Methodist Episcopal church in Western New York. During his sermon, on a hot summer's Sunday morning, Brother Austen, one of the official members of the church, fell fast asleep. Mr. K—— suddenly paused, and called out: "Brother Austen, will you please to open the window there a little? *physicians say it is very unhealthy to sleep in a close room.*" The brother was awakened, and complied.
